Introduction

This document describes the process to upgrade or downgrade an SD-WAN cEdge router in Controller mode from the Command Line (CLI) and from vManage.

Prerequisites

Requirements

- Meet the [SD-WAN Controller Compatibility Matrix](#)
- Download the cEdge router software from software.cisco.com

There could be multiple reasons to plan for a router upgrade, such as:

- New release with new features
- Fix of known caveats
- Deferred release

Note: If the release has been deferred, it is best practice to upgrade as soon as possible. Deferred releases are not recommended on production devices due to known defects.

When it is time to upgrade your router, also consider this useful information:

- Navigate through the [Release Notes](#) of the SD-WAN devices.
- Check the [End-of-Life/End-of-Sale](#) for the SD-WAN product.
- Review the SD-WAN [Security Advisories](#)

Components Used

This document is not restricted to specific software and hardware versions. However, the outputs in this document were based on these software and hardware versions:

- Cisco IOS® XE CSR1000v 17.x
- Cisco vManage 20.8.1

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Check Required DRAM and Checksum

In order to see the minimum memory required, follow these steps:

1. Go to the Software Download page.
2. Select the appropriate options for your router to get to the download page
3. From the download page, hover over the image name to see the min required memor, MD5 checksum, and SHA512 checksum.

Software Download

Downloads Home / Routers / Branch Routers / Catalyst 8300 Series Edge Platforms / Catalyst 8300 Edge Platform / IOS XE Software- Dublin-17.12.2(ED)

The screenshot shows the Cisco Software Download page for the Catalyst 8300 Series Edge Platform. A details popup is open for the Dublin-17.12.2(ED) release. The popup displays the following information:

- Description: Catalyst 8200/8200L/8300 Series Edge
- Release: Dublin-17.12.2
- Release Date: 15-Nov-2023
- FileName: c8000be-universalk9.17.12.02.SPA.bin
- Min Memory: DRAM 8192 Flash 8192
- Size: 837.04 MB (877704222 bytes)
- MD5 Checksum: 8a0c5b4d57d326c93f0794b4cfc99e38
- SHA512 Checksum: 7d7df2eed8a312f8872b6a847451b2cf ...

The popup also includes an 'Advisories' link. The main page shows a list of releases with columns for Release Date and Size. The Dublin-17.12.2(ED) release is highlighted, showing a size of 837.04 MB. Other releases include Bengaluru-17.6.5a(ED) and Amsterdam-17.3.8a(MD).

Software Download minimum memory

Upgrade SD-WAN cEdge Router

SD-WAN cEdge CLI Upgrade

This first section shows step by step how to navigate through the CLI Upgrade Process. The cEdge upgrade process can be similar to the vEdge upgrade, but it differs primarily on the commands used, the next steps shows how to start the procedure:

Step 1. Verify the current version and space available on the cEdge.

Check the version that is currently installed on the device. For this particular example, the cEdge router has installed version 17.04.02:

<#root>

Router#

show version

| include Cisco IOS

Cisco IOS XE Software, Version 17.04.02

In SD-WAN routers, you can check what the version is in use, and the available space:

<#root>

Router#

show sdwan software

VERSION	ACTIVE	DEFAULT	PREVIOUS	CONFIRMED	TIMESTAMP
17.04.02.0.2620	true	true	false	-	2021-09-06T03:32:34-00:00

Total Space:387M Used Space:127M Available Space:255M

Step 2. Transfer/Upload the desired Image to the cEdge router.

To transfer the image without the need of vManage, you can use these two options:

- FTP/TFTP
- USB drive

For both options, the upgrade procedure is the same. USB drive option is useful if you do not have any TFTP/FTP server, or if your router is in an isolated environment with limited remote access. In this example, TFTP/FTP option is used:

<#root>

Router##

copy tftp: bootflash:

Address or name of remote host []? 10.1.1.1

Source filename []?

c8000v-universalk9.17.08.01a.SPA.bin

Destination filename [c8000v-universalk9.17.08.01a.SPA.bin]?

Accessing tftp://10.1.1.1/c8000v-universalk9.17.08.01a.SPA.bin...

<#root>

```
Router#
```

```
copy usb0: bootflash:
```

```
Source filename []? c8000v-universalk9.17.08.01a.SPA.bin
```

```
Destination filename [c8000v-universalk9.17.08.01a.SPA.bin]?
```

Check if the new image is present and has been uploaded correctly to the local storage (flash or bootflash).

```
<#root>
```

```
Router#
```

```
dir
```

```
Directory of bootflash:/
```

```
xxxxxx -rw- 11879476 Jun 29 2022 12:42:37 +00:00
```

```
c8000v-universalk9.17.08.01a.SPA.bin
```

Step 3. Install the new software into the router.

Once the new image has been successfully uploaded, you have to identify the correct path, and name and use it at the end of the command **request platform software sdwan software install**. It is important to mention that this step does not reload your router, and the image requires another action to be activated.

```
<#root>
```

```
Router#
```

```
request platform software sdwan software install bootflash:c8000v-universalk9.17.08.01a.SPA.bin
```

(Optional) Now validate the status of the router. With the **show sdwan software** command, you can verify that the new software release now properly appears in the router, however, observe that the ACTIVE and DEFAULT values show as false which means the image is there and ready to be activated.

```
<#root>
```

```
Router#
```

```
show sdwan software
```

VERSION	ACTIVE	DEFAULT	PREVIOUS	CONFIRMED	TIMESTAMP
17.04.02.0.2620	true	true	false	-	2021-09-06T03:32:34-00:00
17.08.01.0.1526	false	false	false	-	2022-06-29T22:32:28-00:00

Total Space:387M Used Space:148M Available Space:235M

Another place that can be verified is the bootflash. Now, you can see the .bin image has been expanded, and the packages are now listed and ready:

```
<#root>
```

```
Router#
```

```
dir
```

```
Directory of bootflash:/
```

```
393598 -rw- 6895 Jun 29 2022 22:31:55 +00:00 c8000v-universalk9.17.08.01a.SPA.conf
393229 -rw- 51957778 Jun 29 2022 22:31:55 +00:00 c8000v-rpboot.17.08.01a.SPA.pkg
393650 -rw- 800670808 Jun 29 2022 22:30:33 +00:00 c8000v-mono-universalk9.17.08.01a.SPA.pkg
393617 -rw- 4359240 Jun 29 2022 22:30:13 +00:00 c8000v-firmware_nim_ge.17.08.01a.SPA.pkg
393620 -rw- 5575756 Jun 29 2022 22:30:13 +00:00 c8000v-firmware_nim_xdsl.17.08.01a.SPA.pkg
393618 -rw- 11568204 Jun 29 2022 22:30:13 +00:00 c8000v-firmware_nim_shdsl.17.08.01a.SPA.pkg
393616 -rw- 17724492 Jun 29 2022 22:30:13 +00:00 c8000v-firmware_nim_cwan.17.08.01a.SPA.pkg
393610 -rw- 13038668 Jun 29 2022 22:30:13 +00:00 c8000v-firmware_nim_async.17.08.01a.SPA.pkg
393608 -rw- 11760716 Jun 29 2022 22:30:12 +00:00 c8000v-firmware_ngwic_t1e1.17.08.01a.SPA.pkg
393606 -rw- 2376780 Jun 29 2022 22:30:12 +00:00 c8000v-firmware_dsp_sp2700.17.08.01a.SPA.pkg
393605 -rw- 66636 Jun 29 2022 22:30:12 +00:00 c8000v-firmware_dreamliner.17.08.01a.SPA.pkg
```

Step 4. Activation, Confirmation and Setting Default version.

After the image has been successfully installed, the next step is to activate it. Use the command **request platform software sdwan software activate** and introduce the version in a dot decimal notation. In this example, the version used is 17.08.01.0.1526. The release number can be taken from the output **show sdwan software**.

```
<#root>
```

```
Router#
```

```
request platform software sdwan software activate 17.08.01.0.1526
```

Note: After **request platform software sdwan software activate** command is executed, the cEdge device starts a reload process. To avoid any outages, it is important to consider that if this command is executed, the reload cannot be stopped.

Once the router completes the reload process, you need to set the new software as the default. To do so execute **request platform software sdwan software set-default**:

```
<#root>
```

```
Router#
```

```
request platform software sdwan software set-default 17.08.01.0.1526
```

As the last step in the CLI upgrade process, execute the command **request platform software sdwan software upgrade-confirm**. This step is mandatory, otherwise, if you do not confirm the upgrade, your router can rollback to an old release.

```
<#root>
```

```
Router#
```

```
request platform software sdwan software upgrade-confirm
```

With this last action, you have completed the upgrade process for any Cisco IOS XE SD-WAN cEdge router. To perform a downgrade process, use the same steps described so far, and select the appropriate image version.

Verification

(Optional) Once the process has been completed, you can verify the new version that is now active on the device with some of the commands used previously. Notice that the parameters ACTIVE and DEFAULT display a true value, and the CONFIRMED parameter shows a user value.

```
<#root>
```

```
Router#
```

```
show version | include Cisco IOS
```

```
Cisco IOS XE Software, Version 17.8.1a
```

```
<#root>
```

```
Router#
```

```
show sdwan software
```

SD-WAN cEdge vManage Upgrade

This section walks you through another way to perform the upgrade process of the cEdge router, but now

with the use of vManage Graphic User Interface (GUI). With this method, there is actually no need to log into the router via a CLI.

 **Note:** In order to get started, it is recommended that you verify the requirements listed at the beginning of this document.

Step 1. Download the Image and Transfer it to the vManage Software Repository.

To download the proper image for your cEdge Router, you can navigate to software.cisco.com and search your Router Product ID. Then, choose the Cisco IOS XE SD-WAN Software in order to see the list of releases available for your device. Once you have downloaded the image to your PC, you need to upload it into vManage Software Repository. In order to do so, navigate to **vManage > Maintenance > Software Repository**:

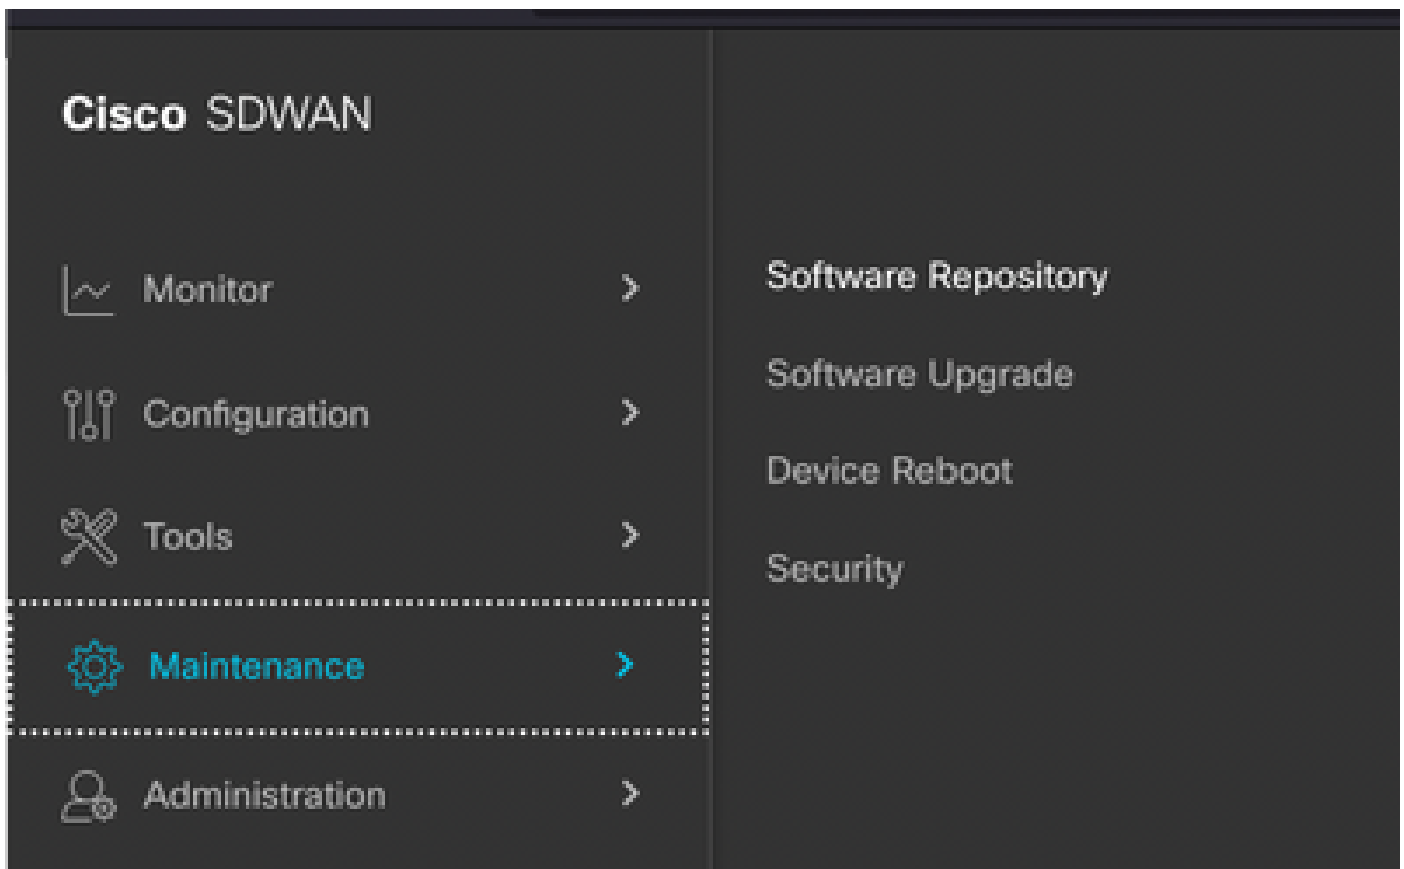

Image 1

Then select **Software Images** at the Top menu (Image 2), and after that click **Add New Software** and **vManage**:

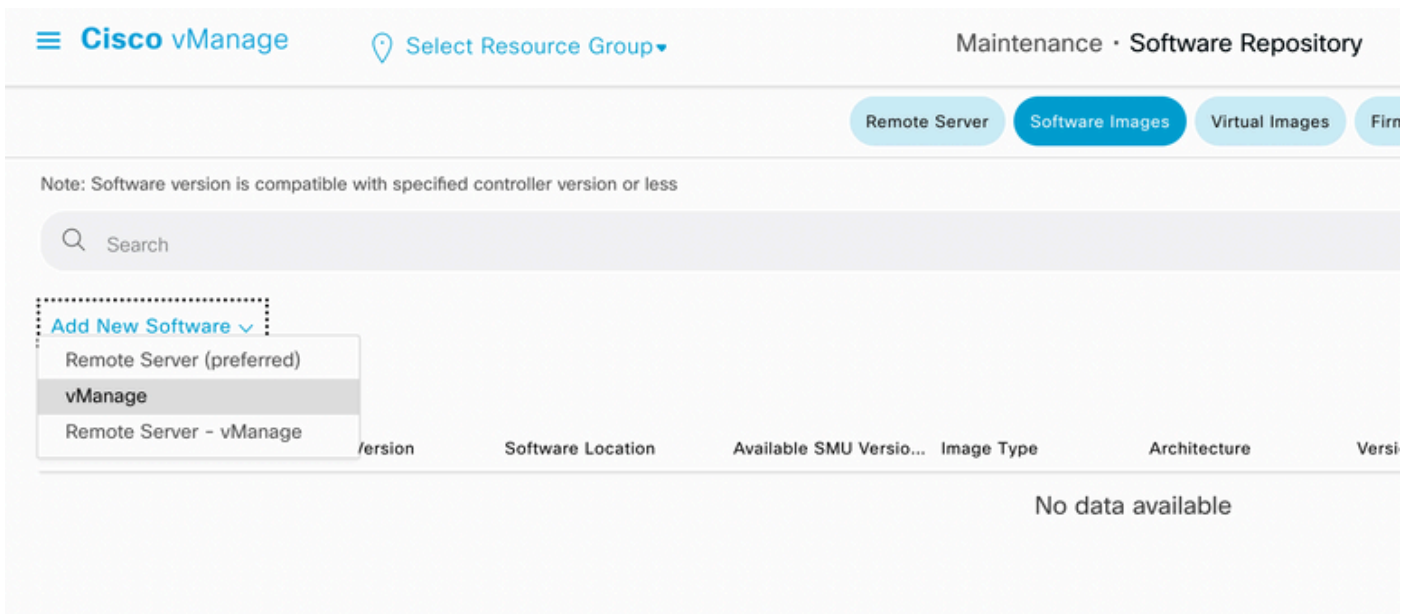

Image 2

After **Add New Software** has been selected a new window appears.

Once in there, you need to click **Browse**, and then select the desired Image to upload into the Repository. After that, click **Upload** (as seen in Image 3):

Image 3

Once uploaded, you can verify if the image has been attached correctly into the vManage Software Repository (Image 4 shows the Software Image is now present):

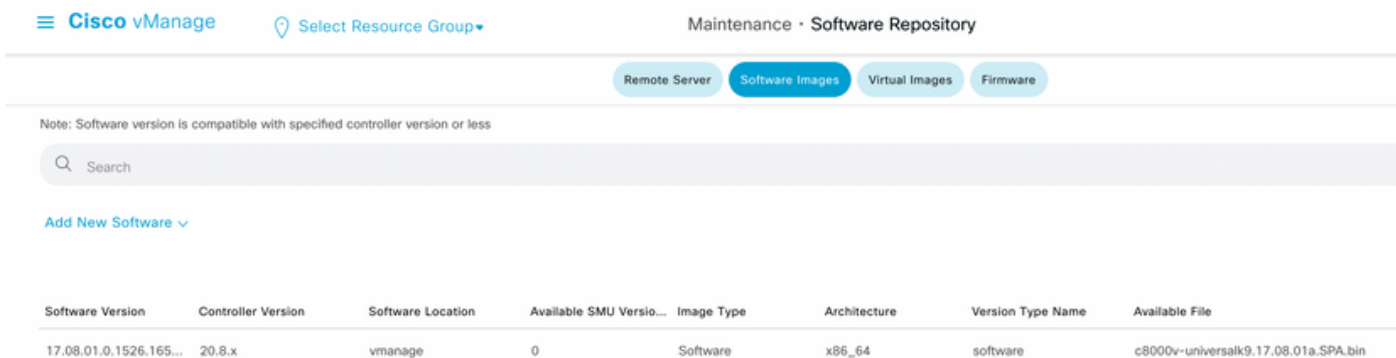

Image 4

Step 2. Perform the upgrade of the cEdge router.

To proceed with this step, you need to navigate to **vManage > Maintenance > Software Upgrade** section:

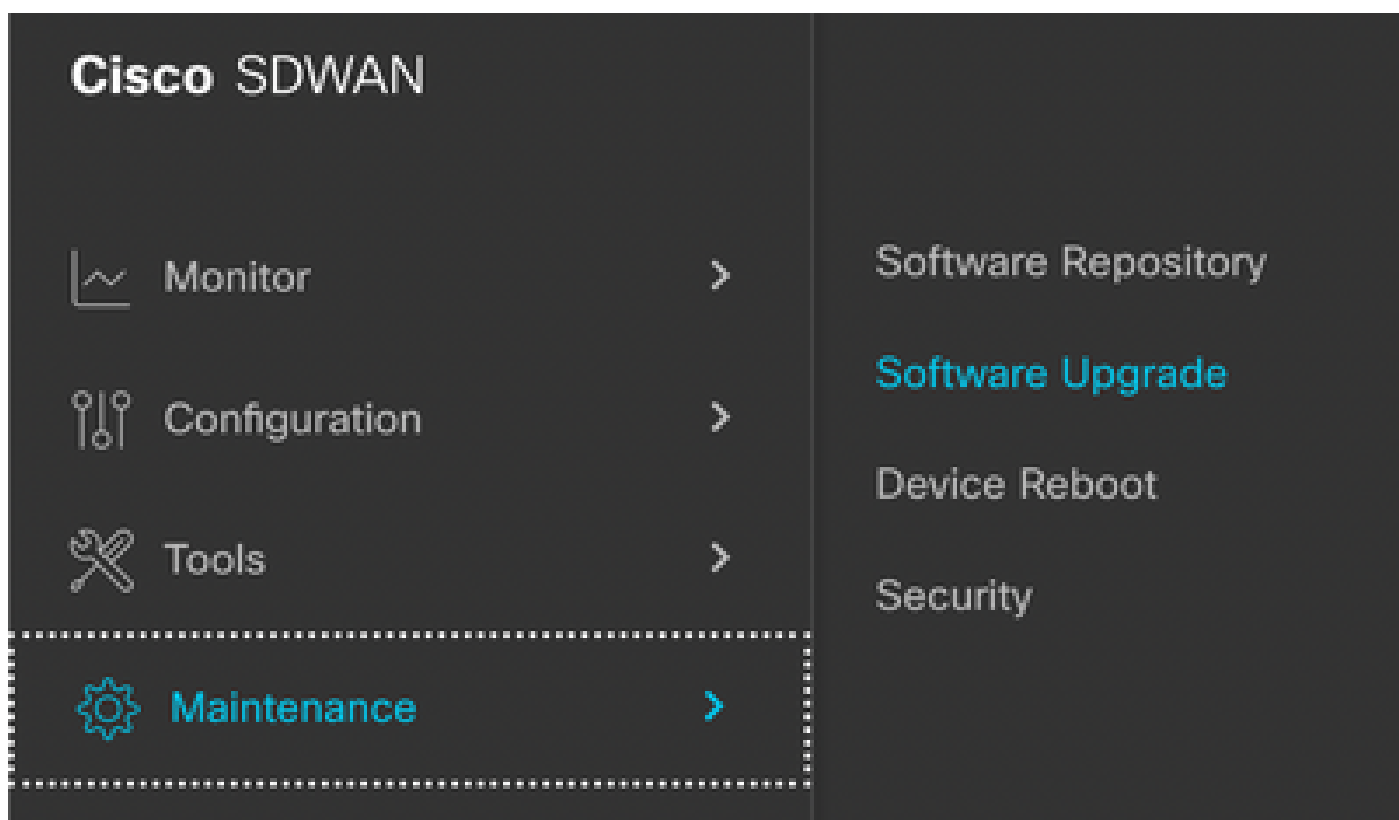

Image 5

Once in **Software Upgrade** section, search for the cEdge router that requires the upgrade (you can type the device IP address and search). Then, click the Check Box next to the device, and click the **Upgrade** option (as shown in Image 6):

5.5.5.1 x Search

1 Rows Selected

Upgrade

Cancel Software Upgrade

Upgrade Virtual Image

Device Group All v

<input type="checkbox"/>	Hostname	System IP	Chassis Number	Site ID	Device Model
<input checked="" type="checkbox"/>	cedge1_...	5.5.5.1	CSR-2F045E7E-146B-AE60...	201	CSR1000v

Image 6

After **Upgrade** has been clicked, a new window appears (Image 7) where you need to select the target release **Version** from the list available in the drop down menu:

Software Upgrade

vManage Remote Server Remote Server - vManage

Platform

CSR1000v

Activate and Reboot

Version

✓ Select
17.08.01.0.1526.1650485556

Upgrade

Cancel

Image 7

 **Note:** If you click on the list and see more than two older images, as a best practice, try to remove

 them. It is better to remove the old software images from the router if they are not used anymore. This action helps to free up space from the router storage.

In this same screen, you are presented with different options where vManage radio button needs to be selected, and also the **Activate and Reboot** check box option is needed (see Image 8):

1. If the **Activate and Reboot** check box option is checked, (and the **Upgrade** button is pressed), vManage starts the upgrade process and the router is rebooted and upgraded.
2. If the **Activate and Reboot** check box option is unchecked, (and the **Upgrade** button is pressed), vManage ONLY transfers the image into the cEdge router. This can be useful if the plan is to complete the Upgrade activity later during a maintenance window.

After the options have been selected, click the **Upgrade** button:

Software Upgrade

vManage Remote Server Remote Server - vManage

Platform

Version

CSR1000v

17.08.01.0.1526.1650485556

Activate and Reboot

Upgrade

Cancel

Image 8

Once the upgrade process is completed, a **Success** green status is shown in vManage.

Status	Message	Hostname	System IP	Site ID	Device Type	Device Model
Success	Software Install complete	cedge1_17_9_eff1	5.5.5.1	201	WAN Edge	CSR1000v

Image 9

Step 3. Set software as Default with **Set Default Version** option.

Once the previous steps have been completed, the router image is now installed and activated. Now, to complete this last action, navigate back to **vManage > Maintenance > Software Upgrade**. Select your cEdge router, and then click **Set Default Version**:

Image 10

A new window is opened (Image 11) where you need to indicate which release is the Default:

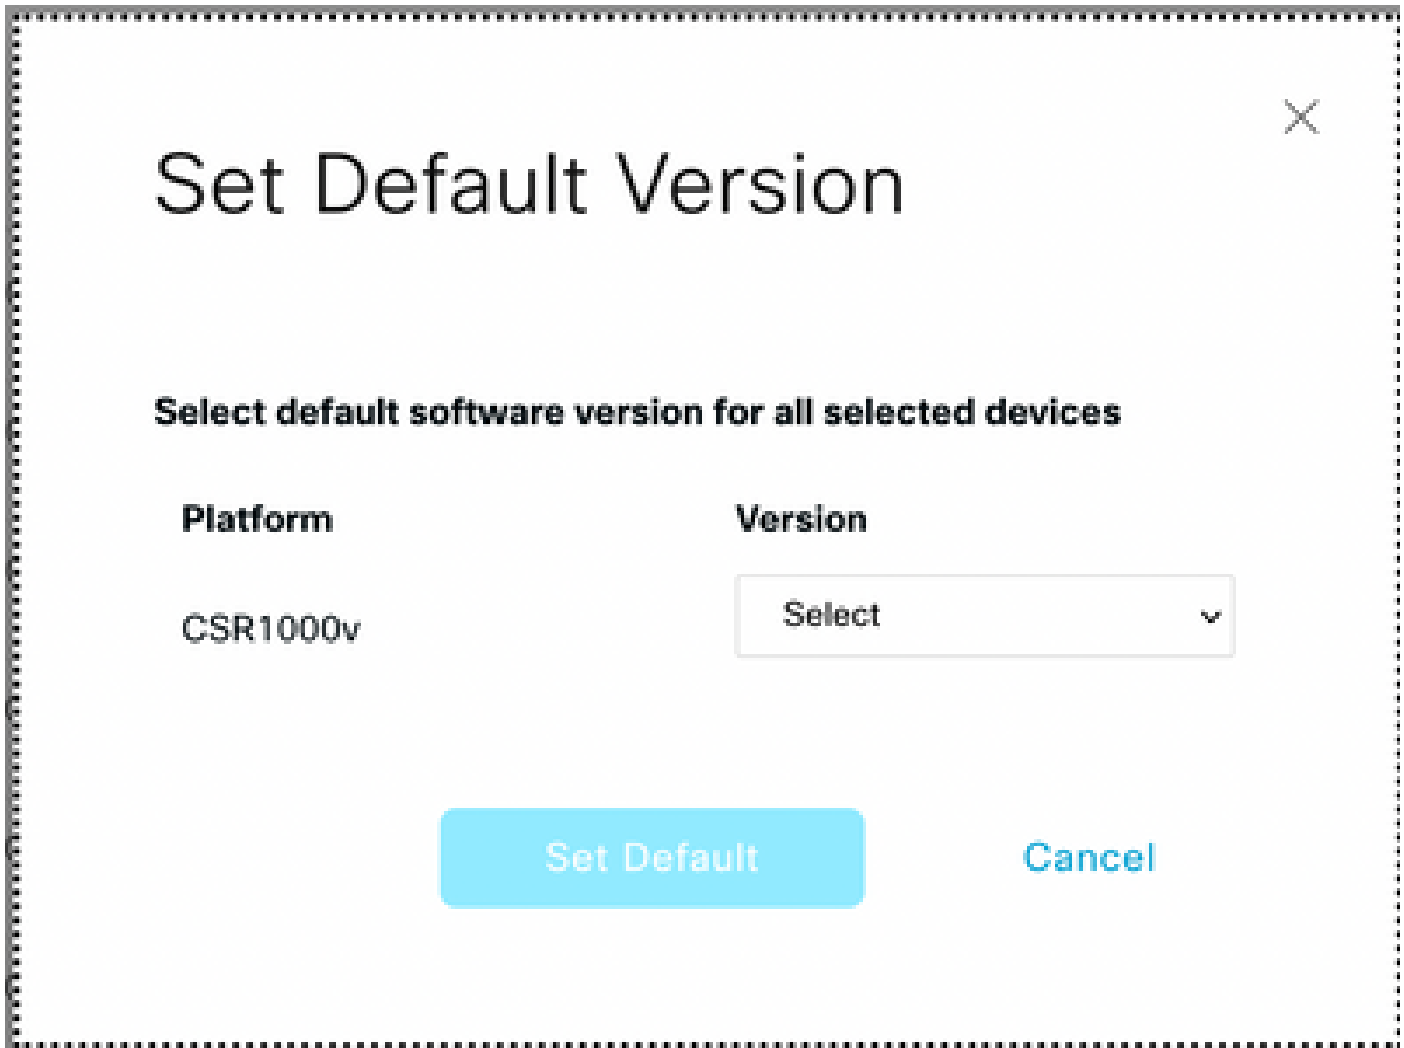

Image 11

Once you have selected the version from the drop down list (remember to select the same version that was recently installed), click **Set Default**. This step completes the Upgrade process via vManage. In the same way, a downgrade can be achieved with the help of vManage.

Best Practices

For brand new routers, routers that come from legacy implementations or Return Material Authorization (RMA) routers, it is highly recommended to perform a **software reset** before the SD-WAN configuration to ensure that the Configuration Data Base (CDB), Forwarding Processor (FP) and all processes in IOS-XE SDWAN are completely clean; this helps avoid possible previous stuck configurations and programmed entries to forward traffic.

```
<#root>
```

```
Router#
```

```
request platform software sdwan software reset
```

Note: Confirm that the **active version** is set as the **default version** before the software reset.

Video

This video provides the steps to upgrade cEdge devices from vManage GUI.
