Introduction

This document describes the different methods available to enable and disable the Message Waiting Indicator (MWI) on an Internet Protocol (IP) Phone, along with how to troubleshoot problems that arise when Cisco Unity Express (CUE) is integrated with Cisco Unified Communications Manager Express (CUCME).

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Call Manager Express (CME) or CUCME
- Cisco Unity Express
- Skinny Call Control Protocol (SCCP)
- Session Initiation Protocol (SIP)

Components Used

The information in this document is based on these software and hardware versions:

- CUE 7.x and 8.x. Sample configurations and screen captures are taken from CUE 7.0.6 and 8.6.2, installed on a NME-CUE module
- CUCME 7.1 and 8.5
- Cisco IP Phone 7965 registered with CUCME, with SCCP

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

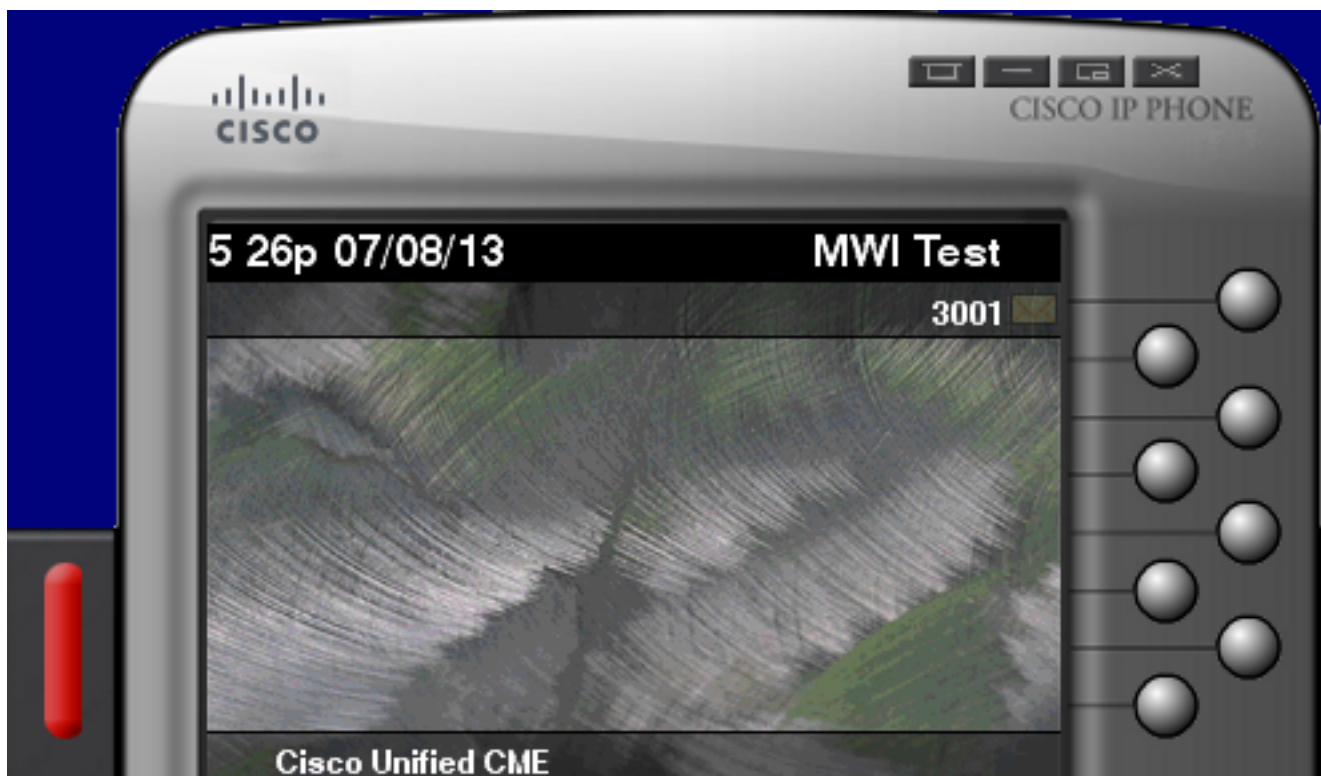

Related Products

This document can also be used with these hardware and software versions:

- Any CUE and CME version can be used
- Any CUE module or CME Router can be used

Background Information

MWI is used to indicate a new message is left in the voice mailbox. To indicate a new message, the red lamp on the IP Phones is turned on along with the envelop icon next to the line display.

Note: This document is based on a CUCME server integrated with a CUE module.

There are three MWI Mechanisms available when CUE integrates with CUCME:

- Outcall
- SIP Subscribe-Notify
- SIP Unsolicited

There is one MWI mechanism available when CUE integrates with CUCM:

- Java Telephony API (JTAPI)/ Computer Telephony Integration (CTI)

Note: The [CUE JTAPI Issues and Case Studies](#) document provides information on how to enable JTAPI Traces in CUE and how to troubleshoot MWI via JTAPI.

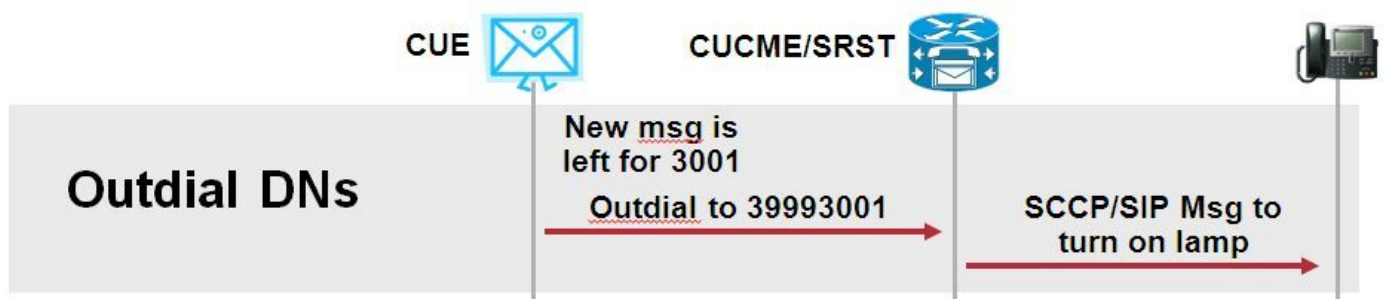

Configure

SIP Outcall Method

Outcall is the default method used in CUE in order to provide backward compatibility for available systems. Although it is recommended to use Subscribe-Notify or Unsolicited for the MWI notification, the Outcall method is used in several network environments to configure and enable MWI for SCCP IP Phones registered to CME.

Note: The Outcall mechanism does not work in Cisco Survivable Remote Site Telephony (SRST) deployments. SIP endpoints are not supported.

In this mechanism, CUE sends an INVITE to CUCME when a user has a new voicemail.

Configure two ephone-dns on CUCME. The two DNs represent the extensions CUE must dial to enable or disable the MWI for a given extension.

```
ephone-dn 3  
mwi on number 3999.... ! ephone-dn 4 mwi off number 3998....
```

Note: The number of dots at the end of the DN must match the extension length used by the phones registered to CUCME.

Ensure CUCME configuration is completed and then proceed to CUE configuration. In the initial configuration of CUE, the MWI DN's are automatically populated in the **Call Handling** section of

the Initialization Wizard.

The screenshot shows the 'Cisco Unity Express Initialization Wizard' with the 'Call Handling' step selected. The wizard is titled 'Cisco Unity Express Initialization Wizard' and has a 'Steps' sidebar on the left with five items: 1. CallManager Express Login, 2. Import CCME Users, 3. Defaults, 4. Call Handling (selected), and 5. Commit. The main area is titled 'Call Handling' and contains the following fields and instructions:

- Enter the Call in Numbers for Voice Mail, Auto Attendant and the Administration via telephone (AVT) system.
- Voice Mail Number *: 3600
- Voice Mail Operator Extension: 1
- Auto Attendant Access Number: 3601
- Auto Attendant Operator Extension: 0
- Administration via Telephone Number: 3602
- SIP MWI Notification Mechanism: Outcalling
- MWI ON Number (Outcalling mechanism): 3999....
- MWI OFF Number (Outcalling mechanism): 3998....

* indicates a mandatory field

Note: To access the Initialization Wizard, CME must be integrated with CUE for Graphical User Interface (GUI) access. On a production system, the DN information is synchronized with CUE. Navigate to **Voice Mail > Message Waiting Indicators > Settings** to view the DNs.

Example MWI settings page after the DN's are configured and synchronized with CUE:

The screenshot shows the 'Voice Mail > Message Waiting Indicators > Settings' page. It has an 'Apply' button and a 'Help' icon. The page is titled 'SIP MWI Notification Mechanism' and contains the following settings:

- Subscribe - Notify**
Currently active subscriptions: 0
 Include envelope information in the notifications.
- Unsolicited Notify**
Failures in last 5 tries: 0
- Outcalling**
MWI On Number: 3999....
MWI Off Number: 3998....

Note: Here **Subscribe-Notify** is also enabled. This is not required but it is supported to have **Subscribe-Notify** and **Outcalling** configured at the same time. CUE sends two notifications, one for each method, in order to turn on or off the MWI.

Note: Configuration of Outcall and Unsolicited Notify is not supported at the same time.

Sample CUE configuration:

```

ccn application ciscomwiapplication aa
  description "ciscomwiapplication"
  enabled
  maxsessions 6
  script "setmwi.aef"
  parameter "strMWI_OFF_DN" "3999" parameter "strMWI_ON_DN" "3998" end application ccn subsystem
sip mwi sip outcall

```

Use the **show ccn subsystem sip** command in order to determine the current MWI configuration.

```

CUE# sh ccn subsystem sip
SIP Gateway:                10.10.202.1
SIP Port Number:            5060
DTMF Relay:                 sip-notify,sub-notify
MWI Notification: outcall MWI Envelope Info: disabled Transfer Mode: bye-also SIP RFC
Compliance: Pre-RFC3261

```

Note: In the sample configuration, the MWI extensions are defined without dots. Dots are defined only in CME to indicate the phone DN extension length. The **show ccn subsystem sip** command output can vary based on CUE version.

Changes to dial-peer, used for CUE, are necessary in order to ensure the correct inbound dial-peer is matched for the Outcall SIP INVITE. A new dial-peer can also be created to act as the inbound dial-peer:

```

dial-peer voice 3600 voip
destination-pattern 3600
session protocol sipv2
session target ipv4:10.10.202.50
incoming called-number 399[89].... dtmf-relay sip-notify codec g711ulaw no vad !

```

Or

```

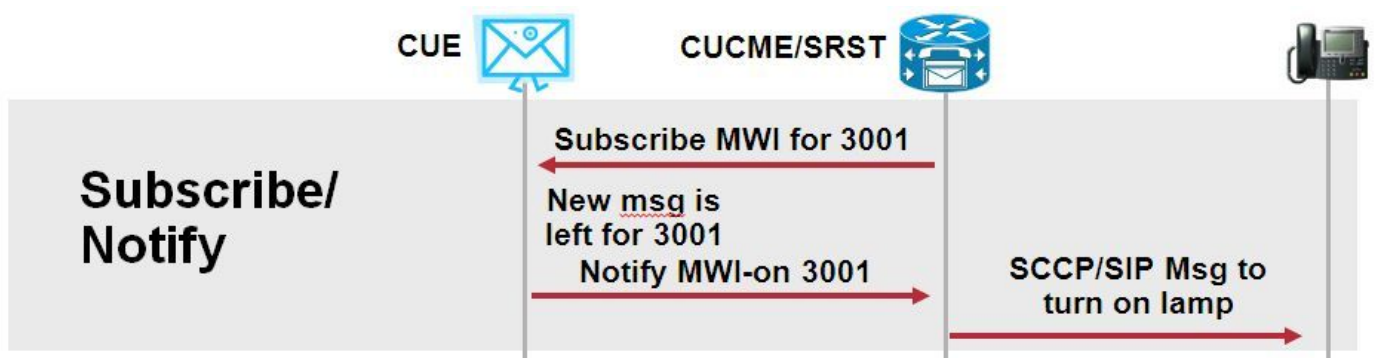

dial-peer voice 3999 voip
session protocol sipv2
incoming called-number 399[89].... dtmf-relay sip-notify codec g711ulaw no vad !

```

SIP Subscribe Notify

In the Subscribe-Notify mechanism, the DNs initially Subscribe with the CUE. After subscription, the NOTIFY message from CUE is accepted for MWI notification.

Note: This method is recommended for SRST and CUCME deployments.

Enable Subscriber Notify in order to use this notification method:

Voice Mail > Message Waiting Indicators > Settings

 [Apply](#)  [Help](#)

SIP MWI Notification Mechanism

Subscribe - Notify

Currently active subscriptions: 0

Include envelope information in the notifications.

Unsolicited Notify

Failures in last 5 tries: 0

Outcalling

MWI On Number:

MWI Off Number:

Alternatively, the Subscriber Notify method can be enabled on the Command Line Interface (CLI):

```
ccn subsystem sip
gateway address "10.10.202.1"
mwi envelope-info mwi sip sub-notify end subsystem
```

Configure the CME with the MWI server (CUE) IP address in the sip-ua section. You can confirm the IP address of the CUE from the Interface configuration of the Service Module on which the CUE is hosted with the **show run interface** command.

```
interface Integrated-Service-Engine1/0
ip unnumbered Vlan400
service-module ip address 10.10.202.50 255.255.255.0 sip-ua mwi-server ipv4:10.10.202.50
expires 3600 port 5060 transport udp
```

The command **mwi-server ipv4:10.10.202.50** under **sip-ua** is sufficient to support Subscribe-Notify events for MWI. The **Expires**, **Port** and **Transport** are automatically included in the configuration with the default settings.

Configure the DNs to Subscribe with the CUE in order to receive MWI notification event. This method can be used for SCCP and SIP IP Phones registered to the CME Router.

```
voice register dn 1
number 3005
mwi ! ephone-dn 1 number 3001 mwi sip
```

Once the command is entered, the phone sends a **SUBSCRIBE** message to CUE in order to request a MWI Update and the CUE responds with a **202 Accepted** SIP message:

```
Sent: SUBSCRIBE sip:3001@10.10.202.50:5060 SIP/2.0 Via: SIP/2.0/UDP
10.10.202.1:5060;branch=z9hG4bK4812E5 From: <sip:3001@10.10.202.1>;tag=CC5F60-3EC To:
<sip:3001@10.10.202.50> Call-ID: AE09C597-E3FE11E2-80F3BB44-39D4A3CF@10.10.202.1 CSeq: 101
SUBSCRIBE Max-Forwards: 70 Date: Thu, 04 Jul 2013 16:36:15 GMT User-Agent: Cisco-SIPGateway/IOS-

```

From: <sip:3001@10.10.202.1>;tag=CC5F60-3EC Call-ID: AE09C597-E3FE11E2-80F3BB44-39D4A3CF@10.10.202.1 CSeq: 101 SUBSCRIBE Content-Length: 0 **Expires: 3600** Contact: sip:3001@10.10.202.50 Allow-Events: refer Allow-Events: telephone-event **Allow-Events: message-summary**

Once the subscription is accepted, CUE sends a **NOTIFY** message with the current status of the MWI for that specific DN. In this example, the MWI Notification is set to Yes:

Received: NOTIFY sip:3001@10.10.202.1:5060 SIP/2.0 Via: SIP/2.0/UDP 10.10.202.50:5060;branch=z9hG4bKkuJtPQPUBreuy0GkQBlQw~~30 Max-Forwards: 70 To: <sip:3001@10.10.202.1>;tag=CC5F60-3EC From: <sip:3001@10.10.202.50>;tag=217fce13-1101 Call-ID: AE09C597-E3FE11E2-80F3BB44-39D4A3CF@10.10.202.1 CSeq: 1 NOTIFY Content-Length: 113 **Contact: sip:3001@10.10.202.50 Event: message-summary** Allow-Events: refer Allow-Events: telephone-event Allow-Events: message-summary **Subscription-State: active** Content-Type: application/simple-message-summary **Messages-Waiting: yes Message-Account: sip:3001@10.10.202.50** Voice-Message: 1/0 (0/0) Fax-Message: 0/0 (0/0) Sent: SIP/2.0 200 OK Via: SIP/2.0/UDP 10.10.202.50:5060;branch=z9hG4bKkuJtPQPUBreuy0GkQBlQw~~30 From: <sip:3001@10.10.202.50>;tag=217fce13-1101 To: <sip:3001@10.10.202.1>;tag=CC5F60-3EC Date: Thu, 04 Jul 2013 16:36:15 GMT Call-ID: AE09C597-E3FE11E2-80F3BB44-39D4A3CF@10.10.202.1 CSeq: 1 NOTIFY Content-Length: 0

On the CUE GUI, notice the **Currently active subscriptions** increments by 1 for each **Subscribe** message it receives:

Voice Mail > Message Waiting Indicators > Settings

Apply ? Help

SIP MWI Notification Mechanism

- Subscribe - Notify**
Currently active subscriptions: 1
 - Include envelope information in the notifications.
- Unsolicited Notify**
Failures in last 5 tries: 0
- Outcalling**
MWI On Number: 3999...
MWI Off Number: 3998...

Use **show ccn sip subscription mwi** command to view the subscription status.

DN	Subscription Time	Expires
3001	Mon Sep 22 13:40:02 EDT 2008	3600

MWI Subscribe-Notify in SRST:

Configure **mwi relay** either under **call-manager-fallback**, for legacy SRST, or **telephony-service** for CME-SRST deployments.

```
call-manager-fallback
```

```
  mwi relay telephony-service mwi relay
```

SIP Unsolicited-Notify

The SIP Unsolicited-Notify method supports both CUCME and SRST. This method uses a SIP NOTIFY message in order to toggle MWI on or off. Unlike with Subscribe-Notify there is no subscription maintained by CUE.

Configure **mwi relay** command under **call-manager-fallback** or **CME-SRST** in order to support SRST deployments, along with the **sip-ua** MWI configuration command.

Enable the Unsolicited Notify option:

Voice Mail > Message Waiting Indicators > Settings

Apply ? Help

SIP MWI Notification Mechanism

Subscribe - Notify
Currently active subscriptions: 2
 Include envelope information in the notifications.

Unsolicited Notify
Failures in last 5 tries: 0

Outcalling
MWI On Number: 3999....
MWI Off Number: 3998....

Alternatively Unsolicited Notify can be enabled on the CUE CLI:

```
ccn subsystem sip
  mwi sip unsolicited
```

Enable unsolicited notify on the CME CLI:

```
sip-ua
  mwi-server ipv4:10.10.202.50 expires 3600 port 5060 transport udp unsolicited
```

Warning: Unless **unsolicited** is configured on the **mwi-server** command, the CME continues to use **Subscribe-Notify** and MWI does not work since the configuration on CME does not match with the configuration on CUE.

Note: You cannot use the **Unsolicited-Notify** mechanism along with any other mechanism at the same time.

MWI with Cisco Unified Communications Manager (CUCM)

When CUE is integrated with CUCM the JTAPI protocol uses the **setMessageWaiting** message to toggle MWI on/off. The CTI Ports controlled by JTAPI are assigned with a Calling Search Space (CSS) that has the partition of the phone's Directory Number. In later releases of CUE, you can configure a dedicated CTI Port in order to provide MWI Notifications. In the event the port is not available, the CUE uses any available port configured that is controlled by JTAPI.

Since JTAPI uses the **setMessageWaiting** message for MWI events, MWI extensions are not configured in CUCM. If the extensions are configured, they are ignored and cause no interoperability issues with JTAPI.

In CUE versions 7.x and higher, you can configure the CUCME Router and CUE to use the Unsolicited-Notify method in order to maintain full MWI functionality while in SRST.

Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

Debugs and Traces

CUCME

In order to troubleshoot MWI issues, use these debugs:

```
debug ccsip messages
debug voice ccapi inout
```

In order to troubleshoot MWI issues with SCCP Phones registered to a CUCME Router with MWI outcall method, use these debugs:

```
debug ccsip messages
debug voice ccapi inout
debug ephone mwi mac <mac address>
debug ephone detail mac <mac address>
```

The **show ephone reg** command is used to confirm the status of MWI regardless of the mechanism used. This is a useful command when the phone is located in a remote site.

```
#show ephone reg
ephone-1[0] Mac:0023.5E18.23EC TCP socket:[1] activeLine:0 whisperLine:0 REGISTERED in SCCP ver
17/12 max_streams=5
mediaActive:0 whisper_mediaActive:0 startMedia:0 offhook:0 ringing:0 reset:0 reset_sent:0 paging
0 debug:1 caps:9 privacy:1
IP:10.10.202.2 22856 7965 keepalive 186 max_line 6 available_line 6
button 1: dn 1 number 3001 CH1 IDLE CH2 IDLE CH3 IDLE CH4 IDLE
```

CUE

In CUE you can use these show commands in order to verify your configuration:

```
show ccn application
show ccn subsystem sip
```

CUE also provides traces in order to troubleshoot any issues related to MWI. You can either use the default traces already enabled in CUE or use a specific trace which is easier to collect and read.

The specific trace you can enable in CUE is:

```
trace ccn stacksip debug
```

This trace provides SIP signaling information useful in order to determine if the **SIP Outcall** or **Notify** message is sent correctly for MWI.

You can also enable the **trace voicemail all** in combination with the stacksip trace in order to get more information about the call and MWI events, or at a minimum enable the **trace voicemail vxml all** and **trace voicemail mwi all**.

Note: For more information about MWI Problems refer to the [Troubleshooting Unity Express Message Waiting Indication \(MWI\) Problems](#).

CUE Licensing

In CUE, ensure licenses are installed in order to support the correct call agent (CUCME or CUCM) and voicemail ports.

In CUE version 7.0.x the command is **show software licenses**.

```
CUE# show software licenses
Installed license files:
- voicemail_lic.sig : 25 MAILBOX LICENSE
- ivr_lic.sig : 4 PORT IVR BASE LICENSE
- port_lic.sig : 24 PORT BASE LICENSE Core: - Application mode: CCME - Total usable system
ports: 24 Voicemail/Auto Attendant: - Max system mailbox capacity time: 18000 - Default # of
general delivery mailboxes: 10 - Default # of personal mailboxes: 25 - Max # of configurable
mailboxes: 35 Interactive Voice Response: - Max # of IVR sessions: 4 Languages: - Max installed
languages: 5 - Max enabled languages: 5
```

In CUE 7.1.x and later the commands are **show license status application** and **show call-agent**

```
CUE# show license status application
voicemail enabled: 10 ports, 10 sessions, 30 mailboxes ivr disabled, ivr session activation
count has been set to zero CUE# show call-agent Call-agent: CUCME
```

You can also use the **show license all** which provides detailed information about the licenses. This show command is useful in order to determine if the CUE has evaluation licenses and how much time is left before it expires or if the licenses installed are permanent:

```
CUE# show license all License Store: Primary License Storage StoreIndex: 0 Feature: VMIVR-VM-MBX
Version: 1.0 License Type: Permanent License State: Active, In Use License Count: 65 /30 License
Priority: Medium License Store: Primary License Storage StoreIndex: 1 Feature: VMIVR-IVR-SESS
Version: 1.0 License Type: Permanent License State: Active, Not in Use License Count: 10 / 0
```

License Priority: Medium License Store: Primary License Storage StoreIndex: 2 Feature: TCV-USER
Version: 1.0 License Type: Permanent License State: Active, Not in Use License Count: 60 / 0
License Priority: Medium License Store: Primary License Storage **StoreIndex: 3 Feature: VMIVR-
PORT** Version: 1.0 **License Type: Permanent License State: Active, In Use License Count: 20 /10**
License Priority: Medium License Store: Evaluation License Storage

Troubleshoot SIP Outcall

The SIP Outcall method generates a SIP call event to CUCME in order to toggle on or off the MWI for one specific extension. CUE waits for the **180 Ringing** message. Once it is received, then it can disconnect the call.

In CUE:

```
CUE# no trace all
#trace ccn StackSip debug # clear trace #mwi refresh telephonenumber 3001 #show trace buff tail
Press <CTRL-C> to exit... 4524 07/04 09:35:16.484 ACCN STGN 0 Task: 263000000018GetListMember:

Common Issues

Issue 1. MWI does not work after SIP bind Commands

SIP Bind commands are configured under **voice service voip** to an interface that is not the one used for CUE. This is a very common issue and tricky to detect with the troubleshoot tools inside CME. From a CME point of view there are no SIP messages shown.

In CME if you run **debug ip udp** you can notice packets from CUE but no messages shown in **debug ccsip messages** or **debug ccsip all**:

```
000186: *Jul  8 17:30:48.843: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
000187: *Jul  8 17:30:49.343: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
000188: *Jul  8 17:30:50.347: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
000189: *Jul  8 17:30:52.351: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
000190: *Jul  8 17:30:56.351: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
000191: *Jul  8 17:31:04.355: UDP: rcvd src=10.10.202.50(32777), dst=10.10.202.1(5060),
length=748
```

If a packet capture is collected directly from the CUE interface with **ip traffic export** you can notice the INVITE is indeed received by CUCME:

No. -	Time	Source	Destination	Protocol	Info
6	0.101558	10.10.202.50	10.10.202.1	SIP/SDP	Request: INVITE sip:39993001@10.10.202.1:5060;user=phone, with session desc
76	0.603723	10.10.202.50	10.10.202.1	SIP/SDP	Request: INVITE sip:39993001@10.10.202.1:5060;user=phone, with session desc
78	1.605571	10.10.202.50	10.10.202.1	SIP/SDP	Request: INVITE sip:39993001@10.10.202.1:5060;user=phone, with session desc
80	3.608380	10.10.202.50	10.10.202.1	SIP/SDP	Request: INVITE sip:39993001@10.10.202.1:5060;user=phone, with session desc
82	7.609776	10.10.202.50	10.10.202.1	SIP/SDP	Request: INVITE sip:39993001@10.10.202.1:5060;user=phone, with session desc

In CUE the INVITE is shown as sent, although since there is no response from CUCME, it continues to send INVITEs until the retry count is reached, then the connection is terminated due to no response:

```

```

Solution:

The **bind** interface command allows you to configure the source IP address of signaling and media packets to a specific interface's IP address. Thus, the address that goes out on the packet is bound to the IP address of the interface specified with the **bind** command. Packets that are not destined to the bound address are discarded.

1. Check the interface used to configure CUE.
2. It is recommended that the interface used in CUCME inside the **ip source-address** is the same used for CUE.
3. Make proper adjustments in order to accept SIP Traffic sourced from CUE interface:

3.1 You can remove the **bind** commands from **voice service voip**. This allows the Gateway to accept SIP Traffic from any interface.

```
voice service voip
sip
no bind control source-interface [interface] no bind media source-interface [interface]
```

3.2 You can configure SIP **bind** commands on a **dial-peer** basis. This is commonly used when you have a SIP Trunk to your Carrier or Firewalls that requires specific IP Addresses to allow:

```
dial-peer voice tag voip
session protocol sipv2
voice-class sip bind {control | media} source interface interface-id[ipv6-address ipv6-address]
exit
```

Issue 2. Proper Extension length not defined in ephone-dn

MWI DN configuration in CUCME for the Outcall Method is not properly provisioned with the correct extension length used in the CUCME Dial Plan for MWI.

Possible Cause #1

If **ephoned-dn** is configured with only the MWI extension and no dots (':') CUE synchronization fails:

Navigate to **Administration > Synchronize Information**

Site: local

The following configuration on the CME and CUE is unsynchronized -

Synchronize MWI On number

3999 is not a valid MWI On number on CME. Create a new MWI On number on CME.

Synchronize MWI Off number

3998 is not a valid MWI Off number on CME. Create a new MWI Off number on CME.

Possible Cause #2

Extension Length does not match the right amount of digits for the users extensions.

In CUCME you can use the **debug ccsip messages** and the messages are present, but the MWI does not work:

available_line 6 button 1: dn 1 number 3001 CH1 IDLE CH2 IDLE Preferred Codec: g711ulaw
Username: MWIOne Password: cisco
```

Solution:

Ensure the proper amount of dots ('.') are configured after the MWI extension number in order to match the length of the extensions used in CUCME for the users:

```
ephone-dn 3
mwi on
number 3999... ! ephone-dn 4 mwi off number 3998...
```

Issue 3. Subscribe-Notify with no Subscription

When SIP Subscribe-Notify method is used and no prior Subscription of the Directory Numbers has taken place, MWI does not work and no SIP Notify is sent for MWI events.

In CUCME after leaving or retrieving voicemails, no SIP Notify is sent from CUE in order to turn on/off MWI:

```
Sent:
BYE sip:3600@10.10.202.50:5060 SIP/2.0
```

Via: SIP/2.0/UDP 10.10.202.1:5060;branch=z9hG4bK601067

Solution:

Configure the proper MWI Subscription commands in order to get the DN's Subscribe with CUE for MWI events:

```
voice register dn 1
  number 3005
  mwi ! ephone-dn 1 number 3001 mwi sip Sent: SUBSCRIBE sip:3001@10.10.202.50:5060 SIP/2.0 Via:

Issue 4. 488 Not Acceptable Media

CUCME sends 488 Not Acceptable Media when CUE sends an Outcall INVITE for MWI.

Sent:
SIP/2.0 488 Not Acceptable Media Via: SIP/2.0/UDP 172.18.106.88:5060 From: "Cisco SIP Channel1"
<sip:outbound-0@172.18.106.66>;tag=75b5194d-133 To:

<sip:1109811043@172.18.106.66;user=phone>;tag=23F1578C-252 Date: Fri, 11 Mar 2005 15:09:13 GMT
Call-ID: e34bafcc-131@172.18.106.88:5060 Server: Cisco-SIPGateway/IOS-12.x CSeq: 51 INVITE
Allow-Events: telephone-event Content-Length: 0

Solution:

CUE only supports G711ulaw

Ensure the proper incoming dial-peer is match that supports codec G711ulaw. You can either create a new dial-peer or use the pre-existing dial-peer for voicemail access:

```
dial-peer voice 3600 voip  
destination-pattern 3600  
session protocol sipv2  
session target ipv4:10.10.202.2  
incoming called-number 399[89].... dtmf-relay sip-notify codec g711ulaw no vad !
```
