Returns a new [LinkedHashMap] with the specified contents, given as a list of pairs where the first component is the key and the second is the value. ```

Returns a list containing only distinct elements from the given collection.

- Among equal elements of the given collection, only the first one will be present in the resulting list.
- The elements in the resulting list are in the same order as they were in the source collection.

@sample

```
samples.collections.Collections.Transformations.distinctAndDistinctBy
```

```
public fun <T> Iterable<T>.distinct(): List<T> {
 return this.toMutableSet().toList()
}
```

Returns a list containing only elements from the given collection having distinct keys returned by the given [selector] function.

- Among elements of the given collection with equal keys, only the first one will be present in the resulting list.
- The elements in the resulting list are in the same order as they were in the source collection.

@sample

```
samples.collections.Collections.Transformations.distinctAndDistinctBy
```

```
public inline fun <T, K> Iterable<T>.distinctBy(selector: (T) -> K): List<T> {
 val set = HashSet<K>()
 val list = ArrayList<T>()
 for (e in this) {
 val key = selector(e)
 if (set.add(key)) list.add(e)
 }
 return list
}
```

Returns a set containing all elements that are contained by both this collection and the specified collection.

The returned set preserves the element iteration order of the original collection.

To get a set containing all elements that are contained at least in one of these collections use [union].

```
public infix fun <T> Iterable<T>.intersect(other: Iterable<T>): Set<T> {
 val set = this.toMutableSet()
 set.retainAll(other)
 return set
}
```

Returns a set containing all elements that are contained by this collection and not contained by the specified collection.

The returned set preserves the element iteration order of the original collection.

```
public infix fun <T> Iterable<T>.subtract(other: Iterable<T>): Set<T> {
 val set = this.toMutableSet()
 set.removeAll(other)
 return set
}
```

Returns a new [MutableSet] containing all distinct elements from the given collection.

The returned set preserves the element iteration order of the original collection.

```
public fun <T> Iterable<T>.toMutableSet(): MutableSet<T> {
 return when (this) {
 is Collection<T> -> LinkedHashSet(this)
 else -> toCollection(LinkedHashSet<T>())
 }
}
```

Returns a set containing all distinct elements from both collections.

The returned set preserves the element iteration order of the original collection.

Those elements of the [other] collection that are unique are iterated in the end in the order of the [other] collection.

To get a set containing all elements that are contained in both collections use [intersect].

```
public infix fun <T> Iterable<T>.union(other: Iterable<T>): Set<T> {
 val set = this.toMutableSet()
 set.addAll(other)
 return set

@sample

```
samples.collections.Collections.Aggregates.any
```

```
public fun <T> Iterable<T>.any(): Boolean {
 if (this is Collection) return !isEmpty()

Returns the number of elements in this collection.

```
public fun <T> Iterable<T>.count(): Int {
 if (this is Collection) return size
 var count = 0
 for (element in this) checkCountOverflow(++count)
 return count
}
```

Returns the number of elements in this collection.

```
@kotlin.internal.InlineOnly

1.6, the [elements] array may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of hashCode() that didn't change between successive invocations. On JVM, you can enable this behavior back with the system property kotlin.collections.convert\_arg\_to\_set\_in\_removeAll set to true. The operation is \_intermediate\_ and \_stateful\_.

```

 return object: Sequence<T> {
 override fun iterator(): Iterator<T> {
 val other = elements.convertToSetForSetOperation()
 return this@minus.filterNot { it in other }.iterator()

```

@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.minusElement(element: T): Sequence<T> {

```

Note that the source sequence and the array being added are iterated only when an iterator is requested from the resulting sequence. Changing any of them between successive calls to iterator may affect the result. The operation is \_intermediate\_ and \_stateless\_.

```

public operator fun <T> Sequence<T>.plus(elements: Array<out T>): Sequence<T> {

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] collection. Note that the source sequence and the collection being added

are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is `_intermediate_ and _stateless_`.

```
public operator fun <T> Sequence<T>.plus(elements: Iterable<T>): Sequence<T> {

}
```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] sequence.

Note that the source sequence and the sequence being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is `_intermediate_ and _stateless_`.

```
public operator fun <T> Sequence<T>.plus(elements: Sequence<T>): Sequence<T> {

```

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is `_intermediate_ and _stateless_`.

```
@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.plusElement(element: T): Sequence<T> {

```

Returns a sequence of snapshots of the window of the given [size] sliding along this sequence with the given [step], where each snapshot is a list.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window

@param step the number of elements to move the window forward by on an each step, by default 1

@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.takeWindows

public fun <T> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {

}
```

Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size] sliding along this sequence with the given [step].

Note that the list passed to the [transform] function is ephemeral and is valid only inside that function. You should not store it or allow it to escape in some way, unless you made a snapshot of it.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

}
```

Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index.

The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_ and _stateless_`.

@sample samples.collections.Sequences.Transformations.zip

```
public infix fun <T, R> Sequence<T>.zip(other: Sequence<R>): Sequence<Pair<T, R>> {

}
```

Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index using the provided [transform] function applied to each pair of elements.

The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_ and _stateless_`.

```

Returns a sequence of pairs of each two adjacent elements in this sequence.

The returned sequence is empty if this sequence contains less than two elements.

The operation is `_intermediate_ and _stateless_`.

@sample samples.collections.Collections.Transformations.zipWithNext

```
@SinceKotlin("1.2")
public fun <T> Sequence<T>.zipWithNext(): Sequence<Pair<T, T>> {

exception.

\* This function returns unintercepted continuation.

\* Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the `[ContinuationInterceptor]` that might be present in the completion's `[CoroutineContext]`.

\* It is the invoker's responsibility to ensure that a proper invocation context is established.

\* Note that `[completion]` of this function may get invoked in an arbitrary context.

\* `[Continuation.intercepted]` can be used to acquire the intercepted continuation.

\* Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and `[completion]` happens in the invocation context established by `[ContinuationInterceptor]`.

\* Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(
 completion: Continuation<T>): Continuation<Unit> =
 // Kotlin/JS suspend lambdas have an extra parameter
 `suspended`

 // When `suspended` is true the continuation is created,
 but not executed
 this.asDynamic()(completion, true)
 } else {
 createCoroutineFromSuspendFunction(completion) {
 this.asDynamic()(completion)
 }
 }

```

\* Creates unintercepted coroutine with receiver type `[R]` and result type `[T]`.

\* This function creates a new, fresh instance of suspendable computation every time it is invoked.

\* To start executing the created coroutine, invoke `resume(Unit)` on the returned `[Continuation]` instance.

\* The `[completion]` continuation is invoked when coroutine completes with result or exception.

\* Intercepts this continuation with `[ContinuationInterceptor]`.

\* This function shall be used on the immediate result of `[createCoroutineUnintercepted]` or `[suspendCoroutineUninterceptedOrReturn]`, in which case it checks for `[ContinuationInterceptor]` in the continuation's `[context][Continuation.context]`, invokes `[ContinuationInterceptor.interceptContinuation]`, caches and returns the result.

\* If this function is invoked on other `[Continuation]` instances it returns `this` continuation unchanged.
