```

coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established.

This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <T> (suspend () -> T).startCoroutineUninterceptedOrReturn(
 completion: Continuation<T>): Any? = this.asDynamic().if (this !is CoroutineImpl) createSimpleCoroutineFromSuspendFunction(completion) else completion, false

```

Starts an unintercepted coroutine with receiver type [R] and result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE\_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception.

The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established.

This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <R, T> (suspend R.() -> T).startCoroutineUninterceptedOrReturn(
 receiver: R, completion: Continuation<T>): Any? = this.asDynamic().(receiver, if (this !is CoroutineImpl) createSimpleCoroutineFromSuspendFunction(completion) else completion, false)

```

Creates an unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")@InlineOnly
public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(
 completion: Continuation<T>): Continuation<Unit> = //
 // Kotlin/JS suspend lambdas have an extra parameter `suspended`
 // When `suspended` is true the continuation is created, but not executed
 this.asDynamic()(completion, true)
} else {
 createCoroutineFromSuspendFunction(completion) {
 this.asDynamic()(completion)
 }
}

```

Creates unintercepted coroutine with receiver type [R] and result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation

library(public val name: String = "")\n\n@Target(CLASS)\n\ninternal annotation class marker\n\n/**\n * Gives a
declaration (a function, a property or a class) specific name in JavaScript.\n */\n * This may be useful in the
following cases:\n */\n * * There are two functions for which the compiler gives same name in JavaScript, you
can\n */\n * mark one with `@JsName(...)` to prevent the compiler from reporting error.\n */\n * * You are writing a
JavaScript library in Kotlin. The compiler produces mangled names\n */\n * for functions with parameters, which is
unnatural for usual JavaScript developer.\n */\n * You can put `@JsName(...)` on functions you want to be available
from JavaScript.\n */\n * * For some reason you want to rename declaration, e.g. there's common term in JavaScript\n */\n *
for a concept provided by the declaration, which is uncommon in Kotlin.\n */\n * Example:\n */\n * ```
kotlin\n * class Person(val name: String) {\n * fun hello() {\n * println("Hello $name!")\n * }\n * }\n *
@JsName("helloWithGreeting")\n * fun hello(greeting: String) {\n * println("$greeting $name!")\n * }\n * }\n *
```\n */\n * @property name the name which compiler uses both for declaration itself and for all
references to the declaration.\n */\n * It's required to denote a valid JavaScript identifier.\n */\n
*/\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR,
PROPERTY_GETTER, PROPERTY_SETTER)\n\npublic actual annotation class JsName(actual val name:
String)\n\n/**\n * Denotes an `external` declaration that must be imported from native JavaScript library.\n */\n *
The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n */\n * it
will import the declaration via the `require(...)` function.\n */\n * The annotation can be used on top-level external
declarations
(classes, properties, functions) and files.\n */\n * In case of file (which can't be `external`) the following rule applies: all
the declarations in\n */\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to
import a JavaScript object\n */\n * that contain all the declarations from the file.\n */\n * Example:\n */\n * ```
kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n *     // some declarations here\n * }\n * }\n *
@JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n */\n * @property import name
of a module to import declaration from.\n */\n * It is not interpreted by the Kotlin compiler, it's passed as is
directly to the target module system.\n */\n * @see JsNonModule\n
*/\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\n\npublic
annotation class JsModule(val import: String)\n\n/**\n * Denotes an `external` declaration that can be used without
module system.\n */\n * By default,
an `external` declaration is available regardless your target module system.\n */\n * However, by applying [JsModule]
annotation you can make a declaration unavailable to *plain* module system.\n */\n * Some JavaScript libraries are
distributed both as a standalone downloadable piece of JavaScript and as a module available\n */\n * as an npm
package.\n */\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the
`@JsNonModule` annotation.\n */\n * For example:\n */\n * ```
kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external abstract class JQuery() {\n *     // some declarations here\n * }\n

```

```

```

elements from the [Grouping] source by key and applies [operation] to the elements of each group sequentially, passing the previously accumulated value and the current element as arguments and stores the results in the given [destination] map. An initial value of accumulator is provided by [initialValueSelector] function.

@param initialValueSelector a function that provides an initial value of accumulator for each group. It's invoked with parameters:

- `key`: the key of the group;
- `element`: the first element being encountered in that group.

If the [destination] map already has a value corresponding to some key, that value is used as an initial value of the accumulator for that group and the [initialValueSelector] function is not called for that group.

@param operation a function that is invoked on each element with the following parameters:

- `key`: the key of the group this element belongs to;
- `accumulator`: the current value of the accumulator of the group;
- `element`: the element from the source being accumulated.

@return the [destination] map associating the key of each group with the result of accumulating the group elements.

@sample

```
samples.collections.Grouping.foldByEvenLengthWithComputedInitialValueTo
```

`@SinceKotlin("1.1")` public inline fun <T, K, R, M : MutableMap<in K, R>>

```
Grouping<T, K>.foldTo(
    destination: M,
    initialValueSelector: (key: K, element: T) -> R,
    operation: (key: K, accumulator: R, element: T) -> R): M =
    @Suppress("UNCHECKED_CAST")
    aggregateTo(destination) { key, acc, e, first -> operation(key, if (first) initialValueSelector(key, e) else acc as R, e) }
```

Groups elements from the [Grouping] source by key and applies [operation] to the elements of each group sequentially, passing the previously accumulated value and the current element as arguments, and stores the results in a new map. An initial value of accumulator is the same [initialValue] for each group.

@param operation a function that is invoked on each element with the following parameters:

- `accumulator`: the current value of the accumulator of the group;
- `element`: the element from the source being accumulated.

@return a [Map] associating the key of each group with the result of accumulating the group elements.

@sample

```
samples.collections.Grouping.foldByEvenLengthWithConstantInitialValue
```

`@SinceKotlin("1.1")` public inline fun <T, K, R> Grouping<T, K>.fold(
 initialValue: R,
 operation: (accumulator: R, element: T) -> R): Map<K, R> =
 @Suppress("UNCHECKED_CAST")
 aggregate { _, acc, e, first -> operation(if (first) initialValue else acc as R, e) }

Groups elements from the [Grouping] source by key and applies [operation] to the elements of each group sequentially, passing the previously accumulated value and the current element as arguments, and stores the results in the given [destination] map.

An initial value of accumulator is the same [initialValue] for each group. If the [destination] map already has a value corresponding to the key of some group, that value is used as an initial value of the accumulator for that group.

@param operation a function that is invoked on each element with the following parameters:

- `accumulator`: the current value of the accumulator of the group;
- `element`: the element from the source being accumulated.

@return the [destination] map associating the key of each group with the result of accumulating the group elements.

@sample

```
samples.collections.Grouping.foldByEvenLengthWithConstantInitialValueTo
```

`@SinceKotlin("1.1")` public inline fun <T, K, R, M : MutableMap<in K, R>> Grouping<T, K>.foldTo(
 destination: M,
 initialValue: R,
 operation: (accumulator: R, element: T) -> R): M =
 @Suppress("UNCHECKED_CAST")
 aggregateTo(destination) { _, acc, e, first -> operation(if (first) initialValue else acc as R, e) }

Groups elements from the [Grouping] source by key and applies the reducing [operation] to the elements of each group sequentially starting from the second element of the group, passing the previously accumulated value and the current element as arguments, and stores the results in a new map.

An initial value of accumulator is the first element of the group.

@param operation a function that is invoked on each subsequent element of the group with the following parameters:

- `key`: the key of the group this element belongs to;
- `accumulator`: the current value of the accumulator of the group;
- `element`: the element from the source being accumulated.

@return a [Map] associating the key of each group with the result of accumulating the group elements.

@sample

```

`ln1p(x: Float): Float = nativeLog1p(x.toDouble()).toFloat()`

* Rounds the given value [x] to an integer towards positive infinity.

* @return the smallest Float value that is greater than or equal to the given value [x] and is a mathematical integer.

* Special cases:

- * - $\text{ceil}(x)$ is x where x is NaN or $+\infty$ or $-\infty$ or already a mathematical integer.

`ceil(x: Float): Float = nativeMath.ceil(x.toDouble()).toFloat()`

* Rounds the given value [x] to an integer towards negative infinity.

* @return the largest Float value that is smaller than or equal to the given value [x] and is a mathematical integer.

* Special cases:

- * - $\text{floor}(x)$ is x where x is NaN or $+\infty$ or $-\infty$ or already a mathematical integer.

`floor(x: Float): Float = nativeMath.floor(x.toDouble()).toFloat()`

* Rounds the given value [x] to an integer towards zero.

* @return the value [x] having its fractional part truncated.

* Special cases:

- * - $\text{truncate}(x)$ is x where x is NaN or $+\infty$ or $-\infty$ or already a mathematical integer.

`truncate(x: Float): Float = truncate(x.toDouble()).toFloat()`

* Rounds the given value [x] towards the closest integer with ties rounded towards even integer.

* Special cases:

- * - $\text{round}(x)$ is x where x is NaN or $+\infty$ or $-\infty$ or already a mathematical integer.

`round(x: Float): Float = round(x.toDouble()).toFloat()`

* Returns the absolute value of the given value [x].

* Special cases:

```

kotlin.annotation.AnnotationTarget.*\nimport kotlin.experimental.ExperimentalTypeInference\n\n/**\n * Allows to
infer generic type arguments of a function from the calls in the annotated function parameter of that function.\n *
When this annotation is placed on a generic function parameter of a function,\n * it enables to infer the type
arguments of that generic function from the lambda body passed to that parameter.\n *\n * The calls that affect
inference are either members of the receiver type of an annotated function parameter or\n * extensions for that type.
The extensions must be themselves annotated with `@BuilderInference`.\n *\n * Example: we declare\n * fun
<T> sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>\n * and use
it like\n *
val result = sequence { yield("result") }\n *
Here the type argument of the resulting sequence is inferred to
`String` from\n * the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to
[sequence].\n *
Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.\n
*/\n@Target(VALUE_PARAMETER, FUNCTION,
PROPERTY)\n@Retention(AnnotationRetention.BINARY)\n@SinceKotlin("1.3")\n@ExperimentalTypeInferenc
e\npublic annotation class BuilderInference\n\n/**\n * Enables overload selection based on the type of the value
returned from lambda argument.\n *\n * When two or more function overloads have otherwise the same parameter
lists that differ only in the return type\n * of a functional parameter, this annotation enables overload selection by the
type of the value returned from\n * the lambda function passed to this functional parameter.\n *\n * Example:\n *
*/\n * @OverloadResolutionByLambdaReturnType\n *
fun create(intProducer: () -> Int): Int\n * fun create(doubleProducer: () -> Double): Double\n * val
newValue = create { 3.14 }\n *
The annotation being applied to one of overloads allows to resolve this
ambiguity by analyzing what value is returned\n * from the lambda function.\n *\n * This annotation is also used to
discriminate the annotated overloads in case if overload selection still cannot\n * choose one of them even taking in
account the result of lambda parameter analysis. In that case a warning is reported.\n *\n * Note: this annotation is
experimental, see [ExperimentalTypeInference] on how to opt-in for it.\n

kotlin.annotation.AnnotationTarget.*\nimport kotlin.reflect.KClass\n\n**\n * Signals that the annotated annotation class is a marker of an API that requires an explicit opt-in.\n *\n * Call sites of any declaration that is either annotated with such a marker or mentions in its signature any\n * other declaration that requires opt-in should opt in to the API either by using [OptIn],\n * or by being annotated with that marker themselves, effectively causing further propagation of the opt-in requirement.\n *\n * The intended uses of opt-in markers include, but are not limited to the following:\n * - Experimental API for public preview that might change its semantics or affect binary compatibility.\n * - Internal declarations that should not be used outside the declaring library, but are `public` for technical reasons.\n * - Fragile or delicate API that needs a lot of expertise to use and thus require an explicit opt-in.\n *\n * ## Contagiousness\n
```

*\n * When a declaration is marked with an opt-in requirement, it is considered to be contagious, meaning that all its uses\n * or mentions in other declarations will require an explicit opt-in.\n * A rule of thumb for propagating is the following: if the marked declaration ceases to exist, only\n * the places with explicit opt-in (or the corresponding warning) will break. This rule does not imply transitivity,\n * e.g. the propagation does not propagate opt-in through inlining, making it the responsibility `inline` function author\n * to mark it properly.\n *\n * ### Type scopes\n *\n * A type is considered requiring opt-in if it is marked with an opt-in marker, or the outer declaration (class or interface) requires opt-in.\n * Any use of any declaration that mentions such type in its signature will require an explicit opt-in, even if it is not used\n * directly on the call site, and even if such declarations do not require opt-in directly.\n *\n * For example, consider the following

```
declarations that are marked with non-propagating opt-in:\n * ```\n * @UnstableApi\n * class Unstable\n *\n * @OptIn(UnstableApi::class)\n * fun foo(): Unstable = Unstable()\n *\n * @OptIn(UnstableApi::class)\n * fun bar(arg: Unstable = Unstable()) {\n *\n * @OptIn(UnstableApi::class)\n * fun Unstable?.baz() {\n *\n * and their respective call sites:\n *\n * fun outerFun() {\n *     val s = foo()\n *     bar()\n *     null.baz()\n * }\n *\n * Even though call sites do not mention `Unstable` type directly, the corresponding opt-in warning or error will be triggered\n * in each call site due to propagation contagiousness. Note that the propagation is not transitive, i.e. calls to `outerFun`\n * itself would not trigger any further opt-in requirements.\n *\n * ### Lexical scopes\n *\n * If a type requires an opt-in, such requirement is propagated to its lexical scope and all its nested declarations.\n * For example, for the following scope:\n *\n * @UnstableApi\n * class
```

```
Unstable {\n *     fun memberFun() = ...\n *\n *     class NestedClass {\n *         fun nestedFun() = ...\n *     }\n *\n * Any use of `Unstable`, `NestedClass`, or their member functions will require an explicit opt-in.\n *\n * ### Overridden declarations\n *\n * Opt-in markers are also propagated through the inheritance and interface implementation.\n * If the base declaration requires an opt-in, overriding it requires either an explicit opt-in or\n * propagating the opt-in requirement.\n *\n * See also [Kotlin language
```

documentation](<https://kotlinlang.org/docs/opt-in-requirements.html>) for more information.\n *\n * @property message message to be reported on usages of API without an explicit opt-in, or empty string for the default message.\n * The default message is: `This declaration is experimental and its usage should be marked

with `Marker` or `@OptIn(Marker::class)`, where `Marker` is the opt-in requirement marker.

`@property` level specifies how usages of API without an explicit opt-in are reported in code.

```

markerClass: KClass<out Annotation>)\n\n/**\n * This annotation marks the experimental preview of the
language feature [SubclassOptInRequired].\n
*\n * > Note that this API is in a preview state and has a chance of being changed in the future.\n * Do not use it if
you develop a library since your library can become source incompatible\n * with the future versions of Kotlin.\n
*\n@Target(CLASS)\n@Retention(BINARY)\n@SinceKotlin("1.8")\npublic annotation class
ExperimentalSubclassOptIn\n\n/**\n * Annotation that marks open for subclassing classes and interfaces, and
makes implementation\n * and extension of such declarations as requiring an explicit opt-in.\n * When applied,
any attempt to subclass the target declaration will trigger an opt-in\n * with the corresponding level and message.\n
*\n * The intended uses of subclass opt-in markers include, but are not limited to the following API:\n * - Stable to
use, but unstable to implement due to its further evolution.\n * - Stable to use, but closed for 3rd-part
implementations due to internal or technical reasons.\n * - Stable to use, but delicate or fragile to implement.\n
*\n * - Stable to use, but with a contract that may be weakened in the future in a backwards-incompatible\n * manner
for external implementations.\n * Contrary to regular [RequiresOptIn], there are three ways to opt-in into the
subclassing requirement:\n * - Annotate declaration with the marker annotation, making it propagating.\n * -
Annotate declaration with [OptIn] in order to opt in into the provided guarantees in a non-propagating manner.\n * -
Annotate declaration with [SubclassOptInRequired] with the same marker class, making it further propagating only
for subclassing.\n * Uses of this annotation are limited to open and abstract classes, and non-fun interfaces.\n
Any other uses allowed by CLASS annotation target yield a compilation error.\n *\/n * @property markerClass
specifies marker annotation that require explicit opt-in.\n * @see RequiresOptIn for a detailed description of opt-in
semantics and propagation rules.\n

continuation instance inside suspend functions and either suspends\n * currently running coroutine or returns result
immediately without suspension.\n * If the [block] returns the special [COROUTINE_SUSPENDED] value, it
means that suspend function did suspend the execution and will\n * not return any result immediately. In this case,
the [Continuation] provided to the [block] shall be\n * resumed by invoking [Continuation.resumeWith] at some
moment in the\n * future when the result becomes available to resume the computation.\n * Otherwise, the
return value of the [block] must have a type assignable to [T] and represents the result of this suspend function.\n *
It means that the execution was not suspended and the [Continuation] provided to the [block] shall not be invoked.\n
* As the result type of the [block] is declared as `Any?` and cannot be correctly type-checked,\n
* its proper return type remains on the conscience of the suspend function's author.\n * Invocation of
[Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the\n *

```

[ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext].\n * It is the invoker's responsibility to ensure that a proper invocation context is established.\n * [Continuation.intercepted] can be used to acquire the intercepted continuation.\n *\n * Note that it is not recommended to call either [Continuation.resume] nor [Continuation.resumeWithException] functions synchronously\n * in the same stackframe where suspension function is run. Use [suspendCoroutine] as a safer way to obtain current\n * continuation instance.\n

```

 Default = BytesHexFormat(\n bytesPerLine = Int.MAX_VALUE,\n bytesPerGroup =
 Int.MAX_VALUE,\n groupSeparator = "
 ",\n byteSeparator = "\",\n bytePrefix = "\",\n byteSuffix = "\n ")\n }\n
 /**\n * Represents hexadecimal format options for formatting and parsing a numeric value.\n *\n *
 The formatting result consist of [prefix] string, hexadecimal representation of the value being formatted, and [suffix]
 string.\n * Hexadecimal representation of a value is calculated by mapping each four-bit chunk\n * of its binary
 representation to the corresponding hexadecimal digit, starting with the most significant bits.\n * [upperCase]
 determines whether upper case `0-9`, `A-F` or lower case `0-9`, `a-f` hexadecimal digits are used.\n * If
 [removeLeadingZeros] it `true`, leading zeros in the hexadecimal representation are removed.\n *\n * For

```

example, the binary representation of the `Byte` value `58` is the 8-bit long `00111010`, which converts to a hexadecimal representation of `3a` or `3A` depending on [upperCase]. Whereas, the binary representation of the `Int` value `58` is the 32-bit long `000000000000000000000000111010`, which converts to a hexadecimal representation of `0000003a` or `0000003A` depending on [upperCase]. If [removeLeadingZeros] is `true`, leading zeros in `0000003a` are removed, resulting in `3a`. To convert a value to hexadecimal string of a particular length, first convert the value to a type with the corresponding bit size. For example, to convert an `Int` value to 4-digit hexadecimal string, convert the value to `toShort()` before hexadecimal formatting. To convert it to hexadecimal string of at most 4 digits without leading zeros, set [removeLeadingZeros] to `true` in addition. Parsing requires [prefix] and [suffix] to be present in the input string and the amount of hexadecimal digits to be at least one and at most the value bit size divided by four. Parsing is performed in case-insensitive manner, and [removeLeadingZeros] is ignored as well. See [NumberHexFormat.Builder] to find out how the options are configured and what is the default value of each option.

```

for [Double]

```

@SinceKotlin("1.2")
public expect fun abs(x: Double): Double
 Returns the sign of the given value [x]:
 * -1.0 if the value is negative,
 * 0 if the value is zero,
 * 1.0 if the value is positive
 * Special case:
 * - sign(NaN) is NaN

```

```

@SinceKotlin("1.2")
public expect fun sign(x: Double): Double
 Returns the smaller of two values.
 * If either value is NaN, then the result is NaN.

```

```

@SinceKotlin("1.2")
public expect fun min(a: Double, b: Double): Double
 Returns the greater of two values.
 * If either value is NaN, then the result is NaN.

```

```

@SinceKotlin("1.2")
public expect fun max(a: Double, b: Double): Double
 Returns the cube root of [x]. For any `x`, `cbrt(-x) == -cbrt(x)`;
 that is, the cube root of a negative value is the negative of the cube root
 of that value's magnitude. Special cases:
 * - If the argument is NaN, then the result is NaN.
 * - If the argument is infinite, then the result is an infinity with the same sign as the argument.
 * - If the argument is zero, then the result is a zero with the same sign as the argument.

```

```

@SinceKotlin("1.8")
@WasExperimental(ExperimentalStdlibApi::class)
public expect fun cbrt(x: Double): Double
 Raises this value to the power [x].
 * Special cases:
 * - b.pow(0.0) is 1.0
 * - b.pow(1.0) == b
 * - b.pow(NaN) is NaN
 * - NaN.pow(x) is NaN for `x != 0.0`
 * - b.pow(Inf) is NaN for `abs(b) == 1.0`
 * - b.pow(x) is NaN for `b < 0` and `x` is finite and not an integer

```

```

@SinceKotlin("1.2")
public expect fun Double.pow(x: Double): Double
 Raises this value to the integer power [n].
 * See the other overload of [pow] for details.

```

```

@SinceKotlin("1.2")
public expect fun Double.pow(n: Int): Double
 Returns the absolute value of this value.
 * Special cases:
 * - NaN.absoluteValue is NaN
 * @see abs function

```

```

@SinceKotlin("1.2")
public expect val Double.absoluteValue: Double
 Returns the sign of this value:
 * -1.0 if the value is negative,
 * 0 if the value is zero,
 * 1.0 if the value is positive
 * Special case:
 * - NaN.sign is NaN

```

```

@SinceKotlin("1.2")
public expect val Double.sign: Double
 Returns this value with the sign bit same as of the [sign] value.
 * If [sign] is NaN the sign of the result is undefined.

```

```

@SinceKotlin("1.2")
public expect fun Double.withSign(sign: Double): Double
 Returns this value with the sign bit same as of the [sign] value.

```

```

@SinceKotlin("1.2")
public expect fun Double.withSign(sign: Int): Double
 Returns the ulp (unit in the last place) of this value.
 * An ulp is a positive distance between this value and the next nearest [Double] value larger in magnitude.
 * Special Cases:
 * - NaN.ulp is NaN
 * - x.ulp is +Inf when `x` is +Inf or -Inf
 * - 0.0.ulp is Double.MIN_VALUE

```

```

@SinceKotlin("1.2")
public expect val Double.ulp: Double
 Returns the [Double] value nearest to this value in direction of positive infinity.

```

```

@SinceKotlin("1.2")
public expect fun Double.nextUp(): Double
 Returns the [Double] value nearest to this value in direction of negative infinity.

```

```

@SinceKotlin("1.2")
public expect fun Double.nextDown(): Double
 Returns the [Double] value nearest to this value in direction from this value towards
 the value [to].
 * Special cases:
 * - x.nextTowards(y) is NaN if either `x` or `y` are NaN
 * - x.nextTowards(x) == x

```

```

@SinceKotlin("1.2")
public expect fun Double.nextTowards(to: Double): Double
 Rounds this [Double] value to the nearest integer and converts the result to [Int].
 * Ties are rounded towards positive infinity.
 * Special cases:
 * - x.roundToInt() == Int.MAX_VALUE when `x > Int.MAX_VALUE`
 * - x.roundToInt() == Int.MIN_VALUE when `x < Int.MIN_VALUE`
 * @throws IllegalArgumentException when this value is NaN

```

```

@SinceKotlin("1.2")
public expect fun Double.roundToInt(): Int
 Rounds this [Double] value to the nearest integer and converts the result to [Long].
 * Ties are rounded towards positive infinity.
 * Special cases:
 * - x.roundToLong() == Long.MAX_VALUE when `x > Long.MAX_VALUE`
 * - x.roundToLong() == Long.MIN_VALUE when `x < Long.MIN_VALUE`
 * @throws IllegalArgumentException when this value is NaN

```

```

@SinceKotlin("1.2")
public expect fun Double.roundToLong(): Long
 endregion
 region ===== Float Math
 =====
 Computes the sine of the angle [x] given in radians.
 * Special cases:
 * - sin(NaN|+Inf|-Inf) is NaN

```

`sin(x: Float): Float` Computes the cosine of the angle [x] given in radians. Special cases: `cos(NaN|+Inf|-Inf)` is `NaN`  
`tan(x: Float): Float` Computes the tangent of the angle [x] given in radians. Special cases: `tan(NaN|+Inf|-Inf)` is `NaN`  
`asin(x: Float): Float` Computes the arc sine of the value [x]; the returned value is an angle in the range from `-PI/2` to `PI/2` radians. Special cases: `asin(x)` is `NaN`, when `abs(x) > 1` or `x` is `NaN`  
`acos(x: Float): Float` Computes the arc cosine of the value [x]; the returned value is an angle in the range from `0.0` to `PI` radians. Special cases: `acos(x)` is `NaN`, when `abs(x) > 1` or `x` is `NaN`  
`atan(x: Float): Float` Computes the arc tangent of the value [x]; the returned value is an angle in the range from `-PI/2` to `PI/2` radians. Special cases: `atan(NaN)` is `NaN`  
`atan2(y: Float, x: Float): Float` Returns the angle `theta` of the polar coordinates `(r, theta)` that correspond to the rectangular coordinates `(x, y)` by computing the arc tangent of the value `y / x`; the returned value is an angle in the range from `-PI` to `PI` radians. Special cases: `atan2(0.0, 0.0)` is `0.0`; `atan2(0.0, x)` is `0.0` for `x > 0` and `PI` for `x < 0`; `atan2(-0.0, x)` is `-0.0` for `x > 0` and `-PI` for `x < 0`; `atan2(y, +Inf)` is `0.0` for `0 < y < +Inf` and `-0.0` for `-Inf < y < 0`; `atan2(y, -Inf)` is `PI` for `0 < y < +Inf` and `-PI` for `-Inf < y < 0`; `atan2(y, 0.0)` is `PI/2` for `y > 0` and `-PI/2` for `y < 0`; `atan2(+Inf, x)` is `PI/2` for finite `x`; `atan2(-Inf, x)` is `-PI/2` for finite `x`; `atan2(NaN, x)` and `atan2(y, NaN)` is `NaN`  
`sinh(x: Float): Float` Computes the hyperbolic sine of the value [x]. Special cases: `sinh(NaN)` is `NaN`; `sinh(+Inf)` is `+Inf`; `sinh(-Inf)` is `-Inf`  
`cosh(x: Float): Float` Computes the hyperbolic cosine of the value [x]. Special cases: `cosh(NaN)` is `NaN`; `cosh(+Inf|-Inf)` is `+Inf`  
`tanh(x: Float): Float` Computes the hyperbolic tangent of the value [x]. Special cases: `tanh(NaN)` is `NaN`; `tanh(+Inf)` is `1.0`; `tanh(-Inf)` is `-1.0`  
`asinh(x: Float): Float` Computes the inverse hyperbolic sine of the value [x]. The returned value is `y` such that `sinh(y) == x`. Special cases: `asinh(NaN)` is `NaN`; `asinh(+Inf)` is `+Inf`; `asinh(-Inf)` is `-Inf`  
`acosh(x: Float): Float` Computes the inverse hyperbolic cosine of the value [x]. The returned value is positive `y` such that `cosh(y) == x`. Special cases: `acosh(NaN)` is `NaN`; `acosh(x)` is `NaN` when `x < 1`; `acosh(+Inf)` is `+Inf`  
`atanh(x: Float): Float` Computes the inverse hyperbolic tangent of the value [x]. The returned value is `y` such that `tanh(y) == x`. Special cases: `atanh(NaN)` is `NaN`; `atanh(x)` is `NaN` when `x > 1` or `x < -1`; `atanh(1.0)` is `+Inf`; `atanh(-1.0)` is `-Inf`  
`hypot(x: Float, y: Float): Float` Computes `sqrt(x^2 + y^2)` without intermediate overflow or underflow. Special cases: returns `+Inf` if any of arguments is infinite; returns `NaN` if any of arguments is `NaN` and the other is not infinite  
`sqrt(x: Float): Float` Computes the positive square root of the value [x]. Special cases: `sqrt(x)` is `NaN` when `x < 0` or `x` is `NaN`  
`exp(x: Float): Float` Computes Euler's number `e` raised to the power of the value [x]. Special cases: `exp(NaN)` is `NaN`; `exp(+Inf)` is `+Inf`; `exp(-Inf)` is `0.0`  
`expm1(x: Float): Float` Computes `exp(x) - 1`. This function can be implemented to produce more precise result for [x] near zero. Special cases: `expm1(NaN)` is `NaN`; `expm1(+Inf)` is `+Inf`; `expm1(-Inf)` is `-1.0`  
`expm1(x: Float, base: Float): Float` Computes the logarithm of the value [x] to the given [base]. Special cases: `log(x, b)` is `NaN` if either `x` or `b` are `NaN`; `log(x, b)` is `NaN` when `x < 0` or `b <= 0` or `b == 1.0`; `log(+Inf, +Inf)` is `NaN`; `log(+Inf, b)` is

`+Inf` for `b > 1` and `-Inf` for `b < 1`.  
`log(0.0, b)` is `-Inf` for `b > 1` and `+Inf` for `b < 1`.  
 See also logarithm functions for common fixed bases: `[ln]`, `[log10]` and `[log2]`.

`fun log(x: Float, base: Float): Float`  
 Computes the natural logarithm (base `E`) of the value `x`.  
 Special cases: `ln(NaN)` is `NaN`, `ln(x)` is `NaN` when `x < 0.0`, `ln(+Inf)` is `+Inf`, `ln(0.0)` is `-Inf`.

`fun ln(x: Float): Float`  
 Computes the common logarithm (base 10) of the value `x`.  
 @see `[ln]` function for special cases.

`fun log10(x: Float): Float`  
 Computes the binary logarithm (base 2) of the value `x`.  
 @see `[ln]` function for special cases.

`fun log2(x: Float): Float`  
 Computes `ln(x + 1)`. This function can be implemented to produce more precise result for `x` near zero.  
 Special cases: `ln1p(NaN)` is `NaN`, `ln1p(x)` is `NaN` where `x < -1.0`, `ln1p(-1.0)` is `-Inf`, `ln1p(+Inf)` is `+Inf`.  
 @see `[ln]` function.

`fun ln1p(x: Float): Float`  
 Rounds the given value `x` to an integer towards positive infinity.  
 @return the smallest `Float` value that is greater than or equal to the given value `x` and is a mathematical integer.  
 Special cases: `ceil(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`fun ceil(x: Float): Float`  
 Rounds the given value `x` to an integer towards negative infinity.  
 @return the largest `Float` value that is smaller than or equal to the given value `x` and is a mathematical integer.  
 Special cases: `floor(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`fun floor(x: Float): Float`  
 Rounds the given value `x` to an integer towards zero.  
 @return the value `x` having its fractional part truncated.  
 Special cases: `truncate(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`fun truncate(x: Float): Float`  
 Rounds the given value `x` towards the closest integer with ties rounded towards even integer.  
 Special cases: `round(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.

`fun round(x: Float): Float`  
 Returns the absolute value of the given value `x`.  
 Special cases: `abs(NaN)` is `NaN`.  
 @see `absoluteValue` extension property for `[Float]`.

`fun abs(x: Float): Float`  
 Returns the sign of the given value `x`: `-1.0` if the value is negative, `0.0` if the value is zero, `1.0` if the value is positive.  
 Special case: `sign(NaN)` is `NaN`.

`fun sign(x: Float): Float`  
 Returns the smaller of two values.  
 If either value is `NaN`, then the result is `NaN`.

`fun min(a: Float, b: Float): Float`  
 Returns the greater of two values.  
 If either value is `NaN`, then the result is `NaN`.

`fun max(a: Float, b: Float): Float`  
 Returns the cube root of `x`. For any `x`, `cbrt(-x) == -cbrt(x)`; that is, the cube root of a negative value is the negative of the cube root of that value's magnitude.  
 Special cases: If the argument is `NaN`, then the result is `NaN`.  
 If the argument is infinite, then the result is an infinity with the same sign as the argument.  
 If the argument is zero, then the result is a zero with the same sign as the argument.

`fun cbrt(x: Float): Float`  
 Raises this value to the power `x`.  
 Special cases: `b.pow(0.0)` is `1.0`, `b.pow(1.0) == b`, `b.pow(NaN)` is `NaN`, `NaN.pow(x)` is `NaN` for `x != 0.0`, `b.pow(Inf)` is `NaN` for `abs(b) == 1.0`, `b.pow(x)` is `NaN` for `b < 0` and `x` is finite and not an integer.

`fun Float.pow(x: Float): Float`  
 Raises this value to the integer power `n`.  
 See the other overload of `[pow]` for details.

`fun Float.pow(n: Int): Float`  
 Returns the absolute value of this value.  
 Special cases: `NaN.absoluteValue` is `NaN`.  
 @see `abs` function.

`val Float.absoluteValue: Float`  
 Returns the sign of this value: `-1.0` if the value is negative, `0.0` if the value is zero, `1.0` if the value is positive.  
 Special case: `NaN.sign` is `NaN`.

`val Float.sign: Float`
