  - If you choose customized web authentication, click **Save** and apply this template to the controller. You are prompted to download the web authentication bundle.

**Note** Before you can choose customized web authentication, you must first download the bundle by going to **Config > Controller** and choose **Download Customized Web Authentication** from the Select a command drop-down list, and click **Go**.

- If you choose external, you need to enter the URL you want to redirect to after a successful authentication. For example, if the value entered for this text box is `http://www.example.com`, the user is directed to the company home page.
- Step 5** Click to enable Logo Display if you want your company logo displayed.
- Step 6** Enter the title you want displayed on the Web authentication page.
- Step 7** Enter the message you want displayed on the Web authentication page.
- Step 8** Provide the URL where the user is redirected after a successful authentication. For example, if the value entered for this text box is `http://www.example.com`, the user would be directed to the company home page.

**Step 9** Click **Save**.

## Downloading a Customized Web Authentication Page

You can download a customized Web authentication page to the controller. With a customized web page, you can establish a username and password for user web access.

When downloading customized web authentication, you must follow these strict guidelines:

- Provide a username.
- Provide a password.
- Retain a redirect URL as a hidden input item after extracting from the original URL.
- Extract the action URL and set aside from the original URL.
- Include scripts to decode the return status code.

Before downloading, follow these steps:

**Step 1** Download the sample login.html bundle file from the server. The .html file is shown in [Figure 11-37](#). The login page is presented to web users the first time they access the WLAN if web authentication is turned on.

**Figure 11-37** Login.html

**Step 2** Edit the login.html file and save it as a .tar or .zip file.

**Note** You can change the text of the Submit button to read Accept terms and conditions and Submit.

**Step 3** Make sure you have a Trivial File Transfer Protocol (TFTP) server available for the download. Keep these guidelines in mind when setting up a TFTP server:

- If you are downloading through the service port, the TFTP server must be on the same subnet as the service port because the service port is not routable. However, if you want to put the TFTP server on a different network while the management port is down, add a static route if the subnet where the service port resides has a gateway (config route add *IP address of TFTP server*).
- If you are downloading through the distribution system network port, the TFTP server can be on the same or a different subnet because the distribution system port is routable.

- A third-party TFTP server cannot run on the same computer as the NCS because NCS's built-in TFTP server and third-party TFTP server use the same communication port.

**Step 4** Download the .tar or .zip file to the controller(s).

---

**Note** The controller allows you to download up to 1 MB of a .tar file containing the pages and image files required for the Web authentication display. The 1 MB limit includes the total size of uncompressed files in the bundle.

---

You can now continue with the download.

**Step 5** Copy the file to the default directory on your TFTP server.

**Step 6** Choose **Configure > Controllers**.

**Step 7** Choose a controller by clicking the URL for the corresponding IP address. If you select more than one IP address, the customized Web authentication page is downloaded to multiple controllers.

**Step 8** From the left sidebar menu, choose **System > Commands**.

**Step 9** From the Upload/Download Commands drop-down list, choose **Download Customized Web Auth, and click Go**.

**Step 10** The IP address of the controller to receive the bundle and the current status are displayed.

**Step 11** Choose **local machine** from the File is Located On parameter. If you know the filename and path relative to the server's root directory, you can also select TFTP server.

---

**Note** For a local machine download, either .zip or .tar file options exists, but the NCS does the conversion of .zip to .tar automatically. If you chose a TFTP server download, only .tar files would be specified.

---

**Step 12** Enter the maximum number of times the controller should attempt to download the file in the Maximum Retries parameter.

**Step 13** Enter the maximum amount of time in seconds before the controller times out while attempting to download the file in the Timeout parameter.

**Step 14** The files are uploaded to the c:\tftp directory. Specify the local file name in that directory or use the Browse button to navigate to it.

**Step 15** Click **OK**.

If the transfer times out, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name is populated for you. The local machine option initiates a two-step operation. First, the local file is copied from the administrator's workstation to NCS's own built-in TFTP server. Then the controller retrieves that file. For later operations, the file is already in the NCS server's TFTP directory, and the download web page now automatically populates the filename.

**Step 16** Click the **Click here to download a sample tar file** link to get an option to open or save the login.tar file.

**Step 17** After completing the download, you are directed to the new page and able to authenticate.

---

## Configuring an External Web Auth Server Template

To create or modify an External Web Auth Server template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Templates Launch Pad**.
- Step 2** Click **External Web Auth Server** or choose **Security > External Web Auth Server** from the left sidebar menu. The External Web Auth Server Controller Templates page displays all currently saved External Web Auth Server templates. It also displays the number of controllers and virtual domains to which each template is applied.
- Step 3** Click a template name to open the Controller Template list page. From here, you can edit the current template parameters.
- 

## Configuring a Security Password Policy Template

This page enables you to determine your security password policy.

To add or make modifications to an existing password policy template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Password Policy** or choose **Security > Password Policy** from the left sidebar menu. The Security > Password Policy page appears.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Password Policy template page appears (see [Figure 11-41](#)).

**Figure 11-38 Password Policy Template**

**New Controller Template**  
 Configure > Controller Template Launch Pad > Security > Password Policy > New Controller Template

**General**

Template Name: Pword\_policy\_temp1

Password must contain characters from at least 3 different classes **Enable**  
 No character can be repeated more than 3 times consecutively **Enable**  
 Password cannot be the default words like cisco, admin **Enable**  
 Password cannot contain username or reverse of username **Enable**

Save Cancel

**Footnotes**

1. Password must contain characters from at least three of the classes : upper case letters , lower case letters, digits, and special characters.  
 2. Password cannot be "cisco", "ocsic", "admin", "nimda" or any variant obtained by changing the capitalization of letters, or by substituting "1" for "l" or "i" for "l", or substituting "0" for "o", or substituting "5" for "s".

- Step 4** Enter the template name.
- Step 5** You can enable or disable the following settings:
- Password must contain characters from at least 3 different classes such as upper case letters , lower case letters, digits, and special characters.
  - No character can be repeated more than 3 times consecutively.
  - Password cannot be the default words like cisco, admin.

**Note**

Password cannot be “cisco”, “ocsic”, “admin”, “nimda” or any variant obtained by changing the capitalization of letters, or by substituting ‘1’ “l” or “!” for i, or substituting “0” for “o”, or substituting “\$” for “s”.

- Password cannot contain username or reverse of username.

**Step 6** Click **Save**.

---

## Configuring Security - Access Control Templates

This section contains the following topics:

- [Configuring an Access Control List Template, page 11-69](#)
- [Configuring an ACL IP Groups Template, page 11-73](#)
- [Configuring an ACL Protocol Groups Template, page 11-74](#)

### Configuring an Access Control List Template

You can create or modify an ACL template for configuring the type of traffic that is allowed, by protocol, direction, and the source or destination of the traffic.

An access control list (ACL) is a set of rules used to limit access to a particular interface (for example, if you want to restrict a wireless client from pinging the management interface of the controller). ACLs can be applied to data traffic to and from wireless clients or to all traffic destined for the controller Central Processing Unit (CPU) and can now support reusable grouped IP addresses and reusable protocols. After ACLs are configured in the template, they can be applied to the management interface, the AP-manager interface, or any of the dynamic interfaces for client data traffic; to the Network Processing Unit (NPU) interface for traffic to the controller CPU; or to a WAN.

To add or modify an existing ACL template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Access Control Lists** or choose **Security > Access Control > Access Control Lists** in the left sidebar menu. The **Security > Access Control List** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.

**Step 3** To create reusable grouped IP addresses and protocols, choose **Access Control > IP Groups** from the left sidebar menu.

**Step 4** All the IP address groups are listed. One IP address group can have a maximum of 128 IP address and netmask combinations. To define a new IP address group, choose **Add IP Group** from the **Select a** command drop-down list, and click **Go**. To view or modify an existing IP address group, click the URL of the IP address group. The IP address group page opens.

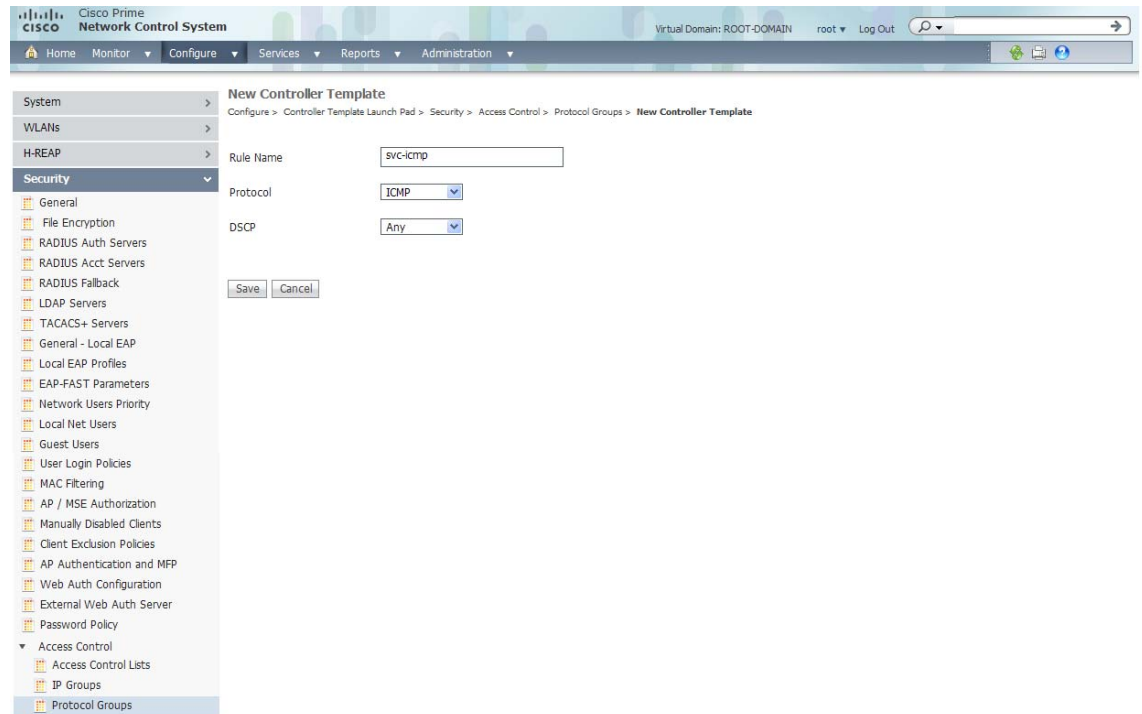

---

**Note** For the IP address of any, an *any* group is predefined.

---

- Step 5** In the ACL IP Groups details page you can edit the current IP group parameters.
- IP Group Name
  - IP Address
  - Netmask OR CIDR Notation—Enter the Netmask or CIDR Notation and then click **Add**. The list of IP addresses or Netmasks appears in the List of IP Address/Netmasks text box.  
CIDR notation allows you to add a large number of clients that exist in a subnet range by configuring a single client object.  
Netmask allows you to set the subnet mask in dotted-decimal notation rather than the CIDR notation for the IP address property.
    - Netmask—A range of IP addresses defined so that only machines with IP addresses within the range are allowed to access an Internet service.
    - CIDR—Classless InterDomain Routing. A protocol which allows the assignment of Class C IP addresses in multiple contiguous blocks.
  - BroadCast/Network
  - List of IP Addresses/Netmasks—Use the Move Up and Move Down buttons to rearrange the order of the list items. Use the Delete button to delete any IP address or Netmask.
- Step 6** To define an additional protocol that is not a standard predefined one, choose **Access Control > Protocol Groups** from the left sidebar menu. The protocol groups with their source and destination port and DSCP are displayed.
- Step 7** To create a new protocol group, choose **Add Protocol Group** from the Select a command drop-down list, and click **Go**. To view or modify an existing protocol group, click the URL of the group. The Protocol Groups page appears (see [Figure 11-39](#)).

Figure 11-39 Protocol Groups Controller Template

- Step 8** The rule name is provided for the existing rules, or you can now enter a name for a new rule. ACLs are not required to have rules defined. When a packet matches all the parameters of a rule, the action for this rule is exercised.
- Step 9** Choose a protocol from the drop-down list:
- Any—All protocols
  - TCP—Transmission Control Protocol
  - UDP—User Datagram Protocol
  - ICMP—Internet Control Message Protocol
  - ESP—IP Encapsulating Security Payload
  - AH—Authentication Header
  - GRE—Generic Routing Encapsulation
  - IP—Internet Protocol
  - Eth Over IP—Ethernet over Internet Protocol
  - Other Port OSPF—Open Shortest Path First
  - Other—Any other IANA protocol (<http://www.iana.org/>)
- Step 10** Some protocol choices (such as TCP or UDP) cause additional Source Port and Dest Port GUI elements to appear.
- Source Port—Specify the source of the packets to which this ACL applies. The choices are Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other, and Port Range.

- **Dest Port**—Specify the destination of the packets to which this ACL applies. The choices are Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other, and Port Range.

**Step 11** From the DSCP (Differentiated Services Code Point) drop-down list, choose **any** or **specific**. If you choose specific, enter the DSCP (range of 0 to 255).

**Note** DSCP is a packet header code that can be used to define the quality of service across the Internet.

**Step 12** Click **Save**.

**Step 13** You can now create new mappings from the defined IP address groups and protocol groups. To define a new mapping, choose the ACL template to which you want to map the new groups. All ACL mappings appear on the top of the page, and all ACL rules appear on the bottom (see [Figure 11-40](#)).

**Figure 11-40 Access Control List Rule Mapping**

The screenshot shows the Cisco Prime Network Control System interface. The main content area is titled "Controller Template 'ACL\_Temp1'". Below the title, there is a navigation breadcrumb: "Configure > Controller Template Launch Pad > Security > Access Control > Access Control List > Controller Template 'ACL\_Temp1'".

On the left, there is a sidebar menu with the following items: System, WLANs, H-REAP, Security (expanded), General, File Encryption, RADIUS Auth Servers, RADIUS Acct Servers, RADIUS Fallback, LDAP Servers, TACACS+ Servers, General - Local EAP, Local EAP Profiles, EAP-FAST Parameters, Network Users Priority, Local Net Users, Guest Users, User Login Policies, MAC Filtering, AP / MSE Authorization, Manually Disabled Clients, Client Exclusion Policies, AP Authentication and MFP, Web Auth Configuration, External Web Auth Server, Password Policy, Access Control (expanded), Access Control Lists (selected), IP Groups, and Protocol Groups.

The main content area contains two tables. The top table is for rule mappings and has columns: Action, Source IP Group, Destination IP Group, Protocol Group, and Direction. Below this table is a "Generate Rules ..." button. The bottom table is for generated rules and has columns: Seq#, Action, Source IP/Mask, Destination IP/Mask, Protocol, Source Port, Dest Port, DSCP, and Direction. Below this table are buttons for "Re-Sequence Rules", "Apply to Controllers...", "Delete", "Copy", and "Cancel".

At the top right of the main content area, there are two "Select a command" drop-down menus and "Go" buttons.

**Step 14** To define a new mapping, choose **Add Rule Mappings** from the Select a command drop-down list. The Add Rule Mapping page appears.

**Step 15** Choose the desired IP address groups, protocol groups, direction, and action, and click **Add**. The new mappings will populate the bottom table.

**Step 16** Click **Save**.

**Step 17** You can now automatically generate rules from the rule mappings you created. Choose the mappings for which you want to generate rules, and click **Generate**. This automatically creates the rules. These rules are generated with contiguous sequence. That is, if rules 1 through 4 are already defined and you add rule 29, it is added as rule 5.

Existing ACL templates are duplicated into a new ACL template. This duplication clones all the ACL rules and mappings defined in the source ACL template.

---

## Configuring an ACL IP Groups Template

To create reusable grouped IP addresses, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Choose **Access Control > IP Groups** from the left sidebar menu.
- Step 3** All the IP address groups are listed. One IP address group can have a maximum of 128 IP address and netmask combinations. To define a new IP address group, choose **Add IP Group** from the Select a command drop-down list, and click **Go**.

---

**Note** For the IP address of any, an *any* group is predefined.

---

- Step 4** Add or modify the following parameters:
- IP Group Name
  - IP Address
  - Netmask OR CIDR Notation—Enter the Netmask or CIDR Notation and then click **Add**. The list of IP addresses or Netmasks appears in the List of IP Addresses/Netmasks text box.  
  
CIDR notation allows the user to add a large number of clients that exist in a subnet range by configuring a single client object.  
  
Netmask allows the user to set the subnet mask in dotted-decimal notation rather than the CIDR notation for the IP address property.
    - Netmask—A range of IP addresses defined so that only machines with IP addresses within the range are allowed to access an Internet service.
    - CIDR—Classless InterDomain Routing. A protocol which allows the assignment of Class C IP addresses in multiple contiguous blocks.
  - BroadCast/Network
  - List of IP Addresses/Netmasks—Use the Move Up and Move Down buttons to rearrange the order of the list items. Use the Delete button to delete an IP address or Netmask.
- Step 5** Click **Save**. Once saved, the IP Group appears in the Template List page.

You can create new mappings from the defined IP address groups and protocol groups. To define a new mapping, choose the ACL template to which you want to map the new groups. All ACL mappings appear in the top of the page, and all ACL rules appear in the bottom. See the [“Configuring an Access Control List Template”](#) section on page 11-69 for more information.

See the [“Configuring an ACL Protocol Groups Template”](#) section on page 11-74 for information on defining Protocol Groups.

---

## Configuring an ACL Protocol Groups Template

To define an additional protocol that is not a standard predefined one, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Choose **Access Control > Protocol Groups** from the left sidebar menu.

**Step 3** Add or modify the following parameters:

- Rule Name—The rule name is provided for the existing rules, or you can now enter a name for a new rule. ACLs are not required to have rules defined. When a packet matches all the parameters of a rule, the action for this rule is exercised.

**Note** See the “[Configuring an Access Control List Template](#)” section on page 11-69 for more information on ACLs.

- Protocol—Choose a protocol from the drop-down list:
  - Any—All protocols
  - TCP—Transmission Control Protocol
  - UDP—User Datagram Protocol
  - ICMP—Internet Control Message Protocol
  - ESP—IP Encapsulating Security Payload
  - AH—Authentication Header
  - GRE—Generic Routing Encapsulation
  - IP—Internet Protocol
  - Eth Over IP—Ethernet over Internet Protocol
  - Other Port OSPF—Open Shortest Path First
  - Other—Any other IANA protocol (<http://www.iana.org/>)
- Source Port—Can be Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other and Port Range.
- Dest Port—Destination port. If TCP or UDP is selected, can be Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other and Port Range.
- DSCP (Differentiated Services Code Point)—Choose Any or Specific from the drop-down list. If Specific is selected, enter the DSCP (range of 0 through 255).

**Note** DSCP is a packet header code that can be used to define the quality of service across the Internet.

**Step 4** Click **Save**. Once saved, the IP Group displays in the Template List page.

You can create new mappings from the defined IP address groups and protocol groups. To define a new mapping, choose the ACL template to which you want to map the new groups. All ACL mappings appear in the top of the page, and all ACL rules appear in the bottom. See the “[Configuring an Access Control List Template](#)” section on page 11-69 for more information.

See the “[Configuring an ACL IP Groups Template](#)” section on page 11-73 for information on defining IP Groups.

---

## Configuring Security - CPU Access Control List Templates

This section contains the following topics:

- [Configuring a CPU Access Control List \(ACL\) Template](#), page 11-75

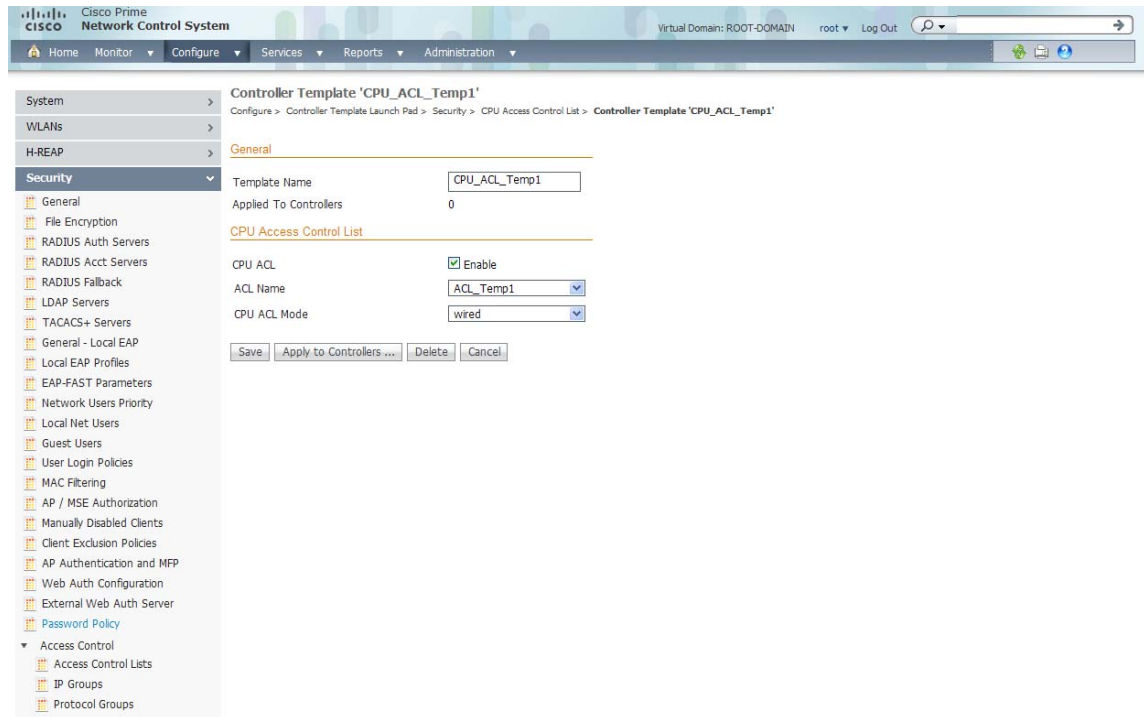

### Configuring a CPU Access Control List (ACL) Template

The existing ACLs established in the “[Configuring an Access Control List Template](#)” section on page 11-69 is used to set traffic controls between the Central Processing Unit (CPU) and Network Processing Unit (NPU).

To add or modify an existing CPU ACL template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **CPU Access Control Lists** or choose **Security > CPU Access Control > CPU Access Control List** from the left sidebar menu. The Security > CPU Access Control List page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The CPU Access Control List template page appears (see [Figure 11-41](#)).

Figure 11-41 CPU Access Control List Template

- Step 4** If you select the check box to enable CPU ACL, two more parameters appear. When CPU ACL is enabled and applied on the controller, NCS displays the details of the CPU ACL against that controller.
- Step 5** From the ACL Name drop-down list, choose a name from the list of defined names.
- Step 6** From the CPU ACL Mode drop-down list, choose which data traffic direction this CPU ACL list controls. The choices are the wired side of the data traffic, the wireless side of the data traffic, or both wired and wireless.
- Step 7** Click **Save**.

## Configuring Security - Rogue Templates

This section contains the following topics:

- [Configuring a Rogue Policies Template, page 11-76](#)
- [Configuring a Rogue AP Rules Template, page 11-78](#)
- [Configuring a Rogue AP Rule Groups Template, page 11-80](#)
- [Configuring a Friendly Access Point Template, page 11-82](#)

### Configuring a Rogue Policies Template

This page enables you to configure the rogue policy (for access points and clients) applied to the controller.

To add or modify an existing template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Rogue Policies** or choose **Security > Rogue > Rogue Policies** from the left sidebar menu. The Security > Rogue Policy Setup page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Rogue Policies template page appears (see Figure 11-42).

**Figure 11-42** Rogue Policy Setup Template

The screenshot shows the Cisco Prime Network Control System interface. The left sidebar has a tree view with 'Security' expanded to 'Rogue Policies'. The main content area is titled 'New Controller Template' and contains the following configuration fields:

| Section      | Field                                                    | Value                                      |
|--------------|----------------------------------------------------------|--------------------------------------------|
| General      | Template Name                                            | Rogue_Policy_Temp1                         |
|              | Rogue Location Discovery Protocol                        | Disable                                    |
|              | Expiration Timeout for Rogue AP and Rogue Client Entries | 1200 (secs)                                |
|              | Validate rogue clients against AAA                       | <input type="checkbox"/> Enable            |
| Auto Contain | Detect and report Adhoc networks                         | <input checked="" type="checkbox"/> Enable |
|              | Rogue on Wire                                            | <input checked="" type="checkbox"/>        |
|              | Using our SSID                                           | <input type="checkbox"/>                   |
|              | Valid client on Rogue AP                                 | <input type="checkbox"/>                   |
|              | AdHoc Rogue                                              | <input type="checkbox"/>                   |

Buttons: Save, Cancel

- Step 4** Determine whether or not the Rogue Location Discovery Protocol (RLDP) is connected to the enterprise wired network. Choose one of the following from the drop-down list:
- **Disable**—Disables RLDP on all access points.
  - **All APs**—Enables RLDP on all access points.
  - **Monitor Mode APs**—Enables RLDP only on access points in monitor mode.

---

**Note** With RLDP, the controller instructs a managed access point to associate with the rogue access point and sends a special packet to the controller. If the controller receives the packet, the rogue access point is connected to the enterprise network. This method works for rogue access points that do not have encryption enabled.

---

- Step 5** Set the expiration timeout (in seconds) for rogue access point entries.
- Step 6** Select the **Validate rogue clients against AAA** check box to enable the AAA validation of rogue clients.
- Step 7** Select the **Detect and report Adhoc networks** check box to enable detection and reporting of rogue clients participating in ad hoc networking.
- Step 8** Click **Save**.
- 

## Configuring a Rogue AP Rules Template

Rogue access point rules allow you to define rules to automatically classify rogue access points. NCS applies the rogue access point classification rules to the controllers. These rules can limit a rogue's appearance on maps based on RSSI level (weaker rogue access points are ignored) and time limit (a rogue access point is not flagged unless it is seen for the indicated period of time).

---

**Note** Rogue access point rules also help reduce false alarms.

---

To view current classification rule templates, rule type, and the number of controllers to which they are applied, choose **Configure > Controller Template Launch Pad > Security > Rogue > Rogue AP Rules**. If you want to view rogue access point rules, see the [“Viewing or Editing Rogue Access Point Rules” section on page 9-190](#).

---

**Note** Rogue classes include the following types:

- Malicious Rogue—A detected access point that matches the user-defined malicious rules or has been manually moved from the Friendly AP category.
- Friendly Rogue—Known, acknowledged, or trusted access point or a detected access point that matches user-defined friendly rules.
- Unclassified Rogue—A detected access point that does not match the malicious or friendly rules.

---

To add or create a new classification rule template for rogue access points, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** From the left sidebar menu, choose **Security > Rogue > Rogue AP Rules**. The Rogue AP Rules Controller Template page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** From the Select a command drop-down list, choose **Add Classification Rule**, and click **Go**. The Rogue AP Rules > New Template page appears (see [Figure 11-43](#)). To modify an existing rogue access point rules template or to apply a current template to the controllers, choose **Configure > Controller Template Launch Pad > Security > Rogue > Rogue AP Rules**, and click a template name.

**Figure 11-43** Rogue AP Rules > New Template Page

- Step 4** In the General portion of the page, enter the following parameters:
- Rule Name—Enter a name for the rule in the text box.
  - Rule Type—Choose **Malicious** or **Friendly** from the drop-down list. A rogue is considered malicious if a detected access point matches the user-defined malicious rules or has been manually moved from the Friendly AP category. A rogue is considered friendly if it is a known, acknowledged, or trusted access point or a detected access point that matches the user-defined Friendly rules.
  - Match Type—Choose **Match All Conditions** or **Match Any Condition** from the drop-down list.
- Step 5** In the Malicious Rogue Classification Rule portion of the page, enter the following parameters.
- Open Authentication—Select the check box to enable open authentication.
  - Match Managed AP SSID—Select the check box to enable the matching of a Managed AP SSID.

**Note** Managed SSIDs are the SSIDs configured for the WLAN and known to the system.

- **Match User Configured SSID**—Select the check box to enable the matching of User Configured SSIDs.

**Note** User Configured SSIDs are the SSIDs that are manually added. Enter the User Configured SSIDs (one per line) in the Match User Configured SSID text box.

- **Minimum RSSI**—Select the check box to enable the Minimum RSSI threshold limit.

**Note** Enter the minimum RSSI threshold level (dB) in the text box. The detected access point is classified as malicious if it is detected above the indicated RSSI threshold.

- **Time Duration**—Select the check box to enable the Time Duration limit.

**Note** Enter the time duration limit (in seconds) in the text box. The detected access point is classified as malicious if it is viewed for a longer period of time than the indicated time limit.

- **Minimum Number Rogue Clients**—Select the check box to enable the Minimum Number Rogue Clients limit. Enter the minimum number of rogue clients allowed. The detected access point is classified as malicious if the number of clients associated to the detected access point is greater than or equal to the indicated value.

**Step 6** Click **Save**.

## Configuring a Rogue AP Rule Groups Template

A rogue access point rule group template allows you to combine more than one rogue access point rule to controllers.

To view current rogue access point rule group templates or create a new rule group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click **Rogue AP Rule Groups** or choose **Security > Rogue > Rogue AP Rule Groups** from the left sidebar menu.
  - Step 3** From the Select a command drop-down list, click **Add Rogue Rule Group**.
  - Step 4** Click **Go**. The Rogue AP Rule Groups > New Template page appears (see [Figure 11-44](#)).

Figure 11-44 Rogue AP Rule Groups &gt; New Template

**Note** To modify an existing rogue policy template or to apply a current template to controllers, choose **Configure > Controller Template Launch Pad > Security > Rogue > Rogue AP Rule Groups** and click a template name. Make the necessary changes to the template and click **Save** or **Apply to Controllers**.

- Step 5** Enter a name for the rule group in the General portion of the page.
- Step 6** To add a Rogue AP rule, click to highlight the rule in the left column. Click **Add** to move the rule to the right column.

**Note** Rogue access point rules can be added from the Rogue Access Point Rules section. See the [“Configuring a Rogue AP Rules Template”](#) section on page 11-78 for more information.

- Step 7** To remove a rogue access point rule, click to highlight the rule in the right column. Click **Remove** to move the rule to the left column.
- Step 8** Use the **Move Up/Move Down** buttons to specify the order in which the rules apply. Highlight the desired rule and click **Move Up** or **Move Down** to move it higher or lower in the current list.
- Step 9** Click **Save** to confirm the rogue access point rule list.
- Step 10** Click **Cancel** to close the page without making any changes to the current list.

**Note** To view and edit the rules applied to a controller, choose **Configure > Controller** and click the controller name.

## Configuring a Friendly Access Point Template

This template allows you to import friendly internal access points. Importing these friendly access points prevents non-lightweight access points from being falsely identified as rogues.

**Note** *Friendly Internal* access points were previously referred to as *Known APs*.

**Note** The friendly access point screen identifies the access point's MAC address, status, any comments, and whether or not the alarm is suppressed for this access point.

To view or edit the current list of friendly access points, follow these steps:

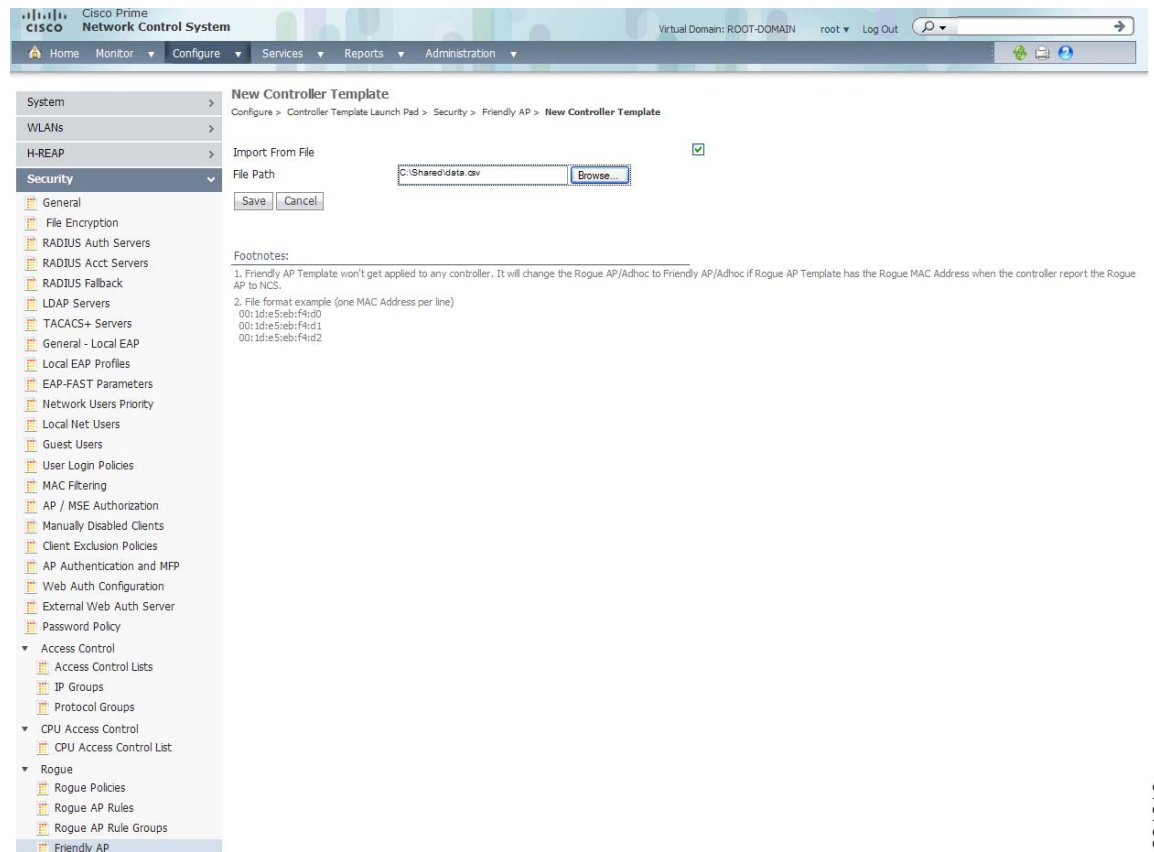

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Friendly AP** or choose **Security > Rogue > Friendly AP** from the left sidebar menu.
- Step 3** From the Select a command drop-down list, choose **Add Friendly**.
- Step 4** Click **Go**. The Friendly AP page appears (see [Figure 11-45](#)).

**Note** To modify an existing friendly access point, choose **Configure > Controller Template Launch Pad > Security > Rogue > Friendly Internal** and click the access point's MAC address. Make the necessary changes to the access point, and click **Save**.

Figure 11-45 Friendly AP &gt; Add Friendly AP Page

**Step 5** Friendly access points can be added by either importing the access point or manually entering the access point information:

- To import an access point using the Import feature:
  - Select the **Import from File** check box.
  - Enter the file path or use the **Browse** button to navigate to the correct file.
- To manually add an access point:
  - Unselect the **Import from File** check box.
  - Enter the MAC address for the access point.

**Note**

Use a line break to separate MAC addresses. For example, enter the MAC addresses as follows:

```
00:00:11:22:33:44
00:00:11:22:33:45
00:00:11:22:33:46
```

- Choose **Internal** access point from the Status drop-down list.
- Enter a comment regarding this access point, if necessary.
- Select the **Suppress Alarms** check box to suppress all alarms for this access point.

- Click **Save** to confirm this access point or **Cancel** to close the page without adding the access point to the list.
- 

## Configuring 802.11 Templates

This section contains the following topics:

- [Configuring Load Balancing Templates, page 11-84](#)
- [Configuring Band Selection Templates, page 11-84](#)
- [Configuring Media Parameters Controller Templates \(802.11a/n\), page 11-89](#)

## Configuring Load Balancing Templates

To configure load balancing templates, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Load Balancing** or choose either **802.11 > Load Balancing** from the left sidebar menu. The Load Balancing page appears.
- Step 3** Enter a value between 1 and 20 for the client window size. The page size becomes part of the algorithm that determines whether an access point is too heavily loaded to accept more client associations:
- $$\text{load-balancing page} + \text{client associations on AP with lightest load} = \text{load-balancing threshold}$$
- In the group of access points accessible to a client device, each access point has a different number of client associations. The access point with the lowest number of clients has the lightest load. The client page size plus the number of clients on the access point with the lightest load forms the threshold. Access points with more client associations than this threshold is considered busy, and clients can associate only to access points with client counts lower than the threshold.
- Step 4** Enter a value between 0 and 10 for the max denial count. The denial count sets the maximum number of association denials during load balancing.
- Step 5** Click **Save**.
- 

## Configuring Band Selection Templates

To configure band selection templates, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Band Select** or choose either **802.11 > Band Select** from the left sidebar menu. The Band Select page appears.
- Step 3** Enter a value between 1 and 10 for the probe cycle count. The cycle count sets the number of suppression cycles for a new client. The default cycle count is 2.
- Step 4** Enter a value between 1 and 1000 milliseconds for the scan cycle period threshold. This setting determines the time threshold during which new probe requests from a client come from a new scanning cycle. The default cycle threshold is 200 milliseconds.

- Step 5** Enter a value between 10 and 200 seconds for the age out suppression parameter. Age-out suppression sets the expiration time for pruning previously known 802.11b/g clients. The default value is 20 seconds. After this time elapses, clients become new and are subject to probe response suppression.
- Step 6** Enter a value between 10 and 300 seconds for the age out dual band parameter. The age-out period sets the expiration time for pruning previously known dual-band clients. The default value is 60 seconds. After this time elapses, clients become new and are subject to probe response suppression.
- Step 7** Enter a value between –20 and –90 dBm for the acceptable client RSSI parameter. This parameter sets the minimum RSSI for a client to respond to a probe. The default value is –80 dBm.
- Step 8** Click **Save**.
- 

## Configuring Media Stream for Controller Templates (802.11)

To configure the media stream for a Controller template for 802.11 Radio, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Scroll down, and under the **802.11** section, click **New** beside Media Stream. The **New Controller Template** page appears.
- Step 3** In the General section, specify an appropriate name for the template.

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

- Step 4** In the Media Stream Configuration section, specify the following parameters
- Media Stream Name
  - Multicast Destination Start IP—Start IP address of the media stream to be multicast
  - Multicast Destination End IP—End IP address of the media stream to be multicast
  - Maximum Expected Bandwidth—Maximum bandwidth that a media stream can use
- Step 5** In the Resource Reservation Control (RRC) Parameters section, specify the following parameters:
- Average Packet Size—Average packet size that a media stream can use
  - RRC Periodical Update—Resource Reservation Control calculations that are updated periodically; if disabled, RRC calculations are done only once when a client joins a media stream.
  - RRC Priority—Priority of RRC with the highest at 1 and the lowest at 8
  - Traffic Profile Violation—Displays if the stream is dropped or put in the best effort queue if the stream violates the QoS video profile
  - Policy—Displays if the media stream is admitted or denied.
- Step 6** Click **Save**.

Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.

---

## Configuring Radio Templates (802.11a/n)

This section contains the following topics:

- [Configuring 802.11a/n Parameters Templates, page 11-86](#)
- [Configuring Media Parameters Controller Templates \(802.11a/n\), page 11-89](#)
- [Configuring EDCA Parameters Through a Controller Template \(802.11a/n\), page 11-90](#)
- [Configuring a Roaming Parameters Template \(802.11a/n\), page 11-92](#)
- [Configuring an 802.11h Template, page 11-93](#)
- [Configuring a High Throughput Template \(802.11a/n\), page 11-94](#)
- [Configuring CleanAir Controller Templates \(802.11a/n\), page 11-95](#)

### Configuring 802.11a/n Parameters Templates

To add or modify radio templates, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Parameters** or choose either **802.11a/n > Parameters** from the left sidebar menu. The 802.11a/n Parameters Template page appears and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the 802.11 network status and the channel and power mode. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n Parameters template page appears (see [Figure 11-46](#)).

Figure 11-46 802.11a/n Parameters Template

- Step 4** Select the check box if you want to enable 802.11a/n network status.
- Step 5** Use the ClientLink drop-down list to enable Clientlink on all access point 802.11a/n radios which support ClientLink. Otherwise, choose **Disable**.
- Step 6** Enter a transmitted power threshold between -50 and -80.
- Step 7** Enter the amount of time between beacons in kilomicroseconds. The valid range is from 20 to 1000 milliseconds.
- Step 8** Enter the number of beacon intervals that may elapse between transmission of beacon frames containing a traffic indicator message (TIM) element whose delivery count text box is 0. This value is transmitted in the DTIM period field of beacon frames. When client devices receive a beacon that contains a DTIM, they normally wake up to check for pending packets. Longer intervals between DTIMS let clients sleep longer and preserve power. Conversely, shorter DTIM periods reduce the delay in receiving packets but use more battery power because clients wake up more often.
- Step 9** At the Fragmentation Threshold parameter, determine the size at which packets are fragmented (sent as several pieces instead of as one block). Use a low setting in areas where communication is poor or where there is a great deal of radio interference.
- Step 10** Enter the percentage for 802.11e maximum bandwidth.
- Step 11** Click if you want short preamble enabled.
- Step 12** At the Dynamic Assignment drop-down list, choose one of three modes:
- Automatic - The transmit power is periodically updated for all access points that permit this operation.
  - On Demand - Transmit power is updated when the Assign Now button is selected.
  - Disabled - No dynamic transmit power assignments occur, and values are set to their global default.
- Step 13** Determine if you want to enable Dynamic Tx Power Control. The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

- Step 14** The Assignment Mode drop-down list has three dynamic channel modes:
- Automatic - The channel assignment is periodically updated for all access points that permit this operation. This is also the default mode.
  - On Demand - Channel assignments are updated when desired.
  - OFF - No dynamic channel assignments occur, and values are set to their global default.
- Step 15** At the Avoid Foreign AP Interference check box, select if you want to enable it. Enable this parameter to have RRM consider interference from foreign Cisco access points (those non-Cisco access points outside RF/mobility domain) when assigning channels. This foreign 802.11 interference. Disable this parameter to have RRM ignore this interference.
- In certain circumstances with significant interference energy (dB) and load (utilization) from foreign access points, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the foreign access points. This increases capacity and reduces variability for the Cisco WLAN Solution.
- Step 16** Select the **Avoid Cisco AP Load** check box if you want it enabled. Enable this bandwidth-sensing parameter to have controllers consider the traffic bandwidth used by each access point when assigning channels to access points. Disable this parameter to have RRM ignore this value.
- In certain circumstances and with denser deployments, there may not be enough channels to properly create perfect channel re-use. In these circumstances, RRM can assign better re-use patterns to those access points that carry more traffic load.
- Step 17** Select the **Avoid non 802.11 Noise** check box if you want to enable it. Enable this noise-monitoring parameter to have access points avoid channels that have interference from non-access point sources, such as microwave ovens or Bluetooth devices. Disable this parameter to have RRM ignore this interference.
- In certain circumstances with significant interference energy (dB) from non-802.11 noise sources, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the noise sources. This increases capacity and reduces variability for the Cisco WLAN Solution.
- Step 18** The Signal Strength Contribution check box is always enabled (not configurable). constantly monitors the relative location of all access points within the RF/mobility domain to ensure near-optimal channel re-use. The net effect is an increase in Cisco WLAN Solution capacity and a reduction in co-channel and adjacent channel interference.
- Step 19** The client and controller negotiate data rates between them. If the data rate is set to Mandatory, the client must support it in order to use the network. If a data rate is set as Supported by the controller, any associated client that also supports that same rate may communicate with the access point using that rate. However, it is not required that a client uses all the rates marked supported in order to associate. For each rate, a drop-down list of Mandatory or Supported is available. Each data rate can also be set to Disabled to match client settings.
- Step 20** At the Channel List drop-down list in the Noise/Interference/Rogue Monitoring Channels section, choose between all channels, country channels, or DCA channels based on the level of monitoring you want. Dynamic Channel Allocation (DCA) automatically selects a reasonably good channel allocation amongst a set of managed devices connected to the controller.
- Step 21** The Cisco Compatible Extension's location measurement interval can only be changed when measurement mode is enabled to broadcast radio measurement requests. When enabled, this enhances the location accuracy of clients.
- Step 22** Click **Save**.
-

## Configuring Media Parameters Controller Templates (802.11a/n)

This page enables you to create or modify a template for configuring 802.11a/n voice parameters such as call admission control and traffic stream metrics.

To add a new template with 802.11a/n voice parameters information (such as call admission control and traffic stream metrics) for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click **New** beside the template you want to add.
  - Step 3** Specify an appropriate name for the template.

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

- Step 4** In the **Voice** tab, add or modify the following parameters:
  - **Admission Control (ACM)**—Select the check box to enable admission control.

For end users to experience acceptable audio quality during a VoIP phone call, packets must be delivered from one endpoint to another with low latency and low packet loss. To maintain QoS under differing network loads, call admission control (CAC) is required. CAC on an access point allows it to maintain controlled QoS when the network is experiencing congestion and keep the maximum allowed number of calls to an acceptable quantity.
  - **CAC Method**—If Admission Control (ACM) is enabled, specify the CAC method as either load-based or static.

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types from itself, from co-channel access points, and by co-located channel interference. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.
  - **Maximum Bandwidth Allowed**—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
  - **Reserved Roaming Bandwidth**—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
  - **Expedited Bandwidth**—Select the check box to enable expedited bandwidth as an extension of CAC for emergency calls.

You must have an expedited bandwidth IE that is CCXv5 compliant so that a TSPEC request is given higher priority.
  - **SIP CAC**—Select the check box to enable SIP CAC.

SIP CAC should be used only for phones that support status code 17 and do not support TSPEC-based admission control.
  - **SIP Codec**—Specify the codec name you want to use on this radio. The available options are G.711, G.729, and User Defined.
  - **SIP Call Bandwidth**—Specify the bandwidth in kilobits per second that you want to assign per SIP call on the network. This parameter can be configured only when the SIP Codec selected is User Defined.
  - **SIP Sample Interval**—Specify the sample interval in milliseconds that the codec must operate in.

- Max Number of Calls per Radio—Specify the maximum number of calls per Radio.
- Metric Collection—Select the check box to enable metric collection.

Traffic stream metrics are a series of statistics about VoIP over your wireless LAN which inform you of the QoS of the wireless LAN. For the access point to collect measurement values, traffic stream metrics must be enabled. When this is enabled, the controller begins collecting statistical data every 90 seconds for the 802.11b/g interfaces from all associated access points. If you are using VoIP or video, this feature should be enabled.

**Step 5** In the **Video** tab, add or modify the following parameters:

- Admission Control (ACM)—Select the check box to enable admission control.
- Maximum Bandwidth—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- Reserved Roaming Bandwidth—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- Unicast Video Redirect—Select the **Unicast Video Redirect** check box to enable all non-media stream packets in video queue are redirected to the best effort queue. If disabled, all packets with video marking are kept in video queue.
- Client Minimum Phy Rate—Specify the physical data rate required for the client to join a media stream from the Client Minimum Phy Rate drop-down list.
- Multicast Direct Enable—Select the **Multicast Direct Enable** check box to set the Media Direct for any WLAN with Media Direct enabled on a WLAN on this radio.
- Maximum Number of Streams per Radio—Specify the maximum number of streams per Radio to be allowed.
- Maximum Number of Streams per Client—Specify the maximum number of streams per Client to be allowed.
- Best Effort QOS Admission—Select the Best Effort QOS Admission check box to redirect new client requests to the best effort queue. This happens only if all the video bandwidth has been used.

**Note** If disabled and maximum video bandwidth has been used, then any new client request is rejected.

**Step 6** On the **General** tab, specify the following parameter:

- Maximum Media Bandwidth (0 to 85%)—Specify the percentage of maximum of bandwidth allowed. This option is only available when CAC is enabled.

**Step 7** Click **Save**.

Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates”](#) section on page 11-2 for more information.

## Configuring EDCA Parameters Through a Controller Template (802.11a/n)

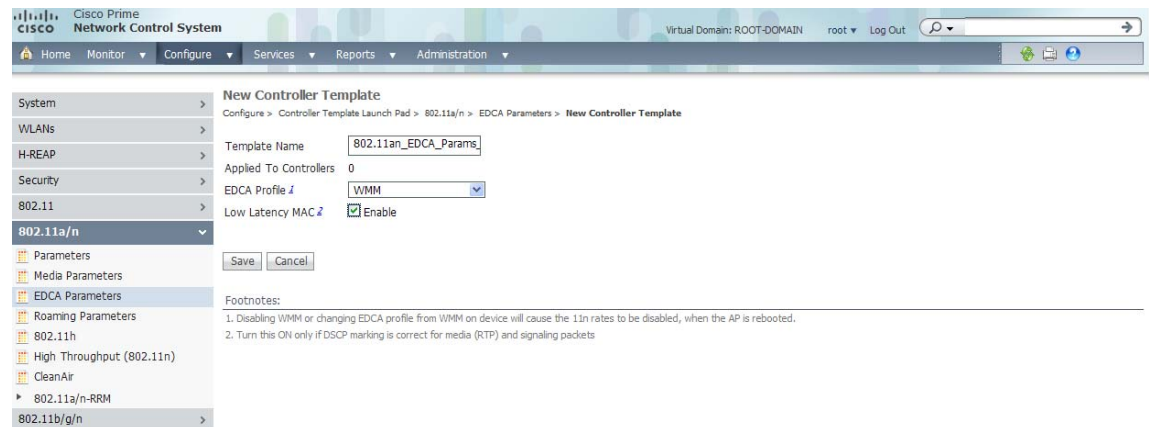

Enhanced distributed channel access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality of service (QoS) traffic.

To add or configure 802.11a/n EDCA parameters through a controller template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **EDCA Parameters** or choose **802.11a/n > EDCA Parameters** from the left sidebar menu. The EDCA Parameters Template page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the EDCP profile and the low latency MAC. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n EDCA Parameters template page appears (see [Figure 11-47](#)).

**Figure 11-47** 802.11a EDCA Parameters

- Step 4** Choose one of the following options from the **EDCA Profile** drop-down list:
- **WMM**—Enables the Wi-Fi Multimedia (WMM) default parameters. This is the default value. Choose this option when voice or video services are not deployed on your network.
  - **Spectralink Voice Priority**—Enables Spectralink voice priority parameters. Choose this option if Spectralink phones are deployed on your network to improve the quality of calls.
  - **Voice Optimized**—Enables EDCA voice-optimized profile parameters. Choose this option when voice services other than Spectralink are deployed on your network.
  - **Voice & Video Optimized**—Enables EDCA voice- and video-optimized profile parameters. Choose this option when both voice and video services are deployed on your network.

**Note** Video services must be deployed with admission control (ACM). Video services without ACM are not supported.

**Note** You must shut down radio interface before configuring EDCA Parameters.

- Step 5** Select the **Low Latency MAC** check box to enable this feature.

**Note** Enable low latency MAC only if all clients on the network are WMM compliant.

## Configuring a Roaming Parameters Template (802.11a/n)

To add or modify an existing roaming parameter template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Roaming Parameters** or choose **802.11a/n > Roaming Parameters** from the left sidebar menu. The Roaming Parameters Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the minimum RSSI, roaming hysteresis, adaptive scan threshold, and transition time. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n Roaming Parameters template page appears (see [Figure 11-48](#)).

**Figure 11-48** 802.11 Roaming Parameters Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb path is: Configure > Controller Template Launch Pad > 802.11a/n > Roaming Parameters > New Controller Template. The configuration fields are as follows:

| Field                   | Value               | Unit   |
|-------------------------|---------------------|--------|
| Template Name           | RoamingParams_Temp1 |        |
| Applied To Controllers  | 0                   |        |
| Mode                    | Custom values       |        |
| Minimum RSSI            | -85                 | (dBm)  |
| Roaming Hysteresis      | 3                   | (dB)   |
| Adaptive Scan Threshold | -72                 | (dBm)  |
| Transition Time         | 5                   | (secs) |

Buttons for 'Save' and 'Cancel' are visible at the bottom of the configuration area.

- Step 4** Use the Mode drop-down list to choose one of the configurable modes: default values and custom values. When the default values option is chosen, the roaming parameters are unavailable with the default values displayed in the text boxes. When the custom values option is selected, the roaming parameters can be edited in the text boxes. To edit the parameters, continue to Step 5.
- Step 5** In the Minimum RSSI field, enter a value for the minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point. If the client's average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

Range: -80 to -90 dBm

Default: -85 dBm

- Step 6** In the Roaming Hysteresis field, enter a value to indicate how strong the signal strength of a neighboring access point must be for the client to roam to it. This parameter is intended to reduce the amount of “ping ponging” between access points if the client is physically located on or near the border between two access points.

Range: 2 to 4 dB

Default: 2 dB

- Step 7** In the Adaptive Scan Threshold field, enter the RSSI value from a client’s associated access point, below which the client must be able to roam to a neighboring access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when below the threshold.

Range: -70 to -77 dB

Default: -72 dB

- Step 8** In the Transition Time field, enter the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold.

The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.

Range: 1 to 10 seconds

Default: 5 seconds

- Step 9** Click **Save**.
- 

## Configuring an 802.11h Template

802.11h informs client devices about channel changes and can limit the client device’s transmit power. Create or modify a template for configuration 802.11h parameters (such as power constraint and channel controller announcement) and applying these settings to multiple controllers.

To add or modify an 802.11h template, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.

- Step 2** Click **802.11h** or choose **802.11a/n > 802.11h** from the left sidebar menu. The 802.11h Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the local power constraint and channel announcement quiet mode. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11h template page appears (see [Figure 11-49](#)).

**Figure 11-49** 802.11h Template

- Step 4** Select the **Power Constraint** check box if you want the access point to stop transmission on the current channel.
- Step 5** Select the **Channel Announcement** check box to enable channel announcement. Channel announcement is a method in which the access point announces when it is switching to a new channel and the new channel number.
- Step 6** Click **Save**.

## Configuring a High Throughput Template (802.11a/n)

To add or modify to an 802.11a/n high throughput template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **High Throughput (802.11n)** or choose **802.11a/n > High Throughput** from the left sidebar menu. The 802.11n Parameters for 2.4 GHz or 802.11n Parameters for 5 GHz template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the 802.11n network status. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n High Throughput template page appears (see [Figure 11-50](#)).

Figure 11-50 802.11n Parameters for 2.4GHz Template

| MCS Index | Data Rate | Supported                           |
|-----------|-----------|-------------------------------------|
| 0         | 7 Mbps    | <input checked="" type="checkbox"/> |
| 1         | 14 Mbps   | <input checked="" type="checkbox"/> |
| 2         | 21 Mbps   | <input checked="" type="checkbox"/> |
| 3         | 29 Mbps   | <input checked="" type="checkbox"/> |
| 4         | 43 Mbps   | <input checked="" type="checkbox"/> |
| 5         | 58 Mbps   | <input checked="" type="checkbox"/> |
| 6         | 65 Mbps   | <input checked="" type="checkbox"/> |
| 7         | 72 Mbps   | <input checked="" type="checkbox"/> |
| 8         | 14 Mbps   | <input checked="" type="checkbox"/> |
| 9         | 29 Mbps   | <input checked="" type="checkbox"/> |
| 10        | 43 Mbps   | <input checked="" type="checkbox"/> |
| 11        | 58 Mbps   | <input checked="" type="checkbox"/> |
| 12        | 87 Mbps   | <input checked="" type="checkbox"/> |
| 13        | 116 Mbps  | <input checked="" type="checkbox"/> |
| 14        | 130 Mbps  | <input checked="" type="checkbox"/> |
| 15        | 144 Mbps  | <input checked="" type="checkbox"/> |

291215

- Step 4** Select the **802.11n Network Status Enabled** check box to enable high throughput.
- Step 5** In the MCS (Data Rate) Settings column, choose which level of data rate you want supported. Modulation coding schemes (MCS) are similar to 802.11a data rate. As a default, 20 MHz and short guarded interval is used.

**Note** When you select the **Supported** check box, the chosen numbers appear in the Selected MCS Indexes page.

- Step 6** Click **Save**.

## Configuring CleanAir Controller Templates (802.11a/n)

Create or modify a template for configuring CleanAir parameters for the 802.11a/n radio. You can configure the template to enable or disable CleanAir, reporting and alarms for the controllers. You can also configure the type of interfering devices to include for reporting and alarms.

To add a new template with 802.11a/n CleanAir information for a controller, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** From the left sidebar menu, choose **802.11a/n > CleanAir**. The 802.11a/n CleanAir Controller Templates page displays all currently saved 802.11a/n CleanAir templates. It also displays and the number of controllers and virtual domains to which each template is applied.
- Step 3** From the **Select a command** drop-down list, choose **Add a Template**, and click **Go**. The **New Controller Template** page appears.
- Step 4** Add or modify the following parameters:
- **Template Name**—Enter the template name.
  - **CleanAir**—Select the check box to enable CleanAir functionality on the 802.11 b/g/n network, or unselect to prevent the controller from detecting spectrum interference.

---

**Note** If CleanAir is enabled, the Reporting Configuration and Alarm Configuration sections appear.

---

- Reporting Configuration—Use the parameters in this section to configure the interferer devices you want to include for your reports.
  - Report Interferers—Select the **report interferers** check box to enable CleanAir system to report and detect sources of interference, or unselect it to prevent the controller from reporting interferers. The default value is selected.
  - Make sure that any sources of interference that need to be detected and reported by the CleanAir system appear in the Interferences to Detect box and any that do not need to be detected appear in the Interferers to Ignore box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources are ignored.
- Alarm Configuration—This section enables you to configure triggering of air quality alarms.
  - Air Quality Alarm—Select the **Air Quality Alarm** check box to enable the triggering of air quality alarms, or unselect the box to disable this feature.
  - Air Quality Alarm Threshold—If you selected the Air Quality Alarm check box, enter a value between 1 and 100 (inclusive) in the Air Quality Alarm Threshold field to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 1.
  - Interferers For Security Alarm—Select the **Interferers For Security Alarm** check box to trigger interferer alarms when the controller detects specified device types, or unselect it to disable this feature. The default value is unselected.
  - Make sure that any sources of interference that need to trigger interferer alarms appear in the Interferers Selected for Security Alarms box and any that do not need to trigger interferer alarms appear in the Interferers Ignored for Security Alarms box. Use the > and < buttons to move interference sources between these two boxes. By default, all interferer sources for security alarms are ignored.

**Step 5** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Configuring Controller Templates” section on page 11-4](#) for more information.

---

## Configuring 802.11a/n RRM Templates

This section contains the following topics:

- [Configuring an RRM Threshold Template \(802.11a/n\), page 11-96](#)
- [Configuring an RRM Interval Template \(802.11a/n\), page 11-98](#)
- [Configuring an RRM Dynamic Channel Allocation Template \(802.11a/n\), page 11-99](#)
- [Configuring an RRM Transmit Power Control Template \(802.11a/n\), page 11-100](#)

### Configuring an RRM Threshold Template (802.11a/n)

To add or make modifications to an 802.11a/n or 802.11b/g/n RRM threshold template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **RRM Thresholds** or choose **802.11a/n > RRM Thresholds**. The 802.11a/n RRM Thresholds Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the interference and noise threshold, maximum clients, and RF utilization. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n RRM Threshold template page appears (see [Figure 11-51](#)).

**Figure 11-51** 802.11a/n RRM Thresholds Template

| Section                 | Parameter                | Value                   | Unit             |
|-------------------------|--------------------------|-------------------------|------------------|
| Coverage Hole Algorithm | Template Name            | 802.11a_n_Thresholds_Te |                  |
|                         | Min Failed Clients       | 3                       |                  |
|                         | Coverage Level           | 6                       | (dB)             |
|                         | Signal Strength          | -84                     | (dBm)            |
|                         | Data RSSI                | -80                     | (-90 to -60 dBm) |
| Load Thresholds         | Max Clients              | 12                      |                  |
|                         | RF Utilization           | 80                      | (percent)        |
| Threshold For Traps     | Interference Threshold   | 10                      | (percent)        |
|                         | Noise Threshold          | -70                     | (dBm)            |
|                         | Coverage Exception Level | 25                      | (percent)        |

291216

- Step 4** Enter the minimum number of failed clients currently associated with the controller.
- Step 5** Enter the target range of coverage threshold.
- Step 6** Enter the Data RSSI (-60 to -90 dBm). This number indicates the value for the minimum Received Signal Strength Indicator (RSSI) for data required for the client to associate to an access point.

**Note** You must disable the 802.11a/n network before applying these RRM threshold parameters.

- Step 7** Enter the Voice RSSI (-60 to -90 dBm). This number indicates the value for the minimum received signal strength indicator (RSSI) required for voice for the client to associate to an access point.
- Step 8** Enter the maximum number of failed clients that are currently associated with the controller.
- Step 9** At the RF Utilization parameter, enter the percentage of threshold for either 802.11a/n.
- Step 10** Enter an interference threshold percentage.
- Step 11** Enter a noise threshold between -127 and 0 dBm. When the controller is outside of this threshold, it sends an alarm to NCS.

- Step 12** Enter the coverage exception level percentage. When the coverage drops by this percentage from the configured coverage for the minimum number of clients, a coverage hole is generated.
- Step 13** Click **Save**.

## Configuring an RRM Interval Template (802.11a/n)

To add or make modifications to an 802.11a/n RRM interval template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **RRM Intervals** or choose **802.11a/n > RRM Intervals** from the left sidebar menu. The 802.11a/n or 802.11b/g/n RRM Threshold Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the neighbor packet frequency, noise measurement interval, and load measurement interval. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n or 802.11b/g/n RRM Intervals template page appears (see [Figure 11-52](#)).

**Figure 11-52** 802.11a/n RRM Intervals Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is: Configure > Controller Template Launch Pad > 802.11a/n > Intervals > New Controller Template. The left sidebar shows the navigation menu with '802.11a/n' selected. The main content area is titled 'New Controller Template' and has a sub-header 'Monitor Intervals'. The 'Template Name' field contains '802.11an\_Intervals\_Tem'. Below this are four input fields with their respective values and units: Neighbor Packet Frequency (60 secs), Channel Scan Duration (180 secs), Load Measurement Interval (60 secs), and Coverage Measurement Interval (180 secs). There are 'Save' and 'Cancel' buttons. A footnote at the bottom reads: '1. Load and coverage measurement intervals are supported until 4.x controller version.'

- Step 4** At the Neighbor Packet Frequency parameter, enter the interval at which you want strength measurements taken for each access point. The default is 300 seconds.
- Step 5** Enter the interval at which you want noise and interference measurements taken for each access point. The default is 300 seconds.
- Step 6** Enter the interval at which you want load measurements taken for each access point. The default is 300 seconds.
- Step 7** At the Coverage Measurement Interval parameter, enter at which interval you want coverage measurements taken for each access point. The default is 300 seconds.

**Step 8** Click **Save**.

---

### Configuring an RRM Dynamic Channel Allocation Template (802.11a/n)

The Radio Resource Management (RRM) Dynamic Channel Assignment (DCA) page allows you to choose the DCA channels as well as the channel width for this controller.

RRM DCA supports 802.11n 40-MHz channel width in the 5-GHz band. The higher bandwidth allows radios to achieve higher instantaneous data rates.

**Note** Choosing a larger bandwidth reduces the non-overlapping channels which could potentially reduce the overall network throughput for certain deployments.

---

To configure 802.11 a/n RRM DCA template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **DCA** or choose **802.11a/n > DCA**. The 802.11a/n DCS Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n TPC template page appears.

**Step 4** Add or modify the following parameters:

- **Template Name**—Enter the template name.
- **Assignment Mode**—At the Dynamic Assignment drop-down list, choose one of three modes:
  - **Automatic** - The transmit power is periodically updated for all access points that permit this operation.
  - **On Demand** - Transmit power is updated when the Assign Now button is selected.
  - **Disabled** - No dynamic transmit power assignments occur, and values are set to their global default.
- At the Avoid Foreign AP Interference check box, select if you want to enable it. Enable this parameter to have RRM consider interference from foreign Cisco access points (those non-Cisco access points outside RF/mobility domain) when assigning channels. This foreign 802.11 interference. Disable this parameter to have RRM ignore this interference.

In certain circumstances with significant interference energy (dB) and load (utilization) from foreign access points, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the foreign access points. This increases capacity and reduces variability for the Cisco WLAN Solution.

- Select the Avoid Cisco AP Load check box if you want it enabled. Enable this bandwidth-sensing parameter to have controllers consider the traffic bandwidth used by each access point when assigning channels to access points. Disable this parameter to have RRM ignore this value.

In certain circumstances and with denser deployments, there may not be enough channels to properly create perfect channel re-use. In these circumstances, RRM can assign better re-use patterns to those access points that carry more traffic load.

- Select the Avoid non 802.11 Noise check box if you want to enable it. Enable this noise-monitoring parameter to have access points avoid channels that have interference from non-access point sources, such as microwave ovens or Bluetooth devices. Disable this parameter to have RRM ignore this interference.

In certain circumstances with significant interference energy (dB) from non-802.11 noise sources, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the noise sources. This increases capacity and reduces variability for the Cisco WLAN Solution.

- The Signal Strength Contribution check box is always enabled (not configurable). constantly monitors the relative location of all access points within the RF/mobility domain to ensure near-optimal channel re-use. The net effect is an increase in Cisco WLAN Solution capacity and a reduction in co-channel and adjacent channel interference.
- Enable or disable event-driven radio resource management (RRM) using the following parameters. Event Driven RRM is used when a CleanAir-enabled access point detects a significant level of interference.
  - Event Driven RRM—Enable or Disable spectrum event-driven RRM. By default, Event Driven RRM is enabled.
  - Sensitivity Threshold—If Event Driven RRM is enabled, this field displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

**Step 5** Click **Save**.

---

### Configuring an RRM Transmit Power Control Template (802.11a/n)

The controller dynamically controls access point transmit power based on real-time wireless LAN conditions. Normally, power can be kept low to gain extra capacity and reduce interference. The controller attempts to balance the access points' transmit power according to how the access points are seen by their third strongest neighbor.

The transmit power control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances TPC will seek to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from Coverage Hole Detection, explained below. Coverage hole detection is primarily concerned with clients, while TPC is tasked with providing enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

To configure 802.11a/n RRM TPC template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **TPC** or choose **802.11a/n > TPC**. The 802.11a/n TPC Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11a/n TPC template page appears.

**Step 4** Add or modify the following parameters:

- **Template Name**—Enter the template name.
- **Dynamic Assignment**—At the Dynamic Assignment drop-down list, choose one of three modes:
  - **Automatic** - The transmit power is periodically updated for all access points that permit this operation.
  - **On Demand** - Transmit power is updated when the Assign Now button is selected.
  - **Disabled** - No dynamic transmit power assignments occur, and values are set to their global default.
- **Maximum Power Assignment**—Indicates the maximum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- **Minimum Power Assignment**—Indicates the minimum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- **Dynamic Tx Power Control**—Determine if you want to enable Dynamic Tx Power Control.
- **Transmitted Power Threshold**—Enter a transmitted power threshold between -50 and -80.
- **Control Interval**—In seconds (read-only).

**Step 5** Click **Save**.

---

## Configuring Radio Templates (802.11b/g/n)

This section contains the following topics:

- [Configuring 802.11b/g/n Parameters Templates, page 11-102](#)
- [Configuring Media Parameters Controller Templates \(802.11b/g/n\), page 11-104](#)
- [Configuring EDCA Parameters Controller Templates \(802.11b/g/n\), page 11-106](#)
- [Configuring Roaming Parameters Controller Templates \(802.11b/g/n\), page 11-107](#)
- [Configuring High Throughput \(802.11n\) Controller Templates \(802.11b/g/n\), page 11-108](#)
- [Configuring CleanAir Controller Templates \(802.11 b/g/n\), page 11-108](#)
- [Configuring 802.11b/g/n RRM Templates, page 11-110](#)

## Configuring 802.11b/g/n Parameters Templates

Create or modify a template for configuring 802.11b/g/n parameters (such as power and channel status, data rates, channel list, and CCX location measurement) and/or applying these settings to controller(s).

To add a new template with 802.11b/g/n parameters information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **New** beside the template you want to add.
- Step 3** Add or modify the following General parameters:
- Policy Name—Security policy in force.
  - 802.11b/g Network Status
  - Beam Forming—Choose **Enable** or **Disable** from the drop-down list.

---

**Note** Beam forming refers to a general signal processing technique used to control the directionality of the reception or transmission of a signal.

---

- Transmitted Power Threshold—The valid range is from -50 to -80.
- Beacon Period—The rate at which the SSID is broadcast by the access point (the amount of time between beacons). The valid range is from 100 to 600 milliseconds.
- DTIM Period—The number of beacon intervals that may elapse between transmission of beacon frames containing a traffic indicator message (TIM) element whose delivery count field is 0. This value is transmitted in the DTIM period field of beacon frames.

When client devices receive a beacon that contains a DTIM, they normally “wake up” to check for pending packets. Longer intervals between DTIMs let clients sleep longer and preserve power. Conversely, shorter DTIM periods reduce the delay in receiving packets but use more battery power because clients wake up more often.

---

**Note** DTIM period is not applicable from 5.0.0.0 version of controller.

---

- Fragmentation Threshold—Determine the size at which packets are fragmented (sent as several pieces instead of as one block). Use a low setting in areas where communication is poor or where there is a great deal of radio interference. The default value is 2346.
- 802.11e Max Bandwidth—Percentage for 802.11e max bandwidth. The default value is 100.

- Step 4** Add or modify the following 802.11b/g Power Status parameters:
- Dynamic Assignment—Dynamic transmit power assignment has three modes:
    - Automatic—The transmit power will be periodically updated for all access points that permit this operation.
    - On Demand—Transmit power is updated when the Assign Now button is selected.
    - Disabled—No dynamic transmit power assignments occur and value are set to their global default. The default is Automatic.

---

**Note** The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

---

- Dynamic Tx Power Control—Select this check box to enable DTTPC support. If this option is enabled, the transmit power level of the radio is advertised in the beacons and the probe responses.

**Step 5** Add or modify the following 802.11b/g Channel Status parameters:

- Assignment Mode—Dynamic channel assignment has three modes:
  - Automatic—The channel assignment will be periodically updated for all access points that permit this operation.
  - On Demand—Channel assignments are updated when desired.
  - Disabled—No dynamic channel assignments occur and value are set to their global default.

---

**Note** The default is Automatic.

---

- Avoid Foreign AP Interference—Enable this foreign 802.11 interference-monitoring parameter to have Radio Resource Management consider interference from foreign (non-Cisco access points outside the RF/mobility domain) access points when assigning channels to Cisco access points.

Disable this parameter to have Radio Resource Management ignore this interference.

---

**Note** In certain circumstances with significant interference energy (dB) and load (utilization) from Foreign access points, Radio Resource Management may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in Cisco access points close to the Foreign access points to increase capacity and reduce variability for the Cisco WLAN Solution.

---

- Avoid Cisco AP Load—Enable this bandwidth-sensing parameter to have controllers consider the traffic bandwidth used by each access point when assigning channels to access points.

Disable this parameter to have Radio Resource Management ignore this value.

---

**Note** In certain circumstances and with denser deployments, there may not be enough channels to properly create perfect channel re-use. In these circumstances, Radio Resource Management can assign better re-use patterns to those APs that carry more traffic load.

---

- Avoid non 802.11 Noise—Enable this noise-monitoring parameter to have access points avoid channels that have interference from non-Access Point sources, such as microwave ovens or Bluetooth devices.

Disable this parameter to have Radio Resource Management ignore this interference.

---

**Note** In certain circumstances with significant interference energy (dB) from non-802.11 noise sources, Radio Resource Management may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the noise sources to increase capacity and reduce variability for the Cisco WLAN Solution.

---

- Signal Strength Contribution—Check box, always enabled (not configurable). constantly monitors the relative location of all access points within the RF/mobility domain to ensure near-optimal channel re-use. The net effect is an increase in Cisco WLAN Solution capacity and a reduction in co-channel and adjacent channel interference.

**Step 6** Add or modify the Data Rate parameters.

The data rates set are negotiated between the client and the controller. If the data rate is set to Mandatory, the client must support it in order to use the network. If a data rate is set as Supported by the controller, any associated client that also supports that same rate may communicate with the access point using that rate. But it is not required that a client be able to use all the rates marked Supported in order to associate. 6, 9, 12, 18, 24, 36, 48, 54 Mbps For each rate, a drop-down list selection of Mandatory or Supported is available. Each data rate can also be set to Disabled to match Client settings.

**Step 7** Add or modify the Noise/Interference/Rogue Monitoring Channels parameters.

Choose between all channels, country channels, or DCA channels based on the level of monitoring you want. Dynamic Channel Allocation (DCA) automatically selects a reasonably good channel allocation among a set of managed devices connected to the controller.

**Step 8** Add or modify the CCX Location Measurement parameters:

- Mode—Enable or disable the broadcast radio measurement request. When enabled, this enhances the location accuracy of clients.
- Interval—Interval in seconds between requests.

**Note** Cisco Compatible Extension location measurement interval can be changed only when measurement mode is enabled.

**Step 9** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the “[Applying Controller Templates](#)” section on page 11-2 for more information.

## Configuring Media Parameters Controller Templates (802.11b/g/n)

Create or modify a template for configuring 802.11b/g/n voice parameters such as call admission control and traffic stream metrics.

To add a new template with 802.11b/g/n voice parameters information (such as call admission control and traffic stream metrics) for a controller, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Specify an appropriate name for the template.

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

**Step 4** In the **Voice** tab, add or modify the following parameters:

- Admission Control (ACM)—Select the check box to enable admission control.

For end users to experience acceptable audio quality during a VoIP phone call, packets must be delivered from one endpoint to another with low latency and low packet loss. To maintain QoS under differing network loads, call admission control (CAC) is required. CAC on an access point allows it to maintain controlled QoS when the network is experiencing congestion and keep the maximum allowed number of calls to an acceptable quantity.

- **CAC Method**—If Admission Control (ACM) is enabled, specify the CAC method as either load-based or static.

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types from itself, from co-channel access points, and by co-located channel interference. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

- **Maximum Bandwidth Allowed**—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- **Reserved Roaming Bandwidth**—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- **Expedited Bandwidth**—Select the check box to enable expedited bandwidth as an extension of CAC for emergency calls.

You must have an expedited bandwidth IE that is CCXv5 compliant so that a TSPEC request is given higher priority.

- **SIP CAC**—Select the check box to enable SIP CAC.  
SIP CAC should be used only for phones that support status code 17 and do not support TSPEC-based admission control.
- **SIP Codec**—Specify the codec name you want to use on this radio. The available options are G.711, G.729, and User Defined.
- **SIP Call Bandwidth**—Specify the bandwidth in kilobits per second that you want to assign per SIP call on the network. This parameter can be configured only when the SIP Codec selected is User Defined.
- **SIP Sample Interval**—Specify the sample interval in milliseconds that the codec must operate in.
- **Max Number of Calls per Radio**—Specify the maximum number of calls per Radio.
- **Metric Collection**—Select the check box to enable metric collection.

Traffic stream metrics are a series of statistics about VoIP over your wireless LAN which inform you of the QoS of the wireless LAN. For the access point to collect measurement values, traffic stream metrics must be enabled. When this is enabled, the controller begins collecting statistical data every 90 seconds for the 802.11b/g interfaces from all associated access points. If you are using VoIP or video, this feature should be enabled.

**Step 5** In the **Video** tab, add or modify the following parameters:

- **Admission Control (ACM)**—Select the check box to enable admission control.
- **Maximum Bandwidth**—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- **Reserved Roaming Bandwidth**—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- **Unicast Video Redirect**—Select the **Unicast Video Redirect** check box to enable all non-media stream packets in video queue are redirected to the best effort queue. If disabled, all packets with video marking are kept in video queue.
- **Client Minimum Phy Rate**—Specify the physical data rate required for the client to join a media stream from the Client Minimum Phy Rate drop-down list.
- **Multicast Direct Enable**—Select the **Multicast Direct Enable** check box to set the Media Direct for any WLAN with Media Direct enabled on a WLAN on this radio.

- Maximum Number of Streams per Radio—Specify the maximum number of streams per Radio to be allowed.
- Maximum Number of Streams per Client—Specify the maximum number of streams per Client to be allowed.
- Best Effort QOS Admission—Select the **Best Effort QOS Admission** check box to redirect new client requests to the best effort queue. This happens only if all the video bandwidth has been used.

**Note** If disabled and maximum video bandwidth has been used, then any new client request is rejected.

**Step 6** In the **General** tab, specify the following parameter:

- Maximum Media Bandwidth (0 to 85%)—Specify the percentage of maximum of bandwidth allowed. This option is only available when CAC is enabled.

**Step 7** Click **Save**.

Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.

## Configuring EDCA Parameters Controller Templates (802.11b/g/n)

Create or modify a template for configuring 802.11b/g/n EDCA parameters. EDCA parameters designate pre-configured profiles at the MAC layer for voice and video.

To add a new template with 802.11b/g/n EDCA parameters information for a controller, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Add or modify the following parameters:

- Template Name

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

- EDCA Profile—Profiles include Wi-Fi Multimedia (WMM), Spectralink Voice Priority (SVP), Voice Optimized, and Voice & Video Optimized. WMM is the default EDCA profile.

**Note** You must shut down radio interface before configuring EDCA Parameters.

- Streaming MAC—Only enable streaming MAC if all clients on the network are WMM compliant.

**Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.

## Configuring Roaming Parameters Controller Templates (802.11b/g/n)

Create or modify a template for configuring roaming parameters for 802.11b/g/n radios.

To add a new template with 802.11b/g/n Roaming parameters information for a controller, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Add or modify the following parameters:

- Template Name

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

- Mode—Select **Default Values** or **Custom Values** from the drop-down list.
  - Default Values—The roaming parameters are unavailable and the default values are displayed.
  - Custom Values—The following roaming parameters can be edited.
- Minimum RSSI—Enter a value for the minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.
 

If the client average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

  - Range: -80 to -90 dBm
  - Default: -85 dBm
- Roaming Hysteresis—Enter a value to indicate how strong the signal strength of a neighboring access point must be in order for the client to roam to it. This parameter is intended to reduce the amount of “ping ponging” between access points if the client is physically located on or near the border between two access points.
  - Range: 2 to 4 dB
  - Default: 2 dB
- Adaptive Scan Threshold—Enter the RSSI value, from a client associated access point, below which the client must be able to roam to a neighboring access point within the specified transition time.
 

This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when below the threshold.

  - Range: -70 to -77 dB
  - Default: -72 dB
- Transition Time—Enter the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client associated access point is below the scan threshold.
  - Range: 1 to 10 seconds
  - Default: 5 seconds

**Note** The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.

- Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates”](#) section on page 11-2 for more information.

## Configuring High Throughput (802.11n) Controller Templates (802.11b/g/n)

Create or modify a template for configuring high-throughput parameters such as MCS (data rate) settings and indexes and for applying these 802.11n settings to multiple controllers.

To add a new template with High Throughput (802.11n) information for a controller, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.

- Step 2** Click **New** beside the template you want to add.

- Step 3** Add or modify the following parameters:

- Template Name

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

- 802.11n Network Status—Select the check box to enable high throughput.
- MCS (Data Rate) Settings—Choose which level of data rate you want supported. MCS is modulation coding schemes which are similar to 802.11a data rate.

**Note** As a default, 20 MHz and short guarded interval are used.

**Note** When you select the Supported check box, the chosen numbers appear in the Selected MCS Indexes page.

- Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates”](#) section on page 11-2 for more information.

## Configuring CleanAir Controller Templates (802.11 b/g/n)

Create or modify a template for configuring CleanAir parameters for the 802.11 b/g/n radio. You can configure the template to enable or disable CleanAir, reporting and alarms for the controllers. You can also configure the type of interfering devices to include for reporting and alarms.

To add a new template with 802.11b/g/n CleanAir information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** From the left sidebar menu, choose **802.11b/g/n > CleanAir**. The 802.11b/g/n CleanAir Controller Templates page displays all currently saved 802.11b/g/n CleanAir templates. It also displays the number of controllers and virtual domains to which each template is applied.
- Step 3** From the Select a command drop-down list, select **Add a Template** and click **Go**.  
The **New Controller Template** page appears.
- Step 4** Add or modify the following parameters:
- **Template Name**—Enter the template name.
  - **CleanAir**—Select the check box to enable CleanAir functionality on the 802.11 b/g/n network, or unselect to prevent the controller from detecting spectrum interference. The default value is selected.
- 
-  **Note** If CleanAir is enabled, the Reporting Configuration and Alarm Configuration sections appear.
- 
- **Reporting Configuration**—Use the parameters in this section to configure the interferer devices you want to include for your reports.
    - **Report Interferers**—Select the report interferers check box to enable CleanAir system to report and detect sources of interference, or unselect it to prevent the controller from reporting interferers. The default value is selected.
    - Make sure that any sources of interference that need to be detected and reported by the CleanAir system appear in the Interferences to Detect box and any that do not need to be detected appear in the Interferers to Ignore box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources are ignored.
  - **Alarm Configuration**—This section enables you to configure triggering of air quality alarms.
    - **Air Quality Alarm**—Select the **Air Quality Alarm** check box to enable the triggering of air quality alarms, or unselect the box to disable this feature.
    - **Air Quality Alarm Threshold**—If you selected the Air Quality Alarm check box, enter a value between 1 and 100 (inclusive) in the Air Quality Alarm Threshold text box to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 1.
    - **Interferers For Security Alarm**—Select the **Interferers For Security** Alarm check box to trigger interferer alarms when the controller detects specified device types, or unselected it to disable this feature. The default value is unselected.
    - Make sure that any sources of interference that need to trigger interferer alarms appear in the Interferers Selected for Security Alarms box and any that do not need to trigger interferer alarms appear in the Interferers Ignored for Security Alarms box. Use the > and < buttons to move interference sources between these two boxes. By default, all interferer sources for security alarms are ignored.
- Step 5** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Adding Controller Templates”](#) section on page 11-2 for more information.

## Configuring 802.11b/g/n RRM Templates

This section contains the following topics:

- [Configuring RRM Thresholds Controller Templates \(802.11b/g/n\)](#), page 11-110
- [Configuring RRM Intervals Controller Templates \(802.11b/g/n\)](#), page 11-111
- [Configuring an RRM Dynamic Channel Allocation Template \(802.11b/g/n\)](#), page 11-111
- [Configuring an RRM Transmit Power Control Template \(802.11b/g/n\)](#), page 11-113

### Configuring RRM Thresholds Controller Templates (802.11b/g/n)

Create or modify a template for setting various RRM thresholds such as load, interference, noise, and coverage.

To add a new template with 802.11b/g/n RRM thresholds information for a controller, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Add or modify the following General parameter:

- Template Name

---

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

**Step 4** Add or modify the following Coverage Hole Algorithm parameters:

- **Min. Failed Clients (#)**—Enter the minimum number of failed clients currently associated with the controller.
- **Coverage Level**—Enter the target range of coverage threshold (dB).
- **Signal Strength**—When the Coverage Level parameter is adjusted, the value of the Signal Strength (dBm) automatically reflects this change. The Signal Strength parameter provides information regarding what the signal strength will be when adjusting the coverage level.
- **Data RSSI**—Enter the Data RSSI (-60 to -90 dBm). This number indicates the value for the minimum received signal strength indicator (RSSI) for data required for the client to associate to an access point.
- **Voice RSSI**—Enter the Voice RSSI (-60 to -90 dBm). This number indicates the value for the minimum received signal strength indicator (RSSI) required for voice for the client to associate to an access point.

**Step 5** Add or modify the following Load Thresholds parameters:

- **Max. Clients**—Enter the maximum number of clients able to be associated with the controller.
- **RF Utilization**—Enter the percentage of threshold for this radio type.

**Step 6** Add or modify the following Threshold for Traps parameters:

- **Interference Threshold**—Enter an interference threshold between 0 and 100 percent.
- **Noise Threshold**—Enter a noise threshold between -127 and 0 dBm. When outside of this threshold, the controller sends an alarm to NCS.

- Coverage Exception Level—Enter the coverage exception level percentage. When the coverage drops by this percentage from the configured coverage for the minimum number of clients, a coverage hole is generated.
- Step 7** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.

### Configuring RRM Intervals Controller Templates (802.11b/g/n)

Create or modify a template for configuring RRM intervals for 802.11b/g/n radios.

To add a new template with 802.11b/g/n RRM intervals information for a controller, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Add or modify the following parameters:

- Template Name

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

- Neighbor Packet Frequency—Enter at which interval you want strength measurements taken for each access point. The default is 300 seconds.
- Noise Measurement Interval—Enter at which interval you want noise and interference measurements taken for each access point. The default is 180 seconds.
- Load Measurement Interval—Enter at which interval you want load measurements taken for each access point. The default is 300 seconds.
- Channel Scan Duration—Enter at which interval you want coverage measurements taken for each access point. The default is 300 seconds.

**Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.

### Configuring an RRM Dynamic Channel Allocation Template (802.11b/g/n)

The Radio Resource Management (RRM) Dynamic Channel Assignment (DCA) page allows you to choose the DCA channels as well as the channel width for this controller.

RRM DCA supports 802.11n 40-MHz channel width in the 5-GHz band. The higher bandwidth allows radios to achieve higher instantaneous data rates.

**Note** Choosing a larger bandwidth reduces the non-overlapping channels which could potentially reduce the overall network throughput for certain deployments.

To configure 802.11b/g/n RRM DCA template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **DCA** or choose **802.11b/g/n > DCA**. The 802.11b/g/n DCS Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11b/g/n TPC template page appears.

- Step 4** Add or modify the following parameters:

- **Template Name**—Enter the template name.
- **Assignment Mode**—At the Dynamic Assignment drop-down list, choose one of three modes:
  - **Automatic** - The transmit power is periodically updated for all access points that permit this operation.
  - **On Demand** - Transmit power is updated when the Assign Now button is selected.
  - **Disabled** - No dynamic transmit power assignments occur, and values are set to their global default.
- At the **Avoid Foreign AP Interference** check box, click if you want to enable it. Enable this parameter to have RRM consider interference from foreign Cisco access points (those non-Cisco access points outside RF/mobility domain) when assigning channels. This foreign 802.11 interference. Disable this parameter to have RRM ignore this interference.

In certain circumstances with significant interference energy (dB) and load (utilization) from foreign access points, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the foreign access points. This increases capacity and reduces variability for the Cisco WLAN Solution.

- Select the **Avoid Cisco AP Load** check box if you want it enabled. Enable this bandwidth-sensing parameter to have controllers consider the traffic bandwidth used by each access point when assigning channels to access points. Disable this parameter to have RRM ignore this value.

In certain circumstances and with denser deployments, there may not be enough channels to properly create perfect channel re-use. In these circumstances, RRM can assign better re-use patterns to those access points that carry more traffic load.

- Select the **Avoid non 802.11 Noise** check box if you want to enable it. Enable this noise-monitoring parameter to have access points avoid channels that have interference from non-access point sources, such as microwave ovens or Bluetooth devices. Disable this parameter to have RRM ignore this interference.

In certain circumstances with significant interference energy (dB) from non-802.11 noise sources, RRM may adjust the channel assignment to avoid these channels (and sometimes adjacent channels) in access points close to the noise sources. This increases capacity and reduces variability for the Cisco WLAN Solution.

- The **Signal Strength Contribution** check box is always enabled (not configurable). constantly monitors the relative location of all access points within the RF/mobility domain to ensure near-optimal channel re-use. The net effect is an increase in Cisco WLAN Solution capacity and a reduction in co-channel and adjacent channel interference.

- Enable or disable event-driven radio resource management (RRM) using the following parameters. Event Driven RRM is used when a CleanAir-enabled access point detects a significant level of interference.
  - Event Driven RRM—Enable or Disable spectrum event-driven RRM. By default, Event Driven RRM is enabled.
  - Sensitivity Threshold—If Event Driven RRM is enabled, this field displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

**Step 5** Click **Save**.

---

### Configuring an RRM Transmit Power Control Template (802.11b/g/n)

The controller dynamically controls access point transmit power based on real-time wireless LAN conditions. Normally, power can be kept low to gain extra capacity and reduce interference. The controller attempts to balance the access points' transmit power according to how the access points are seen by their third strongest neighbor.

The transmit power control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances TPC will seek to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from Coverage Hole Detection, explained below. Coverage hole detection is primarily concerned with clients, while TPC is tasked with providing enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

To configure 802.11b/g/n RRM TPC template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **TPC** or choose **802.11b/g/n > TPC**. The 802.11b/g/n TPC Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The 802.11b/g/n TPC template page appears.

**Step 4** Add or modify the following parameters:

- Template Name—Enter the template name.
- Dynamic Assignment—At the Dynamic Assignment drop-down list, choose one of three modes:
  - Automatic - The transmit power is periodically updated for all access points that permit this operation.
  - On Demand - Transmit power is updated when the Assign Now button is selected.

- Disabled - No dynamic transmit power assignments occur, and values are set to their global default.
- Maximum Power Assignment—Indicates the maximum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- Minimum Power Assignment—Indicates the minimum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- Dynamic Tx Power Control—Determine if you want to enable Dynamic Tx Power Control.
- Transmitted Power Threshold—Enter a transmitted power threshold between -50 and -80.
- Control Interval—In seconds (read-only).

**Step 5** Click **Save**.

---

## Configuring Mesh Templates

This section contains the following topics:

- [Configuring Mesh Setting Templates, page 11-114](#)

## Configuring Mesh Setting Templates

You can configure an access point to establish a connection with the controller.

To add or modify a mesh template, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Mesh Configuration** or choose **Mesh > Mesh Configuration** from the left sidebar menu. The Mesh Configuration Template page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the rootAP to MeshAP range, the client access on backhaul link, and security mode. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Mesh Configuration template page appears (see [Figure 11-53](#)).

Figure 11-53 Mesh Configuration Template

The screenshot shows the Cisco Prime Network Control System interface. The main content area is titled "New Controller Template" and is under the "Mesh" configuration section. The configuration fields are as follows:

| Field                          | Value                                      |
|--------------------------------|--------------------------------------------|
| Template Name                  | Mess_Settings_Temp1                        |
| RootAP to MeshAP Range         | 12000 (feet)                               |
| Client Access on Backhaul Link | <input type="checkbox"/> Enable            |
| Background Scanning            | <input checked="" type="checkbox"/> Enable |
| Mesh DCA Channels              | <input type="checkbox"/> Enable            |
| Security Mode                  | EAP                                        |

Buttons for "Save" and "Cancel" are located at the bottom of the configuration area.

- Step 4** The Root AP to Mesh AP Range is 12,000 feet by default. Enter the optimum distance (in feet) that should exist between the root access point and the mesh access point. This global parameter applies to all access points when they join the controller and all existing access points in the network.
- Step 5** The **Client Access on Backhaul Link** check box is not selected by default. When this option is enabled, mesh access points can associate with 802.11a/n wireless clients over the 802.11a/n backhaul. This client association is in addition to the existing communication on the 802.11a/n backhaul between the root and mesh access points.

**Note** This feature applies only to access points with two radios.

- Step 6** The **Mesh DCA Channels** check box is not selected by default. Select this option to enable backhaul channel deselection on the Controller using the DCA channel list configured in the Controller. Any change to the channels in the Controller DCA list is pushed to the associated access points. This feature applies only to the 1524SB mesh access points. For more information on this feature, see the *Controller Configuration Guide*.
- Step 7** Select the **Background Scanning** check box to enable background scanning or unselect it to disable the feature. The default value is disabled. Background scanning allows Cisco Aironet 1510 Access Points to actively and continuously monitor neighboring channels for more optimal paths and parents. See the [“Background Scanning on 1510s in Mesh Networks” section on page 9-53](#) for further information.
- Step 8** From the Security Mode drop-down list, choose **EAP** (Extensible Authentication Protocol) or **PSK** (Pre-Shared Key).
- Step 9** Click **Save**.

## Configuring Management Templates

This section contains the following topics:

- [Configuring Trap Receiver Templates, page 11-116](#)
- [Configuring Trap Control Templates, page 11-116](#)
- [Configuring Telnet SSH Templates, page 11-119](#)
- [Configuring Legacy Syslog Templates, page 11-120](#)

- [Configuring Multiple Syslog Templates, page 11-120](#)
- [Configuring Local Management User Templates, page 11-121](#)
- [Configuring User Authentication Priority Templates, page 11-122](#)

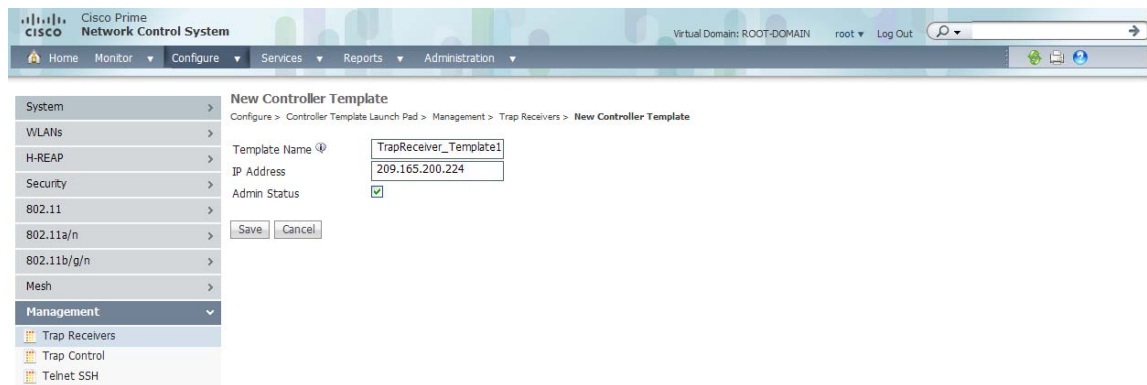

## Configuring Trap Receiver Templates

If you have monitoring devices on your network that receive SNMP traps, you may want to add a trap receiver template.

To add or modify a trap receiver template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Trap Receivers** or choose **Management > Trap Receivers** from the left sidebar menu.
- Step 3** The **Management > Trap Receiver** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the IP address and admin status. The last column indicates when the template was last saved.
- The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.
- Step 4** If you want to add a new template, click **Add Template** from the **Select a command** drop-down list, and click **Go**. To modify an existing template, click the template name. The **Trap Receivers** template page appears (see [Figure 11-54](#)).

**Figure 11-54** Trap Receiver Template

- Step 5** Enter the IP address of the server.
- Step 6** Click to enable the admin status if you want SNMP traps to be sent to the receiver.
- Step 7** Click **Save**.
- 

## Configuring Trap Control Templates

To add or modify a trap control template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Trap Control** or choose **Management > Trap Control** from the left sidebar menu. The Management > Trap Control page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the link port up or down and rogue AP. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Trap Control template page appears (see Figure 11-55).

**Figure 11-55** Trap Controls Template

The screenshot shows the 'New Controller Template' configuration page. The breadcrumb trail is 'Configure > Controller Template Launch Pad > Management > Trap Control > New Controller Template'. The 'Template Name' is 'TrapControl\_Template1'. The 'Select All Traps' checkbox is checked. The traps are organized into several categories:

- Miscellaneous Traps:**
  - SNMP Authentication Link (Port) Up/Down
  - Multiple Users
  - Spanning Tree
  - Rogue AP
  - Controller Config Save
- Auto RF Profile Traps:**
  - Load Profile
  - Noise Profile
  - Interference Profile
  - Coverage Profile
- IP Security Traps:**
  - ESP Authentication Failure
  - ESP Replay Failure
  - Invalid SPI
  - IKE Negotiation Failure
  - IKE Suite Failure
  - Invalid Cookie
- Auto RF Update Traps:**
  - Channel Update
  - Tx Power Update
- Client Related Traps:**
  - 802.11 Association
  - 802.11 Disassociation
  - 802.11 Deauthentication
  - 802.11 Failed Authentication
  - 802.11 Failed Association
  - Excluded
  - 802.11 Authenticated
- AAA Traps:**
  - User Auth Failure
  - RADIUS Server No Response
- 802.11 Security Traps:**
  - WEP Decrypt Error
  - Signature Attack
- Cisco AP Traps:**
  - AP Register
  - AP Interface Up/Down

At the bottom, there are 'Save' and 'Cancel' buttons.

291220

- Step 4** Select the appropriate check box to enable any of the following miscellaneous traps:
- **SNMP Authentication** - The SNMPv2 entity has received a protocol message that is not properly authenticated. When a user who is configured in SNMP V3 mode tries to access the controller with an incorrect password, the authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.
  - **Link (Port) Up/Down**—Link changes states from up or down.
  - **Multiple Users**—Two users log in with the same login ID.
  - **Spanning Tree**—Spanning Tree traps. See the STP specification for descriptions of individual parameters.
  - **Rogue AP**—Whenever a rogue access point is detected or when a rogue access point was detected earlier and no longer exists, this trap is sent with its MAC address.
  - **Controller Config Save**—Notification sent when the configuration is modified.
- Step 5** Select the appropriate check box to enable any of the following client-related traps:

- 802.11 Association—A trap is sent when a client is associated to a WLAN. This trap does not guarantee that the client is authenticated.
- 802.11 Disassociation—The disassociate notification is sent when the client sends a disassociation frame.
- 802.11 Deauthentication—The deauthenticate notification is sent when the client sends a deauthentication frame.
- 802.11 Failed Authentication—The authenticate failure notification is sent when the client sends an authentication frame with a status code other than successful.
- 802.11 Failed Association—The associate failure notification is sent when the client sends an association frame with a status code other than successful.
- Excluded—The associate failure notification is sent when a client is excluded.

**Step 6** Select the appropriate check box to enable any of the following access point traps:

- AP Register—Notification sent when an access point associates or disassociates with the controller.
- AP Interface Up/Down—Notification sent when access point interface (802.11a/n or 802.11b/g/n) status goes up or down.

**Step 7** Select the appropriate check box to enable any of the following auto RF profile traps:

- Load Profile—Notification sent when Load Profile state changes between PASS and FAIL.
- Noise Profile—Notification sent when Noise Profile state changes between PASS and FAIL.
- Interference Profile—Notification sent when Interference Profile state changes between PASS and FAIL.
- Coverage Profile—Notification sent when Coverage Profile state changes between PASS and FAIL.

**Step 8** Select the appropriate check box to enable any of the following auto RF update traps:

- Channel Update—Notification sent when access point's dynamic channel algorithm is updated.
- Tx Power Update—Notification sent when access point's dynamic transmit power algorithm is updated.

**Step 9** Select the appropriate check box to enable any of the following AAA traps:

- User Auth Failure—This trap is to inform you that a client RADIUS authentication failure has occurred.
- RADIUS Server No Response—This trap is to indicate that no RADIUS server(s) are responding to authentication requests sent by the RADIUS client.

**Step 10** Select the appropriate check box to enable the following IP security traps:

- ESP Authentication Failure
- ESP Replay Failure
- Invalid SPI
- IKE Negotiation Failure
- IKE Suite Failure
- Invalid Cookie

**Step 11** Select the appropriate check box to enable the following 802.11 security trap:

- WEP Decrypt Error—Notification sent when the controller detects a WEP decrypting error.
- Signature Attack

**Step 12** Click **Save**.

## Configuring Telnet SSH Templates

To add or modify a Telnet SSH configuration template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Telnet SSH** or choose **Management > Telnet SSH** from the left sidebar menu. The Management > Telnet SSH Configuration page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the session timeout, maximum sessions, and whether Telnet or SSH sessions are allowed. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Telnet SSH template page appears (see [Figure 11-56](#)).

**Figure 11-56** Telnet SSH Configuration Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controller Template Launch Pad > Management > Telnet SSH > New Controller Template. The page title is "New Controller Template". The configuration fields are as follows:

|                          |                      |
|--------------------------|----------------------|
| Template Name            | Telnet_SSH_Template1 |
| Session Timeout          | 5 (mins)             |
| Maximum Sessions         | 3                    |
| Allow New Telnet Session | Yes                  |
| Allow New SSH Session    | Yes                  |

Buttons for "Save" and "Cancel" are visible at the bottom of the form. The left sidebar menu is expanded to "Management", with "Telnet SSH" selected.

- Step 4** Enter the number of minutes a Telnet session is allowed to remain inactive before being logged off. A zero means there is no timeout. The valid range is 0 to 160, and the default is 5.
- Step 5** At the Maximum Sessions parameter, enter the number of simultaneous Telnet sessions allowed. The valid range is 0 to 5, and the default is 5. New Telnet sessions can be allowed or disallowed on the DS (network) port. New Telnet sessions are always allowed on the service port.
- Step 6** Use the Allow New Telnet Session drop-down list to determine if you want new Telnet sessions allowed on the DS port. New Telnet sessions can be allowed or disallowed on the DS (network) port. New Telnet sessions are always allowed on the service port. The default is no.
- Step 7** Use the Allow New SSH Session drop-down list to determine if you want Secure Shell Telnet sessions allowed. The default is yes.

**Step 8** Click **Save**.

## Configuring Legacy Syslog Templates

To add or modify a legacy syslog configuration template, follow these steps:

**Note** Legacy Syslog applies to controllers earlier than version 5.0.6.0

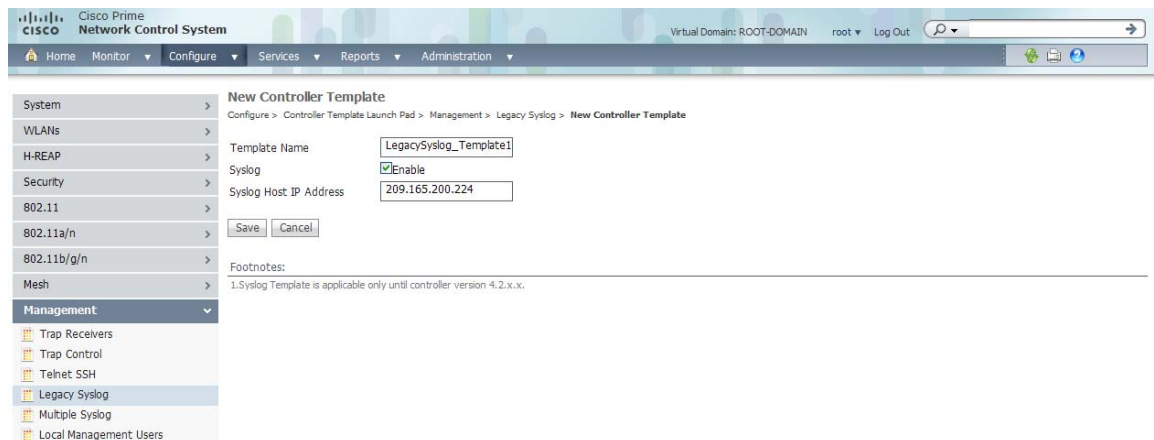

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click Legacy Syslog or choose **Management > Legacy Syslog** from the left sidebar menu. The Management > Legacy Syslog page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Legacy Syslog template page appears (see Figure 11-57).

**Figure 11-57 Syslog Configuration Template**

**Step 4** Enter a template name. The number of controllers to which this template is applied is displayed.

**Step 5** Click to enable syslog. When you do, a Syslog Host IP Address parameter appears.

**Step 6** Click **Save**.

## Configuring Multiple Syslog Templates

To add or modify a multiple syslog configuration template, follow these steps:

**Note** You can enter up to three syslog server templates.

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Multiple Syslog** or choose **Management > Multiple Syslog** from the left sidebar menu. The **Management > Multiple Syslog** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the syslog server address. The last column indicates when the template was last saved.

The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the **Select a command** drop-down list, and click **Go**. To modify an existing template, click the template name. The **Multiple Syslog** template page appears (see [Figure 11-58](#)).

**Figure 11-58 Syslog Server Template Page**

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is: **Configure > Controller Template Launch Pad > Management > Multiple Syslog > New Controller Template**. The left sidebar menu is expanded to **Management**, showing options like **Trap Receivers**, **Trap Control**, **Telnet SSH**, **Legacy Syslog**, **Multiple Syslog** (selected), **Local Management Users**, and **Authentication Priority**. The main content area is titled **New Controller Template** and has a **General** tab selected. It contains two input fields: **Template Name** with the value **MultipleSyslog\_Template1** and **Syslog Server Address** with the value **209.165.200.224**. Below these fields are **Save** and **Cancel** buttons. A **Footnotes** section at the bottom states: **1. Multiple Syslog Template is applicable only for Controller version 5.0.148.0 and later releases.**

**Step 4** Enter a template name and a syslog server IP address.

**Step 5** Click **Save**.

## Configuring Local Management User Templates

To add or modify a local management user template, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Local Management Users** or choose **Management > Local Management Users** from the left sidebar menu. The **Management > Local Management Users** Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the username and access level. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Local Management Users template page appears (see [Figure 11-59](#)).

**Figure 11-59 Local Management Users Template**

The screenshot shows the Cisco Prime Network Control System web interface. The breadcrumb trail is: Configure > Controller Template Launch Pad > Management > Local Management Users > New Controller Template. The page title is 'New Controller Template'. The left sidebar shows a navigation menu with categories: System, WLANs, H-REAP, Security, 802.11, 802.11a/n, 802.11b/g/n, Mesh, Management (expanded), and Location. Under Management, options include Trap Receivers, Trap Control, Telnet SSH, Legacy Syslog, Multiple Syslog, Local Management Users (selected), and Authentication Priority. The main content area is titled 'General' and contains the following fields:

- Template Name: LocalMgmtUser\_Template
- User Name: user1
- Password: [masked]
- Confirm Password: [masked]
- Access Level: Read Write (dropdown menu)
- Update Telnet Credentials:  Enable

At the bottom of the form are 'Save' and 'Cancel' buttons.

- Step 4** Enter a template name
- Step 5** Enter a template username.
- Step 6** Enter a password for this local management user template.
- Step 7** Re-enter the password.
- Step 8** Use the Access Level drop-down list to choose either Read Only or Read Write.
- Step 9** Select the Update Telnet Credentials check box to update the user credentials in NCS for Telnet/SSH access.

**Note** If the template is applied successfully and the Update Telnet Credentials option is enabled, the applied management user credentials will be used in NCS for Telnet/SSH credentials to that applied controller.

- Step 10** Click **Save**.

## Configuring User Authentication Priority Templates

Management user authentication priority templates control the order in which authentication servers are used to authenticate a controller's management users.

To add a user authentication priority template or make modifications to an existing template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Authentication Priority** or choose **Management > Authentication Priority** from the left sidebar menu. The Management > Local Management Users Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also displays the authentication priority list. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Local Management Users template page appears (see [Figure 11-60](#)).

**Figure 11-60** User Authentication Priority Template

- Step 4** Enter a template name.
- Step 5** The local server is tried first. Choose either **RADIUS** or **TACACS+** to try if local authentication fails.
- Step 6** Click **Save**.

## Configuring CLI Templates

This section contains the following topics:

- [Applying a Set of CLI Commands, page 11-124](#)

## Applying a Set of CLI Commands

You can create templates containing a set of CLI commands and apply them to one or more controllers from NCS. These templates are meant for provisioning features in multiple controllers for which there is no SNMP support or custom NCS user interface. The template contents are simply a command array of strings. No support for substitution variables, conditionals, and the like exist.

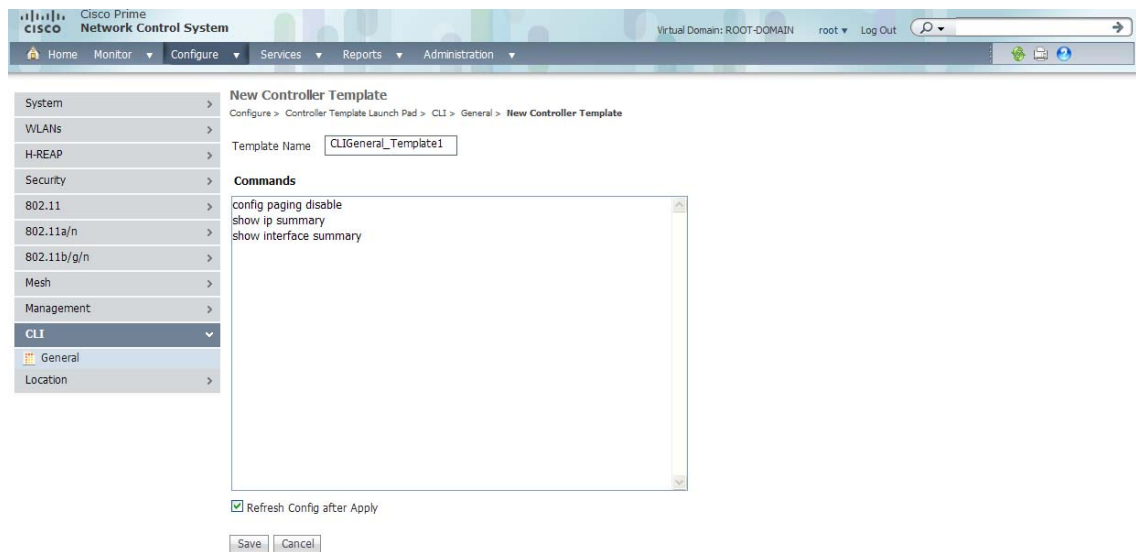

The CLI sessions to the device are established based on user preferences. The default protocol is SSH. See the “[Configuring Protocols for CLI Sessions](#)” section on page 15-79 for information on setting protocol user preferences.

To add or modify a CLI template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **CLI > General** or choose **CLI > General** from the left sidebar menu. The CLI > General page appears, and the number of controllers that the template is applied to automatically populates.
 

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Command-Line Interface General template page appears (see [Figure 11-61](#)).

**Figure 11-61** Command-Line Interface Template

- Step 4** If you are adding a new template, provide a name that you are giving to this string of commands. If you are making modifications to an existing template, the Template Name field cannot be modified.
- Step 5** In the Commands page, enter the series of CLI commands.
- Step 6** Select the **Refresh Config after Apply** check box to perform a refresh config on the controller after the CLI template is applied successfully.

291226

- Step 7** Click **Save** to save the CLI commands to the NCS database without applying to the selected controllers or **Apply to Controllers** to save the commands to the NCS database as well as apply to the selected controllers. If you click **Apply to Controllers**, choose the IP address of the controller to which you want to apply the template.

**Note** When the template is applied to the selected controllers, a status screen appears. If an error occurred while you applied the template, an error message is displayed. You can click the icon in the Session Output column to get the entire session output.

**Note** If the Controller Telnet credentials check fails or the Controller CLI template fails with invalid username and password even though the correct username and password are configured on the controller, check whether the controller has exceeded the number of CLI connections it can accept. If the connections have exceeded the maximum limit, then either increase the maximum allowed CLI sessions or terminate any pre-existing CLI sessions on the controller, and then retry the operation.

## Configuring Location Configuration Templates

To add or modify a location setting template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Location > Location Configuration** or choose **Location > Location Configuration** from the left sidebar menu. The **Location > Location Configuration** page appears, and the number of controllers that the template is applied to automatically populates.
- The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the **Select a command** drop-down list, and click **Go**. To modify an existing template, click the template name. The template page appears (see [Figure 11-62](#)).

Figure 11-62 Location Configuration Template

- Step 4** Select the **RFID Tag Data Collection** check box to enable tag collection. Before the mobility services engine can collect asset tag data from controllers, you must enable the detection of active RFID tags using the CLI command **config rfid status enable** on the controllers.
- Step 5** Select the **Calibrating Client** check box to enable calibration for the client. Controllers send regular S36 or S60 requests (depending on the client capability) by way of the access point to calibrating clients. Packets are transmitted on all channels. All access points irrespective of channel (and without a channel change) gather RSSI data from the client at each location. These additional transmissions and channel changes might degrade contemporaneous voice or video traffic.

**Note** To use all radios (802.11a/b/g/n) available, you must enable multiband in the Advanced page.

- Step 6** Select the **Normal Client** check box to have a non-calibrating client. No S36 requests are transmitted to the client.

**Note** S36 and S60 are client drivers compatible with specific Cisco Compatible Extensions. S36 is compatible with CCXv2 or later. S60 is compatible with CCXv4 or later. For details, see [http://www.cisco.com/en/US/products/ps9806/products\\_qanda\\_item09186a0080af9513.shtml](http://www.cisco.com/en/US/products/ps9806/products_qanda_item09186a0080af9513.shtml)

- Step 7** Specify how many seconds should elapse before notification of the found element (tags, clients, and rogue APs/clients).
- Step 8** Enter the number of seconds after which RSSI measurements for clients should be discarded.
- Step 9** Enter the number of seconds after which RSSI measurements for calibrating clients should be discarded.
- Step 10** Enter the number of seconds after which RSSI measurements for tags should be discarded.
- Step 11** Enter the number of seconds after which RSSI measurement for rogue access points should be discarded.
- Step 12** Click the **Advanced** tab.

- Step 13** Enter a value in seconds to set the RFID tag data timeout setting.
- Step 14** Select the **Calibrating Client Multiband** check box to send S36 and S60 packets (where applicable) on all channels. Calibrating clients must be enabled in the General pane.
- Step 15** Click **Save**.
- 

## Configuring AP Configuration Templates

This menu provides access to the access point templates summary details. Use the selector group box to access and configure the respective templates details.

### Note

Select the template name to view or edit parameters for current access point templates. View the applicable steps in [Configuring a New Lightweight Access Point Template, page 11-127](#) for more information on access point template parameters.

---

- [Configuring Lightweight Access Point Templates, page 11-127](#)
- [Configuring Autonomous Access Point Templates, page 11-136](#)

## Configuring Lightweight Access Point Templates

This section contains the following topics:

- [Configuring a New Lightweight Access Point Template, page 11-127](#)
- [Editing a Current Lightweight Access Point Template, page 11-135](#)

## Configuring a New Lightweight Access Point Template

To configure a new lightweight access point template, follow these steps:

---

- Step 1** Choose **Configure > AP Configuration Templates > Lightweight AP**.
- Step 2** From the **Select a command** drop-down list, choose **Add Template**.
- Step 3** Click **Go**.
- Step 4** Enter a **Template Name**.
- Step 5** Enter a template **Description**.
- Step 6** Click **Save**.
- Step 7** Once loaded, the access point template detail page displays.
- Step 8** The following tabs include the access point template information:
- [AP Parameters](#)
  - [Mesh](#)
  - [802.11a/n Parameters](#)
  - [802.11a SubBand Parameters](#)

- [802.11b/g/n Parameters](#)
- [CDP](#)
- [Select APs](#)
- [Apply/Schedule](#)
- [Report](#)

## AP Parameters

Select the check box of the access point parameters that must be applied.

- Location—Enter the location in the Location text box.
- Admin Status—Select the **Admin and Enabled** check box to enable administrative status.

**Note** In order to conserve energy, access points can be turned off at specified times during non-working hours. Select the **Enabled** check box to allow access points to be turned on or off.

- AP Mode—From the drop-down list, select one of the following:
  - Local—Default
  - Monitor—Monitor mode only.

**Note** Select Monitor to enable this access point template for Cisco Adaptive WIPS. Once Monitor is selected, select the **Enhanced WIPS Engine** check box and the Enabled check box. Then select the **AP Monitor Mode Optimization** check box and WIPS from the AP Monitor Mode Optimization drop-down list. For more information on Cisco Adaptive WIPS, see the [“Configuring WIPS Profiles”](#) section on page 9-220, or the [“WIPS Policy Alarm Encyclopedia”](#) section on page 19-1, and the [“NCS Services”](#) section on page 16-1.

- H-REAP/REAP—Cisco 1030 remote edge lightweight access point (REAP) used for Cisco 1030 IEEE 802.11a/b/g/n remote edge lightweight access points.

**Note** H-REAP must be selected in order to configure an OfficeExtend access point. When the AP mode is H-REAP, H-REAP configuration options display including the option to enable OfficeExtend AP and to enable Least Latency Controller Join. See the [“Configuring Hybrid REAP”](#) section on page 12-4 for more information.

- Rogue Detector—Monitors the rogue access points but does not transmit or contain rogue access points.
- Bridge
- Sniffer—The access point “sniffs” the air on a given channel. It captures and forwards all the packets from the client on that channel to a remote machine that runs airopeek (a packet analyzer for IEEE 802.11 wireless LANs). It includes information on timestamp, signal strength, packet size, and so on. If you choose Sniffer as an operation mode, you are required to enter a channel and server IP address on the AP/Radio Templates 802.11b/g/n or 802.11a/n parameters tab.

---

**Note** The sniffer feature can be enabled only if you are running AiroPeek, which is a third-party network analyzer software that supports decoding of data packets. For more information on AiroPeek, see <http://www.wildpackets.com>.

---

- SE-Connect—This mode allows a CleanAir-enabled access point to be used extensively for interference detection on all monitored channels. All other functions such as IDS scanning and Wi-Fi are suspended.

---

**Note** This option is displayed only if the access point is CleanAir-capable.

---

---

**Note** Changing the AP mode reboots the access point.

---

- Enhanced wIPS Engine—Select the **Enhanced wIPS engine** and the **Enabled** check box to enable.
- AP Monitor Mode Optimization—Select **None** or **wIPS** from the drop-down list.
- AP Height (feet)—Enter the height of the access point (in feet) in the text box.
- Mirror Mode—Select the **Enabled** check box to enable mirror mode.
- Country Code—Select the appropriate country code from the drop-down list.

---

**Note** Changing the country code may cause the access point to reboot.

---

- Stats Collection Interval—Enter the stats collection interval in the text box.
- Cisco Discovery Protocol—Select the **Enabled** check box to enable Cisco Discovery Protocol.
- AP Failover Priority—Select **Low**, **Medium**, **High**, or **Critical** from the drop-down list to indicate the access point failover priority. The default priority is low. See the “[Setting AP Failover Priority](#)” section on page 9-152 for more information.
- Pre-Standard State
- Power Injector State—When enabled, this allows you to manipulate power injector settings through NCS without having to go directly to the controllers. If the Enable Power Injector State is selected, power injector options appear.
- Power Injector Selection—Select **installed** or **override** from the drop-down list.
- Injector Switch MAC Address—Enter the MAC address of the injector switch.
- Primary, Secondary, and Tertiary Controller IP—The Primary/Secondary/Tertiary Controller IP is the Management IP of the controller.
- Domain Name
- Domain Name Server IP Address—Domain Name Server IP and Domain Name can be configured only on APs which have static IP.
- Rogue Detection—Select the check box to enable rogue detection. See the “[Rogue Access Point Location, Tagging, and Containment](#)” section on page 3-13 for more information on rogue detection.

---

**Note** Rogue detection is disabled automatically for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect a large number of rogue devices. For more information regarding OfficeExtend access points, see *Cisco Wireless LAN Controller Configuration Guide*.

---

- Encryption—Select the **Encryption** check box to enable encryption.

---

**Note** Enabling or disabling encryption functionality causes the access point to reboot which then causes a loss of connectivity for clients.

---

---

**Note** DTLS data encryption is enabled automatically for OfficeExtend access points to maintain security. Encryption is only available if the access point is connected to a 5500 series controller with a Plus license. Encryption is not available for all access point models.

---

---

**Note** Enabling encryption may impair performance.

---

- SSH Access—Select the **SSH Access** check box to enable SSH access.
- Telnet Access—Select the **Telnet Access** check box to enable Telnet access.

---

**Note** An OfficeExtend access point may be connected directly to the WAN which could allow external access if the default password is used by the access point. Because of this, Telnet and SSH access are disabled automatically for OfficeExtend access points.

---

- Link Latency—You can configure link latency on the controller to measure the link between an access point and the controller. This feature can be used with all access points joined to the controller but is especially useful for hybrid-REAP access points, for which the link could be a slow or unreliable WAN connection. See the [“Configuring Link Latency Settings for Access Points” section on page 9-203](#) for more information.

---

**Note** Link latency is supported for use only with hybrid-REAP access points in connected mode. Hybrid-REAP access points in standalone mode are not supported.

---

- Reboot AP—Select the check box to enable a reboot of the access point after making any other updates.
- AP Failover Priority—Select Low, Medium, High, or Critical from the drop-down list to indicate the access point failover priority. The default priority is low. See the [“Setting AP Failover Priority” section on page 9-152](#) for more information.
- Controllers—Select the **Controllers** check box to enable the drop-down lists for the primary, secondary, and tertiary controller names.
- Group VLAN name—Choose the appropriate group VLAN name from the drop-down list.
- H-REAP Configuration—Select the check box to enable H-REAP configuration (including VLAN support, native VLAN ID, and profile name VLAN mappings).

---

**Note** These options are only available for access points in H-REAP mode.

---

- OfficeExtend—The default is Enabled.

---

**Note** Unselecting the check box simply disables OfficeExtend mode for this access point. It does not undo all of the configuration settings on the access point. If you want to clear the access point configuration and return it to factory default settings, click **Clear Config** at the bottom of the access point details page. If you want to clear only the access point personal SSID, click Reset Personal SSID at the bottom of the access point details page. See the [“Restoring Factory Defaults” section on page 9-33](#) for more information.

---

---

**Note** When you select Enable for the OfficeExtend AP, several configuration changes automatically occur including: encryption and link latency are enabled; rogue detection, SSH access, and Telnet access are disabled.

---

---

**Note** When you enable the OfficeExtend access point, you must configure at least one primary, secondary, and tertiary controller (including name and IP address).

---

- Least Latency Controller Join—When enabled, the access point switches from a priority order search (primary, secondary, and then tertiary controller) to a search for the controller with the best latency measurement (least latency). The controller with the least latency provides the best performance.

---

**Note** The access point only performs this search once when it initially joins the controller. It does not recalculate the primary, secondary, and tertiary controllers’ latency measurements once joined to see if the measurements have changed.

---

- VLAN Support
- Native VLAN ID

---

**Note** The valid native VLAN ID range is 1—4094. If you are changing the mode to REAP and if the access point is not already in REAP mode, then all other REAP parameters are not applied on the access point.

---

- Override Global Username Password—Select the check box to enable an override for the global username/password. Enter and confirm the new access point username and password in the appropriate text boxes. See the [“Configuring a Global Access Point Password” section on page 9-59](#) for more information on a global username and password.

---

**Note** On the System > AP Username Password page, you can set global credentials for all access points to inherit as they join a controller. These established credentials are displayed in the lower right of the AP Parameter tab page.

---

- Override Supplicant Credentials

## Mesh

Use the Mesh tab to set the following parameters for mesh access points:

- Bridge Group Name—Enter a bridge group name (up to 10 characters).

**Note** Bridge groups are used to logically group the mesh access points to avoid two networks on the same channel from communicating with each other.

**Note** For mesh access points to communicate, they must have the same bridge group name.

**Note** For configurations with multiple RAPs, make sure that all RAPs have the same bridge group name to allow failover from one RAP to another.

- Data Rate (Mbps)—Select the data rate for the backhaul interface from the drop-down list. Data rates available are dictated by the backhaul interface. The default rate is 18 Mbps.

**Note** This data rate is shared between the mesh access points and is fixed for the whole mesh network.

**Note** Do not change the data rate for a deployed mesh networking solution.

- Ethernet Bridging—Choose the **Enable** option from the Ethernet Bridging drop-down list to enable Ethernet bridging for the mesh access point.
- Role—Select the role of the mesh access point from the drop-down list (MAP or RAP). The default setting is MAP.

**Note** An access point in a mesh network functions as either a root access point (RAP) or mesh access point (MAP).

### 802.11a/n Parameters

Select the check box of the 802.11a/n parameters that must be applied:

- Channel Assignment
- Admin Status
- Antenna Mode
- Antenna Diversity
- Antenna Name
- Power Assignment
- WLAN Override

- 11n Antenna Selection
- CleanAir

### 802.11a SubBand Parameters

Select the 802.11a Sub Band options (for either 4.9 or 5.8 parameters) that must be applied.

**Note** Options are disabled unless the check box to the left of the parameter is selected.

- Admin Status
- Channel Assignment—Select the check box and then select the appropriate channel from the drop-down list.

**Note** The channel number is validated against the radio list of supported channels.

- Power Assignment—Select the check box and then select the appropriate power level from the drop-down list.

**Note** The power level is validated against the radio list of supported power levels.

- WLAN Override—Select the check box and then choose **Disable** or **Enable** from the drop-down list.

**Note** The access point must be reset for the WLAN override change to take effect.

- Antenna Type—Select the check box and then choose the antenna type from the drop-down list.
- Antenna Name—Select the **Antenna Type** check box and then choose the applicable antenna name from the drop-down list.

**Note** Not all antenna models are supported by radios of different access point types.

### 802.11b/g/n Parameters

Select the check box of the 802.11b/g/n parameters that must be applied.

- Channel Assignment
- Admin Status
- Antenna Mode
- Antenna Diversity
- Antenna Name
- Power Assignment
- WLAN Override
- Tracking Optimized Monitor Mode
- 11n Antenna Selection

- CleanAir

## CDP

- In the Cisco Discovery Protocol on Ethernet Interfaces group box, select the slots of Ethernet interfaces for which you want to enable CDP.
- In the Cisco Discovery Protocol on Radio Interfaces group box, select the slots of Radio interfaces for which you want to enable CDP.

## Select APs

Use the **Search APs** drop-down list to search for Last Applied AP(s), Scheduled AP(s), All, All Mesh MAP AP(s), All Mesh RAP AP(s), By Controller (select the controller from the drop-down list), By Controller Name (select the controller name from the drop-down list), By Floor Area (select the campus, building, and floor area from the drop-down lists), By Outdoor Area (select the campus and the outdoor area from the drop-down lists), By Model (select the model from the drop-down list), By AP MAC Address (enter the MAC address), By AP Name (enter the complete AP name or starting characters of the AP name), and By AP IP Address Range (enter the IP address).

**Note** The input text for IP address search can be of two formats X.X.X.\* or X.X.X.[0-255]. For example, 10.10.10.\* or 10.10.10.[20-50] will search the APs in 10.10.10.10 to 10.10.10.50 IP address range.

**Note** The search filter "All Applied AP's" and "Scheduled AP's", lists the last 24 hours AP data.

**Note** The search filter "AP(s) unassigned to Map(s)" lists the APs that have not yet been assigned to any maps.

- Click **Save** to save the parameters selections.
- Click **Apply** to save and apply the AP/Radio parameters to the selected access points from the search.

## Apply/Schedule

Allows you to save the current template, apply the current template immediately, or schedule the current template to start the provisioning at the applicable time.

- **Save**—Click **Save** to save the current template configuration.
- **Apply**—Click **Apply** to save the template and start the provisioning of the template to selected access points.

**Note** This provisioning process continues until completed even if you leave the page and log out of NCS.

- **Schedule**—Allows you to configure and start the provisioning at a scheduled time.
  - **Enable schedule**—Select the **Enable schedule** check box to activate the scheduling function.

- Start Date—Enter a starting date in the text box or use the calendar icon to select a start date.
- Start Time—Select the starting time using the hours and minutes drop-down lists.
- Recurrence—Select from no recurrence, hourly, daily, or weekly to determine how often this provisioning occurs. Enter how often (in days) the provisioning is to occur.
- Schedule—Click **Schedule** to start the provisioning at the scheduled time.

## Report

Displays all recently applied reports including the apply status and the date and time the apply was initiated. The following information is provided for each individual access point:

- Status—Indicates success, partial failure, failure, or not initiated. For failed or partially failed provisioning, click **Details** to view the failure details (including what failed and why it failed).
- Ethernet MAC—Indicates the ethernet MAC address for the applicable access point.
- Controller—Indicates the controller IP address for the applicable access point.
- Map—Identifies a map location for the access point.

---

**Note** Click the **click here** link at the bottom of the Report page to view scheduled task reports.

---

## Editing a Current Lightweight Access Point Template

To edit a current lightweight access point template, follow these steps:

- 
- Step 1** Choose **Configure > AP Configuration Templates > Lightweight AP**.
- Step 2** Click the applicable template in the **Template Name** column.
- Step 3** Edit the necessary parameters under the following tabs:
- AP Parameters—Select the check box of the access point parameters that must be applied.
  - Mesh
  - 802.11a/n Parameters—Select the check box of the 802.11a/n parameters that must be applied.
  - 802.11b/g/n Parameters—Select the check box of the 802.11b/g/n parameters that must be applied.
  - Select APs
    - Use the **Search APs** drop-down list to search for Last Applied APs, All APs, All MAP(s), or All RAP(s).
    - Click **Save** to save the parameters selections.
    - Click **Apply** to save and apply the AP/Radio parameters to the selected access points from the search.
    - Apply Report—Displays the reports from the applied template.
-

## Configuring Autonomous Access Point Templates

The Configuring > Autonomous Access Point Templates page allows you to configure CLI templates for autonomous access points.

This section contains the following topics:

- [Configuring a New Autonomous Access Point Template, page 11-136](#)
- [Applying an AP Configuration Template to an Autonomous Access Point, page 11-136](#)
- [Editing Current Autonomous AP Migration Templates, page 11-140](#)

### Configuring a New Autonomous Access Point Template

To configure a new autonomous access point template, follow these steps:

- 
- Step 1** Choose **Configure > Autonomous AP Configuration Templates**.
  - Step 2** From the Select a command drop-down list, choose **Add Template**.
  - Step 3** Click **Go**.
  - Step 4** Enter a Template Name.
  - Step 5** Enter the applicable CLI commands.

**Note** Do not include any show commands in the CLI commands text box. The show commands are not supported.

---

- Step 6** Click **Save**.
- 

### Applying an AP Configuration Template to an Autonomous Access Point

To apply an AP configuration template to an autonomous access point, follow these steps:

- 
- Step 1** Choose **Configure > AP Configuration Templates > Autonomous AP**.
  - Step 2** Click the template name link to select a template and apply it to the an autonomous access point. The Autonomous AP Template page appears.
  - Step 3** Enter a **Template Name**.
  - Step 4** Enter the applicable CLI commands.
  - Step 5** Click **Save**.
  - Step 6** Click **Apply to Autonomous Access Points**. The Apply to Autonomous Access Points page appears.
  - Step 7** Select the desired autonomous access point.
  - Step 8** Click **OK**.

**Note**

Select the **Ignore errors on Apply template to Controllers** check box to ignore errors and apply all commands in the template to the Autonomous AP. If this check box is not selected, any errors encountered while applying a command in the template to a Autonomous AP causes the rest of the commands to be not applied.

## Viewing Template Results

To view the results when you apply an AP configuration template to an access point, follow these steps:

- Step 1** Choose **Configure > AP Configuration Templates > Autonomous AP**.
- Step 2** Click the template name link to select a template and apply it to the an autonomous access point. The Autonomous AP Template page appears.
- Step 3** Enter a **Template Name**.
- Step 4** Enter the applicable CLI commands.
- Step 5** Click **Save**.
- Step 6** Click **Apply to Autonomous Access Points**. The Apply to Autonomous Access Points page appears.
- Step 7** Select the desired autonomous access point.
- Step 8** Click **OK**. The Template Results page appears. The following parameters appear:
  - IP Address —IP address of the access point.
  - AP Name—The name of the access point.
  - Apply Status—Indicates success, failure, initiated or not initiated.
  - Operation Status—Displays the operational status: Success or Failure.
  - Reason—Indicates the reasons for failure.
  - Session Output

## Configuring Switch Location Configuration Templates

You can configure the location template for a switch using the Switch Location Configuration Template option.

To configure a location template for a Switch, follow these steps:

- Step 1** Choose **NCS > Configure > Switch Location Configuration Template**.  
The Switch Location Configuration Template page appears.
- Step 2** From the drop-down list towards the right of the page, choose, **Add Template** and Click **Go**.  
The New Template page appears.  
[Table 11-4](#) lists the fields in the New Template page.

**Table 11-4** Parameters in the New Template page

| Parameter                      | Description                                                                 |
|--------------------------------|-----------------------------------------------------------------------------|
| <b>General</b>                 |                                                                             |
| Template Name                  | Name of the template.                                                       |
| Map Location                   |                                                                             |
| Campus                         | Choose a Campus for the map location for a Switch/Switch port.              |
| Building                       | Choose a Building for the map location for a Switch/Switch port.            |
| Floor                          | Choose a Floor for the map location for a Switch/Switch port.               |
| Import                         | Imports the civic information for the Campus, Building and Floor selected.  |
| <b>ELIN and Civic Location</b> |                                                                             |
| ELIN                           | The Emergency Location Identification Number.                               |
| Civic Address tab              | The available Civic address information for the Switch/Switch port.         |
| Advanced tab                   | Detailed information about the Switch/Switch port location.                 |
| NMSP                           | Select or unselect this check box to enable or disable NMSP for the Switch. |
| <b>Buttons</b>                 |                                                                             |
| Save                           | Saves the template.                                                         |
| Cancel                         | Discards the template creation.                                             |

## Configuring Autonomous AP Migration Templates

This section contains the following topics:

- [Migrating Autonomous Access Point to CAPWAP Access Point, page 11-138](#)
- [Migrating a Autonomous Access Point to a Lightweight Access Point, page 11-139](#)

### Migrating Autonomous Access Point to CAPWAP Access Point

To make a transition from an Autonomous solution to a Unified architecture, autonomous access points must be converted to CAPWAP access points. The migration utility is available from the **Configure > Migration Templates** page where existing templates are listed.

From the Select a command drop-down list, the following functions can be performed:

- Add Template—Allows you to provide necessary information for migration.
- Delete Templates—Allows you to delete a current template.

- View Migration Report—Allows you to view information such as AP address, migration status (in progress or fail), timestamp, and a link to detailed logs.
- View Current Status—Allows you to view the progress of the current migration (updated every three seconds).

**Note**

---

When migrating an already-managed autonomous access point to CAPWAP, its location and antenna information is migrated as well. You do not need to re-enter the information. NCS automatically removes the autonomous access point after migration.

---

- View Migration Analysis Summary—Lists the basic criteria pass or fail status as required for an access point conversion. Only those access points with all criteria as pass are eligible for conversion.

## Migrating a Autonomous Access Point to a Lightweight Access Point

To make a transition from an Autonomous solution to a Unified architecture, autonomous access points must be converted to lightweight access points. The migration utility is available in the **Configure > Autonomous AP Migration Templates** page where existing templates are listed.

The Autonomous AP Migration Templates list page displays the following information:

- Name—The template name.
- Description—The description of template.
- AP Count—The number of autonomous access points selected for migration.
- Schedule Run—The time at which the task is scheduled to run.
- Status—Indicates one of the following task statuses:
  - Not initiated—The template is yet to start the migration and will start at the scheduled time.
  - Disabled—The template is disabled and will not run at the scheduled time. This is the default state for a template when it is created without selecting any autonomous access points.
  - Expired—The template did not run at the scheduled time (this may be due to the NCS server being down).
  - Enabled—The template is yet to start the migration and will start at the scheduled time.
  - In progress—The template is currently converting the selected autonomous access points to CAPWAP.
  - Success—The template has completed the migration of autonomous access point to CAPWAP successfully.
  - Failure—The template failed to migrate all the selected autonomous access point to CAPWAP. You can check the detailed status about the failures by using the View Migration Status page.
  - Partial Success—The template failed to migrate a subset of the selected autonomous access point to CAPWAP. You can check the detailed status about the failures by using the View Migration Status page.

**Note**

---

In any of the above states, you can edit the template by clicking the Name link.

---

**Note**

Once an access point is converted to lightweight, the previous status or configuration of the access point is not retained.

From the Select a command drop-down list, the following functions can be performed:

- Add Template—Allows you to provide necessary information for migration.
- Delete Templates—Allows you to delete a current template.
- View Migration Report—Allows you to view information such as AP address, migration status (in progress or fail), timestamp, and a link to detailed logs.
- View Current Status—Allows you to view the progress of the current migration (updated every three seconds).

**Note**

When you migrate an already-managed autonomous access point to lightweight, its location and antenna information is migrated as well. You do not need to re-enter the information. NCS automatically removes the autonomous access point after migration.

- View Migration Analysis Summary—Lists the pass or fail status as required for an access point conversion. Only those access points with all criteria as pass are eligible for conversion.

**Note**

The Migration Analysis option will not run during discovery by default. If you prefer to run the migration analysis during discovery, choose Administration > Settings > CLI Session to enable this option.

## Editing Current Autonomous AP Migration Templates

To edit a current migration template, follow these steps:

- Step 1** Choose **Configure > Autonomous AP Migration Templates**.
- Step 2** Click the migration template from the Name column.
- Step 3** Edit the necessary parameters:
  - General
    - Name—Indicates the user-defined name of the migration template.
    - Description—Enter a brief description to help you identify the migration template.
  - Upgrade Options
    - DHCP Support—Click to enable Dynamic Host Configuration Protocol support. This ensures that after the conversion every access point gets an IP from the DHCP server.
    - Retain AP HostName—Click to enable retention of the same hostname for this access point.

**Note**

Hostname will be retained in the CAPWAP, only when you are migrating the AP to CAPWAP for the first time. It may not be retained if you are upgrading an AP for several times. CAPWAP access points hostname will be set to default, if autonomous access points hostname has more than 32 characters.

**Note** If you upgrade the access points to LWAPP from 12.3(11)JA, 12.3(11)JA1, 12.3(11)JA2, 12.3(11)JA3 autonomous images, the converted access points may not retain their Static IP Address, Netmask, Hostname and Default Gateway.

- Migrate over WANLink—If you enable this option, the *env\_vars* file stores the remote TFTP server location. This information is copied to the AP. If this option is not selected, then the NCS internal TFTP server will be used to copy the *env\_vars* file to AP.
- DNS Address—Enter the DNS address.
- Domain Name—Enter the domain name.

- Controller Details

**Note** Ensures that the access point authorization information (SSC) can be configured on this controller and the converted access points can join.

- Controller IP
- AP Manager IP
- User Name
- Password
- TFTP Details
  - TFTP Server IP
  - File Path
  - File Name
- Schedule Details
  - Apply Template
  - Notification (Optional)

**Step 4** Click **Save**.

## Viewing the Migration Analysis Summary

To view the Migration Analysis Summary, follow these steps:

**Note** You can also view the migration analysis summary by choosing **Tools > Migration Analysis**.

**Step 1** Choose **Configure > Autonomous AP Migration Templates**.

**Step 2** Click **View Migration Analysis Summary** from the Select a command drop-down list, and click **Go**. The Migration Analysis Summary page appears.

The autonomous access points are eligible for migration only if all the criteria have a pass status. A red X designates ineligibility, and a green checkmark designates eligibility. These columns represent the following:

- **Privilege 15 Criteria**—The Telnet credential provided as part of the autonomous access point discovery must be privilege 15.
- **Software Version Criteria**—Conversion is supported only from Cisco IOS 12.3(7)JA releases excluding 12.3(11)JA, 12.3(11)JA1, 12.3(11)JA2, and 12.3(11)JA3.
- **Role Criteria**—A wired connection between the access point and controller is required in order to send the association request; therefore, the following autonomous access point roles are required:
  - root
  - root access point
  - root fallback repeater
  - root fallback shutdown
  - root access point only
- **Radio Criteria**—In dual-radio access points, the conversion can happen even if only one radio is of the supported type.

## Adding/Modifying a Migration Template

If you want to add a migration template, choose **Add Template** from the Select a command drop-down page of the Configure > Autonomous AP Migration Templates page.

To modify an existing template, click the template name from the summary list.

Enter or modify the following migration parameters:

### General

- **Name**—User-defined name of this migration template.
- **Description**—Brief description to help you identify the migration template.

### Upgrade Options

- **DHCP Support**—Ensures that after the conversion every access point gets an IP from the DHCP server.
- **Retain AP HostName**—Allows you to retain the same hostname for this access point.
- **Migrate over WANLink**—Increases the default timeouts for the CLI commands executed on the access point.
- **DNS Address**
- **Domain Name**

### Controller Details

#### Note

---

Ensure that the access point authorization information (SSC) can be configured on this controller and the converted access points can join.

---

- **Controller IP**—Enter the IP address of the WLAN controller you are wanting to add to the newly migrated access point.

- AP Manager IP—Specify the controller the access point should join by entering the access point manager IP address.

**Note** For SSC-enabled access points, this IP address must be the same as the controller IP field. For MIC-enabled access points, the IP addresses need not match.

- User Name—Enter a valid username for login of the WLAN controller.
- Password—Enter a valid password for this username used during WLAN controller login.

### TFTP Details

When you installed and set up NCS, it provided its own TFTP and FTP server.

- TFTP Server IP—Enter the IP address of the NCS server.
- File Path—Enter the TFTP directory which was defined during NCS setup.
- File Name—Enter the CAPWAP conversion file defined in the TFTP directory during NCS setup (for example, c1240-rcvk9w8-tar.123-11JX1.tar).

### Schedule Details

This area enables you to specify scheduling options for migration templates.

- Apply Template—Select an option by which you want to apply the template for migration.
  - Now—Select this option to run the migration task immediately.
  - Schedule for later date/time—If you plan to schedule the migration at a later time, enter the Schedule parameters. Enter a date in the text box, or click the calendar icon to open a calendar from which you can choose a date. Select the time from the hours and minutes drop-down lists. The report will begin running on this data and at this time.
- (Optional) Notification—Enter the e-mail address of recipient to send notifications via e-mail.

**Note** To receive email notifications, configure the NCS mail server in the Administration > Settings > Mail Server Configuration page.

- Click **Save**.

Once a template is added in NCS, the following additional buttons appear:

- Select APs—Selecting this option provides a list of autonomous access points in NCS from which to choose the access points for conversion. Only those access points with migration eligibility as *pass* can be chosen for conversion.
- Select File—To provide CSV information for access points intended for conversion.

## Copying a Migration Template

To copy a migration template, follow these steps:

- 
- Step 1** Choose **Configure > Autonomous AP Migration Templates**.
  - Step 2** Select the check box of the template you want to copy, and then select **Copy Template** from the Select a command drop-down list.

- Step 3** Click **Go**.
- Step 4** Enter the name for the new template to which you want to copy the current template.
- 

## Deleting Migration Templates

To delete migration templates, follow these steps:

---

- Step 1** Choose **Configure > Autonomous AP Migration Templates**.
- Step 2** Select the check box(es) of the template(s) you want to delete, and then select **Delete Templates** from the Select a command drop-down list.
- Step 3** Click **Go**.
- Step 4** Click **OK** to confirm the deletion or **Cancel** to close this page without deleting the template.
- 

## Viewing Current Status of Cisco IOS Access Points

Select **View Current Status** from the Select a command drop-down list of the Autonomous AP Migration Templates to view the status of Cisco IOS access point migration.

The following information is displayed:

- IP Address—IP address of the access point.
- Status—Current status of the migration.
- Progress—Summary of the migration progress.

## Disabling Access Points that are Ineligible

If an autonomous access point is labelled as ineligible for conversion, you can disable it.

## CHAPTER 12

# Configuring Hybrid REAP

---

This chapter describes hybrid REAP and explains how to configure this feature on controllers and access points. It contains these sections:

- [Information About Hybrid REAP, page 12-1](#)
- [Configuring Hybrid REAP, page 12-4](#)
- [Hybrid REAP Access Point Groups, page 12-11](#)

## Information About Hybrid REAP

*Hybrid REAP* is a solution for branch office and remote office deployments. It enables customers to configure and control access points in a branch or remote office from the corporate office through a wide area network (WAN) link without deploying a controller in each office. There is no deployment restriction on the number of hybrid-REAP access points per location. The hybrid-REAP access points can switch client data traffic locally and perform client authentication locally when their connection to the controller is lost. When they are connected to the controller, they can also send traffic back to the controller.

Hybrid REAP is supported only on the 1130AG, 1240AG, 1142 and 1252 access points and on the 2000 and 4400 series controllers, the Catalyst 3750G Integrated Wireless LAN Controller Switch, the Cisco WiSM, and the Controller Network Module for Integrated Services Routers, and the controller within the Catalyst 3750G Integrated Wireless LAN Controller Switch. [Figure 12-1](#) illustrates a typical hybrid-REAP deployment.

Figure 12-1 Hybrid REAP Deployment

## Hybrid-REAP Authentication Process

When a hybrid-REAP access point boots up, it looks for a controller. If it finds one, it joins the controller, downloads the latest software image from the controller and configuration information, and initializes the radio. It saves the downloaded configuration in non-volatile memory for use in standalone mode.

A hybrid-REAP access point can learn the controller IP address in one of these ways:

- If the access point has been assigned an IP address from a DHCP server, it discovers a controller through the regular CAPWAP discovery process [Layer 3 broadcast, over-the-air provisioning (OTAP), DNS, or DHCP option 43.]

### Note

OTAP does not work on the first boot out of the box.

- If the access point has been assigned a static IP address, it can discover a controller through any of the CAPWAP discovery process methods except DHCP option 43. If the access point cannot discover a controller through Layer 3 broadcast or OTAP, we recommend DNS resolution. With DNS, any access point with a static IP address that knows of a DNS server can find at least one controller.
- If you want the access point to discover a controller from a remote network where CAPWAP discovery mechanisms are not available, you can use priming. This method enables you to specify (through the access point CLI) the controller to which the access point is to connect.

When a hybrid-REAP access point can reach the controller (referred to as *connected mode*), the controller assists in client authentication. When a hybrid-REAP access point cannot access the controller, the access point enters standalone mode and authenticates clients by itself.

### Note

The LEDs on the access point change as the device enters different hybrid-REAP modes. See the Hardware Installation Guide for your access point for information on LED patterns.

When a client associates to a hybrid-REAP access point, the access point sends all authentication messages to the controller and either switches the client data packets locally (locally switched) or sends them to the controller (centrally switched), depending on the WLAN configuration. With respect to client authentication (open, shared, EAP, web authentication, and NAC) and data packets, the WLAN can be in any one of the following states depending on the configuration and state of controller connectivity:

- **central authentication, central switching**—In this state, the controller handles client authentication, and all client data tunnels back to the controller. This state is valid only in connected mode.
- **central authentication, local switching**—In this state, the controller handles client authentication, and the hybrid-REAP access point switches data packets locally. After the client authenticates successfully, the controller sends a configuration command with a new payload to instruct the hybrid-REAP access point to start switching data packets locally. This message is sent per client. This state is applicable only in connected mode.
- **local authentication, local switching**—In this state, the hybrid-REAP access point handles client authentication and switches client data packets locally. This state is valid in standalone mode and connected mode.

Local authentication is useful where you cannot maintain the criteria a remote office setup of minimum bandwidth of 128 kbps with the roundtrip latency no greater than 100 ms and the maximum transmission unit (MTU) no smaller than 500 bytes. In local switching, the authentication capabilities are present in the access point itself. Thus local authentication reduces the latency requirements of the branch office.

---

**Note** Local authentication can only be enabled on the WLAN of a H-REAP AP that is in local switching mode.

---

Local authentication is not supported in the following scenarios:

- Guest Authentication cannot be done on a H-REAP local authentication enabled WLAN.
- RRM information is not available at the controller for the hybrid REAP local authentication enabled WLAN.
- Local radius is not supported.
- Once the client has been authenticated, roaming will only be supported after the WLC and the other hybrid REAPs in the group are updated with the client information.
- **authentication down, switching down**—In this state, the WLAN disassociates existing clients and stops sending beacon and probe responses. This state is valid only in standalone mode.
- **authentication down, local switching**—In this state, the WLAN rejects any new clients trying to authenticate, but it continues sending beacon and probe responses to keep existing clients alive. This state is valid only in standalone mode.

When a hybrid-REAP access point enters standalone mode, WLANs that are configured for open, shared, WPA-PSK, or WPA2-PSK authentication enter the “local authentication, local switching” state and continue new client authentications. Other WLANs enter either the “authentication down, switching down” state (if the WLAN was configured to central switching) or the “authentication down, local switching” state (if the WLAN was configured to local-switch).

When a hybrid-REAP access point enters standalone mode, it disassociates all clients that are on centrally switched WLANs. For 802.1X or web-authentication WLANs, existing clients are not disassociated, but the hybrid-REAP access point stops sending beacons when the number of associated clients reaches zero (0). It also sends disassociation messages to new clients associating to 802.1X or

web-authentication WLANs. Controller-dependent activities such as 802.1X authentication, NAC, and web authentication (guest access) are disabled, and the access point does not send any intrusion detection system (IDS) reports to the controller. Furthermore, most radio resource management (RRM) features (such as neighbor discovery; noise, interference, load, and coverage measurements; use of the neighbor list; and rogue containment and detection) are disabled. However, a hybrid-REAP access point supports dynamic frequency selection in standalone modes.

**Note**

If your controller is configured for network access control (NAC), clients can associate only when the access point is in connected mode. When NAC is enabled, you need to create an unhealthy (or quarantined) VLAN so that the data traffic of any client that is assigned to this VLAN passes through the controller, even if the WLAN is configured for local switching. After a client is assigned to a quarantined VLAN, all of its data packets are centrally switched.

The hybrid-REAP access point maintains client connectivity even after entering standalone mode. However, once the access point re-establishes a connection with the controller, it disassociates all clients, applies new configuration information from the controller, and reallows client connectivity.

## Hybrid REAP Guidelines

Keep these guidelines in mind when using hybrid REAP:

- A hybrid-REAP access point can be deployed with either a static IP address or a DHCP address. In the case of DHCP, a DHCP server must be available locally and must be able to provide the IP address for the access point at bootup.
- Hybrid REAP supports a 500-byte maximum transmission unit (MTU) WAN link at minimum.
- Roundtrip latency must not exceed 300 milliseconds (ms) between the access point and the controller, and CAPWAP control packets must be prioritized over all other traffic. In cases where you cannot achieve this, you can configure the access point to perform local authentication. See the [“Hybrid-REAP Authentication Process” section on page 12-2](#) to know more about hybrid REAP local authentication using local authentication and local switching.
- The controller can send multicast packets in the form of unicast or multicast packets to the access point. In hybrid-REAP mode, the access point receives multicast packets only in unicast form.
- Hybrid REAP supports CCKM full authentication but not CCKM fast roaming.
- Hybrid REAP supports a 1-1 network address translation (NAT) configuration. It also supports port address translation (PAT) for all features except true multicast. Multicast is supported across NAT boundaries when configured using the Unicast option.
- VPN, IPSec, L2TP, PPTP, Fortres authentication, and Cranite authentication are supported for locally switched traffic, provided that these security types are accessible locally at the access point.

## Configuring Hybrid REAP

To configure hybrid REAP, you must follow the instructions in these sections in the order provided:

- [Configuring the Switch at the Remote Site, page 12-5](#)
- [Configuring the Controller for Hybrid REAP, page 12-6](#)
- [Configuring an Access Point for Hybrid REAP, page 12-9](#)

- [Connecting Client Devices to the WLANs, page 12-11](#)

## Configuring the Switch at the Remote Site

Follow these steps to prepare the switch at the remote site.

- Step 1** Attach the access point that will be enabled for hybrid REAP to a trunk or access port on the switch.

**Note** The sample configuration below shows the hybrid-REAP access point connected to a trunk port on the switch.

- Step 2** See the sample configuration below to configure the switch to support the hybrid-REAP access point.

In this sample configuration, the hybrid-REAP access point is connected to trunk interface FastEthernet 1/0/2 with native VLAN 100. The access point needs IP connectivity on the native VLAN. The remote site has local servers/resources on VLAN 101. A DHCP pool is created in the local switch for both VLANs in the switch. The first DHCP pool (NATIVE) is used by the hybrid-REAP access point, and the second DHCP pool (LOCAL-SWITCH) is used by the clients when they associate to a WLAN that is locally switched. The bolded text in the sample configuration illustrates these settings.

**Note** The addresses in this sample configuration are for illustration purposes only. The addresses that you use must fit into your upstream network.

```
ip dhcp pool NATIVE
 network 10.10.100.0 255.255.255.0
 default-router 10.10.100.1
!
ip dhcp pool LOCAL-SWITCH
 network 10.10.101.0 255.255.255.0

 ip helper-address 10.10.101.1
end
```

## Configuring the Controller for Hybrid REAP

This section provides instructions for configuring the controller for hybrid REAP. The controller configuration for hybrid REAP consists of creating centrally switched and locally switched s. This procedure uses these three WLANs as examples:

| WLAN           | Security           | Switching | Interface Mapping (VLAN)             |
|----------------|--------------------|-----------|--------------------------------------|
| employee       | WPA1+WPA2          | Central   | management (centrally switched VLAN) |
| employee-local | WPA1+WPA2 (PSK)    | Local     | 101 (local switched VLAN)            |
| guest-central  | Web authentication | Central   | management (centrally switched VLAN) |

- Step 1** Follow these steps to create a centrally switched WLAN. In our example, this is the first WLAN (employee).
- Choose **Configure > Controllers**.
  - Click in the IP Address column for a particular controller.
  - Click **WLANs > WLAN Configuration** to access the WLAN Configuration page.
  - Choose **Add a WLAN** from the Select a command drop-down list, and click **Go** (see [Figure 12-2](#)).

**Note** Cisco access points can support up to 16 WLANs per controller. However, some Cisco access points do not support WLANs that have a WLAN ID greater than 8. In such cases, when you attempt to create a WLAN, you get a message that says “Not all types of AP support WLAN ID greater than 8, do you wish to continue?”. Clicking OK creates a WLAN with the next available WLAN ID. However, if you delete a WLAN that has a WLAN ID less than 8, then the WLAN ID of the deleted WLAN is applied to the next created WLAN.

Figure 12-2 WLANs &gt; New Page

The screenshot displays the Cisco Prime Network Control System interface for configuring a WLAN. The breadcrumb trail is: Configure > Controllers > 9.1.188.40 > WLANs > WLAN Configuration > WLAN Configuration Details. The left sidebar shows a navigation menu with 'WLANs' selected. The main content area is titled 'WLAN Configuration Details : 100' and has tabs for General, Security, QoS, and Advanced. Under the 'General' tab, the following settings are visible: 'Wired LAN' is unchecked; 'LAN Type' is set to 'WLAN'; 'Profile Name' is 'dummy1'; 'SSID' is 'dummy1'; 'Status' is unchecked; 'Schedule Status' is unchecked. Under 'Security Policies', the policy is '[WPA2] [Auth( 802.1X)]' with a note: '(Modifications done under security tab will appear after save operation.)'. Under 'Radio Policy', 'All' is selected for the policy, 'Interface' is selected for the radio policy type, and 'management' is selected for the interface. 'Broadcast SSID' is checked. At the bottom, there are 'Audit' and 'Save' buttons, and a 'Footnotes' section with a note: '1. When Client Exclusion is enabled, a Timeout Value of zero means infinity (will require administrative override to reset excluded clients.)'. The top navigation bar includes 'Home', 'Monitor', 'Configure', 'Services', 'Reports', and 'Administration'. The bottom status bar shows 'Tools', 'Help', 'Alarm Browser', and 'Alarm Summary' with 74 errors, 1 warning, and 699 alerts.

- e. If you want to apply a template to this controller, choose a template name from the drop-down list. The parameters populate according to how the template is set. If you want to create a new WLAN template, use the [click here](#) link to be redirected to the template creation page (see the “[Configuring WLAN Template](#)” section on page 11-22).
- f. Modify the configuration parameters for this WLAN. In our employee WLAN example, you would need to choose **WPA1+WPA2** from the Layer 2 Security drop-down list.
- g. Be sure to enable this WLAN by selecting the **Status** check box under General Policies.

**Note** If NAC is enabled and you created a quarantined VLAN for use with this, make sure to select it from the Interface drop-down list under General Policies. Also, select the **Allow AAA Override** check box to ensure that the controller validates a quarantine VLAN assignment.

- h. Click **Save** to commit your changes.

**Step 2** Follow these steps to create a locally switched WLAN. In our example, this is the second WLAN (employee-local).

- a. Follow the substeps in [Step 1](#) to create a new WLAN. In our example, this WLAN is named “employee-local.”

- b. Click a WLAN ID from the original WLAN page to move to a WLANs edit page. Modify the configuration parameters for this WLAN. In our employee WLAN example, you would need to choose **WPA1+WPA2** from the Layer 2 Security drop-down box. Make sure to choose PSK authentication key management and enter a pre-shared key.

---

**Note** Make sure to enable this WLAN by selecting the **Admin Status** check box under General Policies. Also, make sure to enable local switching by selecting the **H-REAP Local Switching** check box. When you enable local switching, any hybrid-REAP access point that advertises this WLAN is able to locally switch data packets (instead of tunneling them to the controller).

---

---

**Note** For hybrid-REAP access points, the interface mapping at the controller for WLANs configured for H-REAP Local Switching is inherited at the access point as the default VLAN tagging. This can be easily changed per SSID and per hybrid-REAP access point. Non-hybrid-REAP access points tunnel all traffic back to the controller, and VLAN tagging is dictated by each WLAN's interface mapping.

---

- c. Click **Save** to commit your changes.

**Step 3** Follow these steps if you also want to create a centrally switched WLAN that is used for guest access. In our example, this is the third WLAN (guest-central). You might want to tunnel guest traffic to the controller so you can exercise your corporate data policies for unprotected guest traffic from a central site.

- a. Follow the substeps in [Step 1](#) to create a new WLAN. In our example, this WLAN is named “guest-central.”
- b. In the WLANs Edit page, modify the configuration parameters for this WLAN. In our employee WLAN example, you would need to choose **None** from both the Layer 2 Security and Layer 3 Security drop-down boxes from the Security tab, select the **Web Policy** check box, and make sure **Authentication** is selected.

---

**Note** If you are using an external web server, you must configure a preauthentication access control list (ACL) on the WLAN for the server and then choose this ACL as the WLAN preauthentication ACL.

---

- c. Make sure to enable this by selecting the **Status** check box under General Policies.
- d. Click **Save** to commit your changes.
- e. If you want to customize the content and appearance of the login page that guest users see the first time they access this, follow the instructions in the [“Configuring a Web Authentication Template” section on page 11-64](#).
- f. To add a local user to this WLAN, choose **Configure > Controller Template Launch Pad**.
- g. Choose **Security > Local Net Users** from the left sidebar menu.
- h. When the Local Net Users page appears, choose **Add Template** from the Select a command drop-down list, and click **Go**.
- i. Unselect the Import from File check box.
- j. Enter a username and password for the local user.
- k. From the Profile drop-down list, choose the appropriate SSID.

- l. Enter a description of the guest user account.
- m. Click **Save**.

**Step 4** Go to the “[Configuring an Access Point for Hybrid REAP](#)” section on page 12-9 to configure two or three access points for hybrid REAP.

## Configuring an Access Point for Hybrid REAP

This section provides instructions for configuring an access point for hybrid REAP.

Follow these steps to configure an access point for hybrid REAP.

- Step 1** Make sure that the access point has been physically added to your network.
- Step 2** Choose **Configure > Access Points**.
- Step 3** Choose which access point you want to configure for hybrid REAP by clicking one from the AP Name list. The detailed access point page appears (see [Figure 12-3](#)).

**Figure 12-3** Detailed Access Point Page

Access Point Detail : RB\_1140\_0022.bd1a.609a  
Configure > Access Points > Access Point Detail

**Radio Interfaces**

| Protocol    | Admin Status | Channel Number | Power Level | Antenna Diversity |
|-------------|--------------|----------------|-------------|-------------------|
| 802.11b/g/n | Enabled      | 2              | 1           | Not Applicable    |
| 802.11a/n   | Enabled      | 36             | 1           | Not Applicable    |

**Hardware Reset**  
Perform a Hardware reset on this AP

**Set to Factory Defaults**  
Clear configuration on this AP and reset it to factory defaults

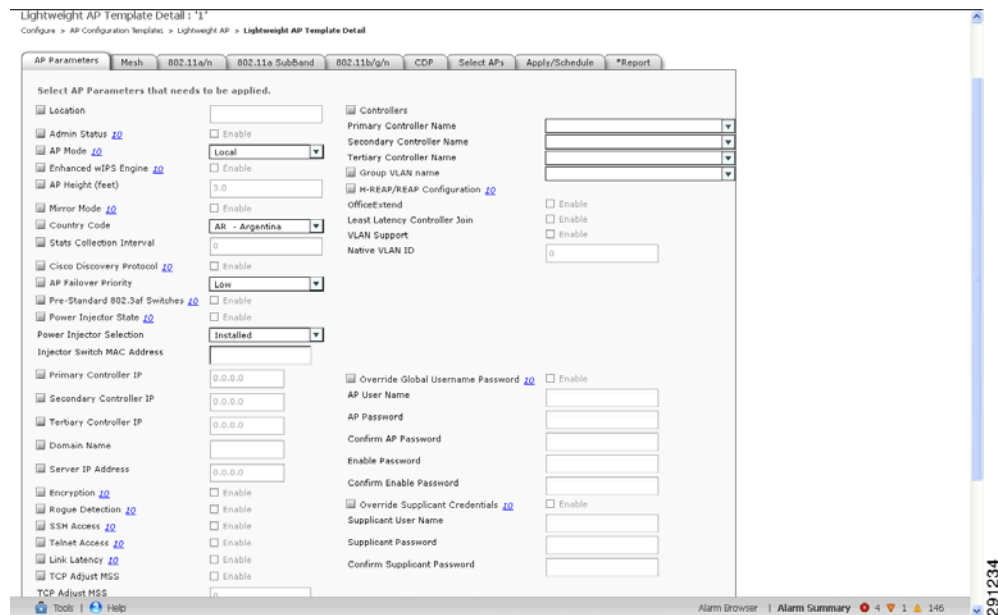

Tools | Help | Alarm Browser | Alarm Summary | 74 | 1 | 698

291233

The last parameter under Inventory Information indicates whether this access point can be configured for hybrid REAP. Only the 1130AG and 1240AG access points support hybrid REAP.

- Step 4** Verify that the AP Mode parameter displays *H-REAP*. If it does not, continue to Step 5. If H-REAP is showing as supported, skip to Step 9.
- Step 5** Choose **Configure > AP Configuration Templates > Lightweight AP** or **Autonomous AP**.
- Step 6** Choose which access point you want to configure for hybrid REAP by clicking one from the AP Name list. The AP Template Detail page appears (see [Figure 12-4](#)).

**Figure 12-4** AP/Radio Template Page

- Step 7** Select the **H-REAP/REAP Config** check box. Enabling this configuration allows you to view all profile mappings.

**Note** If you are changing the mode to H-REAP/REAP and if the access point is not already in H-REAP/REAP mode, all other H-REAP/REAP parameters will not be applied on the access point.

- Step 8** Select the **VLAN Support** check box and enter the number of the native VLAN on the remote network (such as 100) in the **Native VLAN ID** text box.

**Note** By default, a VLAN is not enabled on the hybrid-REAP access point. When hybrid REAP is enabled, the access point inherits the VLAN ID associated to the WLAN. This configuration is saved in the access point and received after the successful join response. By default, the native VLAN is 1. One native VLAN must be configured per hybrid-REAP access point in a VLAN-enabled domain. Otherwise, the access point cannot send and receive packets to and from the controller. When the client is assigned a VLAN from the RADIUS server, that VLAN is associated to the locally switched WLAN.

- Step 9** Click the **Apply/Schedule** tab to save your changes.
- Step 10** The Locally Switched VLANs section shows which WLANs are locally switched and provides their VLAN identifier. Click the **Edit** link to change the number of VLANs from which a client IP address is obtained. You are then redirected to a page where you can save the VLAN identifier changes.
- Step 11** Click **Save** to save your changes.
- Step 12** Repeat this procedure for any additional access points that need to be configured for hybrid REAP at the remote site.
- 

## Connecting Client Devices to the WLANs

Follow the instructions for your client device to create profiles that connect to the WLANs you created in the “[Configuring the Controller for Hybrid REAP](#)” section on page 12-6.

In our example, you would create three profiles on the client:

1. To connect to the “employee” WLAN, you would create a client profile that uses WPA/WPA2 with PEAP-MSCHAPV2 authentication. When the client becomes authenticated, it gets an IP address from the management VLAN of the controller.
2. To connect to the “local-employee” WLAN, you would create a client profile that uses WPA/WPA2 authentication. When the client becomes authenticated, it gets an IP address from VLAN 101 on the local switch.
3. To connect to the “guest-central” WLAN, you would create a profile that uses open authentication. When the client becomes authenticated, it gets an IP address from VLAN 101 on the network local to the access point. After the client connects, the local user types any HTTP address in the web browser. The user is automatically directed to the controller to complete the web-authentication process. When the web login page appears, the user enters his or her username and password.

To see if a client’s data traffic is being locally or centrally switched, click **Monitor > Devices > Clients**.

## Hybrid REAP Access Point Groups

Hybrid REAP enables you to configure and control access points in a branch or remote office from the corporate office through a wide area network (WAN) link without deploying a controller in each office. There is no deployment restriction on the number of hybrid-REAP access points per location, but you can organize and group the access points per floor and limit them per building, since it is likely the branch offices share the same configuration.

By forming access point groups with similar configurations, a procedure such as CCKM fast roaming can be processed more quickly than going through the controller individually. For example, to activate CCKM fast roaming, the H-REAP access points must know the CCKM cache for all clients that could associate. If you have a controller with 300 access points and 1000 clients that can potentially connect, it is quicker and more practical to process and send the CCKM cache for the H-REAP group rather than for all 1000 clients. One particular H-REAP group could focus on a branch office with a small number of access points so that clients in the branch office could only connect to and roam between those few access points. With the established group, features such as CCKM cache and backup RADIUS are configured for the entire H-REAP group rather than being configured in each access point.

All of the hybrid-REAP access points in a group share the same WLAN, backup RADIUS server, CCKM, and local authentication configuration information. This feature is helpful if you have multiple hybrid-REAP access points in a remote office or on the floor of a building and you want to configure them all at once. For example, you can configure a backup RADIUS server for a hybrid-REAP group rather than having to configure the same server on each access point. Figure 12-5 illustrates a typical hybrid-REAP group deployment with a backup RADIUS server in the branch office.

**Figure 12-5** Hybrid-REAP Group Deployment

## Hybrid-REAP Groups and Backup RADIUS Servers

You can configure the controller to allow a hybrid-REAP access point in standalone mode to perform full 802.1x authentication to a backup RADIUS server. You can configure a primary RADIUS server or both a primary and secondary RADIUS server.

## Hybrid-REAP Groups and CCKM

Hybrid-REAP groups are required for CCKM fast roaming to work with hybrid-REAP access points. CCKM fast roaming is achieved by caching a derivative of the master key from a full EAP authentication so that a simple and secure key exchange can occur when a wireless client roams to a different access point. This feature prevents the need to perform a full RADIUS EAP authentication as the client roams from one access point to another. The hybrid-REAP access points need to obtain the CCKM cache information for all the clients that might associate so they can process it quickly instead of sending it back to the controller. If, for example, you have a controller with 300 access points and 100 clients that might associate, sending the CCKM cache for all 100 clients is not practical. If you create a hybrid-REAP group comprising a limited number of access points (for example, you create a group for four access points in a remote office), the clients roam only among those four access points, and the CCKM cache is distributed among those four access points only when the clients associate to one of them.

**Note** CCKM fast roaming among hybrid-REAP and non-hybrid-REAP access points is not supported.

## Hybrid-REAP Groups and Local Authentication

You can configure the controller to allow a hybrid-REAP access point in standalone mode to perform LEAP or EAP-FAST authentication for up to 20 statically configured users. The controller sends the static list of usernames and passwords to each hybrid-REAP access point when it joins the controller. Each access point in the group authenticates only its own associated clients.

This feature is ideal for customers who are migrating from an autonomous access point network to an lightweight hybrid-REAP access point network and are not interested in maintaining a large user database nor adding another hardware device to replace the RADIUS server functionality available in the autonomous access point.

**Note**

This feature can be used in conjunction with the hybrid-REAP backup RADIUS server feature. If a hybrid-REAP group is configured with both a backup RADIUS server and local authentication, the hybrid-REAP access point always attempts to authenticate clients using the primary backup RADIUS server first, followed by the secondary backup RADIUS server (if the primary is not reachable), and finally the hybrid-REAP access point itself (if the primary and secondary are not reachable).

## Configuring Hybrid-REAP Groups

Follow these steps to configure H-REAP groups. If you want to apply an H-REAP template to multiple controllers, refer to the template instructions in the [“Configuring H-REAP AP Groups Template”](#) section on page 11-38.

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Choose a specific controller by clicking on the desired IP address.
  - Step 3** From the left sidebar menu choose **H-REAP > H-REAP AP Groups**. The established H-REAP AP groups appear.
  - Step 4** The Group Name column shows the group names assigned to the H-REAP access point groups. If you want to add an additional group, choose **Add H-REAP AP Group** from the Select a command drop-down list.  
or  
To make modifications to an existing template, click a template in the Template Name column. The General tab of the H-REAP AP Groups template appears (see [Figure 12-6](#)).

Figure 12-6 H-REAP AP Groups

**Note** To delete a group name, click the group name you want to remove and choose **Delete H-REAP AP Group** from the Select a command drop-down list.

The Template Name parameter shows the group name assigned to the H-REAP access point group.

**Step 5** Choose the primary RADIUS authentication servers for each group. If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply.

**Note** You must configure the RADIUS server configuration on the controller before you apply H-REAP RADIUS server configuration from NCS.

**Step 6** Choose the secondary RADIUS authentication servers for each group. If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply.

**Step 7** If you want to add an access point to the group, click the **H-REAP AP** tab.

**Step 8** An access point Ethernet MAC address cannot exist in more than one H-REAP group on the same controller. If more than one group is applied to the same controller, click the **Ethernet MAC** check box to unselect an access point from one of the groups. You should save this change or apply it to controllers.

**Step 9** If you want to enable local authentication for a hybrid-REAP group, click the **H-REAP Configuration** tab. The H-REAP Configuration tab appears.

---

**Note** Make sure that the Primary RADIUS Server and Secondary RADIUS Server parameters are set to **None** on the General tab.

---

**Step 10** Select the **H-REAP Local Authentication** check box to enable local authentication for this hybrid-REAP group. The default value is unselected.

---

**Note** When you attempt to use this feature, a warning message indicates that it is a licensed feature.

---

**Step 11** To allow a hybrid-REAP access point to authenticate clients using LEAP, select the **LEAP** check box. Otherwise, to allow a hybrid-REAP access point to authenticate clients using EAP-FAST, select the **EAP-FAST** check box.

**Step 12** Perform one of the following, depending on how you want protected access credentials (PACs) to be provisioned:

- To use manual PAC provisioning, enter the key used to encrypt and decrypt PACs in the EAP-FAST Key text box. The key must be 32 hexadecimal characters.
- To allow PACs to be sent automatically to clients that do not have one during PAC provisioning, select the **Auto Key Generation** check box.

**Step 13** In the EAP-FAST Authority ID text box, enter the authority identifier of the EAP-FAST server. The identifier must be 32 hexadecimal characters.

**Step 14** In the EAP-FAST Authority Info text box, enter the authority identifier of the EAP-FAST server in text format. You can enter up to 32 hexadecimal characters.

**Step 15** In the EAP-FAST Pac Timeout text box, specify a PAC timeout value by entering the number of seconds for the PAC to remain viable in the edit box. The valid range is 2 to 4095 seconds.

---

**Note** To verify that an individual access point belongs to a hybrid-REAP group, click the **Users configured in the group** link. It advances you to the H-REAP AP Group screen which shows the names of the groups and the access points that belong in it.

---

## Auditing an H-REAP Group

If the H-REAP configuration changes over a period of time either on NCS or the controller, you can audit the configuration. The changes are visible on subsequent screens. You can choose to synchronize the configuration by refreshing NCS or the controller.

# CHAPTER 13

## Alarm and Event Dictionary

---

This chapter describes the event and alarm notifications that the wireless LAN controller, access points, and location appliances can receive. It also identifies specific actions the administrator can take to address these alarms and events.

It describes the event and alarm notifications that the wireless LAN controller, access points, and location appliances can receive. In addition, specific actions an administrator can do to address these alarms and events are described.

### Note

---

Not all traps which are seen on the WLC GUI are supported by NCS.

# Notification Format

For each alarm and event notification, the following information is provided (see [Table 13-1](#)).

**Table 13-1** Trap Notification Format

| Field               | NCS Message                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | The MIB Name is the name of the notification as defined in the management information base (MIB). In some cases, if the event is specific only to the NMS, this field is not relevant. You can define multiple events in NCS from the same trap based on the values of the variables present in the trap. In such cases, multiple subentries appear with the same MIB Name. In addition, this field displays the value of the variable that caused NCS to generate this event. |
| Alarm Condition     | This field displays the condition for which the trap was generated.                                                                                                                                                                                                                                                                                                                                                                                                            |
| NCS Message         | The NCS Message is a text string that reflects the message displayed in the NCS alarm or event browser associated with this event. Numbers such as "{0}" reflect internal NCS variables that typically are retrieved from variables in the trap. However, the order of the variables as they appear in the trap cannot be derived from the numbers.                                                                                                                            |
| Symptoms            | This field displays the symptoms associated with this event.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Severity            | This field displays the severity assigned to this event in NCS.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category            | This field displays the category of the trap.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Probable Causes     | This field lists the probable causes of the notification.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Recommended Actions | This field lists any actions recommended for the administrator managing the wireless network.                                                                                                                                                                                                                                                                                                                                                                                  |

## Traps Added in Release 2.0

The following traps were added to WCS Release 2.0:

- [AP\\_BIG\\_NAV\\_DOS\\_ATTACK](#), page 13-4
- [AP\\_CONTAINED\\_AS\\_ROGUE](#), page 13-4
- [AP\\_HAS\\_NO\\_RADIOS](#), page 13-4
- [AP\\_MAX\\_ROGUE\\_COUNT\\_CLEAR](#), page 13-5
- [AP\\_MAX\\_ROGUE\\_COUNT\\_EXCEEDED](#), page 13-5
- [AUTHENTICATION\\_FAILURE](#) (From MIB-II standard), page 13-6
- [BSN\\_AUTHENTICATION\\_FAILURE](#), page 13-6
- [IPSEC\\_IKE\\_NEG\\_FAILURE](#), page 13-6
- [IPSEC\\_INVALID\\_COOKIE](#), page 13-7
- [LINK\\_DOWN](#) (FROM MIB-II STANDARD), page 13-7
- [LINK\\_UP](#) (FROM MIB-II STANDARD), page 13-7
- [LRAD\\_ASSOCIATED](#), page 13-7
- [LRAD\\_DISASSOCIATED](#), page 13-8

- LRADIF\_COVERAGE\_PROFILE\_PASSED, page 13-8
- LRADIF\_CURRENT\_CHANNEL\_CHANGED, page 13-9
- LRADIF\_CURRENT\_TXPOWER\_CHANGED, page 13-9
- LRADIF\_DOWN, page 13-9
- LRADIF\_INTERFERENCE\_PROFILE\_FAILED, page 13-10
- LRADIF\_INTERFERENCE\_PROFILE\_PASSED, page 13-10
- LRADIF\_LOAD\_PROFILE\_PASSED, page 13-11
- LRADIF\_NOISE\_PROFILE\_PASSED, page 13-11
- LRADIF\_UP, page 13-11
- MAX\_ROGUE\_COUNT\_CLEAR, page 13-12
- MAX\_ROGUE\_COUNT\_EXCEEDED, page 13-12
- MULTIPLE\_USERS, page 13-12
- NETWORK\_DISABLED, page 13-13
- NO\_ACTIVITY\_FOR\_ROGUE\_AP, page 13-13
- POE\_CONTROLLER\_FAILURE, page 13-13
- RADIO\_ADMIN\_UP\_OPER\_DOWN, page 13-14
- RADIOS\_EXCEEDED, page 13-14
- RADIUS\_SERVERS\_FAILED, page 13-14
- ROGUE\_ADHOC\_DETECTED, page 13-15
- ROGUE\_ADHOC\_ON\_NETWORK, page 13-15
- ROGUE\_AP\_DETECTED, page 13-15
- ROGUE\_AP\_ON\_NETWORK, page 13-16
- ROGUE\_AP\_REMOVED, page 13-16
- RRM\_DOT11\_A\_GROUPING\_DONE, page 13-17
- RRM\_DOT11\_B\_GROUPING\_DONE, page 13-17
- SENSED\_TEMPERATURE\_HIGH, page 13-17
- SENSED\_TEMPERATURE\_LOW, page 13-18
- STATION\_ASSOCIATE, page 13-18
- STATION\_ASSOCIATE\_FAIL, page 13-18
- STATION\_AUTHENTICATE, page 13-19
- STATION\_AUTHENTICATION\_FAIL, page 13-19
- STATION\_BLACKLISTED, page 13-19
- STATION\_DEAUTHENTICATE, page 13-20
- STATION\_DISASSOCIATE, page 13-20
- STATION\_WEP\_KEY\_DECRYPT\_ERROR, page 13-20
- STATION\_WPA\_MIC\_ERROR\_COUNTER\_ACTIVATED, page 13-21
- SWITCH\_DETECTED\_DUPLICATE\_IP, page 13-21
- SWITCH\_UP, page 13-22

- [TEMPERATURE\\_SENSOR\\_CLEAR](#), page 13-22
- [TEMPERATURE\\_SENSOR\\_FAILURE](#), page 13-22
- [TOO\\_MANY\\_USER\\_UNSUCCESSFUL\\_LOGINS](#), page 13-23

## AP\_BIG\_NAV\_DOS\_ATTACK

|                     |                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnApBigNavDosAttack.                                                                                                                                                             |
| Alarm Condition     | AP big nav DOS attack.                                                                                                                                                            |
| NCS Message         | The AP "{0}" with protocol "{1}" receives a message with a large NAV field and all traffic on the channel is suspended. This is most likely a malicious denial of service attack. |
| Symptoms            | The system detected a possible denial of service attack and suspended all traffic to the affected channel.                                                                        |
| Severity            | Critical.                                                                                                                                                                         |
| Category            | Security                                                                                                                                                                          |
| Probable Causes     | A malicious denial of service attack is underway.                                                                                                                                 |
| Recommended Actions | Identify the source of the attack in the network and take the appropriate action immediately.                                                                                     |

## AP\_CONTAINED\_AS\_ROGUE

|                     |                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPContainedAsARogue.                                                                   |
| Alarm Condition     | AP contained as rogue.                                                                    |
| NCS Message         | AP "{0}" with protocol "{1}" on Switch "{2}" is contained as a Rogue preventing service.  |
| Symptoms            | An access point is reporting that it is being contained as a rogue.                       |
| Severity            | Critical.                                                                                 |
| Category            | Access Point.                                                                             |
| Probable Causes     | Another system is containing this access point.                                           |
| Recommended Actions | Identify the system containing this access point. You may need to use a wireless sniffer. |

## AP\_HAS\_NO\_RADIOS

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| MIB Name        | bsnApHasNoRadioCards.                                    |
| Alarm Condition | AP has no radios.                                        |
| NCS Message     | AP "{0}" on Controller "{1}" has no Radio cards.         |
| Symptoms        | An access point is reporting that it has no radio cards. |
| Severity        | Critical.                                                |
| Category        | Access Point.                                            |

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| MIB Name            | bsnApHasNoRadioCards.                                        |
| Alarm Condition     | AP has no radios.                                            |
| Probable Causes     | Manufacturing fault or damage to the system during shipping. |
| Recommended Actions | Call customer support.                                       |

### AP\_MAX\_ROGUE\_COUNT\_CLEAR

|                     |                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnApMaxRogueCountClear.                                                                                                                            |
| Alarm Condition     | AP maximum rogue count cleared.                                                                                                                     |
| NCS Message         | Fake AP or other attack on AP with MAC address "{0}" associated with Switch "{2}" is cleared now. Rogue AP count is within the threshold of "{1}'." |
| Symptoms            | The number of rogues detected by a switch (controller) is within acceptable limits.                                                                 |
| Severity            | Clear.                                                                                                                                              |

| Probable Causes     | None.                                                                                                                                               |
| Recommended Actions | None.                                                                                                                                               |

### AP\_MAX\_ROGUE\_COUNT\_EXCEEDED

|                     |                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnApMaxRogueCountExceeded.                                                                                                                                                 |
| Alarm Condition     | AP maximum rogue count exceeded.                                                                                                                                            |
| NCS Message         | Fake AP or other attack may be in progress. Rogue AP count on AP with MAC address "{0}" associated with Switch "{2}" has exceeded the severity warning threshold of "{1}'." |
| Symptoms            | The number of rogues detected by a switch (controller) exceeds the internal threshold.                                                                                      |
| Severity            | Critical.                                                                                                                                                                   |
| Category            | Rogue AP                                                                                                                                                                    |
| Probable Causes     | <ul style="list-style-type: none"> <li>• There may be too many rogue access points in the network.</li> <li>• A fake access point attack may be in progress.</li> </ul>     |
| Recommended Actions | Identify the source of the rogue access points.                                                                                                                             |

**AUTHENTICATION\_FAILURE (From MIB-II standard)**

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| MIB Name            | AuthenticationFailure.                                                                                          |
| Alarm Condition     | Authentication failure reported by controller.                                                                  |
| NCS Message         | Switch "{0}". Authentication failure reported.                                                                  |
| Symptoms            | There was an SNMP authentication failure on the switch (controller).                                            |
| Severity            | Minor.                                                                                                          |
| Category            | Security                                                                                                        |
| Probable Causes     | An incorrect community string is in use by a management application.                                            |
| Recommended Actions | Identify the source of the incorrect community string and correct the string within the management application. |

**BSN\_AUTHENTICATION\_FAILURE**

|                     |                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAuthenticationFailure.                                                                                                  |
| Alarm Condition     | Client authentication failure.                                                                                             |
| NCS Message         | Switch "{0}." User authentication from Switch "{0}" failed for user name "{1}" and user type "{2}."                        |
| Symptoms            | A user authentication failure is reported for a local management user or a MAC filter is configured on the controller.     |
| Severity            | Minor.                                                                                                                     |
| Category            | Clients                                                                                                                    |
| Probable Causes     | Incorrect login attempt by an admin user from the controller CLI or controller GUI, or a client accessing the WLAN system. |
| Recommended Actions | If the user has forgotten the password, the superuser may need to reset it.                                                |

**IPSEC\_IKE\_NEG\_FAILURE**

|                     |                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnIpssecIkeNegFailure.                                                                                                                                           |
| Alarm Condition     | IPsec IKE negotiation failure.                                                                                                                                    |
| NCS Message         | IPsec IKE Negotiation failure from remote IP address "{0}."                                                                                                       |
| Symptoms            | Unable to establish an IPsec tunnel between a client and a WLAN appliance.                                                                                        |
| Severity            | Minor.                                                                                                                                                            |
| Category            | Security                                                                                                                                                          |
| Probable Causes     | Configuration mismatch.                                                                                                                                           |
| Recommended Actions | Validate configuration, verify that authentication credentials match (preshared keys or certificates); and verify that encryption algorithms and strengths match. |

**IPSEC\_INVALID\_COOKIE**

|                     |                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnIpssecInvalidCookieTrap.                                                                                                                                                              |
| Alarm Condition     | IPsec invalid cookie.                                                                                                                                                                    |
| NCS Message         | IPsec Invalid cookie from remote IP address "{0}."                                                                                                                                       |
| Symptoms            | Cannot successfully negotiate an IPsec session.                                                                                                                                          |
| Severity            | Minor.                                                                                                                                                                                   |
| Category            | Security                                                                                                                                                                                 |
| Probable Causes     | Synchronization problem. The client believes a tunnel exists while the WLAN appliance does not. This problem often happens when the IPsec client does not detect a disassociation event. |
| Recommended Actions | Reset the IPsec client and then restart tunnel establishment.                                                                                                                            |

**LINK\_DOWN (FROM MIB-II STANDARD)**

|                     |                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | linkDown.                                                                                                                                        |
| Alarm Condition     | Interface state change.                                                                                                                          |
| NCS Message         | Port "{0}" is down on Switch "{1}."                                                                                                              |
| Symptoms            | The physical link on one of the switch (controller) ports is down.                                                                               |
| Severity            | Critical.                                                                                                                                        |
| Category            | Controller.                                                                                                                                      |
| Probable Causes     | <ul style="list-style-type: none"> <li>An access point or a port was manually disconnected from the network.</li> <li>A port failure.</li> </ul> |
| Recommended Actions | Troubleshoot physical network connectivity to the affected port.                                                                                 |

| MIB Name        | bsnWepKeyDecryptError.                                                                                                  |
| Alarm Condition | Client WEP key decryption error.                                                                                        |
| NCS Message     | The WEP Key configured at the station may be wrong. Station MAC Address is "{0}," AP MAC is "{1}" and Slot ID is "{2}." |
| Symptoms        | A client station seems to have the wrong WEP key.                                                                       |
| Severity        | Minor.                                                                                                                  |
| Category        | Security                                                                                                                |

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| Probable Causes     | A client has an incorrectly configured WEP key.            |
| Recommended Actions | Identify the client and correct the WEP key configuration. |

## STATION\_WPA\_MIC\_ERROR\_COUNTER\_ACTIVATED

|                     |                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnWpaMicErrorCounterActivated.                                                                                                                                 |
| Alarm Condition     | Client WPA MIC error counter activated.                                                                                                                         |
| NCS Message         | The AP "{1}" received a WPA MIC error on protocol "{2}" from Station "{0}." Counter measures have been activated and traffic has been suspended for 60 seconds. |
| Symptoms            | A client station has detected a WPA MIC error.                                                                                                                  |
| Severity            | Critical.                                                                                                                                                       |
| Category            | Security                                                                                                                                                        |
| Probable Causes     | A possible hacking attempt is underway.                                                                                                                         |
| Recommended Actions | Identify the station that is the source of this threat.                                                                                                         |

## SWITCH\_DETECTED\_DUPLICATE\_IP

|                     |                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnDuplicateIpAddressReported.                                                                             |
| Alarm Condition     | Controller Detected Duplicate IP.                                                                          |
| NCS Message         | Switch "{0}" detected duplicate IP address "{0}" being used by machine with mac address "{1}."             |
| Symptoms            | The system has detected a duplicate IP address in the network that is assigned to the switch (controller). |
| Severity            | Critical.                                                                                                  |
| Category            | Security                                                                                                   |
| Probable Causes     | Another device in the network is configured with the same IP address as that of the switch (controller).   |
| Recommended Actions | Correct the misconfiguration of IP addresses in the network.                                               |

**SWITCH\_UP**

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| MIB Name            | This is a NCS-only event.                                           |
| Alarm Condition     | Controller up.                                                      |
| NCS Message         | Switch "{0}" is reachable.                                          |
| Symptoms            | A switch (controller) is now reachable from the management station. |
| Severity            | Clear.                                                              |
| Category            | Switch                                                              |
| Probable Causes     | A switch (controller) is reachable from the management station.     |
| Recommended Actions | None.                                                               |

**TEMPERATURE\_SENSOR\_CLEAR**

|                     |                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------|
| MIB Name            | bsnTemperatureSensorClear.                                                                  |
| Alarm Condition     | Temperature sensure clear                                                                   |
| NCS Message         | The temperature sensor is working now on the switch "{0}." The sensed temperature is "{1}." |
| Symptoms            | The temperature sensor is operational.                                                      |
| Severity            | Clear.                                                                                      |
| Category            | Controller                                                                                  |
| Probable Causes     | The system is detecting the temperature sensor to be operational now.                       |
| Recommended Actions | None.                                                                                       |

**TEMPERATURE\_SENSOR\_FAILURE**

|                     |                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnTemperatureSensorFailure.                                                                                          |
| Alarm Condition     | Temperature sensor failure                                                                                            |
| NCS Message         | The temperature sensor failed on the Switch "{0}." Temperature is unknown.                                            |
| Symptoms            | The system is reporting that a temperature sensor has failed and the system is unable to report accurate temperature. |
| Severity            | Major.                                                                                                                |
| Category            | Controller                                                                                                            |
| Probable Causes     | The temperature sensor has failed due to hardware failure.                                                            |
| Recommended Actions | Call customer support.                                                                                                |

## TOO\_MANY\_USER\_UNSUCCESSFUL\_LOGINS

|                     |                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnTooManyUnsuccessLoginAttempts.                                                                                                                                                                             |
| Alarm Condition     | Too many user unsuccessful logins.                                                                                                                                                                            |
| NCS Message         | User "{1}" with IP Address "{0}" has made too many unsuccessful login attempts.                                                                                                                               |
| Symptoms            | A management user has made too many login attempts.                                                                                                                                                           |
| Severity            | Critical.                                                                                                                                                                                                     |
| Category            | Security                                                                                                                                                                                                      |
| Probable Causes     | <ul style="list-style-type: none"> <li>• An admin user has made too many login attempts.</li> <li>• A user attempted to break into the administration account of the management system.</li> </ul>            |
| Recommended Actions | <ul style="list-style-type: none"> <li>• Identify the source of the login attempts and take the appropriate action.</li> <li>• Increase the value of the login attempt threshold if it is too low.</li> </ul> |

## Traps Added in Release 2.1

The following traps were added for WCS Release 2.1:

- [ADHOC\\_ROGUE\\_AUTO\\_CONTAINED](#), page 13-24
- [ADHOC\\_ROGUE\\_AUTO\\_CONTAINED\\_CLEAR](#), page 13-24
- [NETWORK\\_ENABLED](#), page 13-24
- [ROGUE\\_AP\\_AUTO\\_CONTAINED](#), page 13-25
- [ROGUE\\_AP\\_AUTO\\_CONTAINED\\_CLEAR](#), page 13-25
- [TRUSTED\\_AP\\_INVALID\\_ENCRYPTION](#), page 13-25
- [TRUSTED\\_AP\\_INVALID\\_ENCRYPTION\\_CLEAR](#), page 13-26
- [TRUSTED\\_AP\\_INVALID\\_RADIO\\_POLICY](#), page 13-26
- [TRUSTED\\_AP\\_INVALID\\_RADIO\\_POLICY\\_CLEAR](#), page 13-26
- [TRUSTED\\_AP\\_INVALID\\_SSID](#), page 13-26
- [TRUSTED\\_AP\\_INVALID\\_SSID\\_CLEAR](#), page 13-27
- [TRUSTED\\_AP\\_MISSING](#), page 13-27
- [TRUSTED\\_AP\\_MISSING\\_CLEAR](#), page 13-27

**ADHOC\_ROGUE\_AUTO\_CONTAINED**

|                     |                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAdhocRogueAutoContained.                                                                                                  |
| Alarm Condition     | Adhoc Rogue auto contained.                                                                                                  |
| NCS Message         | Adhoc Rogue "{0}" was found and is auto contained as per WPS policy.                                                         |
| Symptoms            | The system detected an ad hoc rogue and automatically contained it.                                                          |
| Severity            | Major.                                                                                                                       |
| Category            | Security                                                                                                                     |
| Probable Causes     | The system detected an ad hoc rogue and automatically contained it as configured in the system's wireless prevention policy. |
| Recommended Actions | Identify the ad hoc rogue through the location application and take the appropriate action.                                  |

| Symptoms            | The wireless system no longer detects a trusted access point.        |
| Severity            | Major.                                                               |
| Category            | Security                                                             |
| Probable Causes     | A trusted access point has left the network or has failed.           |
| Recommended Actions | Track down the trusted access point and take the appropriate action. |

### TRUSTED\_AP\_MISSING\_CLEAR

|                 |                                                                          |
|-----------------|--------------------------------------------------------------------------|
| MIB Name        | bsnTrustedApIsMissing (bsnClearTrapVariable set to true).                |
| Alarm Condition | Trusted AP missing clear.                                                |
| NCS Message     | Trusted AP "{0}" is missing or has failed. The alert state is clear now. |
| Symptoms        | The system has found a trusted access point again.                       |
| Severity        | Clear.                                                                   |
| Category        | Security                                                                 |

|                     |                                                                    |
|---------------------|--------------------------------------------------------------------|
| Probable Causes     | The system has detected a previously missing trusted access point. |
| Recommended Actions | None.                                                              |

## Traps Added in Release 2.2

The following traps were added in WCS Release 2.2:

- [AP\\_IMPERSONATION\\_DETECTED](#), page 13-28
- [AP\\_RADIO\\_CARD\\_RX\\_FAILURE](#), page 13-28
- [AP\\_RADIO\\_CARD\\_RX\\_FAILURE\\_CLEAR](#), page 13-29
- [AP\\_RADIO\\_CARD\\_TX\\_FAILURE](#), page 13-29
- [AP\\_RADIO\\_CARD\\_TX\\_FAILURE\\_CLEAR](#), page 13-29
- [SIGNATURE\\_ATTACK\\_CLEARED](#), page 13-30
- [SIGNATURE\\_ATTACK\\_DETECTED](#), page 13-30
- [TRUSTED\\_AP\\_INVALID\\_PREAMBLE](#), page 13-31
- [TRUSTED\\_AP\\_INVALID\\_PREAMBLE\\_CLEARED](#), page 13-31

### AP\_IMPERSONATION\_DETECTED

|                     |                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPImpersonationDetected.                                                                                                                                                                       |
| Alarm Condition     | AP impersonation detected.                                                                                                                                                                        |
| NCS Message         | AP Impersonation with MAC "{0}" is detected by authenticated AP "{1}" on "{2}" radio and Slot ID "{3}."                                                                                           |
| Symptoms            | A radio of an authenticated access point has heard from another access point whose MAC address neither matches that of a rogue nor is it an authenticated neighbor of the detecting access point. |
| Severity            | Critical.                                                                                                                                                                                         |
| Category            | Security                                                                                                                                                                                          |
| Probable Causes     | A severity breach related to access point impersonation may be under way.                                                                                                                         |
| Recommended Actions | Track down the MAC address of the impersonating access point in the network and contain it.                                                                                                       |

### AP\_RADIO\_CARD\_RX\_FAILURE

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| MIB Name        | bsnAPRadioCardRxFailure.                                                  |
| Alarm Condition | AP impersonation detected.                                                |
| NCS Message     | Receiver failure detected on the "{0}" radio of AP "{1}" on Switch "{2}." |
| Symptoms        | A radio card is unable to receive data.                                   |
| Severity        | Critical.                                                                 |
| Category        | Security                                                                  |

|                     |                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Probable Causes     | <ul style="list-style-type: none"> <li>• A radio card is experiencing reception failure.</li> <li>• The antenna of the radio is disconnected.</li> </ul> |
| Recommended Actions | <ul style="list-style-type: none"> <li>• Check the access point's antenna connection.</li> <li>• Call customer support.</li> </ul>                       |

### AP\_RADIO\_CARD\_RX\_FAILURE\_CLEAR

|                     |                                                                          |
|---------------------|--------------------------------------------------------------------------|
| MIB Name            | bsnAPRadioCardRxFailureClear.                                            |
| Alarm Condition     | Radiocard failure clear.                                                 |
| NCS Message         | Receiver failure cleared on the "{0}" radio of AP "{1}" on Switch "{2}." |
| Symptoms            | A radio is no longer experiencing reception failure.                     |
| Severity            | Clear.                                                                   |
| Category            | Access Point.                                                            |
| Probable Causes     | A malfunction in the access point has been corrected.                    |
| Recommended Actions | None.                                                                    |

### AP\_RADIO\_CARD\_TX\_FAILURE

|                     |                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPRadioCardTxFailure.                                                                                                                                        |
| Alarm Condition     | Radiocard failure.                                                                                                                                              |
| NCS Message         | Transmitter failure detected on the "{0}" radio of AP "{1}" on Switch "{2}."                                                                                    |
| Symptoms            | A radio card is unable to transmit.                                                                                                                             |
| Severity            | Critical.                                                                                                                                                       |
| Category            | Access Point.                                                                                                                                                   |
| Probable Causes     | <ul style="list-style-type: none"> <li>• A radio card is experiencing transmission failure.</li> <li>• The antenna of the radio may be disconnected.</li> </ul> |
| Recommended Actions | <ul style="list-style-type: none"> <li>• Check the antenna of the access point.</li> <li>• Call customer support.</li> </ul>                                    |

### AP\_RADIO\_CARD\_TX\_FAILURE\_CLEAR

|                     |                                                                             |
|---------------------|-----------------------------------------------------------------------------|
| MIB Name            | bsnAPRadioCardTxFailureClear.                                               |
| Alarm Condition     | NA                                                                          |
| NCS Message         | Transmitter failure cleared on the "{0}" radio of AP "{1}" on Switch "{2}." |
| Symptoms            | A radio is no longer experiencing transmission failure.                     |
| Severity            | Clear.                                                                      |
| Category            | Access Point.                                                               |
| Probable Causes     | A malfunction in the access point has been corrected.                       |
| Recommended Actions | None.                                                                       |

**SIGNATURE\_ATTACK\_CLEARED**

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnSignatureAttackDetected (bsnClearTrapVariable is set to True).                                            |
| Alarm Condition     | Signature attack cleared.                                                                                    |
| NCS Message         | Switch "{0}" is cleared from IDS signature attack. The wireless system is no longer detecting the intrusion. |
| Symptoms            | The switch (controller) no longer detects a signature attack.                                                |
| Severity            | Clear.                                                                                                       |
| Category            | Security                                                                                                     |
| Probable Causes     | The signature attack that the system previously detected has stopped.                                        |
| Recommended Actions | None.                                                                                                        |

**SIGNATURE\_ATTACK\_DETECTED**

|                     |                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnSignatureAttackDetected                                                                                                                                                                                                       |
| Alarm Condition     | Signature attack detected                                                                                                                                                                                                        |
| NCS Message         | IDS Signature attack detected on Switch "{0}." The Signature Type is "{1}," Signature Name is "{2}," and Signature description is "{3}."                                                                                         |
| Symptoms            | The switch (controller) is detecting a signature attack. The switch (controller) has a list of signatures that it monitors. When it detects a signature, it provides the name of the signature attack in the alert it generates. |
| Severity            | Critical.                                                                                                                                                                                                                        |
| Category            | Security                                                                                                                                                                                                                         |
| Probable Causes     | Someone is mounting a malevolent signature attack.                                                                                                                                                                               |
| Recommended Actions | Track down the source of the signature attack in the wireless network and take the appropriate action.                                                                                                                           |

**TRUSTED\_AP\_INVALID\_PREAMBLE**

|                     |                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnTrustedApHasInvalidPreamble.                                                                                                          |
| Alarm Condition     | Trusted AP with invalid preamble.                                                                                                        |
| NCS Message         | Trusted AP "{0}" on Switch "{3}" has invalid preamble. It is using "{1}" instead of "{2}." It has been auto contained as per WPS policy. |
| Symptoms            | The system has contained a trusted rogue access point for using an invalid preamble.                                                     |
| Severity            | Major.                                                                                                                                   |
| Category            | Security                                                                                                                                 |
| Probable Causes     | The system has detected a possible severity breach because a rogue is transmitting an invalid preamble.                                  |
| Recommended Actions | Locate the rogue access point using location features or the access point detecting it and take the appropriate actions.                 |

**TRUSTED\_AP\_INVALID\_PREAMBLE\_CLEARED**

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| MIB Name            | bsnTrustedApHasInvalidPreamble (bsnClearTrapVariable is set to true).                |
| Alarm Condition     | Trusted AP with invalid preamble cleared.                                            |
| NCS Message         | Trusted AP "{0}" on Switch "{3}" had invalid preamble. The alert state is clear now. |
| Symptoms            | The system has cleared a previous alert about a trusted access point.                |
| Severity            | Clear.                                                                               |
| Category            | Security                                                                             |
| Probable Causes     | The system has cleared a previous alert about a trusted access point.                |
| Recommended Actions | None.                                                                                |

**Traps Added in Release 3.0**

The following traps were added in WCS Release 3.0:

- [AP\\_FUNCTIONALITY\\_DISABLED](#), page 13-32
- [AP\\_IP\\_ADDRESS\\_FALLBACK](#), page 13-32
- [AP\\_REGULATORY\\_DOMAIN\\_MISMATCH](#), page 13-33
- [RX\\_MULTICAST\\_QUEUE\\_FULL](#), page 13-33

**AP\_FUNCTIONALITY\_DISABLED**

|                     |                                                                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPFunctionalityDisabled.                                                                                                                                                          |
| Alarm Condition     | AP functionality disabled.                                                                                                                                                           |
| NCS Message         | AP functionality has been disabled for key "{0}," reason being "{1}" for feature-set "{2}."                                                                                          |
| Symptoms            | The system sends this trap out when the controller disables access point functionality because the license key has expired.                                                          |
| Severity            | Critical.                                                                                                                                                                            |
| Category            | Controller                                                                                                                                                                           |
| Probable Causes     | When the controller boots up, it checks whether the feature license key matches the controller's software image. If it does not, the controller disables access point functionality. |
| Recommended Actions | Configure the correct license key on the controller and reboot it to restore access point functionality.                                                                             |

**AP\_IP\_ADDRESS\_FALLBACK**

|                     |                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPIPAddressFallback.                                                                                                                                                             |
| Alarm Condition     | AP IP fallback.                                                                                                                                                                     |
| NCS Message         | AP "{0}" with static-ip configured as "{2}" has fallen back to the working DHCP address "{1}."                                                                                      |
| Symptoms            | This trap is sent out when an access point, with the configured static ip-address, fails to establish connection with the outside world and starts using DHCP as a fallback option. |
| Severity            | Minor.                                                                                                                                                                              |
| Category            | Access Point.                                                                                                                                                                       |
| Probable Causes     | If the configured IP address on the access point is incorrect or obsolete, and if the AP Fallback option is enabled on the switch (controller), the access point starts using DHCP. |
| Recommended Actions | Reconfigure the access point's static IP to the correct IP address if desired.                                                                                                      |

**AP\_REGULATORY\_DOMAIN\_MISMATCH**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPRegulatoryDomainMismatch.                                                                                                                                                                                                                                                                                                                                                                                         |
| Alarm Condition     | AP regulatory domain mismatch.                                                                                                                                                                                                                                                                                                                                                                                         |
| NCS Message         | AP "{1}" is unable to associate. The Regulatory Domain configured on it "{3}" does not match the Controller "{0}" country code "{2}."                                                                                                                                                                                                                                                                                  |
| Symptoms            | The system generates this trap when an access point's regulatory domain does not match the country code configured on the controller. Due to the country code mismatch, the access point will fail to associate with the controller.                                                                                                                                                                                   |
| Severity            | Critical.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Category            | Access Point.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Probable Causes     | <ul style="list-style-type: none"> <li>• If someone changes the controller's country code configuration and some of the existing access points support a different country code, these access points fail to associate.</li> <li>• An access point on the controller's network sends join requests to the controller, but the regulatory domain is outside the domain in which the controller is operating.</li> </ul> |
| Recommended Actions | Either remove the access points that are not meant for inclusion in the controller's domain or correct the controller's country code setting.                                                                                                                                                                                                                                                                          |

**RX\_MULTICAST\_QUEUE\_FULL**

|                     |                                                                     |
|---------------------|---------------------------------------------------------------------|
| MIB Name            | bsnRxMulticastQueueFull.                                            |
| Alarm Condition     | CPU RX Multicast queue full.                                        |
| NCS Message         | CPU Receive Multicast Queue is full on Controller "{0}."            |
| Symptoms            | This trap indicates that the CPU's Receive Multicast queue is full. |
| Severity            | Critical.                                                           |
| Category            | Controller                                                          |
| Probable Causes     | An ARP storm.                                                       |
| Recommended Actions | None.                                                               |

## Traps Added in Release 3.1

The following traps were added in WCS Release 3.1:

- [AP\\_AUTHORIZATION\\_FAILURE](#), page 13-34
- [HEARTBEAT\\_LOSS\\_TRAP](#), page 13-35
- [INVALID\\_RADIO\\_INTERFACE](#), page 13-35
- [RADAR\\_CLEARED](#), page 13-36
- [RADAR\\_DETECTED](#), page 13-36
- [RADIO\\_CORE\\_DUMP](#), page 13-36
- [RADIO\\_INTERFACE\\_DOWN](#), page 13-37
- [RADIO\\_INTERFACE\\_UP](#), page 13-37
- [UNSUPPORTED\\_AP](#), page 13-37

### AP\_AUTHORIZATION\_FAILURE

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| MIB Name            | bsnAPIfUp.                                                                                                                                                                                   |
| Alarm Condition     | Radio interface up.                                                                                                                                                                          |
| NCS Message         | Radio with MAC address "{0}" and protocol "{1}" is up. The reason is "{2}."                                                                                                                  |
| Symptoms            | When a radio interface is operational again, NCS clears the previous alert. Reason for the radio being up again is also noted.                                                               |
| Severity            | Clear.                                                                                                                                                                                       |
| Category            | Access Point.                                                                                                                                                                                |
| Probable Causes     | <ul style="list-style-type: none"> <li>• Admin status of access point is enabled.</li> <li>• Admin status of radio is enabled.</li> <li>• Global network admin status is enabled.</li> </ul> |
| Recommended Actions | None.                                                                                                                                                                                        |

**UNSUPPORTED\_AP**

|                 |                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------|
| MIB Name        | unsupportedAPTrap.                                                                                   |
| Alarm Condition | Unsupported AP.                                                                                      |
| NCS Message     | AP "{0}" tried to join controller "{1}" and failed. The controller does not support this kind of AP. |

|                     |                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Symptoms            | When unsupported access points try to join 40xx/410x controllers or 3500 controller with 64 MB flash, these controllers generate a trap, and the trap is propagated as an event in NCS. |
| Severity            | Informational.                                                                                                                                                                          |
| Category            | Access Point.                                                                                                                                                                           |
| Probable Causes     | Access point is not supported by the controller.                                                                                                                                        |
| Recommended Actions | None.                                                                                                                                                                                   |

## Traps Added in Release 3.2

The following trap was added in WCS Release 3.2:

### LOCATION\_NOTIFY\_TRAP

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | locationNotifyTrap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Alarm Condition     | Location notify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NCS Message         | <p>Depending on the notification condition reported, the trap is sent out in an XML format and is reflected in NCS with the following alert messages:</p> <ul style="list-style-type: none"> <li>Absence of &lt;Element&gt; with MAC &lt;macAddress&gt;, last seen at &lt;timestamp&gt;.</li> <li>&lt;Element&gt; with MAC &lt;macAddress&gt; is &lt;In   Out&gt; the Area &lt;campus   building   floor   coverageArea&gt;.</li> <li>&lt;Element&gt; with MAC &lt;macAddress&gt; has moved beyond &lt;specifiedDistance&gt; ft. of marker &lt;MarkerName&gt;, located at a range of &lt;foundDistance&gt; ft.</li> </ul> <p>For detailed info on the XML format for the trap content, consult the <i>2700 Location Appliance Configuration Guide</i>.</p> |
| Symptoms            | A 2700 location appliance sends this trap out when the defined location notification conditions are met (such as element outside area, elements missing, and elements exceeded specified distance). NCS uses this trap to display alarms about location notification conditions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Severity            | Minor (under the Location Notification dashboard).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Category            | Context Aware Notifications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Probable Causes     | The location notification conditions configured for a 2700 location appliance are met for certain elements on the network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Traps Added In Release 4.0

The following traps were added in WCS Release 4.0:

- [CISCO\\_LWAPP\\_MESH\\_POOR\\_SNR](#), page 13-39
- [CISCO\\_LWAPP\\_MESH\\_PARENT\\_CHANGE](#), page 13-39

- [CISCO\\_LWAPP\\_MESH\\_CHILD\\_MOVED](#), page 13-40
- [CISCO\\_LWAPP\\_MESH\\_CONSOLE\\_LOGIN](#), page 13-40
- [CISCO\\_LWAPP\\_MESH\\_AUTHORIZATION\\_FAILURE](#), page 13-40
- [EXCESSIVE\\_ASSOCIATION](#), page 13-41
- [CISCO\\_LWAPP\\_MESH\\_PARENT\\_EXCLUDED\\_CHILD](#), page 13-41
- [CISCO\\_LWAPP\\_MESH\\_CHILD\\_EXCLUDED\\_PARENT](#), page 13-42
- [CISCO\\_LWAPP\\_MESH\\_EXCESSIVE\\_PARENT\\_CHANGE](#), page 13-42
- [IDS\\_SHUN\\_CLIENT\\_TRAP](#), page 13-42
- [IDS\\_SHUN\\_CLIENT\\_CLEAR\\_TRAP](#), page 13-43
- [MFP\\_TIMEBASE\\_STATUS\\_TRAP](#), page 13-43
- [MFP\\_ANOMALY\\_DETECTED\\_TRAP](#), page 13-43
- [GUEST\\_USER\\_REMOVED\\_TRAP](#), page 13-44

|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappMeshPoorSNR                                                                                                                                                                                                                                                                                                                                        |
| Alarm Condition     | NA                                                                                                                                                                                                                                                                                                                                                           |
| NCS Message         | Poor SNR.                                                                                                                                                                                                                                                                                                                                                    |
| Symptoms            | SNR (signal-to-noise) ratio is important because high signal strength is not enough to ensure good receiver performance. The incoming signal must be stronger than any noise or interference that is present. For example, you can have high signal strength and still have poor wireless performance if there is strong interference or a high noise level. |
| Severity            | Major.                                                                                                                                                                                                                                                                                                                                                       |
| Category            | Mesh                                                                                                                                                                                                                                                                                                                                                         |
| Probable Causes     | The link SNR fell below 12 db. The threshold level cannot be changed. If poor SNR is detected on the backhaul link for a child or parent, the trap is generated and contains SNR values and MAC addresses.                                                                                                                                                   |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                                                        |

## CISCO\_LWAPP\_MESH\_PARENT\_CHANGE

|                 |                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name        | ciscoLwappMeshParentChange                                                                                                                  |
| Alarm Condition | NA                                                                                                                                          |
| NCS Message     | Parent changed.                                                                                                                             |
| Symptoms        | When the parent is lost, the child joins with another parent, and the child sends traps containing both old and new parent's MAC addresses. |
| Severity        | Informational                                                                                                                               |
| Category        | Mesh                                                                                                                                        |

|                     |                                    |
|---------------------|------------------------------------|
| Probable Causes     | The child moved to another parent. |
| Recommended Actions | None.                              |

## CISCO\_LWAPP\_MESH\_CHILD\_MOVED

|                     |                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappMeshChildMoved                                                                                                                                   |
| Alarm Condition     | Done.                                                                                                                                                      |
| NCS Message         | Child moved.                                                                                                                                               |
| Symptoms            | When the parent access point detects a child being lost and communication is halted, the child lost trap is sent to NCS, along with the child MAC address. |
| Severity            | Informational                                                                                                                                              |
| Category            | Mesh                                                                                                                                                       |
| Probable Causes     | The child moved from the parent.                                                                                                                           |
| Recommended Actions | None.                                                                                                                                                      |

## CISCO\_LWAPP\_MESH\_CONSOLE\_LOGIN

|                     |                                                                                                                                                                                                                                                                                                                                                                                |

| MIB Name            | ciscoLwappMeshConsoleLogin                                                                                                                                                                                                                                                                                                                                                     |
| Alarm Condition     | NA                                                                                                                                                                                                                                                                                                                                                                             |
| NCS Message         | Console login successful or failed.                                                                                                                                                                                                                                                                                                                                            |
| Symptoms            | The console port provides the ability for the customer to change the user name and password to recover the stranded outdoor access point. To prevent any unauthorized user access to the access point, NCS sends an alarm when someone tries to log in. This alarm is required to provide protection because the access point is physically vulnerable being located outdoors. |
| Severity            | A login is of critical severity.                                                                                                                                                                                                                                                                                                                                               |
| Category            | Mesh                                                                                                                                                                                                                                                                                                                                                                           |
| Probable Causes     | You have successfully logged in to the access point console port or failed on three consecutive tries.                                                                                                                                                                                                                                                                         |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                                                                          |

## CISCO\_LWAPP\_MESH\_AUTHORIZATION\_FAILURE

|                 |                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| MIB Name        | ciscoLwappMeshAuthorizationFailure                                                                                             |
| Alarm Condition | NA                                                                                                                             |
| NCS Message     | Fails to authenticate with controller.                                                                                         |
| Symptoms        | NCS receives a trap from the controller. The trap contains the MAC addresses of those access points that failed authorization. |
| Severity        | Minor.                                                                                                                         |

|                     |                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Category            | Mesh                                                                                                                                 |
| Probable Causes     | The access point tried to join the MESH but failed to authenticate because the MESH node MAC address was not on the MAC filter list. |
| Recommended Actions | None.                                                                                                                                |

## EXCESSIVE\_ASSOCIATION

|                     |                                                                                                                                                                                                                                                                                                                                                    |

| Alarm Condition     | NA                                                                                                                                                                                                                                                                                                                                                 |
| NCS Message         | Excessive association failures.                                                                                                                                                                                                                                                                                                                    |
| Symptoms            | This trap is raised after a failed-association-attempt exceeds the threshold (which is not user configurable). Association failures are cumulative of the total failures from different MAPs. The trap sent by the controller contains the MAC address of the access point on which the association failed and the number of association failures. |
| Severity            | Major.                                                                                                                                                                                                                                                                                                                                             |
| Category            | Mesh                                                                                                                                                                                                                                                                                                                                               |
| Probable Causes     | The controller encountered excessive association failures.                                                                                                                                                                                                                                                                                         |

| Alarm Condition     | NA                                                                                                                                                                                                                                    |
| NCS Message         | Excluded by parent AP due to failed authentication.                                                                                                                                                                                   |
| Symptoms            | When a child keeps failing authentication at the controller, the parent can mark that child for exclusion. The child cannot associate with the parent during this exclusion period. The trap contains the excluded child MAC address. |
| Severity            | Informational                                                                                                                                                                                                                         |

| Alarm Condition     | NA                                                                                                                                                                                                                                                                                                             |
| NCS Message         | Parent AP being excluded by child AP.                                                                                                                                                                                                                                                                          |
| Symptoms            | When a child fails authentication at the controller after a fixed number of attempts, the child can exclude that parent. The child remembers the excluded parent so that when it joins the network, it sends the trap which contains the excluded parent MAC address and the duration of the exclusion period. |
| Severity            | Informational                                                                                                                                                                                                                                                                                                  |
| Category            | Mesh                                                                                                                                                                                                                                                                                                           |
| Probable Causes     | A child marked a parent for exclusion.                                                                                                                                                                                                                                                                         |

| Alarm Condition | IDS Shun client.                                                                                                                                                                                          |
| NCS Message     | The Cisco Intrusion Detection System "{0}" has detected a possible intrusion attack by the wireless client "{1}."                                                                                         |
| Symptoms        | This trap is generated in response to a shun client clear alert originated from a Cisco IDS/IPs appliance ("{0}") installed in the data path between the wireless client ("{1}") and the site's intranet. |
| Severity        | Critical.                                                                                                                                                                                                 |
| Category        | Security                                                                                                                                                                                                  |

|                     |                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Probable Causes     | The designated client is generating a packet-traffic pattern which shares properties with a well-known form of attack on the customer's network. |
| Recommended Actions | Investigate the designated client and determine if it is an intruder, a virus, or a false alarm.                                                 |

| Alarm Condition     | IDS Shun client clear.                                                                                                                                                                                                                                                                                                  |
| NCS Message         | The Cisco Intrusion Detection System "{0}" has cleared the wireless client "{1}" from possibly having generated an intrusion attack.                                                                                                                                                                                    |
| Symptoms            | This trap is generated in response to one of two things: 1) a shun client clear alert originated from a Cisco IDS/IPS appliance ("{0}") installed in the data path between the wireless client ("{1}") and the site's intranet, or 2) a scheduled timeout of the original IDS_SHUN_CLIENT_TRAP for the wireless client. |
| Severity            | Clear.                                                                                                                                                                                                                                                                                                                  |
| Category            | Security                                                                                                                                                                                                                                                                                                                |
| Probable Causes     | The designated client is no longer generating a suspicious packet-traffic pattern.                                                                                                                                                                                                                                      |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                   |

### MFP\_TIMEBASE\_STATUS\_TRAP

|                     |                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-MFP-MIB. ciscoLwappMfpTimebaseStatus.                                                                                                   |
| Alarm Condition     | MFP timebase out of sync.                                                                                                                           |
| NCS Message         | Controller "{0}" is "{1}" with the Central time server.                                                                                             |
| Symptoms            | This notification is sent by the agent to indicate when the synchronization of the controller's time base with the Central time base last occurred. |
| Severity            | Critical (not in sync trap) and clear (sync trap).                                                                                                  |
| Category            | Security                                                                                                                                            |
| Probable Causes     | The controller's time base is not in sync with the Central time base.                                                                               |
| Recommended Actions | None.                                                                                                                                               |

### MFP\_ANOMALY\_DETECTED\_TRAP

|                 |                                                                                                                                                                                       |

| MIB Name        | CISCO-LWAPP-MFP-MIB. ciscoLwappMfpAnomalyDetected.                                                                                                                                    |
| Alarm Condition | MFP anomaly detected.                                                                                                                                                                 |
| NCS Message     | MFP configuration of the WLAN was violated by the radio interface "{0}" and detected by the radio interface "{1}" of the access point with MAC address "{2}." The violation is "{3}." |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Symptoms            | <p>This notification is sent by the agent when the MFP configuration of the WLAN was violated by the radio interface cLApIfSmtDot11Bssid and detected by the radio interface cLApDot11IfSlotId of the access point cLApSysMacAddress. This violation is indicated by cLMfpEventType.</p> <p>When observing the management frame(s) given by cLMfpEventFrames for the last cLMfpEventPeriod time units, the controller reports the occurrence of a total of cLMfpEventTotal violation events of type cLMfpEventType. When the cLMfpEventTotal is 0, no further anomalies have recently been detected, and the NMS should clear any alarm raised about the MFP errors.</p> <p><b>Note</b> This notification is generated by the controller only if MFP was configured as the protection mechanism through cLMfpProtectType.</p> |
| Severity            | Critical.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Category            | Security                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Probable Causes     | The MFP configuration of the WLAN was violated. Various types of violations are invalidMic, invalidSeq, noMic, and unexpectedMic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## GUEST\_USER\_REMOVED\_TRAP

|                     |                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-WEBAUTH-MIB. cLWAGuestUserRemoved.                                                                                                      |
| Alarm Condition     | Guest user removed.                                                                                                                                 |

## Traps Added or Updated in Release 4.0.96.0

The following traps were added in WCS Release 4.0.96.0:

- [AP\\_IMPERSONATION\\_DETECTED](#), page 13-45
- [RADIUS\\_SERVER\\_DEACTIVATED](#), page 13-45
- [RADIUS\\_SERVER\\_ACTIVATED](#), page 13-45
- [RADIUS\\_SERVER\\_WLAN\\_DEACTIVATED](#), page 13-46
- [RADIUS\\_SERVER\\_WLAN\\_ACTIVATED](#), page 13-46
- [RADIUS\\_SERVER\\_TIMEOUT](#), page 13-46
- [DECRYPT\\_ERROR\\_FOR\\_WRONG\\_WPA\\_WPA2](#), page 13-46

**AP\_IMPERSONATION\_DETECTED**

|                     |                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPImpersonationDetected.                                                                                                                                                                            |
| Alarm Condition     | AP impersonation detected.                                                                                                                                                                             |
| NCS Message         | AP Impersonation with MAC "{0}" using source MAC "{1}" is detected by authenticated AP "{2}" on "{3}" radio and slot ID "{4}."                                                                         |
| Symptoms            | A radio of an authenticated access point had communication with another access point whose MAC address neither matches that of a rogue nor is an authenticated neighbor of the detecting access point. |
| Severity            | Critical.                                                                                                                                                                                              |
| Category            | Security                                                                                                                                                                                               |
| Probable Causes     | A security breach related to access point impersonation may be occurring.                                                                                                                              |
| Recommended Actions | Track down the MAC address of the impersonating access point and contain it.                                                                                                                           |

**RADIUS\_SERVER\_DEACTIVATED**

|                     |                                                                                  |
|---------------------|----------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappAAARadiusServerGlobalDeactivated.                                      |
| Alarm Condition     | RADIUS Server deactivated.                                                       |
| NCS Message         | RADIUS server "{0}" (port {1}) is deactivated.                                   |
| Symptoms            | The controller detects that the RADIUS server is deactivated in the global list. |
| Severity            | Major.                                                                           |
| Category            | Controller                                                                       |
| Probable Causes     | RADIUS server is deactivated in the global list.                                 |
| Recommended Actions | None.                                                                            |

**RADIUS\_SERVER\_ACTIVATED**

|                     |                                                                                  |
|---------------------|----------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappAAARadiusServerGlobalDeactivated.                                      |
| Alarm Condition     | Radius server activated.                                                         |
| NCS Message         | RADIUS server "{0}" (port {1}) is activated.                                     |
| Symptoms            | The controller detects that the RADIUS server is deactivated in the global list. |
| Severity            | Clear.                                                                           |
| Category            | Controller                                                                       |
| Probable Causes     | RADIUS server is activated in the global list.                                   |
| Recommended Actions | None.                                                                            |

|                     |                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| NCS Message         | Decrypt error occurred at AP with MAC "{0}" running TKIP with wrong WPA/WPA2 by client with MAC "{1}."      |
| Symptoms            | The controller detects that a user is trying to connect with an invalid security policy for WPA/WPA2 types. |
| Severity            | Minor.                                                                                                      |
| Category            | Security                                                                                                    |
| Probable Causes     | The user failed to authenticate and join the controller.                                                    |
| Recommended Actions | None.                                                                                                       |

## Traps Added or Updated in Release 4.1

The following traps were added for WCS Release 4.1:

- [AP\\_IMPERSONATION\\_DETECTED](#), page 13-48
- [INTERFERENCE\\_DETECTED](#), page 13-48
- [INTERFERENCE\\_CLEAR](#), page 13-48
- [ONE\\_ANCHOR\\_ON\\_WLAN\\_UP](#), page 13-49
- [RADIUS\\_SERVER\\_DEACTIVATED](#), page 13-49
- [RADIUS\\_SERVER\\_ACTIVATED](#), page 13-49
- [RADIUS\\_SERVER\\_WLAN\\_DEACTIVATED](#), page 13-50
- [RADIUS\\_SERVER\\_WLAN\\_ACTIVATED](#), page 13-50
- [RADIUS\\_SERVER\\_TIMEOUT](#), page 13-50
- [MOBILITY\\_ANCHOR\\_CTRL\\_PATH\\_DOWN](#), page 13-50
- [MOBILITY\\_ANCHOR\\_CTRL\\_PATH\\_UP](#), page 13-51
- [MOBILITY\\_ANCHOR\\_DATA\\_PATH\\_DOWN](#), page 13-51
- [MOBILITY\\_ANCHOR\\_DATA\\_PATH\\_UP](#), page 13-52

## AP\_IMPERSONATION\_DETECTED

|                     |                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnAPImpersonationDetected.                                                                                                                                                                           |
| Alarm Condition     | AP impersonation detected.                                                                                                                                                                            |
| NCS Message         | AP impersonation of MAC "{0}" using source MAC "{1}" is detected by an authenticated AP "{2}" on "{3}" radio and slot ID "{4}."                                                                       |
| Symptoms            | A radio of an authenticated access point received signals from another access point whose MAC address neither matches that of a rogue nor is an authenticated neighbor of the detecting access point. |
| Severity            | Critical.                                                                                                                                                                                             |
| Category            | Access Point..                                                                                                                                                                                        |
| Probable Causes     | A security breach related to access point impersonation has occurred.                                                                                                                                 |
| Recommended Actions | Track down the MAC address of the impersonating access point and contain it.                                                                                                                          |

## INTERFERENCE\_DETECTED

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| MIB Name            | cognioInterferenceAlarm.                                                      |
| Alarm Condition     | None.                                                                         |
| NCS Message         | Interference detected by type {0} with power {1}.                             |
| Symptoms            | A Cognio spectrum agent detected interference over its configured thresholds. |
| Severity            | Minor.                                                                        |
| Category            | SE Detected Interferers                                                       |
| Probable Causes     | Excessive wireless interference or noise.                                     |
| Recommended Actions | None.                                                                         |

## INTERFERENCE\_CLEAR

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| MIB Name            | COGNIO-TRAPS-MIB. cognioInterferenceClear                                                                |
| Alarm Condition     | None.                                                                                                    |
| NCS Message         | Interference cleared.                                                                                    |
| Symptoms            | The Cognio spectrum expert agent no longer detects an interference source over its configured threshold. |
| Severity            | Clear.                                                                                                   |
| Category            | SE Detected Interferers                                                                                  |
| Probable Causes     | Previous excessive wireless interference or noise is gone.                                               |
| Recommended Actions | None.                                                                                                    |

**ONE\_ANCHOR\_ON\_WLAN\_UP**

|                     |                                                                        |
|---------------------|------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-MOBILITY-MIB.<br>ciscoLwappMobilityOneAnchorOnWlanUp.      |
| Alarm Condition     |                                                                        |
| NCS Message         | Controller "{0}." An anchor of WLAN "{1}" is up.                       |
| Symptoms            | Successive EoIP and UDP ping to at least one anchor on the WLAN is up. |
| Severity            | Clear.                                                                 |
| Category            | Controller                                                             |
| Probable Causes     | At least one anchor is reachable from an EoIP/UDP ping.                |
| Recommended Actions | None.                                                                  |

**RADIUS\_SERVER\_DEACTIVATED**

|                     |                                                                                  |
|---------------------|----------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-AAA-MIB.<br>ciscoLwappAAARadiusServerGlobalDeactivated.              |
| Alarm Condition     | RADIUS Server deactivated.                                                       |
| NCS Message         | RADIUS server "{0}" (port {1}) is deactivated.                                   |
| Symptoms            | The controller detects that the RADIUS server is deactivated in the global list. |
| Severity            | Major.                                                                           |
| Category            | Controller                                                                       |
| Probable Causes     | RADIUS server is deactivated in the global list.                                 |
| Recommended Actions | None.                                                                            |

**RADIUS\_SERVER\_ACTIVATED**

|                     |                                                                                |

| NCS Message         | Parent AP being excluded by child AP due to failed authentication, AP current parent MAC address "{0}," previous parent MAC address "{1}."                                                                                                                                                                                                                                                                                                                                                                                                                |
| Symptoms            | This notification is sent by the agent when the child access point marks a parent access point for exclusion. When the child fails to authenticate at the controller after a fixed number of times, the child marks the parent for exclusion. The child remembers the excluded MAC address and informs the controller when it joins the network. The child access point marks the MAC address and excludes it for the time determined by MAP node so that it does not try to join this excluded node. The child MAC address is sent as part of the index. |
| Severity            | Informational                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Alarm Condition     | Mesh excessive parent change.                                                                                                                                                                                                                                                                                                                          |
| NCS Message         | MESH "{0}" changes parent frequently.                                                                                                                                                                                                                                                                                                                  |
| Symptoms            | This notification is sent by the agent if the number of parent changes for a given mesh access point exceeds the threshold. Each access point keeps count of the number of parent changes within a fixed time. If the count exceeds the threshold defined by c1MeshExcessiveParentChangeThreshold, then the child access point informs the controller. |
| Severity            | Major.                                                                                                                                                                                                                                                                                                                                                 |
| Category            | Mesh                                                                                                                                                                                                                                                                                                                                                   |
| Probable Causes     | The child access point has frequently changed its parent.                                                                                                                                                                                                                                                                                              |
| Recommended Actions | None.                                                                                                                                                                                                                                                                                                                                                  |

| Alarm Condition     | Radio interface regulatory domain mismatch.                                                                                                                                                                                                                                                                                              |
| NCS Message         | Access Point "{0}" is unable to associate. The Regulatory Domain "{1}" configured on interface "{2}" does not match the controller "{3}" regulatory domain "{4}."                                                                                                                                                                        |
| Symptoms            | The system generates this trap when the regulatory domain configured on the access point radios does not match the country code configured on the controller.                                                                                                                                                                            |
| Severity            | Critical.                                                                                                                                                                                                                                                                                                                                |
| Category            | Access Point.                                                                                                                                                                                                                                                                                                                            |
| Probable Causes     | If the controller's country code configuration is changed, and some access points support a different country code, then these access points fail to associate. An access point on the controller's network sends join requests to the controller, but the regulatory domain is outside the domain in which the controller is operating. |
| Recommended Actions | Either remove the access points that are not meant for inclusion in the controller's domain or correct the controller's country code setting.                                                                                                                                                                                            |

## LRAD\_CRASH

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappApCrash                                                                 |
| Alarm Condition     | Access point crash.                                                               |
| NCS Message         | Access Point "{0}" crashed and has a core dump on controller "{1}."               |
| Symptoms            | An access point has crashed.                                                      |
| Severity            | Informational.                                                                    |
| Category            | Access Point.                                                                     |
| Probable Causes     | Access point failure.                                                             |
| Recommended Actions | Capture the core dump file using the controller's CLI and send it to TAC support. |

## LRAD\_UNSUPPORTED

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappApUnsupported                                                                       |
| Alarm Condition     | Access point not supported.                                                                   |
| NCS Message         | Access Point "{0}" tried to join controller "{1}" and failed. Associate failure reason "{2}." |
| Symptoms            | An access point tried to associate to a controller to which it is not supported.              |
| Severity            | Informational.                                                                                |
| Category            | Access Point.                                                                                 |
| Probable Causes     | The access point is not supported by the controller.                                          |
| Recommended Actions | None.                                                                                         |

## Traps Added or Updated in Release 4.2

The following traps were added to WCS Release 4.2:

- [GUEST\\_USER\\_ADDED](#), page 13-58
- [GUEST\\_USER\\_AUTHENTICATED](#), page 13-58
- [IOSAP\\_LINK\\_UP](#), page 13-58
- [LRAD\\_POE\\_STATUS](#), page 13-59
- [ROGUE\\_AP\\_NOT\\_ON\\_NETWORK](#), page 13-59
- [IOSAP\\_UP](#), page 13-59

**GUEST\_USER\_ADDED**

|                     |                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-WEBAUTH-MIB. cLWAGuestUserAdded                                                |
| Alarm Condition     | Guest user added.                                                                          |
| NCS Message         | Guest user "{0}" created on the controller "{1}."                                          |
| Symptoms            | This notification is sent by the agent when the GuestUser account is created successfully. |
| Severity            | Informational.                                                                             |
| Category            | NCS                                                                                        |
| Probable Causes     | The guest user account was created on the agent by either CLI, Web UI, or NCS.             |
| Recommended Actions | None.                                                                                      |

**GUEST\_USER\_AUTHENTICATED**

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-WEBAUTH-MIB. cLWAGuestUserLogged                                                                    |
| Alarm Condition     | Guest user authenticated.                                                                                       |
| NCS Message         | Guest user "{1}" logged into controller "{0}."                                                                  |
| Symptoms            | This notification is sent by the agent when the GuestUser logged into the network through webauth successfully. |
| Severity            | Informational.                                                                                                  |
| Category            | Controller                                                                                                      |
| Probable Causes     | The guest user was successful with webauth authentication.                                                      |
| Recommended Actions | None.                                                                                                           |

**IOSAP\_LINK\_UP**

|                     |                                                                   |
|---------------------|-------------------------------------------------------------------|
| MIB Name            | linkUp                                                            |
| Alarm Condition     | Autonomous AP Link Up.                                            |
| NCS Message         | Autonomous AP "{0}," Interface "{1}" is {2} up.                   |
| Symptoms            | The physical link is up on an autonomous access point radio port. |
| Severity            | Clear.                                                            |
| Category            | Access Point.                                                     |
| Probable Causes     | A physical link has been restored to the autonomous access point. |
| Recommended Actions | None.                                                             |

**LRAD\_POE\_STATUS**

|                     |                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappApPower                                                                                  |
| Alarm Condition     | POE Status.                                                                                        |
| NCS Message         | Access point "{0}" draws low power from Ethernet. Failure reason: "{1}"                            |
| Symptoms            | This notification is generated when the access point draws low power from the Ethernet connection. |
| Severity            | Critical.                                                                                          |
| Category            | Access Point.                                                                                      |
| Probable Causes     | The access point receives low power from the Ethernet connection.                                  |
| Recommended Actions | Check the power status of the access point and the device connected to the access point.           |

**ROGUE\_AP\_NOT\_ON\_NETWORK**

|                     |                                                                              |
|---------------------|------------------------------------------------------------------------------|
| MIB Name            | bsnRogueAPDetectedOnWiredNetwork (bsnRogueAPOnWiredNetwork is set to false). |
| Alarm Condition     | ROGUE_AP_NOT_ON_NETWORK                                                      |
| NCS Message         | Rogue AP or ad hoc rogue "{0}" is not able to connect to the wired network.  |
| Symptoms            | A rogue access point is no longer on the wired network.                      |
| Severity            | Informational.                                                               |
| Category            | Rogue AP                                                                     |
| Probable Causes     | The rogue access point is no longer reachable on the wired network.          |
| Recommended Actions | None.                                                                        |

**IOSAP\_UP**

|                     |                                                                |
|---------------------|----------------------------------------------------------------|
| MIB Name            | None.                                                          |
| Alarm Condition     | Autonomous AP Up.                                              |
| NCS Message         | The autonomous AP "{0}" is reachable.                          |
| Symptoms            | The autonomous AP is SNMP reachable.                           |
| Severity            | Clear.                                                         |
| Category            | Access Point.                                                  |
| Probable Causes     | The autonomous access point starts to respond to SNMP queries. |
| Recommended Actions | None.                                                          |

## Traps Added or Updated in Release 5.0

The following traps were added for WCS Release 5.0:

- [GUEST\\_USER\\_LOGOFF](#), page 13-60
- [STATION\\_ASSOCIATE\\_DIAG\\_WLAN](#), page 13-60

### GUEST\_USER\_LOGOFF

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| MIB Name            | CISCO-LWAPP-WEBAUTH-MIB. cLWAGuestUserLoggedOut                                                              |
| Alarm Condition     | Guest user logged off.                                                                                       |
| NCS Message         | Guest user "{1}" logged out from the controller "{0}."                                                       |
| Symptoms            | This notification is sent by the agent when a GuestUser who was previously logged into the network logs out. |
| Severity            | Informational.                                                                                               |
| Category            | Controller                                                                                                   |
| Probable Causes     | The GuestUser logs off from the network.                                                                     |
| Recommended Actions | None.                                                                                                        |

### STATION\_ASSOCIATE\_DIAG\_WLAN

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Alarm Condition     | Client Associated to Diagnostic Channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NCS Message         | Client "{0}" is associated to diagnostic WLAN with reason "{1}."                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Symptoms            | This notification is sent by the agent when a v5 client associates to a diagnostic channel.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Severity            | Informational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Probable Causes     | When a CCXv5 client gets associated to the diagnostic channel WLAN on WLC, this trap is raised.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Category            | Clients                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Recommended Actions | If you wish to automatically perform client troubleshooting, you must enable Client Troubleshooting in Administration > Settings > client. After it is enabled, the series of V5 tests are carried out on the client upon trap arrival, and the client is updated with the test status via pop-up messages. The report is placed in the logs directory. The log filename is shown in the Client Details page in the Automated Troubleshooting Report section. You can export all automated troubleshooting logs. |

## Traps Added or Updated in Release 5.2

The following traps were added for WCS Release 5.2:

- [LRAD\\_REBOOTREASON](#), page 13-61
- [WIPS\\_TRAPS](#), page 13-61

**LRAD\_REBOOTREASON**

|                     |                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappApAssociated                                                                                |
| Alarm Condition     | AP reboot reason.                                                                                     |
| NCS Message         | Access Point “{0}” associated to controller “{2}” on port number “{1}”. Reason for association “{3}”. |
| Symptoms            |                                                                                                       |
| Severity            | Informational                                                                                         |
| Category            | Access Point.                                                                                         |
| Probable Causes     | None.                                                                                                 |
| Recommended Actions | None.                                                                                                 |

**WIPS\_TRAPS**

|                     |                                                                         |
|---------------------|-------------------------------------------------------------------------|
| MIB Name            | ciscoLwappIpsMIBNotif                                                   |
| Alarm Condition     | wIPS Traps.                                                             |
| NCS Message         | Dynamically generated per alarm.                                        |
| Symptoms            | Refer to wIPS alarm encyclopedia under WCS>Configuration>wIPS Profiles. |
| Severity            | Critical                                                                |
| Category            | Security                                                                |
| Probable Causes     | Possible security attacks.                                              |
| Recommended Actions | None.                                                                   |

## Alarm Names

- DoS: Association flood
- DoS: Association table overflow
- DoS: Authentication flood
- DoS: EAPOL-Start attack
- DoS: PS-Poll flood
- DoS: Unauthenticated association
- DoS: CTS flood
- DoS: Queensland University of Technology Exploit
- DoS: RF jamming
- DoS: RTS flood
- DoS: Virtual Carrier attack
- DoS: Authentication-failure attack
- DoS: De-Auth broadcast flood
- DoS: De-Auth flood
- DoS: Dis-Assoc broadcast flood
- DoS: Dis-Assoc flood
- DoS: EAPOL-Logoff attack
- DoS: FATA-Jack tool
- DoS: Premature EAP-Failure
- DoS: Premature EAP-Success
- ASLEAP tool detected
- Airsnarf attack
- ChopChop attack
- Day-Zero attack by WLAN security anomaly
- Day-Zero attack by device security anomaly
- Device probing for APs
- Dictionary attack on EAP methods
- Fake APs detected
- Fake DHCP server detected
- Fast WEP crack tool detected
- Fragmentation attack
- Honeypot AP detected
- Hotspotter tool detected
- Hotspotter tool detected
- Malformed 802.11 packets detected
- Man in the middle attack

- NetStumbler detected
- Netstumbler victim detected
- PSPF violation detected
- Soft AP or host AP detected
- Spoofed MAC address detected
- Suspicious after-hours traffic detected
- Unauthorized association by vendor list
- Unauthorized association detected
- Wellenreiter detected

## Traps Added or Updated in Release 6.0

The following traps were added for WCS Release 6.0:

- [MSE\\_EVAL\\_LICENSE](#), page 13-63
- [MSE\\_LICENSING\\_ELEMENT\\_LIMIT](#), page 13-64
- [STATION\\_AUTHENTICATED](#), page 13-64
- [WLC\\_LICENSE\\_NOT\\_ENFORCED](#), page 13-64
- [WLC\\_LICENSE\\_COUNT\\_EXCEEDED](#), page 13-65
- [VOIP\\_CALL\\_FAILURE](#), page 13-65

### MSE\_EVAL\_LICENSE

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| MIB Name            | None                                                                                                            |
| Alarm Condition     | MSE Evaluation license expired.                                                                                 |
| NCS Message         | Evaluation license for {0} is expired.                                                                          |
| Symptoms            | The tracking for clients or tags stops, or service does not come up.                                            |
| Severity            | Critical.                                                                                                       |
| Category            | MSE                                                                                                             |
| Probable Causes     | The evaluation period for the service has expired.                                                              |
| Recommended Actions | Add a permanent license for the service using License Center or the appropriate third-party vendor application. |

**MSE\_LICENSING\_ELEMENT\_LIMIT**

|                     |                                                                         |
|---------------------|-------------------------------------------------------------------------|
| MIB Name            | None                                                                    |
| Alarm Condition     | MSE Licensing element limit reached.                                    |
| NCS Message         | {0} limit for {1} is reached or exceeded.                               |
| Symptoms            | Elements are not tracked beyond a certain limit.                        |
| Severity            | Critical.                                                               |
| Category            | MSE                                                                     |
| Probable Causes     | Limit for the specified service has been reached.                       |
| Recommended Actions | Add a license with higher licensed capacity for the particular service. |

**STATION\_AUTHENTICATED**

|                     |                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappDot11ClientMovedToRunState                                                                       |
| Alarm Condition     | Client Authentication failure.                                                                             |
| NCS Message         | Client "{0}" is authenticated with interface "{2}" of AP "{1}."                                            |
| Symptoms            | A client has completed a security policy and has moved to Run state. It can start to send or receive data. |
| Severity            | Informational.                                                                                             |
| Category            | Wired Clients.                                                                                             |
| Probable Causes     | A client has completed security policy and moved to Run state.                                             |
| Recommended Actions | None.                                                                                                      |

|                     |                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | clmgmtLicenseNotEnforced                                                                                                                                    |
| Alarm Condition     | Attempt to use an unlicensed Controller feature.                                                                                                            |
| NCS Message         | Controller {0} has AP with unlicensed feature {1} version {2} attempting to join.                                                                           |
| Symptoms            | An access point with a licensed feature is trying to join a controller without the proper license.                                                          |
| Severity            | Critical.                                                                                                                                                   |
| Category            | Controller                                                                                                                                                  |
| Probable Causes     | An access point with a WPLUS feature like indoor mesh or OfficeExtend AP is trying to join a controller without a WPLUS license.                            |
| Recommended Actions | You must add a WPLUS license to the controller or fix the primary, secondary, or tertiary controller configuration to have controllers with WPLUS licenses. |

**WLC\_LICENSE\_COUNT\_EXCEEDED**

|                     |                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| MIB Name            | clmgmtLicenseUsageCountExceeded                                                                           |
| Alarm Condition     | AP attempted to join Controller with licensed AP count exceeded.                                          |
| NCS Message         | Controller {0} with license {1} version {2} and counted feature {4} with limit {3} has been exceeded {5}. |
| Symptoms            | The access point cannot join a controller.                                                                |
| Severity            | Critical.                                                                                                 |
| Category            | Controller                                                                                                |
| Probable Causes     | The controller has reached the maximum licensed access point capacity.                                    |
| Recommended Actions | Add a license capacity to the controller or move the access point to a controller with more capacity.     |

**VOIP\_CALL\_FAILURE**

|                     |                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappVoipCallfailureNotif                                                                                                                                             |
| Alarm Condition     | VoIP Call failed.                                                                                                                                                          |
| NCS Message         | VoIP Call failure of {4} (Error Code {3}) occurred on Client {0} with phone number {5} calling {6} which was associated with AP {1} on interface {2}.                      |
| Symptoms            | VoIP snooping is enabled on a WLAN.                                                                                                                                        |
| Severity            | Informational.                                                                                                                                                             |
| Category            | Clients                                                                                                                                                                    |
| Probable Causes     | A SIP error is detected by an access point.                                                                                                                                |
| Recommended Actions | The actions depend on the type of error that is being reported. Errors can range from “dialed number does not exist,” “busy,” “service unavailable,” to “service timeout.” |

**Traps Added or Updated in Release 7.0**

- [SI\\_AQ\\_TRAPS](#), page 13-65
- [SI\\_SECURITY\\_TRAPS](#), page 13-66
- [SI\\_SENSOR\\_CRASH\\_TRAPS](#), page 13-66

**SI\_AQ\_TRAPS**

|                 |                                                           |
|-----------------|-----------------------------------------------------------|
| MIB Name        | ciscoLwappSiAqLow                                         |
| Alarm Condition | Air Quality Traps                                         |
| NCS Message     | Air Quality Index on Channel {0} is {1} (Threshold: {2}). |
| Symptoms        | Air Quality fall below the set Threshold.                 |
| Severity        | Minor.                                                    |
| Category        | Performance.                                              |

|                     |                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Probable Causes     | Threshold is set via the configuration->controller->CleanAir. When the Air Quality Index computed by the AP falls below the set threshold this is triggered. |
| Recommended Actions | Detect Source of Interference and remove it from the environment or enable RRM so that AP can move to another clean channel.                                 |

| MIB Name            | ciscoLwappSiIdrDevice                                                                                                                                                                           |
| Alarm Condition     | Interferer Security Traps.                                                                                                                                                                      |
| NCS Message         | Set: Security-Risk Interferer {0} is detected.<br>Clear: Security-risk Interferer "{0}" is no longer detected.                                                                                  |
| Symptoms            | Raised when Interferer marked as a security threat is detected by the network.                                                                                                                  |
| Severity            | Critical.                                                                                                                                                                                       |
| Category            | Security                                                                                                                                                                                        |
| Probable Causes     | Interferer marked as a security threat is detected by the network. Interferers have to configured to as Security threat and it can be done via the configuration->controller->CleanAir section. |
| Recommended Actions | Detect Source of Interference and remove it from the environment.                                                                                                                               |

## SI\_SENSOR\_CRASH\_TRAPS

|                     |                                              |
|---------------------|----------------------------------------------|
| MIB Name            | ciscoLwappSiSensorCrash                      |
| Alarm Condition     | Sensor Crash Traps                           |
| NCS Message         | CleanAir Sensor Status: {0} Error Code: {1}. |
| Symptoms            | CleanAir Sensor Software stopped working.    |
| Severity            | Critical.                                    |
| Category            | Access Point.                                |
| Probable Causes     | General SensorD crashes.                     |
| Recommended Actions | Reboot the AP.                               |

## Traps Added or Updated in Release 7.0.1

The following traps were added to WCS Release 7.0.1:

- [FAN\\_MONITOR](#), page 13-67
- [FUTURE\\_RESTART\\_DAY\\_MSG](#), page 13-67
- [LOCATION\\_CALCULATOR](#), page 13-68
- [RAID\\_MONITOR](#), page 13-72
- [POWER\\_MONITOR](#), page 13-72
- [SI\\_AQ\\_BUFFER\\_UNAVAILABLE\\_TRAPS](#), page 13-73

- [NCS\\_NOTIFICATION\\_ALARM](#), page 13-74
- [NMSP](#), page 13-75
- [MSE\\_DOWN](#), page 13-75

## FAN\_MONITOR

|                     |                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                       |
| Alarm Condition     | Fan Monitor on MSE                                                                                                                          |
| Category            | Mobility Services                                                                                                                           |
| Symptoms            | A system cooling fan gone bad.                                                                                                              |
| Severity            | Critical                                                                                                                                    |
| NCS Message         | Cooling fan failure [ applies to MSE-3355 only]. One of the CPU cooling fans on \$HOST [\$IP] has failed.                                   |
| Probable Causes     | Failure of a fan.                                                                                                                           |
| Recommended Actions | Customer should contact Cisco TAC to arrange for replacing the system. This failure cannot be fixed in the field ( fan is not replaceable). |

## FUTURE\_RESTART\_DAY\_MSG

|                     |                                                                    |

| Alarm Condition     | RAID Monitor on MSE.                                                                                                                                                                                                                          |
| Category            | Mobility Services                                                                                                                                                                                                                             |
| Symptoms            | One of the disks in a RAID array has failed, as reported by the RAID controller.                                                                                                                                                              |
| Severity            | Critical                                                                                                                                                                                                                                      |
| NCS Message         | A Hard Disk in a RAID set has failed. This applies to all three [3310, 3350, 3355] platforms.<br>One of the hard drives on \$HOST [\$IP] has failed and must be replaced. Contact Cisco Customer Support immediately for assistance.          |
| Probable Causes     | Failure of a disk drive.                                                                                                                                                                                                                      |
| Recommended Actions | Replace the failed drive (if 3350, 3355) with a new hard drive, or setup an RMA with Cisco (for 3310). The new drive is automatically rebuilt (3355, 3350) by the RAID controller. For 3310, field replacement of the drive is NOT supported. |

| NCS Message     | Power supply missing or failed [ applies to MSE-3355 only]<br>Message Detail: One of the power supplies on \$HOST [\$IP] has failed or is missing." >. |
| Symptoms        | System has two power supplies but one of them has failed or one of them has been physically removed.                                                   |

|                     |                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Severity            | Critical                                                                                                                                                                                                              |
| Category            | Mobility Service                                                                                                                                                                                                      |
| Probable Causes     | Bad or missing power supply.                                                                                                                                                                                          |
| Recommended Actions | Customer should check the power supplies and if it has failed, then replace it with a good one. Power supplies are spare items than can be ordered by customers. If the power supply is missing, then do the obvious. |

| Probable Causes     | NMSP Connection was reestablished between the MSE and the Controller or Switch. |
| Recommended Actions | None.                                                                           |

**MSE\_DOWN**

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                |
| Alarm Condition     | MSE down                                                                                             |
| NCS Message         | MSE <Name> with IP Address <IPAddress> on port <port number> is unreachable.                         |
| Symptoms            | Communication with MSE is not happening.                                                             |
| Severity            | Major.                                                                                               |
| Category            | Mobility Services                                                                                    |
| Probable Causes     | This alarm is generated when the MSE or the LBS is unreachable from the NCS.                         |
| Recommended Actions | Ensure that the MSE Service is network reachable from NCS and services on MSE are running correctly. |

## Traps Added in NCS Release 1.0

The following traps were added in NCS 1.0:

- [AP\\_FUNCTIONALITY\\_LICENSE\\_EXPIRED](#), page 13-77
- [AP\\_IP\\_FALLBACK](#), page 13-77
- [COUNTRY\\_CODE\\_CHANGED](#), page 13-77
- [CPU\\_RX\\_MULTICAST\\_QUEUE\\_FULL](#), page 13-78
- [FAN\\_FAILURE](#), page 13-78
- [GUEST\\_USER\\_REMOVED](#), page 13-78
- [HEART\\_BEAT\\_LOSS](#), page 13-79
- [IPSEC\\_ESP\\_AUTH\\_FAILURE](#), page 13-79
- [IPSEC\\_ESP\\_INVALID\\_SPI](#), page 13-79
- [IPSEC\\_ESP\\_REPLAY\\_FAILURE](#), page 13-80
- [IPSEC\\_SUITE\\_NEG\\_FAILURE](#), page 13-80
- [INVALID\\_RADIO](#), page 13-80
- [LINK\\_FAILURE](#), page 13-81
- [MESH\\_BATTERY](#), page 13-81
- [MESH\\_DEFAULTBRIDGEGROUPNAME](#), page 13-81

|-----------------|-----------------------|
| MIB Name        | countryChangeTrap     |
| Alarm Condition | Country code changes. |
| NCS Message     | None.                 |
| Symptoms        | None.                 |
| Severity        | Information           |

|                     |            |
|---------------------|------------|
| Category            | Controller |
| Probable Causes     | None.      |
| Recommended Actions | None.      |

## CPU\_RX\_MULTICAST\_QUEUE\_FULL

|                     |                                                          |
|---------------------|----------------------------------------------------------|
| MIB Name            | bsnRxMulticastQueueFull                                  |
| Alarm Condition     | CPU RX Multicast queue full.                             |
| NCS Message         | CPU Receive Multicast Queue is full on Controller "{0}". |
| Symptoms            | None.                                                    |
| Severity            | Critical                                                 |
| Category            | Controller                                               |
| Probable Causes     | None.                                                    |
| Recommended Actions | None.                                                    |

## FAN\_FAILURE

|                     |                                |
|---------------------|--------------------------------|
| MIB Name            | fanFailureTrap                 |
| Alarm Condition     | Fan failure.                   |
| NCS Message         | Fan failure. Controller "{0}". |
| Symptoms            | None.                          |
| Severity            | Critical                       |
| Category            | Controller                     |
| Probable Causes     | None.                          |
| Recommended Actions | None.                          |

## GUEST\_USER\_REMOVED

|                 |                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name        | cLWAGuestUserRemoved                                                                                                                            |
| Alarm Condition | Guest user removed.                                                                                                                             |
| NCS Message     | Guest user "{1}" deleted on Controller "{0}".                                                                                                   |
| Symptoms        | This notification is generated when the lifetime of the guest-user {1} expires and the guest-user's accounts are removed from Controller "{0}". |
| Severity        | Informational                                                                                                                                   |
| Category        | Controller                                                                                                                                      |

|                     |       |
|---------------------|-------|
| Probable Causes     | None. |
| Recommended Actions | None. |

## HEART\_BEAT\_LOSS

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| MIB Name            | heartbeatLossTrap                                               |
| Alarm Condition     | Heart beat loss                                                 |
| NCS Message         | Keepalive messages are lost between Master and Controller”{0}”. |
| Symptoms            | None.                                                           |
| Severity            | Major                                                           |
| Category            | Controller                                                      |
| Probable Causes     | None.                                                           |
| Recommended Actions | None.                                                           |

## IPSEC\_ESP\_AUTH\_FAILURE

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| MIB Name            | bsnIpssecEspAuthFailureTrap                                                          |
| Alarm Condition     | IPsec ESP auth failure.                                                              |
| NCS Message         | IPsec ESP Authentication failure from remote IP address “{0}”. Error Count is “{1}”. |
| Symptoms            | None.                                                                                |
| Severity            | Minor                                                                                |

|-----------------|--------------------------------------------------------------------------------------|
| MIB Name        | dot11AuthenticateFail                                                                |
| Alarm Condition | Autonomous AP Client 802.11 authentication failure.                                  |
| NCS Message     | Client "{0}" has failed authenticating with AP "{1}". The reason code is "{2}({3})". |

|                     |                                                                                          |
|---------------------|------------------------------------------------------------------------------------------|
| Symptoms            | This notification is generated by the AP when 802.11 authentication of the client fails. |
| Severity            | Informational.                                                                           |
| Category            | Clients                                                                                  |
| Probable Causes     | 802.11 Authentication failure of the client.                                             |
| Recommended Actions | Check client configuration for configured keys or passwords.                             |

## STATION\_WIRED\_CHANGED

|                     |                                                |
|---------------------|------------------------------------------------|
| MIB Name            | cmnMacChangedNotifications                     |
| Alarm Condition     | MAC Address table notification trap.           |
| NCS Message         | Wired Client {0} {1} from Switch {2}           |
| Symptoms            | A MAC address table change on the switch.      |
| Severity            | Informational                                  |
| Category            | Clients.                                       |
| Probable Causes     | Switch detected a change in MAC address table. |
| Recommended Actions | None.                                          |

## STP\_NEWROOT

|                     |                                                                                          |
|---------------------|------------------------------------------------------------------------------------------|
| MIB Name            | stpInstanceNewRootTrap.                                                                  |
| Alarm Condition     | STP newroot.                                                                             |
| NCS Message         | Controller "{0}". Spanning Tree Protocol Instance Root changed for VLAN ID "{1}".        |
| Symptoms            | This notification is generated by the AP when 802.11 authentication of the client fails. |
| Severity            | Informational.                                                                           |
| Category            | Controller                                                                               |
| Probable Causes     | Failed Client authentication.                                                            |
| Recommended Actions | Check client configuration for configured keys or passwords.                             |

## TEMP\_MOBILITY\_ANCHOR\_CTRL\_PATH\_DOWN

|                 |                                             |
|-----------------|---------------------------------------------|
| MIB Name        | ciscoTempLwappMobilityAnchorControlPathDown |
| Alarm Condition | Mobility anchor control path down.          |

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| NCS Message         | Controller "{0}". Control path on anchor "{1}" is down. |
| Symptoms            | None.                                                   |
| Severity            | Major                                                   |
| Category            | Controller                                              |
| Probable Causes     | None.                                                   |
| Recommended Actions | None.                                                   |

### TEMP\_MOBILITY\_ANCHOR\_DATA\_PATH\_DOWN

|                     |                                                      |
|---------------------|------------------------------------------------------|
| MIB Name            | ciscoTempLwappMobilityAnchorDataPathDown             |
| Alarm Condition     | Mobility anchor data path down                       |
| NCS Message         | Controller "{0}". Data path on anchor "{1}" is down. |
| Symptoms            | None.                                                |
| Severity            | Major                                                |
| Category            | Controller                                           |
| Probable Causes     | None.                                                |
| Recommended Actions | None.                                                |

### TEMP\_WLAN\_ALL\_ANCHORS\_TRAP\_DOWN

|                     |                                                      |
|---------------------|------------------------------------------------------|
| MIB Name            | ciscoTempLwappMobilityAllAnchorsOnWlanDown           |
| Alarm Condition     | Mobility anchors down (Temp).                        |
| NCS Message         | Controller "{0}". Data path on anchor "{1}" is down. |
| Symptoms            | None.                                                |
| Severity            | Major                                                |
| Category            | Controller                                           |
| Probable Causes     | None.                                                |
| Recommended Actions | None.                                                |

### VOICE\_COVERAGE\_HOLE\_ALARM

|                 |                                           |
|-----------------|-------------------------------------------|
| MIB Name        | ciscoLwappDot11ClientCoverageHolePreAlarm |
| Alarm Condition | Voice coverage hole detected.             |
| Symptoms        | None.                                     |

|                     |               |
|---------------------|---------------|
| Category            | Coverage Hole |
| Severity            | Information   |
| NCS Message         | None.         |
| Probable Causes     | None.         |
| Recommended Actions | None.         |

## WLC\_SCHEDULED\_RESET

|                     |                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoLwappScheduledResetNotif                                                                                        |
| Alarm Condition     | None.                                                                                                                |
| Symptoms            | None.                                                                                                                |
| Category            | Controller                                                                                                           |
| Severity            | Informational                                                                                                        |
| NCS Message         | Controller ‘‘{0}’’ is going to be reboot in {1} seconds.The reboot has been triggered from WLC CLI or Web Interface. |
| Probable Causes     | None.                                                                                                                |
| Recommended Actions | None.                                                                                                                |

## Switch Traps

The following are the Switch traps added in NCS 1.0:

- [SWT\\_AUTH\\_FAIL](#), page 13-92
- [SWT\\_CAEM\\_TEMPERATURE](#), page 13-93
- [SWT\\_CAEM\\_VOLTAGE](#), page 13-93
- [SWT\\_CDER\\_MON\\_EXCEPTION](#), page 13-93
- [SWT\\_CEFC\\_STATUS\\_CHANGE](#), page 13-94
- [SWT\\_CEV\\_FANONS15540\\_FAN\\_TRAY8](#), page 13-94
- [SWT\\_CEV\\_PORT\\_TRANSPARENT](#), page 13-94
- [SWT\\_CEV\\_PORT\\_WAVE](#), page 13-95
- [SWT\\_CONFIG\\_MAN\\_EVENT](#), page 13-95
- [SWT\\_CONTENT\\_ENGINE\\_OVERLOAD](#), page 13-95
- [SWT\\_CONTENT\\_ENGINE\\_WRITE\\_FAILED](#), page 13-96
- [SWT\\_CVPDN\\_SESSION](#), page 13-96
- [SWT\\_DMD\\_NBRLAYER2\\_CHANGE](#), page 13-96
- [SWT\\_ENV\\_MON\\_SHUTDOWN](#), page 13-97
- [SWT\\_GROUP\\_CHANGE](#), page 13-97

- [SWT\\_IP\\_PERMIT\\_DENIED](#), page 13-97
- [SWT\\_LER\\_ALARM\\_ON](#), page 13-98
- [SWT\\_LS1010\\_CHASSIS\\_CHANGE](#), page 13-98
- [SWT\\_LS1010\\_CHASSIS\\_FAILURE](#), page 13-98
- [SWT\\_PETH\\_POWER\\_USAGE\\_OFF](#), page 13-99
- [SWT\\_PETH\\_POWER\\_USAGE\\_ON](#), page 13-100
- [SWT\\_PETH\\_PSE\\_PORT\\_STATUS](#), page 13-100
- [SWT\\_RESET\\_EVENT](#), page 13-100
- [SWT\\_RPTR\\_HEALTH](#), page 13-101
- [SWT\\_RTT\\_MON\\_CONN\\_CHANGE](#), page 13-101
- [SWT\\_RTT\\_MON\\_NOTE](#), page 13-101
- [SWT\\_RTT\\_MON\\_THRESHOLD](#), page 13-102
- [SWT\\_RTT\\_MON\\_TIMEOUT](#), page 13-102
- [SWT\\_RTT\\_MON\\_VERIFY\\_ERROR](#), page 13-102
- [SWT\\_STP\\_NEW\\_ROOT](#), page 13-103

## COLD\_START (FROM MIB-II STANDARD)

|                 |                                                                                       |
|-----------------|---------------------------------------------------------------------------------------|
| MIB Name        | coldStart.                                                                            |
| Alarm Condition | Cold start trap from controller.                                                      |
| NCS Message     | Cold start. Switch "{0}."                                                             |
| Symptoms        | The switch is reinitializing itself and that its configuration may have been altered. |
| Severity        | Informational.                                                                        |
| Category        | Controller                                                                            |

|                     |                                                                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Probable Causes     | <ul style="list-style-type: none"> <li>• The switch (controller) has power-cycled.</li> <li>• The switch (controller) went through a hard reset.</li> <li>• The switch (controller) went through a software restart.</li> </ul> |
| Recommended Actions | Power recycled; Software reset.                                                                                                                                                                                                 |

## LINK\_DOWN (FROM MIB-II STANDARD)

|                     |                                                                    |
|---------------------|--------------------------------------------------------------------|
| MIB Name            | linkDown.                                                          |
| Alarm Condition     | Interface state change.                                            |
| NCS Message         | Port "{0}" is down on Switch "{1}."                                |
| Symptoms            | The physical link on one of the switch (controller) ports is down. |
| Severity            | Critical.                                                          |
| Category            | Switch.                                                            |
| Probable Causes     | A communication link to the port is disconnected.                  |
| Recommended Actions | None.                                                              |

## LINK\_UP (FROM MIB-II STANDARD)

|                     |                                                     |
|---------------------|-----------------------------------------------------|
| MIB Name            | linkUp.                                             |
| Alarm Condition     | Interface state change.                             |
| NCS Message         | Port "{0}" is up on Switch "{1}."                   |
| Symptoms            | A previously down link on a switch port is up now.  |
| Severity            | Clear.                                              |
| Category            | Switch                                              |
| Probable Causes     | A communication link has been restored to the port. |
| Recommended Actions | None.                                               |

## AP\_DETECTED\_DUPLICATE\_IP

|                     |                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnDuplicateIpAddressReported.                                                                             |
| Alarm Condition     | AP Detected Duplicate IP.                                                                                  |
| NCS Message         | AP "{0}" on Switch "{3}" detected duplicate IP address "{2}" being used by machine with mac address "{1}." |
| Symptoms            | The system detects a duplicate IP address in the network that matches that assigned to an access point.    |
| Severity            | Critical.                                                                                                  |
| Category            | Security                                                                                                   |
| Probable Causes     | Another device in the network is configured with the same IP address as an access point.                   |
| Recommended Actions | Correct the misconfiguration of IP addresses in the network.                                               |

## AUTHMGR-5-SUCCESS

| Category            | Clients                                                                                                                                                                                                                                                       |
| Severity            | Minor                                                                                                                                                                                                                                                         |
| Probable Causes     | A host on the specified interface is attempting to gain access into the network or is trying to authenticate in a host mode that does not support the number of hosts attached. This is treated as a security violation and the port has been error-disabled. |
| Recommended Actions | Ensure that the port is configured to support the number of hosts attached. Enter the shutdown command followed by no shutdown command to restart the port.                                                                                                   |

## NCS\_CLIENT\_TRAP\_DISABLED

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Alarm Condition     | Client Traps are disabled on controllers.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NCS Message         | Client traps are disabled on controller(s) {0}.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Symptoms            | <p>This notification is generated by NCS when required client traps are disabled in one or more controllers. These traps are needed for NCS to detect client sessions in a timely and efficient manner. The required traps are:</p> <ul style="list-style-type: none"> <li>• 802.11 Association</li> <li>• 802.11 Disassociation</li> <li>• 802.11 Authentication</li> <li>• 802.11 Deauthentication</li> <li>• 802.11 Failed Association</li> <li>• 802.11 Failed Authentication</li> </ul> |
| Severity            | Minor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Category            | NCS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Probable Causes     | When a controller is added to NCS, NCS enables the required client traps. If NCS does not have the correct SNMP read-write community, it could fail. The trap controls can also be changed by pushing the SNMP trap control template or using controller GUI/CLI.                                                                                                                                                                                                                            |
| Recommended Actions | Use the NCS template to enable the required client traps on the controller list.                                                                                                                                                                                                                                                                                                                                                                                                             |

## AUTHMGR-5-START

|                     |                                                                 |

### APPLIANCE\_POWER\_SUPPLY\_BACK\_TO\_NORMAL

|                     |                                 |
|---------------------|---------------------------------|
| MIB Name            | None.                           |
| Alarm Condition     | None.                           |
| NCS Message         | Power supply is back to normal. |
| Symptoms            | Power supply is back to normal. |
| Severity            | Clear                           |
| Category            | NCS                             |
| Probable Causes     | None.                           |
| Recommended Actions | None.                           |

### APPLIANCE\_POWER\_SUPPLY\_BAD\_OR\_MISSING

|                     |                                           |
|---------------------|-------------------------------------------|
| MIB Name            | None.                                     |
| Alarm Condition     | None.                                     |
| NCS Message         | Power supply is is either bad or missing. |
| Symptoms            | Power supply is either bad or missing.    |
| Severity            | Major                                     |
| Category            | NCS                                       |
| Probable Causes     | Power supply is is either bad or missing. |
| Recommended Actions | Replace bad or missing power supply.      |

### APPLIANCE\_RAID\_BACK\_TO\_NORMAL

|                 |                            |
|-----------------|----------------------------|
| MIB Name        | None.                      |
| Alarm Condition | None.                      |
| Symptoms        | None.                      |
| Severity        | Clear                      |
| NCS Message     | RAID array in good health. |

|                     |        |
|---------------------|--------|
| Category            | Switch |
| Probable Causes     | None.  |
| Recommended Actions | None.  |

## APPLIANCE\_RAID\_BAD\_OR\_MISSING

|                     |                                                  |
|---------------------|--------------------------------------------------|
| MIB Name            | None.                                            |
| Alarm Condition     | None.                                            |
| NCS Message         | Drive "\${0}" is missing or bad.                 |
| Symptoms            | Disk or RAID failure.                            |
| Severity            | Major                                            |
| Category            | NCS                                              |
| Probable Causes     | Disk or RAID failure.                            |
| Recommended Actions | Contact Technical Support. Replace failed drive. |

## APPLIANCE\_TEMP\_BACK\_TO\_NORMAL

|                     |                               |
|---------------------|-------------------------------|
| MIB Name            | None.                         |
| Alarm Condition     | None.                         |
| NCS Message         | Both CPU temperatures are OK. |
| Symptoms            | None.                         |
| Severity            | Clear                         |
| Category            | Switch                        |
| Probable Causes     | None.                         |
| Recommended Actions | None.                         |

## APPLIANCE\_TEMP\_EXCEED\_UPPER\_LIMIT

|                     |                                            |
|---------------------|--------------------------------------------|
| MIB Name            | None.                                      |
| Alarm Condition     | None.                                      |
| NCS Message         | Appliance temperature exceeds upper limit. |
| Symptoms            | None.                                      |
| Severity            | Major                                      |
| Category            | NCS                                        |
| Probable Causes     | None.                                      |
| Recommended Actions | Contact Technical Support.                 |

**AUDIT\_STATUS\_DIFFERENCE**

|                     |                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                                                 |
| Alarm Condition     | Audit status difference.                                                                                                                                              |
| NCS Message         | Switch "{0}" Audit done at "{1}." Config differences found between NCS and controller.                                                                                |
| Symptoms            | This notification is generated by NCS when audit differences are detected while auditing a controller during a network audit background task or per controller audit. |
| Severity            | Minor.                                                                                                                                                                |
| Category            | NCS                                                                                                                                                                   |
| Probable Causes     | The NCS and controller configuration are not synchronized.                                                                                                            |
| Recommended Actions | Refresh the configuration from the controller so that it synchronizes with the controller configuration on NCS.                                                       |

|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | coldStart.                                                                                                                                                                                                                      |
| Alarm Condition     | Cold start trap from controller.                                                                                                                                                                                                |
| NCS Message         | Switch "{0}." Cold start.                                                                                                                                                                                                       |
| Symptoms            | The switch (controller) went through a reboot.                                                                                                                                                                                  |
| Severity            | Informational.                                                                                                                                                                                                                  |
| Category            | Controller                                                                                                                                                                                                                      |
| Probable Causes     | <ul style="list-style-type: none"> <li>• The switch (controller) has power-cycled.</li> <li>• The switch (controller) went through a hard reset.</li> <li>• The switch (controller) went through a software restart.</li> </ul> |
| Recommended Actions | Power recycled; Software reset.                                                                                                                                                                                                 |

**CONFIGAUDITSET\_ENFORCEMENT\_FAIL**

|                     |                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                                                                      |
| Alarm Condition     | Enforcement on config group failed.                                                                                                                                                        |
| NCS Message         | Failed to enforce Config Group "0" on controllers "1."                                                                                                                                     |
| Symptoms            | This notification is generated by NCS during network audit when some failures are encountered during enforcement of the templates from the config groups (which as opted to be enforced).  |
| Severity            | Critical.                                                                                                                                                                                  |
| Category            | NCS                                                                                                                                                                                        |
| Probable Causes     | The config group (which are opted to be enforced) templates are not in sync with the device values.                                                                                        |
| Recommended Actions | Look at the controller audit report for the list of enforced values and for the failed enforcements. An alarm is cleared upon successful enforcements during the next network audit cycle. |

|                 |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name        | None.                                                                                                                                                               |
| Alarm Condition | Enforcement on config group succeeded.                                                                                                                              |
| NCS Message     | Successfully enforced Config Group "0" on controllers "1."                                                                                                          |
| Symptoms        | This notification is generated by NCS during network audit when all the templates from the config group (which are opted to be enforced) are successfully enforced. |
| Severity        | Minor.                                                                                                                                                              |
| Category        | NCS                                                                                                                                                                 |

|                     |                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Probable Causes     | The config group (which are opted to be enforced) templates are not in sync with the device values.                                                          |
| Recommended Actions | Look at the controller audit report for the list of enforced values. An alarm is cleared when no enforcements are found during the next network audit cycle. |

## CONFIG\_SAVED

|                     |                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | bsnConfigSaved.                                                                                                        |
| Alarm Condition     | Configuration saved.                                                                                                   |
| NCS Message         | Switch "{0}." Configuration saved in flash.                                                                            |
| Symptoms            | A configuration save to flash is performed on the switch (controller).                                                 |
| Severity            | Informational.                                                                                                         |
| Category            | Controller.                                                                                                            |
| Probable Causes     | The switch (controller) saves the configuration to the flash via a CLI command or entry via the controller GUI or NCS. |
| Recommended Actions | If you change the configuration using the controller CLI or controller GUI, you may need to refresh the configuration. |

## CPM\_REACHABLE

|                     |                                               |
|---------------------|-----------------------------------------------|
| MIB Name            | None.                                         |
| Alarm Condition     | Identity Services Engine reachable            |
| NCS Message         | Identity Services Engine "{0}" is reachable.  |
| Symptoms            | Identity Services Engine is reachable by NCS. |
| Severity            | Clear.                                        |
| Category            | ISE                                           |
| Probable Causes     | Clear alarm for CPM_UNREACHABLE.              |
| Recommended Actions | None.                                         |

## DOT1X\_SWITCH-5-ERR\_VLAN\_NOT\_FOUND

|                 |                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------|
| MIB Name        | None.                                                                                                    |
| Alarm Condition | Authorization vlan not found on switch.                                                                  |
| NCS Message     | Attempt to assign non-existent or shutdown VLAN %s to 802.1x port %s AuditSessionID %s                   |
| Symptoms        | "An attempt was made to assign a VLAN to an 802.1x port but the VLAN was not found in the VTP database." |
| Severity        | Informational                                                                                            |

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Category            | Clients                                                                                                  |
| Probable Causes     | "An attempt was made to assign a VLAN to an 802.1x port but the VLAN was not found in the VTP database." |
| Recommended Actions | Make sure the VLAN exists and is not shut-down or use another VLAN.                                      |

## DOT1X-5-FAIL

|                     |                                             |
|---------------------|---------------------------------------------|
| MIB Name            | None.                                       |
| Alarm Condition     | Wired client 802.1X authentication failure. |
| Category            | Clients                                     |
| Severity            | Information                                 |
| NCS Message         | None.                                       |
| Probable Causes     | None.                                       |
| Recommended Actions | None.                                       |

## DOT1X-5-SUCCESS

|                     |                                             |
|---------------------|---------------------------------------------|
| MIB Name            | None.                                       |
| Alarm Condition     | Wired client 802.1X authentication success. |
| Category            | Clients                                     |
| Severity            | Information                                 |
| NCS Message         | None.                                       |
| Probable Causes     | None.                                       |
| Recommended Actions | None.                                       |

## DBADMIN\_PASSWORD\_RESET

|                     |                                                      |
|---------------------|------------------------------------------------------|
| MIB Name            | None.                                                |
| Alarm Condition     | None.                                                |
| NCS Message         | DBAdmin password has been changed.                   |
| Symptoms            | DBAdmin password has been changed.                   |
| Severity            | Informational                                        |
| Category            | NCS                                                  |
| Probable Causes     | Clear alarm for DBADMIN_PASSWORD_RESET_FAILED_ALERT. |
| Recommended Actions | None.                                                |

**DBADMIN\_PASSWORD\_RESET\_FAILED**

|                     |                                                  |
|---------------------|--------------------------------------------------|
| MIB Name            | None.                                            |
| Alarm Condition     | DBAdmin password reset failed.                   |
| NCS Message         | DBAdmin password reset has failed.               |
| Symptoms            | DBAdmin password could not be reset.             |
| Severity            | Major                                            |
| Category            | NCS                                              |
| Probable Causes     | There is probably some issues with the database. |
| Recommended Actions | None.                                            |

**DBADMIN\_PASSWORD\_RESET\_FAILED\_ALERTi**

|                     |                                                  |
|---------------------|--------------------------------------------------|

| NCS Message         | Database is down, trying to restart.              |
| Symptoms            | NCS database is down.                             |
| Severity            | Critical                                          |
| Category            | NCS                                               |
| Probable Causes     | The database is down and cannot be started by HM. |
| Recommended Actions | Check server.                                     |

**HM\_DATABASE**

|                     |                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | ciscoWirelessMOStatusNotification                                                                                      |
| Alarm Condition     | NCS primary lost connection to the secondary.                                                                          |
| NCS Message         | NCS lost connection with the other server..                                                                            |
| Symptoms            | NCS lost connection with the other server..                                                                            |
| Severity            | Major                                                                                                                  |
| Category            | NCS                                                                                                                    |
| Probable Causes     | At the Database level, the connection between primary and secondary is lost. The server probably rebooted or shutdown. |
| Recommended Actions | Check server and network connections.                                                                                  |

**HM\_FAILOVER**

|                     |                                       |
|---------------------|---------------------------------------|
| MIB Name            | ciscoWirelessMOStatusNotification.    |
| Alarm Condition     | NCS failover attempted and failed.    |
| NCS Message         | NCS failover attempted and failed.    |
| Symptoms            | NCS could not perform failover.       |
| Severity            | Major                                 |
| Category            | NCS                                   |
| Probable Causes     | Unknown.                              |
| Recommended Actions | Check server and network connections. |

**HM\_FAILBACK**

|                     |                                       |
|---------------------|---------------------------------------|
| MIB Name            | ciscoWirelessMOStatusNotification     |
| Alarm Condition     | NCS failback attempted and failed.    |
| NCS Message         | NCS failback attempted and failed.    |
| Symptoms            | NCS could not perform failback.       |
| Severity            | Major                                 |
| Category            | NCS                                   |
| Probable Causes     | Unknown.                              |
| Recommended Actions | Check server and network connections. |

**HM\_REACHABILITY**

|                     |                                                                                    |
|---------------------|------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                              |
| Alarm Condition     | NCS primary and Secondary cannot reach each other.                                 |
| NCS Message         | NCS servers cannot reach each other.                                               |
| Symptoms            | NCS servers cannot reach each other.                                               |
| Severity            | Major                                                                              |
| Category            | NCS                                                                                |
| Probable Causes     | HA setup/configuration might be wrong. Servers may have also rebooted or shutdown. |
| Recommended Actions | Check HA setup/configuration.                                                      |

**HM\_REGISTRATION**

|                     |                                  |
|---------------------|----------------------------------|
| MIB Name            | None.                            |
| Alarm Condition     | NCS failed HA registration.      |
| NCS Message         | NCS failed HA registration.      |
| Symptoms            | NCS failed on HA registration.   |
| Severity            | Major                            |
| Category            | NCS                              |
| Probable Causes     | HA configuration might be wrong. |
| Recommended Actions | Check HA configuration.          |

**IOSAP\_LINK\_DOWN**

|                     |                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | linkDown                                                                                                               |
| Alarm Condition     | Autonomous AP Link Down.                                                                                               |
| NCS Message         | Autonomous AP "{0}," Interface "{1}" is {2} down.                                                                      |
| Symptoms            | The physical link is down on an autonomous access point radio port.                                                    |
| Severity            | Critical.                                                                                                              |
| Category            | Access Point.                                                                                                          |
| Probable Causes     | The radio port of an autonomous access point was disabled manually or a port failure occurred.                         |
| Recommended Actions | Check the administrative status of the port. If the port administrative status is not down, check other port settings. |

**IPSEC\_ESP\_POLICY\_FAILURE**

|                     |                          |
|---------------------|--------------------------|
| MIB Name            | None.                    |

| Alarm Condition     | NCS has low disk space                                                                                                                                                                                                                                                                                                 |
| NCS Message         | NCS "{0}" does not meet the minimum hardware requirements for disk space. Available: "{3}." Minimum requirement: "{4}" Mb.                                                                                                                                                                                             |
| Symptoms            | This notification is generated by NCS when the free disk space where NCS is installed does not meet minimum hardware requirements. This event is of major severity if minimum requirements are not met. This event is of critical severity when the available disk space is less than half of the minimum requirement. |
| Severity            | Major/Critical.                                                                                                                                                                                                                                                                                                        |
| Category            | NCS                                                                                                                                                                                                                                                                                                                    |
| Probable Causes     | This can happen when the disk is out of space.                                                                                                                                                                                                                                                                         |
| Recommended Actions | Free up disk space.                                                                                                                                                                                                                                                                                                    |

| MIB Name            | None.                                                                   |
| Alarm Condition     | Wired Client guest VLAN assigned                                        |
| Category            | Clients                                                                 |
| Severity            | Information                                                             |
| NCS Message         | Guest VLAN %s is assigned to Wired Client "%s".                         |
| Probable Causes     | Client is moved to Auth Fail VLAN because client failed authentication. |
| Recommended Actions | Check that client provided appropriate credentials.                     |

## TRACKED\_CLIENT\_DETECTION

|                     |                                         |
|---------------------|-----------------------------------------|
| MIB Name            | None.                                   |
| Alarm Condition     | Tracked client detected on the network. |
| Category            | Security                                |
| Severity            | Major                                   |
| NCS Message         | None.                                   |
| Probable Causes     | None.                                   |
| Recommended Actions | None.                                   |

**USER\_AUTHENTICATION\_FAILURE**

|                     |                                                     |
|---------------------|-----------------------------------------------------|
| MIB Name            | None.                                               |
| Alarm Condition     | User Authentication Failure.                        |
| Category            | Security                                            |
| Severity            | Informational                                       |
| NCS Message         | "%s" "%s" failed authentication on Controller "%s". |
| Probable Causes     | User failed to authenticate.                        |
| Recommended Actions | Check that user provides appropriate credentials.   |

**WARM\_START**

|                     |                                 |
|---------------------|---------------------------------|
| MIB Name            | None.                           |
| Alarm Condition     | Warm start trap from controller |
| Category            | Controller                      |
| Severity            | Informational                   |
| NCS Message         | None.                           |
| Probable Causes     | None.                           |
| Recommended Actions | None.                           |

**Wireless Intrusion Protection Alarms**

|                     |                                                                         |
|---------------------|-------------------------------------------------------------------------|
| MIB Name            | None.                                                                   |
| Alarm Condition     | wIPS engine on MSE.                                                     |
| NCS Message         | Dynamically generated. Refer WCS Monitor>Alarms.                        |
| Symptoms            | Refer to wIPS alarm encyclopedia under WCS>Configuration>wIPS Profiles. |
| Severity            | Critical.                                                               |
| Category            | Mobility Service                                                        |
| Probable Causes     | Possible security attack.                                               |
| Recommended Actions | None.                                                                   |

**WLAN\_SHUT\_FAILED**

|                     |                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                                                             |
| Alarm Condition     | Client associated failure with AP.                                                                                                                                                |
| NCS Message         | Wlan "{0}" shutdown failed on controller "{1}."                                                                                                                                   |
| Symptoms            | This notification is generated by NCS during scheduled operations for a given WLAN Config object. It notifies the user that the WLAN status did not change at the scheduled time. |
| Severity            | Major.                                                                                                                                                                            |
| Category            | NCS                                                                                                                                                                               |
| Probable Causes     | The controller for the selected WLAN is not reachable, or the WLAN object does not exist.                                                                                         |
| Recommended Actions | Check the NCS logs at the time of event generation and verify if the WLAN exists on the controller.                                                                               |

**WLAN\_SHUT\_SUCCESS**

|                     |                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB Name            | None.                                                                                                                                                                                  |
| Alarm Condition     | WLAN successfully shutdown.                                                                                                                                                            |
| NCS Message         | Wlan "{0}" successfully shutdown on controller "{1}."                                                                                                                                  |
| Symptoms            | This notification is generated by NCS during scheduled operation for each given WLAN configuration object. It notifies the user that the admin status has been successfully completed. |
| Severity            | Informational..                                                                                                                                                                        |
| Category            | NCS                                                                                                                                                                                    |
| Probable Causes     | Verify the admin status for the displayed WLAN on the controller.                                                                                                                      |
| Recommended Actions | Remove the event from the event list page.                                                                                                                                             |

**WLC\_CANCEL\_SCHEDULED\_RESET**

|                     |               |
|---------------------|---------------|
| MIB Name            | None.         |
| Alarm Condition     | None.         |
| Category            | Controller    |
| Severity            | Informational |
| NCS Message         | None.         |
| Probable Causes     | None.         |
| Recommended Actions | None.         |

## WLC\_SCHEDULED\_RESET\_FAILED

# CHAPTER 14

## Reports

---

Cisco NCS reporting is necessary to monitor the system and network health as well as troubleshoot problems. A number of reports can be generated to run on an immediate and scheduled basis. Each report type has a number of user-defined criteria to aid in the defining of the reports. The reports are formatted as a summary, tabular, or combined (tabular and graphical) layout. Once defined, the reports can be saved for future diagnostic use or scheduled to run and report on a regular basis.

Reports are saved in either CSV or PDF format and are either saved to a file on NCS for later download or e-mailed to a specific e-mail address.

The reporting types include the following:

- Current, which provides a snap shot of the data that is not dependent upon time.
- Historical, which retrieves data from the device periodically and stores it in the NCS database
- Trend, which generates a report using aggregated data. Data can be periodically collected based from devices on user-defined intervals, and a schedule can be established for report generation.

With NCS, you also have the ability to export any report that you can view, sort reports into logical groups, and archive for long-term storage.

### Note

---

As of NCS 1.0, the size limitations of reports is removed. So, you can view a report of any size with any number of graphs using HTML or saved as CSV/PDF files.

---

The Reports menu provides access to all NCS reports as well as currently saved and scheduled reports.

- Report Launch Pad—The hub for all NCS reports. From this page, you can access specific types of reports and create new reports. See the [“Report Launch Pad” section on page 14-2](#) for more information.
- Scheduled Run Results—Allows you to access and manage all currently scheduled runs in NCS. In addition, allows you to access and manage on-demand export as well as e-mailed reports. See the [“Managing Scheduled Run Results” section on page 14-14](#) for more information.
- Saved Report Templates—Allows you to access and manage all currently saved report templates in NCS. See the [“Managing Saved Report Templates” section on page 14-16](#) for more information.

# Report Launch Pad

The report launch pad provides access to all NCS reports from a single page. From this page, you can view current reports, open specific types of reports, create and save new reports, and manage scheduled runs (see [Figure 14-1](#)).

Tip

Hover your mouse cursor over the tool tip next to the report type to view more report details.

**Figure 14-1** Report Launch Pad

The screenshot shows the Cisco Prime Network Control System interface. The top navigation bar includes Home, Monitor, Configure, Services, Reports, and Administration. The left sidebar lists various report categories. The main content area, titled 'Report Launch Pad', displays a grid of report cards. Each card represents a report type, such as 'Autonomous AP Memory and CPU Utilization', 'Guest Accounts Status', 'Client Count', etc. Each card has a 'New' button and a help icon. The reports are organized into sections: Autonomous AP, CleanAir, Client, Compliance, Guest, Mesh, Network Summary, Performance, and Security.

This section contains the following topics:

- [Mapping Reports in WCS with Reports in NCS, page 14-3](#)
- [Creating and Running a New Report, page 14-6](#)
- [Managing Current Reports, page 14-13](#)
- [Managing Scheduled Run Results, page 14-14](#)
- [Managing Saved Report Templates, page 14-16](#)

## Mapping Reports in WCS with Reports in NCS

Table 14-1 provides the mapping between the reports in WCS and Reports in NCS. Additionally, the new reports that were added to NCS are also specified.

**Table 14-1** Mapping Reports in WCS with Reports in NCS

| Reports                                  | In WCS | In NCS |
|------------------------------------------|--------|--------|
| <b>Autonomous AP</b>                     | -      | -      |
| Autonomous AP Memory and CPU Utilization | No     | Yes    |
| Autonomous AP Summary                    | No     | Yes    |
| Autonomous AP Tx Power and Channel       | No     | Yes    |
| Autonomous AP Uptime                     | No     | Yes    |
| Autonomous AP Utilization                | No     | Yes    |
| Busiest Autonomous APs                   | No     | Yes    |
| <b>CleanAir</b>                          | -      | -      |
| Air Quality vs Time                      | Yes    | Yes    |
| Security Risk Interferers                | Yes    | Yes    |
| Worst Air Quality APs                    | Yes    | Yes    |
| Worst Interferers                        | Yes    | Yes    |
| <b>Client</b>                            | -      | -      |
| Busiest Clients                          | Yes    | Yes    |
| Client Count                             | Yes    | Yes    |
| Client Sessions                          | Yes    | Yes    |
| Client Summary                           | Yes    | Yes    |
| Client Traffic                           | Yes    | Yes    |
| Client Traffic Stream Metrics            | Yes    | Yes    |
| Posture Status Count                     | No     | Yes    |
| Throughput                               | Yes    | Yes    |
| Unique Clients                           | Yes    | Yes    |
| v5 Client Statistics                     | Yes    | Yes    |
| <b>Compliance</b>                        | -      | -      |
| Configuration Audit                      | Yes    | Yes    |
| PCI DSS Detailed                         | Yes    | Yes    |
| PCI DSS Summary                          | Yes    | Yes    |
| <b>ContextAware</b>                      | -      | -      |
| Client Location History                  | Yes    | Yes    |
| Client Location Tracking                 | Yes    | Yes    |

**Table 14-1 Mapping Reports in WCS with Reports in NCS (continued)**

| <b>Reports</b>                      | <b>In WCS</b> | <b>In NCS</b> |
|-------------------------------------|---------------|---------------|
| Guest Location Tracking             | Yes           | Yes           |
| Location Notifications              | Yes           | Yes           |
| Rogue AP Location Tracking          | Yes           | Yes           |
| Rogue Client Location Tracking      | Yes           | Yes           |
| Tag Location History                | Yes           | Yes           |
| Tag Location Tracking               | Yes           | Yes           |
| <b>Device</b>                       | -             | -             |
| AP Image Pre-download               | Yes           | Yes           |
| AP Profile Status                   | Yes           | Yes           |
| AP Summary                          | Yes           | Yes           |

| Voice Statistics                | Yes           | Yes           |
| <b>Security</b>                 | -             | -             |
| Adaptive wIPS Alarm             | Yes           | Yes           |
| Adaptive wIPS Alarm Summary     | Yes           | Yes           |
| Adaptive wIPS Top 10 AP         | Yes           | Yes           |
| Adhoc Rogue Count Summary       | Yes           | Yes           |
| Adhoc Rogues                    | Yes           | Yes           |
| New Rogue AP Count Summary      | Yes           | Yes           |
| New Rogue APs                   | Yes           | Yes           |
| Rogue AP Count Summary          | Yes           | Yes           |
| Rogue APs                       | Yes           | Yes           |
| Security Alarm Trending Summary | Yes           | Yes           |

## Non Upgradable Reports from WCS to NCS

The following reports cannot be upgraded to NCS 1.0:

- Client Count
- Client Summary

- Client Throughput
- Security Summary
- Adhoc Rogue Count Summary
- Adhoc Rogues
- New Rogue AP Count Summary
- New Rogue APs
- Rogue AP Count Summary
- Rogue APs

## Creating and Running a New Report

To create and run a new report, follow these steps:

---

**Step 1** Choose **Reports > Report Launch Pad**.

The reports are listed by category in the main section of the page and on the left sidebar menu (see [Figure 14-1](#)).

**Step 2** Find the appropriate report in the main section of the Report Launch Pad.

---

**Note** Click the report name from the Report Launch Pad or use the navigation on the left side of the Report Launch Pad page to view any currently saved report templates for that report type.

---

**Step 3** Click **New** to the right of the report. The Report Details page appears (see [Figure 14-2](#)).

Figure 14-2 Report Details Page

**Step 4** In the Report Details page, enter the following Settings parameters:

**Note** Certain parameters may or may not appear depending on the report type.

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By—Choose the appropriate Report By category from the drop-down list. The categories differ for each report. See specific report sections for Report By categories for each report.
- Report Criteria—The parameter allows you to sort your results depending on the previous Report By selection made. Click **Edit** to open the Filter Criteria page.

**Note** Click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Communication Protocol—Choose either of these protocols **All Clients**, **All Wired (802.3)**, **All Wireless (802.11)**, **802.11a/n**, **802.11b/g/n**, **802.11a**, **802.11b**, **802.11g**, **802.11n (5 GHz)**, or **802.11n (2.4 GHz)**.
- Report Period
  - Last—Select the **Last** radio button and choose the period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

- Show—Enter the number of records that you want displayed in the report.

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

**Step 5** If you plan to run this report at a later time or as a recurring report, enter the Schedule parameters. The Schedule parameters allow you to control when and how often the report runs.

- Enable Schedule—Select the check box to run the report on the set schedule.
- Export Format—Choose your format for exported files (CSV or PDF).
- Destination—Choose your destination type (File or Email). Enter the applicable file location or the e-mail address.

**Note** The default file locations for CSV and PDF files are as follows:

```
/ncs-ftp/reports/Inventory/<ReportTitleName>_<yyyymmdd>_<HHMMSS>.csv
/ncs-ftp/reports/Inventory/<ReportTitleName>_<yyyymmdd>_<HHMMSS>.pdf
```

**Note** To set the mail server setup for e-mails, choose **Administration > Settings**, then choose **Mail Server** from the left side-bar menu to open the Mail Server Configuration page. Enter the SMTP and other required information.

- Start Date/Time—Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date. Choose the time from the hours and minutes drop-down lists. The report will begin running on this data and at this time.

**Note** The time referred here is the NCS server time and not the local time of the browser.

- Recurrence—Enter the frequency of this report.
  - No Recurrence—The report runs only once (at the time indicated for the Start Date/Time).
  - Hourly—The report runs on the interval indicated by the number of hours you enter in the Entry text box.
  - Daily—The report runs on the interval indicated by the number of days you enter in the Every text box.
  - Weekly—The report runs on the interval indicated by the number of weeks you enter in the Every text box and on the days specified by the selected check boxes.

The Create Custom Report page allows you to customize the report results. [Table 14-2](#) specifies which reports are customizable, which have multiple sub-reports, and which report views are available. In future releases, all reports will be customizable.

**Table 14-2 Report Customization**

| <b>Report</b>                            | <b>Customizable?</b> | <b>Multiple Sub-Reports?</b> | <b>Report Views</b>  | <b>Data Field Sorting?</b> |
|------------------------------------------|----------------------|------------------------------|----------------------|----------------------------|
| Autonomous AP Memory and CPU Utilization | No                   | No                           | Graphical            | No                         |
| Autonomous AP Summary                    | Yes                  | No                           | Tabular              | No                         |
| Autonomous AP Tx Power and Channel       | No                   | Yes                          | Graphical            | No                         |

| Adhoc Rogue Count Summary         | Yes           | No                    | Both         | No                  |
| Adhoc Rogues                      | Yes           | No                    | Tabular      | No                  |
| New Rogue AP Count Summary        | Yes           | No                    | Both         | No                  |
| New Rogue APs                     | No            | No                    | Graphical    | No                  |
| Rogue AP Count Summary            | Yes           | No                    | Both         | No                  |
| Rogue APs                         | Yes           | No                    | Tabular      | No                  |
| Security Alarm Trending Summary   | No            | No                    | Graphical    | No                  |

1. Sub-report Client Summary view is tabular only. The rest of the sub-reports such as Client Summary by Protocol have both report views and are customizable to show either tabular, graphical, or both.
2. Combined inventory report now contains APs/Controllers/MSEs/Autonomous APs/Switches. Reports that are by model or version have both views. These views are customizable with setting such as Count of Controllers by Model. Other reports, such as Controller Inventory, are tabular only.

**Step 6** Click **Customize** to open a separate Create Custom Report page (see [Figure 14-3](#)).

**Figure 14-3** *Customize Report View Page*

- a. From the Custom Report Name drop-down list, choose the report you intend to customize. The Available and Selected column heading selections may change depending on the report selected.
- b. From the Report View drop-down list, specify if the report will appear in tabular, graphical, or combined form (both). This option is not available on every report.
- c. Use the **Add >** and **< Remove** buttons to move highlighted column headings between the two panes (Available data fields and Data fields to include).

**Note** Column headings in **blue** are mandatory in the current sub report. They cannot be removed from the Selected Columns area.

- d. Use the **Change Order** buttons (Move Up or Move Down) to determine the order of the columns in the results table. The higher the column heading appears in the Selected Columns list, the farther left it appears in the results table.
- e. In the **Data field Sorting** section, indicate your sorting preference (Ascending or Descending). Determine how the report data is sorted.
  - You can select four data fields for which you can specify sorting order. Use the Sort by and Then by drop-down lists to choose each data field for sorting.
  - For each sorted data field, choose whether you want it sorted in Ascending or Descending order.

**Note** Only reports in table form (rather than graphs or combined) can be sorted. Only fields that can be sorted appear in the Data field sorting drop-down lists.

---

**Note** The Sortable fields displayed in the Customize page would list out all sortable fields irrespective of the data fields which are in the Data fields to include pane. The Report will be sorted based on the data field selected even if that column is not displayed in the report.

---

- f. Click **Apply** to confirm the changes, **Reset** to return columns to the default, or **Cancel** to close this page with no changes made.

---

**Note** The changes made in the Create Custom Report page are not saved until you click **Save** on the Report Details page.

---

**Step 7** When all report parameters have been set, choose one of the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
  - **Save and Run**—Click to save this report setup and to immediately run the report.
  - **Run**—Click to run the report without saving the report setup.
  - **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
  - **Save and Email**—Click to save the report and e-mail the results.
  - **Cancel**—Click to return to the previous page without running nor saving this report.
- 

## Managing Current Reports

If a report has been saved for a specific report type, you can access the current reports from the Report Launch Pad.

To access current or saved report templates from the Report Launch Pad or Saved Report Template, follow these steps:

---

**Step 1** Choose **Reports > Report Launch Pad**.

**Step 2** Choose the specific report from the left sidebar menu or from the main section of the Report Launch Pad. The page displays a list of current reports for this report type (see [Figure 14-4](#)).

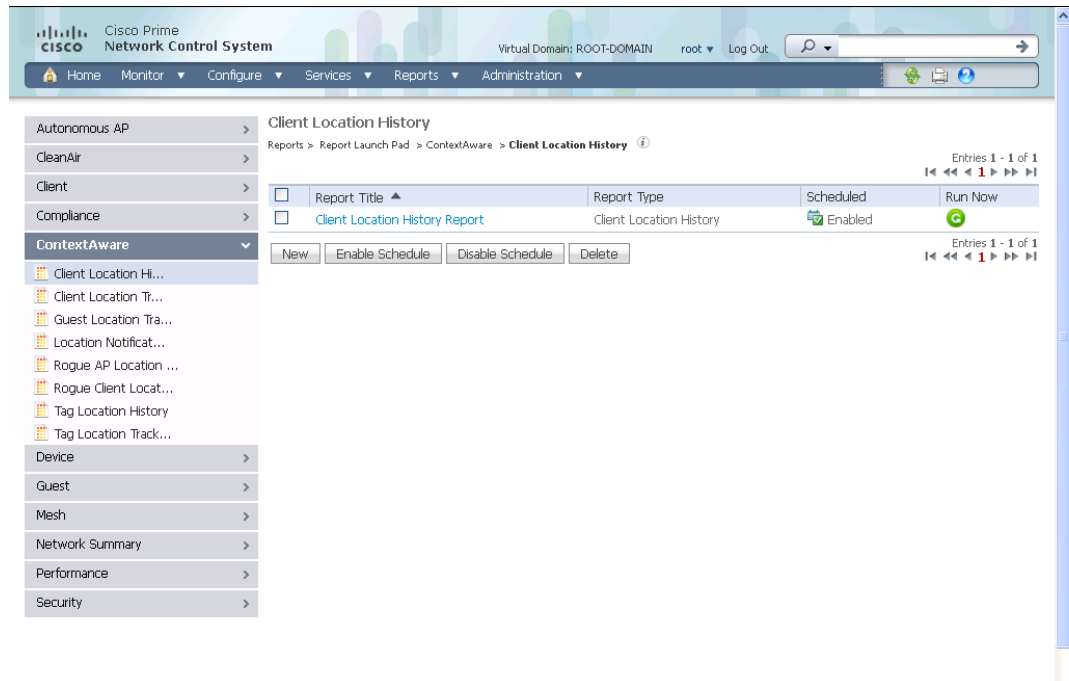

---

**Note** To view a list of saved report templates, choose **Reports > Saved Report Templates**. See the [“Managing Saved Report Templates”](#) section on page 14-16 for more information.

---

Figure 14-4 Current Reports Page

## Managing Scheduled Run Results

To view all currently scheduled runs in NCS, choose **Report > Scheduled Run Results** (see [Figure 14-5](#)).

**Note** The list of scheduled runs can be sorted by report category, report type, and time frame.

Figure 14-5 Scheduled Run Results Page

The Scheduled Run Results page displays the following information:

- Report Title—Identifies the user-assigned report name.

**Note** Click the report title to view the details for this report.

- Report Type—Identifies the specific report type.
- Status—Indicates whether or not the report ran successfully.
- Message—Indicates whether or not this report was saved and the file name for this report (if saved).
- Run Date/Time—Indicates the date and time that the report is scheduled to run.
- History—Click the History icon to view all scheduled runs and their details for this report.
- Download—Click the Download icon to open or save a .csv/.pdf file of the report results.

For more information about scheduled run results, see the following:

- [Sorting Scheduled Run Results, page 14-15](#)
- [Viewing or Editing Scheduled Run Details, page 14-16](#)

## Sorting Scheduled Run Results

You can use the Show drop-down lists to sort the Scheduled Run Results by category, type, and time frame (see [Figure 14-6](#)):

- Report Category—Choose the appropriate report category from the drop-down list or choose **All**.
- Report Type—Choose the appropriate report type from the drop-down list or choose **All**. The report Type selections change depending on the selected report category.
- From/To—Type the report start (From) and end (To) dates in the text boxes or click the calendar icons to select the start and end dates.

Click **Go** to sort this list. Only reports that match your criteria appear.

Figure 14-6 Sorting Scheduled Run Results

Show: Report Category ContextAware Report Type All From 04/27/2011 To 04/27/2011 Report Generation Method Scheduled

| Report Title                                   | Report Type             | Run Date/Time             |
|------------------------------------------------|-------------------------|---------------------------|
| <a href="#">Client Location History Report</a> | Client Location History | 2011-Apr-27, 05:35:00 PDT |

## Viewing or Editing Scheduled Run Details

To view or edit a saved report template, follow these steps:

- Step 1** Choose **Report > Scheduled Run Results**.
- Step 2** Click the Report Title link for the appropriate report to open the Report Details page.
- Step 3** From this page, you can view or edit the details for the scheduled run.
- Step 4** When all scheduled run parameters have been edited (if necessary), select from the following:
  - **Save**—Click to save this schedule run without immediately running the report. The report will automatically run at the scheduled time.
  - **Save and Run**—Click to save this scheduled run and to immediately run the report.
  - **Cancel**—Click to return to the previous page without running nor saving this report.
  - **Delete**—Click to delete the current saved report template.

## Managing Saved Report Templates

In the Saved Report Templates page, you can create and manage saved report templates (see [Figure 14-7](#)). To open this page in NCS, choose **Reports > Saved Report Templates**.

### Note

The list of saved report templates can be sorted by report category, report type, and scheduled status (enabled, disabled, or expired).

Entries 1 - 6 of 6

201243

The Saved Report Templates page displays the following information:

- Report Title—Identifies the user-assigned report name.

**Note** Click the report title to view the details for this report.

- Report Type—Identifies the specific report type.
- Scheduled—Indicates whether this report is enabled or disabled.
- Run—Click the **Run** icon to immediately run the current report.

This section consists of the following topics:

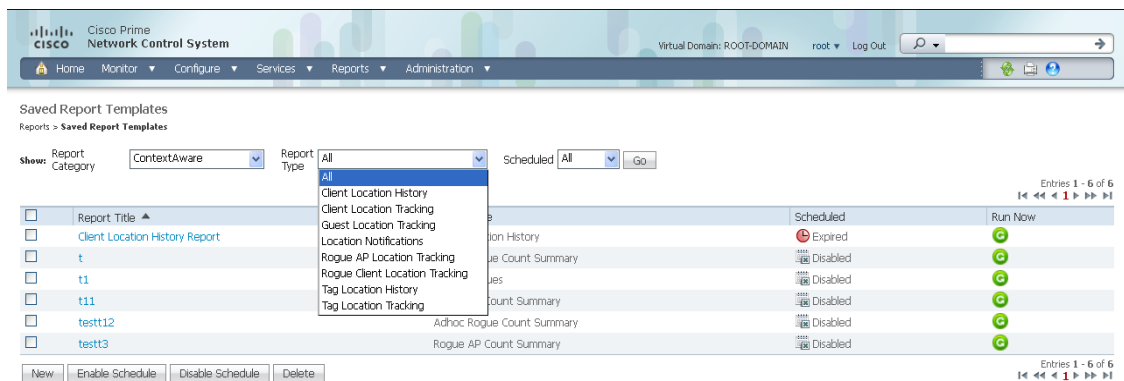

- [Filtering Saved Report Templates, page 14-17](#)
- [Viewing or Editing Saved Report Template Details, page 14-18](#)
- [Running a Saved Report Template, page 14-18](#)

## Filtering Saved Report Templates

You can use the Show drop-down lists to filter the Saved Report Templates list by category, type, and scheduled status (see [Figure 14-8](#)).

- Report Category—Choose the appropriate report category from the drop-down list or choose **All**.
- Report Type—Choose the appropriate report type from the drop-down list or choose **All**. The Report Type selections change depending on the selected report category.
- Scheduled—Choose **All**, **Enabled**, **Disabled**, or **Expired** to filter the Saved Report Templates list by scheduled status.

Figure 14-8 Filtering Saved Report Templates

Click **Go** to filter this list. Only reports that match your criteria appear.

## Viewing or Editing Saved Report Template Details

To view or edit a saved report template, follow these steps:

- Step 1** Choose **Report > Saved Report Templates**.
- Step 2** Click the Report Title link for the appropriate report to open the Report Details page.
- Step 3** From this page, you can view or edit the details for the saved report template.
- Step 4** When all report parameters have been edited, choose one of the following:
  - **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
  - **Save and Run**—Click to save this report setup and to immediately run the report.
  - **Run**—Click to run the report without saving the report setup.
  - **Cancel**—Click to return to the previous page without running nor saving this report.
  - **Delete**—Click to delete the current saved report template.

## Running a Saved Report Template

In the Reports > Saved Report Templates page, click **Run** for the appropriate report. A list of reports specific to NCS follows.

## Autonomous AP Reports

This section lists and describes the various Autonomous AP reports that you can generate in NCS. Click **New** next to the Autonomous AP report category to create a new report. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

The following Autonomous AP reports are available in NCS:

- [Autonomous AP Memory and CPU Utilization](#)
- [Autonomous AP Summary](#)
- [Autonomous AP Tx Power and Channel](#)
- [Autonomous AP Uptime](#)
- [Autonomous AP Utilization](#)
- [Busiest Autonomous APs](#)

## Autonomous AP Memory and CPU Utilization

This report displays the memory and CPU utilization trends of Autonomous APs based on the filtering criteria specified during report generation. It could help in identifying unexpected behavior or issues with network performance.

This section contains the following topics:

- [Configuring an Autonomous AP Memory and CPU Utilization Report, page 14-21](#)
- [Autonomous AP Memory and CPU Utilization Report Results, page 14-22](#)

## Configuring an Autonomous AP Memory and CPU Utilization Report

This section describes how to configure an Autonomous AP Memory and CPU Utilization report.

### Settings

The following settings can be configured for a Autonomous AP Memory and CPU Utilization report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By

- Autonomous AP IP Address—Choose from the Report Criteria list or click **Edit** to choose specific access points.
- Autonomous AP Host Name—Choose from the Report Criteria list or click **Edit** to choose specific access points.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** Leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

---

**Note** See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Autonomous AP Memory and CPU Utilization Report Results

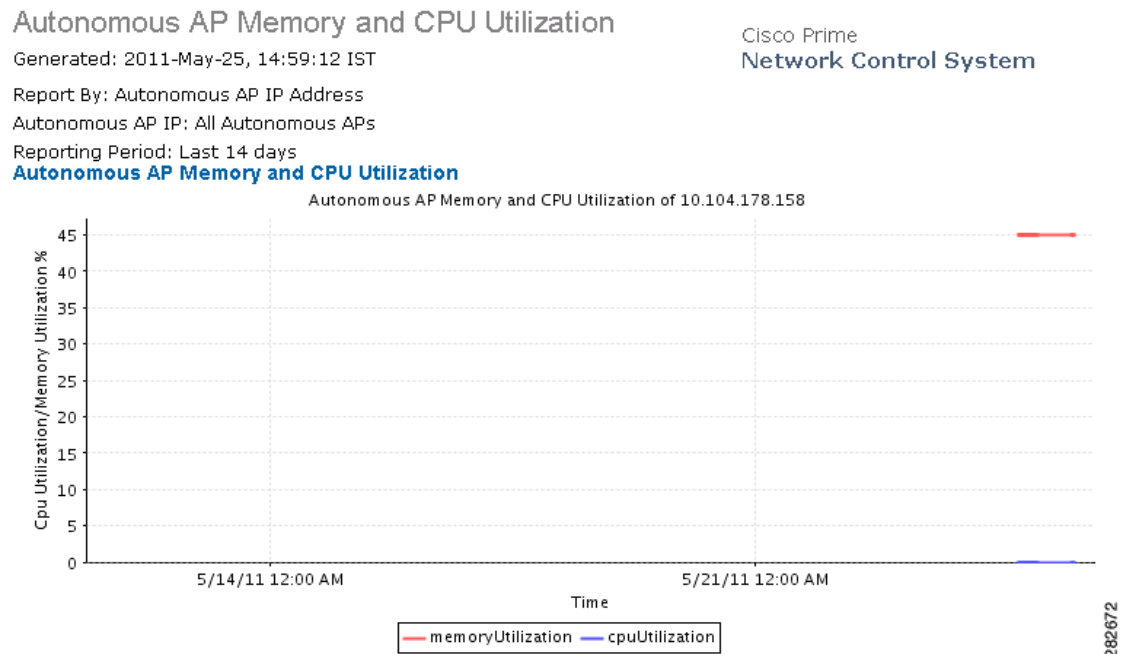

---

**Note** Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

Figure 14-9 shows the potential results for an Autonomous AP Memory and CPU Utilization report, depending on how the report is customized.

**Figure 14-9 Autonomous AP Memory and CPU Utilization Report**

## Autonomous AP Summary

This report displays the Autonomous AP summary.

This section contains the following topics:

- [Configuring the Autonomous AP Summary Report, page 14-23](#)
- [Autonomous AP Summary Report Results, page 14-24](#)

## Configuring the Autonomous AP Summary Report

This section describes how to configure an Autonomous AP Summary report.

### Settings

The following settings can be configured for a Autonomous AP Summary report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Autonomous AP IP Address—Choose from the Report Criteria list or click **Edit** to choose specific access points.
  - Autonomous AP Host Name—Choose from the Report Criteria list or click **Edit** to choose specific access points.
  - Floor Area—Choose **All Campuses > All Buildings > All Floors** or click **Edit** to choose specific locations.

- Outdoor Area—Choose **All Campuses > All Outdoor Areas** or click **Edit** to choose specific locations.

---

**Note** Leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Autonomous AP Summary Report Results

**Note**

---

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for an Autonomous AP Summary report, depending on how the report is customized:

- AP Name
- Ethernet MAC Address
- AP IP Address
- Model
- Map Location

## Autonomous AP Tx Power and Channel

This report displays the channel plan assignment and transmits power level trends of devices based on the filtering criteria used when the report was generated. It could help identify unexpected behavior or issues with network performance.

This section contains the following topics:

- [Configuring an Autonomous AP Tx Power and Channel Report, page 14-25](#)
- [Autonomous AP Tx Power and Channel Report Results, page 14-26](#)

### Configuring an Autonomous AP Tx Power and Channel Report

This section describes how to configure an Autonomous AP Tx Power and Channel report.

#### Settings

The following settings can be configured for a Autonomous AP Tx Power and Channel report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Autonomous AP IP Address—Choose from the Report Criteria list or click **Edit** to choose specific access points.
  - Autonomous AP Host Name—Choose from the Report Criteria list or click **Edit** to choose specific access points.
  - Autonomous AP By Floor Area—Choose **All Campuses > All Buildings > All Floors** or click **Edit** to choose specific locations.
  - Autonomous AP By Outdoor Area—Choose **All Campuses > All Outdoor Areas** or click **Edit** to choose specific locations.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

#### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Autonomous AP Tx Power and Channel Report Results

**Note**

---

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following information is displayed for a Tx Power and Channel report (see [Figure 14-10](#)):

- Transmit power level for each access point during the specified period of time.
- Channel number for each access point during the specified period of time.

Figure 14-10 Autonomous AP Tx Power and Channel Report

## Autonomous AP Uptime

This report displays the Autonomous AP uptime.

This section contains the following topics:

- [Configuring Autonomous AP Uptime Report, page 14-27](#)
- [Autonomous AP Uptime Report Results, page 14-28](#)

## Configuring Autonomous AP Uptime Report

This section describes how to configure an Autonomous AP Uptime report.

### Settings

The following settings can be configured for a Autonomous AP Uptime report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Autonomous AP IP Address—Choose from the Report Criteria list or click **Edit** to choose specific access points.
  - Autonomous AP Host Name—Choose from the Report Criteria list or click **Edit** to choose specific access points.

- Autonomous AP By Floor Area—Choose **All Campuses > All Buildings > All Floors** or click **Edit** to choose specific locations.
- Autonomous AP By Outdoor Area—Choose **All Campuses > All Outdoor Areas** or click **Edit** to choose specific locations.
- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

---

**Note** See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Autonomous AP Uptime Report Results

---

**Note** Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for an Autonomous AP Uptime report, depending on how the report is customized:

- AP Name
- IP Address
- Map Location

- AP Up Time

## Autonomous AP Utilization

This report displays the utilization trends of Autonomous AP radios based on the filtering criteria used when the report was generated. It could help identify current network performance and capacity planning for future scalability needs.

This section contains the following topics:

- [Configuring an Autonomous AP Utilization Report, page 14-29](#)
- [Autonomous AP Utilization Report Results, page 14-30](#)

## Configuring an Autonomous AP Utilization Report

This section describes how to configure an Autonomous AP Utilization report.

### Settings

The following settings can be configured for a Autonomous AP Utilization report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Autonomous AP IP Address—Choose from the list or click **Edit** to choose specific access points.
  - Autonomous AP Host Name—Choose **System Campus > All Access Points** or click **Edit** to choose specific access points.
  - Autonomous AP Floor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** or click **Edit** to choose specific locations or access points.
  - Autonomous AP Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** or click **Edit** to choose specific locations or access points.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** Leave the text box blank to display all records.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

### Note

See the [“Creating and Running a New Report”](#) section on page 14-6 for additional information on running or scheduling a report.

## Autonomous AP Utilization Report Results

### Note

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on customizing report results.

Figure 14-11 shows the potential results for an Autonomous AP Utilization report, depending on how the report is customized.

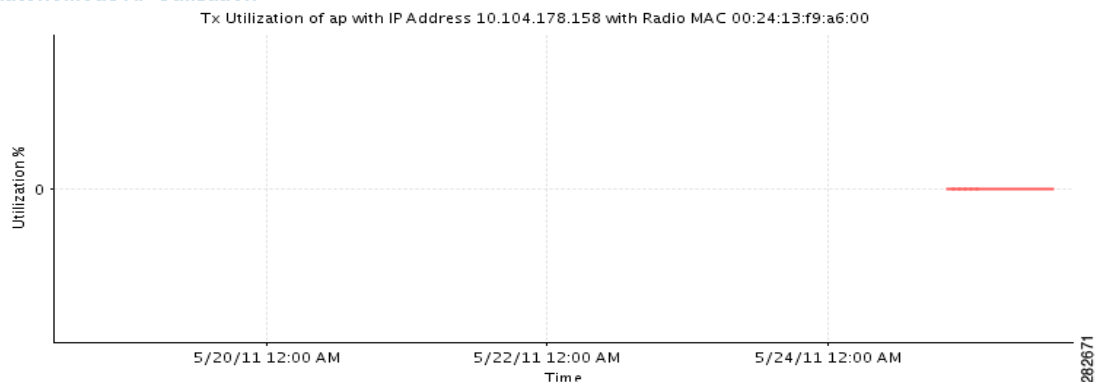

**Figure 14-11 Autonomous AP Utilization Report**

### Test4

Generated: 2011-May-25, 14:48:24 IST  
 Report By: Autonomous AP IP Address  
 Autonomous AP IP: All Autonomous APs  
 Protocol: 802.11a/n  
 Reporting Period: Last 7 days

Cisco Prime  
 Network Control System

### Autonomous AP Utilization

## Busiest Autonomous APs

This report displays the Autonomous APs with the highest total usage (the sum of transmitting, receiving, and channel usage) on your wireless network.

### Configuring a Busiest Autonomous APs Report

This section describes how to configure an Busiest Autonomous APs report.

#### Settings

The following settings can be configured for a Busiest Autonomous APs report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Autonomous AP IP Address—Choose from the list or click **Edit** to choose specific access points.
  - Autonomous AP Host Name—Choose **System Campus > All Access Points** or click **Edit** to choose specific access points.
  - Autonomous AP Floor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** or click **Edit** to choose specific locations or access points.
  - Autonomous AP Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** or click **Edit** to choose specific locations or access points.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last—Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

#### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

#### Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- **Save and Run**—Click to save this report setup and to immediately run the report.
- **Run**—Click to run the report without saving the report setup.
- **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
- **Save and Email**—Click to save the report and e-mail the results.
- **Cancel**—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Busiest Autonomous APs Report Results

**Note**

---

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for an Busiest Autonomous APs report, depending on how the report is customized:

- IP Address
- AP Name
- Rx Utilization (%)
- Tx Utilization (%)

## CleanAir Reports

Click **New** for CleanAir report type to create a new report. See the [“Creating and Running a New Report” section on page 14-6](#) for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

This section contains the following CleanAir reports:

- [Air Quality vs Time](#)
- [Security Risk Interferers](#)
- [Worst Air Quality APs](#)
- [Worst Interferers](#)

## Air Quality vs Time

This report displays the air quality index distributions over a period of time for access points on your wireless networks.

Click **Air Quality vs Time** from the Report Launch Pad to open the Air Quality vs Time page. In this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Air Quality vs Time page. See the “[Configuring an Air Quality vs Time Report](#)” section on page 14-33 and the “[Air Quality vs Time Report Results](#)” section on page 14-34 for more information.

## Configuring an Air Quality vs Time Report

This section describes how to configure an Air Quality vs Time report.

### Settings

The following settings can be configured for an Air Quality vs Time report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - AP By Controller—Choose **All Controllers > All Access Points**, or click **Edit** to choose specific access points.
  - AP By Floor Area—Choose **System Campus > All Access Points**, or click **Edit** to choose specific access points.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points**, or click **Edit** to choose specific locations or access points.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last—Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- **Save and Run**—Click to save this report setup and to immediately run the report.
- **Run**—Click to run the report without saving the report setup.
- **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
- **Save and Email**—Click to save the report and e-mail the results.
- **Cancel**—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Air Quality vs Time Report Results

**Note**

---

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for an Air Quality vs Time report, depending on how the report is customized:

- AP Name
- MAC Address
- Radio Type
- Time
- AQ Minimum Index
- AQ Average Index

## Security Risk Interferers

This report displays the security risk interferers on your wireless network.

Click **Security Risk Interferers** from the Report Launch Pad to open the Security Risks Interferers page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Security Risk Interferers page. See the [“Configuring a Security Risk Interferers Report” section on page 14-35](#) and the [“Security Risks Interferers Report Results” section on page 14-36](#) for more information.

## Configuring a Security Risk Interferers Report

This section describes how to configure a Security Risk Interferers report.

### Settings

The following settings can be configured for a Security Risks Interferers report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - AP By Controller—Choose **All Campuses>All Buildings > All Floors > All Access Points**, or click **Edit** to choose specific access points.
  - AP By Floor Area—Choose **All Campuses>All Buildings > All Floors > All Access Points**, or click **Edit** to choose specific access points.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points**, or click **Edit** to choose specific locations or access devices.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

**Note**

---

The information in this report will be available only if you set a security alarm on the interferer.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

### Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.

- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

**Note**

See the [“Creating and Running a New Report”](#) section on page 14-6 for additional information on running or scheduling a report.

## Security Risks Interferers Report Results

**Note**

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on customizing report results.

The following are potential results for a Security Risks Interferers report, depending on how the report is customized:

- Interferer Type
- Affected Channels
- Discovered
- Last Updated
- Detected AP Name
- Affected Band

## Worst Air Quality APs

This report displays the access points with the lowest air quality index.

Click **Worst Air Quality APs** from the Report Launch Pad to open the Worst Air Quality APs page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Worst Air Quality APs page. See the [“Configuring a Worst Air Quality APs Report”](#) section on page 14-36 and the [“Worst Air Quality APs Report Results”](#) section on page 14-38 for more information.

## Configuring a Worst Air Quality APs Report

This section describes how to configure a Worst Air Quality APs report.

### Settings

The following settings can be configured for a Worst Air Quality APs report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By

- AP By Controller—Choose **All Campuses>All Buildings > All Floors > All Access Points**, or click **Edit** to choose specific access points.
- AP By Floor Area—Choose **All Campuses>All Buildings > All Floors > All Access Points**, or click **Edit** to choose specific access points.
- AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points**, or click Edit to choose specific locations or access devices.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Worst Air Quality APs Report Results

**Note**

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

The following are potential results for a Worst Air Quality APs report, depending on how the report is customized:

- AP Name
- Radio Type
- Worst Air Quality Value
- Channel Number
- Most Recent Reported Time
- Interferer Count

## Worst Interferers

This report displays the worst interferers on your wireless network.

Click **Worst Interferers** from the Report Launch Pad to open the Worst Air Quality APs page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Worst Interferers page.

## Configuring a Worst Interferers Report

This section describes how to configure a Worst Interferers report.

### Settings

The following settings can be configured for a Worst Interferers report:

- Report Title—If you plan to use this as a saved report template, type an appropriate name.
- Report By
  - Cluster Center AP
  - Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the report criteria area, or click **Edit** to choose specific locations.
  - Outdoor Area—Choose **All Campuses > All Outdoor Area** from the report criteria area, or click **Edit** to choose specific locations.
- Protocol—Select the radio type by selecting the check box specific to a radio frequency.
- Reporting Period—You can configure the reporting period in two ways:
  - Last— Select the first radio button to generate reports for a period of time from the drop-down list.

- From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.
- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Create a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Command Buttons

Once all report parameters have been set, select from the following:

- Save—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- Save and Run—Click to save this report setup and to immediately run the report.
- Run—Click to run the report without saving the report setup.
- Save and Export—Click to save the report and export the results to either CSV or PDF format.
- Save and Email—Click to save the report and e-mail the results.
- Cancel—Click to return to the previous page without running nor saving this report.

---

**Note** See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Worst Interferers Report Results

---

**Note** Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for a Worst Interferers report, depending on how the report is customized:

- Device Type
- Severity
- Worst Severity Time
- Duty Cycle (%)

- Affected Channels
- Cluster Center APs
- Map Location
- Discovered

**Note**

---

Severity value N/A means that the severity value for this device is not available. A value of 1 means that the severity is minimal and a value of 100 means very severe.

---

**Note**

---

Interferers with unknown location are not listed if the Report By criteria is Floor Area or Outdoor Area.

---

## Client Reports

The report structure has changed in Release 6.0 or later:

- The Client Association and Detailed Client report are replaced by the Client Session report.
- Any saved Detailed Client reports are migrated to the Client Session report.
- Client Association data from 5.1 or earlier is not migrated.

**Note**

---

After migration to 6.0 or later releases, you cannot see previous Client Association information that was presented in the Client Association report.

---

- The Client Count report that was under 802.11 Scaling in release 5.2 is now consolidated into one Client Count report.

The following types of client reports are available:

- [Busiest Clients](#)
- [Client Count](#)
- [Client Sessions](#)
- [Client Summary](#)
- [Client Traffic Stream Metrics](#)
- [Throughput](#)
- [Unique Clients](#)
- [V5 Client Statistics](#)
- [Posture Status Count](#)

## Busiest Clients

This report displays the busiest and least busy clients on the wireless network by throughput, utilization, and other statistics. You can sort this report by location, by band, or by other parameters.

**Note**

Busiest Clients reports do *not* include autonomous clients.

Click Busiest Clients from the Report Launch Pad to open the Busiest Clients Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

## Configuring a Busiest Client Report

This section describes how to configure a Busiest Client report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.
  - Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
  - Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - SSID—Choose **All SSIDs** from the Report Criteria page or click **Edit** to choose a specific or multiple SSIDs.
  - AP by RAP Mesh Role—Choose **All RAP APs** from the Report Criteria page, or click **Edit** to choose a specific RAP access point.

**Note**

In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Protocol—Choose **All Clients**, **Wired Clients**, or a specific radio type from the drop-down list.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Click **From** and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the clients last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to available columns.

---

Available information for the Busiest Client report results contains the following:

- Client MAC Address—The MAC address of the client.
- Client IP Address—The IP address of the client.
- Username
- Protocol—802.11a, 802.11b, 802.11g, 802.11n\_5 GHz, or 802.11n\_2.4 GHz
- Throughput (Mbps)—The average throughput (in Mbps) for the client.
- Utilization (%)—The average percentage of use for this client.
- On Controller—The controller on which the client is located.
- Bytes Sent—The number of bytes sent.
- Bytes Received—The number of bytes received.
- Packets Sent—The number of packets sent.
- Packets Received—The number of packets received.

## Busiest Client Report Results

**Note**

---

Use the Customize Report Format to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following potential results occur, depending on how the report is customized (see [Figure 14-12](#)):

- Client MAC address, IP address, and username
- Protocol—802.11a/n or 802.11b/g/n
- Throughput—Either Mbps or kbps

---

**Note** If throughput is less than 0.1 kbps, you see <0.1 kbps.

---

- Utilization (%)
- On Controller—The controller on which the client is located.
- Bytes sent and received

**Note**

If the value is greater than 1,000,000,000, a G is appended at the end of the value (such as 3.45 G). If the value is greater than 1,000,000 but less than 1,000,000,000, an M is appended at the end of the value (such as 456.8 M).

- Packets sent and received

**Note**

If the value is greater than 1,000,000,000, a G is appended at the end of the value (such as 3.45 G). If the value is greater than 1,000,000 but less than 1,000,000,000, an M is appended at the end of the value (such as 456.8 M).

**Figure 14-12** Busiest Client Report Results

| Controller Name | Controller IP  | Model         | Feature | AP Limit | AP Count | % Used | Type      | Status |
|-----------------|----------------|---------------|---------|----------|----------|--------|-----------|--------|
| RB5500          | 9.1.120.11     | AIR-CT5508-K9 | base    | 12       | 1        | 8%     | Permanent | In Use |
| SR5508          | 9.1.105.40     | AIR-CT5508-K9 | base    | 500      | 4        | 1%     | Permanent | In Use |
| COMMON-5500-2   | 9.1.192.50     | AIR-CT5508-K9 | base    | 12       | 0        | 0%     | Permanent | In Use |
| RK5508          | 9.1.73.50      | AIR-CT5508-K9 | base    | 500      | 2        | 1%     | Permanent | In Use |
| vijayraj        | 10.104.173.178 | AIR-CT5508-K9 | base    | 12       | 11       | 100%   | Permanent | In Use |

291295

## Client Count

This trending report displays the total number of active clients on your wireless network.

The Client Count report displays data on the numbers of clients that connected to the network through a specific device, in a specific geographical area, or through a specific or multiple SSIDs.

**Note**

Client Count reports include clients connected to autonomous Cisco IOS access points.

## Configuring a Client Count Report

This section describes how to configure a Client Count report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.

- Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
- Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
- AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
- AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
- SSID—Choose **All SSIDs** from the Report Criteria page, or click **Edit** to choose a specific or multiple SSIDs.
- AP by RAP Mesh Role—Choose **All RAP APs** from the Report Criteria page, or click **Edit** to choose a specific RAP access point.

---

**Note** In the Report Criteria page, click **Select** to confirm your sort criteria or **Close** to return to the previous page.

---

- Protocol—Choose **All Clients** or a specific radio type from the drop-down list.

---

**Note** Wired clients and clients associated to Cisco IOS access points are not included as part of this report.

---

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Client Count report results contain the following:

- Controller IP—The IP address of the controller.

- Time—The time the client count occurred.
- Associated Client Count—The number of associated clients for the specified period of time.
- Authenticated Client Count—The number of authenticated clients for the specified period of time.

## Client Count Report Results

**Note**

---

Use the Customize Report Format to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for a Client Count report, depending on how the report is customized (see [Figure 14-13](#)):

- Client IP address
- AP Name
- Key
- SSID
- Date and time the count was taken
- Associated client count
- Authenticated client count

**Figure 14-13 Client Count Report Results****Client Count**

## Client Sessions

This report provides client sessions for the given period of time. It displays the history of client sessions, statistics, and the duration at which clients are connected to an access point at any given period of time.

Click **Client Sessions** from the Report Launch Pad to open the Client Sessions Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

## Configuring a Client Sessions Report

This section describes how to configure a Client Sessions report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.
  - Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.

- Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
- AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
- AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
- SSID—Choose **All SSIDs** from the Report Criteria page, or click **Edit** to choose a specific or multiple SSIDs.
- AP by RAP Mesh Role—Choose **All RAP APs** from the Report Criteria page, or click **Edit** to choose a specific RAP access point.

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- VLAN
- Client MAC Address
- Client Username
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

Available information for Client Sessions report results contain the following:

- Client Username
- Client IP Address—The IP address of the client.
- Client MAC Address—The MAC address of the client.
- Association Time —The date and time the client associated.

- Vendor—The vendor name for this client.
- AP Name—The access point to which this client is associated.
- Controller Name—The name of the controller to which this client is associated.
- Map Location—The building, floor area, or outdoor area (as applicable) where the client is located.
- SSID—The SSID to which this client is associated.
- Profile—The name of the profile to which this client is associated.
- VLAN ID—The VLAN Identifier. The range is 1 to 4096.
- Protocol—802.11a, 802.11b, 802.11g, 802.11n\_5 GHz, or 802.11b\_2.4 GHz.
- Session Duration—The length of time of the client session in hours, minutes, and seconds.
- Policy Type—The type of security policy for this client session.
- Average Session Throughput (kbps)—The average throughput in kbps for this client session.
- Host Name—The DNS host name of the device the client is on. NCS does a DNS lookup to resolve the host name from the IP address of the client. The IP address to host name mapping must be defined in a DNS server. By default, the host name lookup is disabled. Use Administration > Settings > Clients to enable host name lookup.
- CCX—The Cisco Client Extension version number.
- AP MAC Address
- IP address
- AP Radio—The radio type of the access point.
- Controller IP Address—The IP address of the controller to which this client is associated.
- Controller Port—The port number for the controller to which this client is associated.
- Anchor Controller—The IP address of the anchor or foreign controller for the mobility client.
- Association ID
- Disassociation Time—The date and time this client disassociated.
- Authentication—The authentication method for this client.
- Encryption Cipher
- EAP Type
- Authentication Algorithm
- Web Security
- Tx and Rx (bytes)—The approximate number of bytes transmitted or received during the session.

## Client Sessions Report Results

### Note

---

Use the Customize Report Format to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for a Client Sessions report, depending on how the report is customized (see [Figure 14-14](#)):

- Client username, IP address, and MAC address (mandatory columns)

- Association time (mandatory column)
- Vendor
- Access point name—The access point name to which this client is assigned.
- Controller names
- Map Location—The building, floor area, or outdoor area (as applicable) where the client is located.
- SSID—The SSID to which this client is associated.
- Profile—The name of the profile to which this client is associated.
- VLAN ID—The VLAN Identifier. The range is 1 to 4096.
- Protocol—802.11a, 802.11b, 802.11g, 802.11n\_5GHz, or 802.11b\_2.4GHz.
- Session Duration
- Policy Type—The type of security policy for this client session.
- Average Session Throughput (kbps)
- Host Name—The DNS host name of the machine on which this client is located.  
NCS performs a DNS lookup to resolve the host name from the client IP address. The IP address to host name mapping must be defined in a DNS server. By default, the host name lookup is disabled. You can enable it from the Administration > Settings > Clients page.
- CCX—The Cisco Client Extension version number.
- AP MAC address
- IP address
- AP Radio—The radio type of the access point.
- Controller IP address
- Controller Port—The port number for the controller to which this client is associated.
- Anchor Controller—The IP address of the anchor or foreign controller for the mobility client, if applicable.
- Association ID—Association ID used in this client session.
- Disassociation Time—The date and time this client disassociated.
- Authentication—The authentication method for this client.
- Encryption Cypher—Encryption cypher used in this client session.
- EAP Type—EAP type used in this client session.
- Authentication Algorithm—Authentication algorithm used in this client session.
- Web Security—Web security used in this client session.
- Tx and Rx (bytes)—The approximate number of bytes transmitted or received during the client session.
- Packets sent and received
- SNR—Signal-to-noise ratio for this client session.
- RSSI—The received signal strength indicator in dBm.
- Status—Associated or disassociated.
- Reason—Reason for disassociation.
- E2E—Version number or *Not Supported*.

## Client Summary

The Client Summary is a detailed report that displays various client statistics.

Click Client Summary from the Report Launch Pad to open the Client Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

### Note

You cannot upgrade the settings for the Client Summary report from WCS 7.x to NCS 1.0.

## Configuring a Client Summary Report

This section describes how to configure a Client Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

### Note

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### Note

The data for client summary report is computed at backend. The report uses the computed data only. The data is computed every hour for one day and every night for a year. Thus you would only be able to create hourly-based client summary reports for the last 24 hours.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

### Note

Fixed columns appear in blue font and cannot be moved to Available Columns.

### Note

A Client Summary report contains summary results sorted by protocol, SSID, VLAN, and vendor. To customize report results for a particular section, choose the applicable section from the Customizable Report drop-down list.

The Client Summary report contains four sub reports. Each of them can be independently customized. The following is default information available from a Client Summary report depending on the customizable report selected:

- Number of Sessions
- Number of Total Users
- Number of Unique Users
- Number of New Users
- Number of Unique APs
- Number of Users per AP
- Total Traffic (MB)
- Average Traffic per Session (KB) and per user (in KB)
- Total Throughput (Mbps)
- Average Throughput per Session and per user (Mbps)

### Note

When NCS does not receive client traps, it relies on client status polling to discover client associations (The task runs every 5 minutes by default.). However, NCS cannot accurately determine when the client was actually associated. NCS assumes the association started at the polling time which may be later than the actual association time. Therefore the calculation of the average client throughput can give inaccurate results, especially for short client sessions.

- Protocol—802.11a/n or 802.11b/g/n.
- SSID—The user-defined Service Set Identifier name

- VLAN
- Vendor
- User Count
- Time Used (Minutes)
- Traffic (MB)
- Session Count
- % of Users
- % of Time
- % of Traffic
- % of Session
- Total Time of a session

## Client Summary Report Results

**Note**

---

Use the Customize Report Format to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for a Client Summary report, depending on how the report is customized (see [Figure 14-15](#)):

### Client Summary

- Number of Sessions (mandatory column)
- Number of Total Users (mandatory column)—Number of unique endpoints or MAC addresses.
- Number of Unique Users—Number of unique user names that are authenticated.
- Number of New Users
- Number of Unique Access Points
- Number of Users per Access Point
- Total session time in minutes
- Total traffic (MB)
- Average traffic per session (KB) and per user (in KB)
- Total throughput (MBPS)
- Average throughput per session and per user (MBPS)

**Note**

---

When NCS does not receive client traps, it relies on client status polling to discover client associations (The task runs every 5 minutes by default). However, NCS cannot accurately determine when the client was actually associated. NCS assumes the association started at the polling time which may be later than the actual association time. Therefore the calculation of the average client throughput can give inaccurate results, especially for short client sessions.

---

---

**Note** NCS only counts authenticated sessions. If a user fails on DHCP or authentication, NCS will not have a session for it. Also, NCS considers every detected AP association as a session. For instance, if a client roams from one access point to another, NCS can have two association sessions.

---

#### Client Summary by Protocol, SSID, VLAN, and Vendor

- Protocol (mandatory column)
- SSID (mandatory column)
- VLAN (mandatory column)
- Vendor (mandatory column)
- User Count (mandatory column)
- Time Used (mandatory column)
- Traffic (mandatory column)
- Session Count (mandatory column)
- % of users, time, traffic, and sessions

**Figure 14-15 Client Summary Report Results****Client Summary**

Generated: 2011-May-17, 04:01:11 UTC

Cisco Prime

Network Control System

Reporting Period: Last 1 day

[Client Session Summary](#)

| Connection Type | Number of Sessions | Average Number of Clients | Posture passed Daily Count | Posture failed Daily Count | Average Number of Users | Number of New Clients |
|-----------------|--------------------|---------------------------|----------------------------|----------------------------|-------------------------|-----------------------|
| Lightweight     | 3117               | 442                       | 0                          | 0                          | 442                     | 0                     |
| <b>Total</b>    | <b>3117</b>        | <b>442</b>                | <b>0</b>                   | <b>0</b>                   | <b>442</b>              | <b>0</b>              |

**Client Device Summary**

| Connection Type | Average Number of Devices | Average Clients per Device | Average Sessions per Device | Average Number of APs | Average Clients per AP | Average Sessions per AP |
|-----------------|---------------------------|----------------------------|-----------------------------|-----------------------|------------------------|-------------------------|
| Lightweight     | 15                        | 29.47                      | 207.8                       | 331                   | 1.34                   | 9.42                    |
| <b>Total</b>    | <b>15</b>                 | <b>29.47</b>               | <b>207.8</b>                | <b>331</b>            | <b>1.34</b>            | <b>9.42</b>             |

**Client Traffic Summary**

| Connection Type | Total Session Time (Hours) | Average Session Time (Minutes) | Average Session Time per Client (Minutes) | Total Traffic (MB) | Average Traffic per Session (KB) | Average Traffic per Client (KB) | Total Throughput (Mbps) | Average Throughput per Session (Kbps) | Average Throughput per Client (Kbps) |
|-----------------|----------------------------|--------------------------------|-------------------------------------------|--------------------|----------------------------------|---------------------------------|-------------------------|---------------------------------------|--------------------------------------|
| Lightweight     | 714.42                     | 13.75                          | 96.98                                     | 136430.05          | 43769.67                         | 308665.28                       | 563609.0                | 180817.77                             | 1275133.48                           |
| <b>Total</b>    | <b>714.42</b>              | <b>13.75</b>                   | <b>96.98</b>                              | <b>136430.05</b>   | <b>43769.67</b>                  | <b>308665.28</b>                | <b>563609.0</b>         | <b>180817.77</b>                      | <b>1275133.48</b>                    |

**Client Summary by Protocol**

| Protocol       | Number of Sessions | Number of Clients | Session Time (Hours) | Traffic (MB) | % of Sessions | % of Clients | % of Session Time | % of Traffic |
|----------------|--------------------|-------------------|----------------------|--------------|---------------|--------------|-------------------|--------------|
| 802.11g        | 1280               | 748               | 271.85               | 14791.58     | 41.07         | 40.02        | 38.05             | 10.84        |
| 802.11a        | 809                | 523               | 233.17               | 58436.33     | 25.95         | 27.98        | 32.64             | 42.83        |
| 802.11n_2.4GHz | 489                | 326               | 105.78               | 59001.99     | 15.69         | 17.44        | 14.81             | 43.25        |
| 802.11n_5GHz   | 313                | 241               | 86.72                | 4200.16      | 10.04         | 12.89        | 12.14             | 3.08         |
| 802.11b        | 225                | 30                | 16.85                | 0.0          | 7.22          | 1.61         | 2.36              | 0.0          |
| 802.3          | 1                  | 1                 | 0.0                  | 0.0          | 0.03          | 0.05         | 0.0               | 0.0          |

Clients by Protocol

## Client Traffic

This report displays the traffic by the wireless clients on your network.

Click **Client Traffic** from the Report Launch Pad to open the Client Traffic Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

## Configuring a Client Traffic Report

This section describes how to configure a Client Traffic report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by

- Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.
- Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
- Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
- SSID—Choose **All SSIDs** from the Report Criteria page, or click **Edit** to choose a specific or multiple SSIDs.
- Reporting Period—Specify the time period for which the report needs to be generated. You can choose from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

## Client Traffic Report Results

**Note** Use the Customize Report Format to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

The following figure shows the potential results for a Client Traffic report, depending on how the report is customized (see [Figure 14-16](#)).

Figure 14-16 Client Traffic Report Results

## Client Traffic

Generated: 2011-May-23, 10:27:07 UTC

## Total Client Traffic

Cisco Prime  
Network Control System

Report By: All

Connection Protocol: All Clients

Reporting Period: Last 7 days

## Total Client Traffic

## Client Traffic Stream Metrics

This report displays Traffic Stream Metrics for clients. You can select from the following:

- All clients of a given set of SSIDs
- All clients
- One specific client

Click **Client Traffic Stream Metrics** from the Report Launch Pad to open the Client Traffic Stream Metrics Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Client Traffic Stream Metrics Reports page.

**Note**

The traffic stream metrics and radio performance background tasks must be running prior to generating this report.

## Configuring a Client Traffic Stream Metrics Report

This section describes how to configure a Client Traffic Stream Metrics report.

## Settings

The following settings can be configured for a Client Traffic Stream Metrics report:

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - SSID—Choose **All SSIDs** from the Report Criteria page, or click **Edit** to choose a specific or multiple SSIDs.
  - Client MAC Address—Choose **All Clients** from the Report Criteria page, or click **Edit** to choose specific clients.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - **Last**—Select the **Last** radio button and a period of time from the drop-down list.
  - **From**—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Mandatory columns are displayed in blue font and cannot be moved to Available Columns. Time, Client MAC address, and QoS are mandatory columns for the Client Traffic Stream Metrics report.

---

---

**Note** Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

The following are potential results for a Client Traffic Stream Metrics report, depending on how the report is customized:

- Time (mandatory column)
- Client MAC (mandatory column)
- QoS (mandatory column)—QoS values (packet latency, packet jitter, packet loss, roaming time) which can affect how the WLAN are monitored. Access points and clients measure the metrics, access points collect the measurements and send them to the controller. The access points update the controller with traffic stream metric information every 90 seconds and 10 minutes of data is stored at one time.

- AP Name (mandatory column)
- Radio Type (mandatory column)
- Avg Queuing Delay (ms) (Downlink) (mandatory column)—Average queuing delay in milliseconds for the downlink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes the time for re-tries, if needed.
- Avg Queuing Delay (ms) (Uplink) (mandatory column)—Average queuing delay in milliseconds for the uplink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.
- % PLR (Downlink)—Percentage of packets lost on the downlink (access point to client) during the 90 second interval.
- % PLR (Uplink)—Percentage of packets lost on the uplink (client to access point) during the 90 second interval.
- % Packets > 40ms Queuing Delay (Uplink)—Percentage of queuing delay packets greater than 40 ms.
- % Packets 20ms-40ms Queuing Delay (Uplink)—Percentage of queuing delay packets between 20 ms and 40 ms.
- Roaming Delay—Roaming delay in milliseconds. Roaming delay, which is measured by clients, is measured beginning when the last packet is received from the old access point and ending when the he first packet is received from the new access point after a successful roam.
- Time—Time that the statistics were gathered from the access point(s).
- Client MAC—MAC address of the client. This shows a list of the clients evaluated during the most recent 90 second interval. The client could be a VoIP phone, laptop, or PDA and refers to any client attached to the access point collecting measurements.

## Client Traffic Stream Metrics Report Results

### Note

---

Use the Create Custom Report page to customize the displayed results. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on customizing report results.

---

The following are potential results for a Client Traffic Stream Metrics report, depending on how the report is customized (see [Figure 14-17](#)):

- Time (mandatory column)
- Client MAC (mandatory column)
- QoS (mandatory column)—QoS values (packet latency, packet jitter, packet loss, roaming time) which can affect the WLAN are monitored. Access points and clients measure the metrics, access points collect the measurements and send them to the controller. The access points update the controller with traffic stream metric information every 90 seconds and 10 minutes of data per client is stored in the WLC. NCS polls this data and stores it for the last seven days.
- AP Name (mandatory column)
- Radio Type (mandatory column)

- Avg Queuing Delay (ms) (Downlink) (mandatory column)—Average queuing delay in milliseconds for the downlink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.
- Avg Queuing Delay (ms) (Uplink) (mandatory column)—Average queuing delay in milliseconds for the uplink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.
- % PLR (Downlink)—Percentage of packets lost on the downlink (access point to client) during the 90 second interval.
- % PLR (Uplink)—Percentage of packets lost on the uplink (client to access point) during the 90 second interval.
- % Packets > 40ms Queuing Delay (Uplink)—Percentage of queuing delay packets greater than 40 ms.
- % Packets 20ms-40ms Queuing Delay (Uplink)—Percentage of queuing delay packets between 20ms-40 ms.
- Roaming Delay—Roaming delay in milliseconds. Roaming delay, which is measured by clients, is measured beginning when the last packet is received from the old access point and ending when the first packet is received from the new access point after a successful roam.
- Time—Time that the statistics were gathered from the access point(s).

Client MAC—MAC address of the client. This shows a list of the clients evaluated during the most recent 90 second interval. The client could be a VoIP phone, laptop, PDA and refers to any client attached to the access point collecting measurements.

**Figure 14-17 Client Traffic Stream Metrics Report Results**

## Posture Status Count

This trending report displays the failed or succeeded client posture status count on your network.

This section consists of the following topics:

- [Configuring a Posture Status Count Report](#)
- [Posture Status Count Report Results](#)

## Configuring a Posture Status Count Report

This section describes how to configure a Posture Status Count report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.

- From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

## Posture Status Count Report Results

The Posture Status Count graph displays the following (see [Figure 14-18](#)):

**Figure 14-18** Posture Status Count Report

## Throughput

This report displays the ongoing bandwidth used by the wireless clients on your network.

### Note

The Throughput report does not include wired clients or clients connected to Autonomous Cisco IOS access points.

Click **Throughput** from the Report Launch Pad to open the Throughput Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

## Configuring a Throughput Report

This section describes how to configure a Throughput report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.
  - Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
  - Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
  - AP by Controller—Choose **All Controllers > All Access Points** or click **Edit** to choose specific devices.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.

### Note

In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Protocol—Choose **All Clients** or a specific radio type from the drop-down list.

### Note

Wired clients and clients associated to Cisco IOS access points are not included as part of this report.

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

**Schedule**

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on scheduling a report.

**Throughput Report Results**

The Throughput report graph displays the following (also see [Figure 14-19](#)):

- Total throughput (mbps)
- Throughput for the selected protocol
- Date and time for each indicated throughput level

**Figure 14-19** Throughput Report Results

## Unique Clients

This report displays all unique clients by the time, protocol, and controller filters that you select. A unique client is determined by the MAC address of the client device. These clients are sorted by controller in this report.

Click **Unique Clients** from the Report Launch Pad to open the Unique Clients Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

A new First Seen column is added in release 6.0. It is the time that NCS first learned of the client MAC address. For existing clients, NCS sets the First Seen column with the timestamp currently in the database, which is the time the record was last updated.

**Note**

---

The Unique Client report covers any client that started the connection during the specified time period or ended the connection during the specified time period or connected during the specified time period. The specified time period refers to the reporting period that you specify while scheduling the report.

---

**Note**

---

Unique Clients reports do *not* include autonomous clients.

---

## Configuring a Unique Clients Report

This section describes how to configure a Unique Clients report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Controller—Choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices.
  - Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
  - Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All APs** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - SSID—Choose **All SSIDs** from the Report Criteria page, or click **Edit** to choose a specific or multiple SSIDs.
  - AP by RAP Mesh Role—Choose **All RAP APs** from the Report Criteria page, or click **Edit** to choose a specific RAP access point.

**Note**

---

In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **All Clients**, **Wired Clients**, or a specific radio type from the drop-down list.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

Mandatory columns are displayed in blue font and cannot be moved to Available data fields Column. Last Seen, User, and MAC address are mandatory columns for the Unique Client report.

The following information is available on the unique client report:

- Host Name
- AP MAC Address
- IP Address—The IP address of the controller to which this client is associated.
- Controller IP Address
- Port
- Last Session Length
- VLAN ID—The VLAN Identifier. The range is 1 to 4096.
- CCX—The Cisco Client Extension version number.
- E2E
- Vendor—The vendor name for this client.
- IP Address
- AP Name—The access point to which this client is associated.
- Controller—The name of the controller to which this client is associated.
- 802.11 State—Client association status.
- SSID—The SSID to which this client is associated.
- Profile—The name of the profile to which this client is associated.
- Authenticated
- Protocol—802.11a, 802.11b, 802.11g, 802.11n\_5 GHz, or 802.11b\_2.4 GHz.
- Map Location

## Unique Client Report Results

The following information is displayed for a Unique Client report (see Figure 14-20):

- First/Last Seen—Date and time the unique client was first and last viewed
- User—Client username
- Vendor—The vendor name or Unknown
- Client IP Address and MAC Address
- AP Name
- Controller—The controller to which the client was associated
- Port
- 802.11 State—Associated, Disassociated, or Idle
- SSID

**Note** N/A may display in the SSID field if the client is probing.

- Authenticated—Indicates whether or not the client is authenticated (Yes or No)
- Protocol—802.11a, 802.11b, 802.11g, 802.11n\_5GHz, or 802.11b\_2.4GHz.
- VLAN ID
- CCX—Indicates whether or not CCX (Cisco Client Extensions) is supported.
- E2E—Indicates whether or not E2E (End to End) is supported.
- Map Location

## V5 Client Statistics

This report displays the 802.11 and security statistics for Cisco Compatible Extensions v5 clients.

Click **V5 Client Statistics** from the Report Launch Pad to open the V5 Client Statistics Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

### Configuring a V5 Client Statistics Report

This section describes how to configure a V5 Client Statistics report.

#### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

---

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

#### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### V5 Client Statistics Report Results

The following information is displayed for the v5 Client Statistics report (see [Figure 14-21](#)):

- Client MAC Address
- Transmitted Fragment Count—This counter is incremented for each successfully received MPDU Data or Management type.
- Multicast Transmitted Frame Count—This counter increments only when the multicast bit is set in the destination MAC address of a successfully transmitted MSDU. When operating as a STA in an ESS, where these frames are directed to the access point, this implies having received an acknowledgment to all associated MPDUs.
- Failed Count—This counter increments when an MSDU is unsuccessfully transmitted.
- Retry Count—This counter increments when an MSDU is successfully transmitted after one or more retransmissions.
- Multicast Retry Count—This counter increments when an MSDU is successfully transmitted after more than one retransmission.
- Frame Duplicate Count—This counter increments when a frame is received that the Sequence Control field indicates is a duplicate.

- RTS Success Count—This counter increments when a CTS (clear-to-send) is received in response to an RTS (ready-to-send).
- RTS Fail Count—This counter increments when a clear-to-send is not received in response to a ready-to-send.
- ACK Fail Count—This counter increments when an ACK is not received when expected.
- Received Fragment Count—The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).
- Multicast Received Frame Count—This counter increments when a MSDU is received with the multicast bit set in the destination MAC address.
- FCS Error Count—This counter increments when a Frame Check Sequence error is detected in a received MPDU.
- Transmitted Frame Count—This counter increments for each successfully transmitted MSDU.

**Figure 14-21 V5 Client Statistics Report Results**

## Compliance Reports

The Configuration Audit report displays the differences between NCS and its controllers. The PCI DSS Compliance report summarizes your Wireless LAN Security components with reference to the Payment Card Industry (PCI) Data Security Standard (DSS) requirements. PCI DSS compliance is required for all merchants and service providers that store, process, or transmit cardholder data. You can find PCI DSS standards at the PCI Security Standards Council website.

The following Compliance Reports are available:

- [Configuration Audit](#)
- [PCI DSS Detailed](#)

- [PCI DSS Summary](#)

## Configuration Audit

This report displays the configuration differences between NCS and its controllers. You must configure audit mode on the Administration > Settings page. In audit mode, you can perform an audit based on templates or the stored configuration. The report shows the last time an audit was performed using the Configuration Sync background task.

Click **Configuration Audit** from the Report Launch Pad to open the Configuration Audit Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Configuration Reports page. See the [“Configuring a Configuration Audit Report”](#) section on page 14-69 and the [“Configuration Audit Report Results”](#) section on page 14-70 for more information.

## Configuring a Configuration Audit Report

This section describes how to configure a Configuration Audit report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Controller—Choose **All Controllers** or a specific controller from the available list.
- Audit Time—Choose **Latest** or a specific date and time from the available list.

---

**Note** The available audit times are based on when the Configuration Sync background task was run.

---

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

**Note**

---

A Configuration Audit report contains the following sections: Audit Summary, Applied Templates and Config Group Template Discrepancies, Enforced Values, Failed Enforcements, and NCS Config Discrepancies. Choose the applicable report from the Customizable Report drop-down list. To customize report results for a particular section, choose the applicable section from the Customizable Report drop-down list.

---

A Configuration Audit report contains the following default information, depending on which customized report is selected:

- Controller Name
- Audit Status
- Audit Time
- Name
- Audit Object Display Name
- Device Sync State
- Time
- Client MAC Address
- IP Address
- Message
- Description
- Attribute
- Attribute Value in NCS
- Attribute Value in Device
- Enforced Value
- Instance Name
- Description
- Error Message
- Attribute Value in DB

## Configuration Audit Report Results

The following are potential results for a Configuration Audit report, depending on how the report is customized (see [Figure 14-22](#)):

- Audit Summary results
  - Controller Name (mandatory column)

- Audit Status (mandatory column)—Not Available (no audit occurred on this switch), Identical (no configuration differences were discovered), Mismatch (configuration differences were discovered).
- Audit Time (mandatory column)—The time when the network audit background task was run via Configuration Sync task.
- IP Address—The IP address of the audited controller.
- Message—It reports “Device unreachable” if the device is unreachable. Also, if any exceptions is found during the audit, it reports “Internal Exception, check the log files”.
- Applied Templates and Config Group Template Discrepancies results
  - Name (mandatory column)
  - Template Name (mandatory column)
  - Audit Status (mandatory column)—(Mismatch, Identical, Not Available)
  - Template Applied Via—Template description.
  - Attribute
  - NCS Value
  - Controller Device
- Enforced Values results
  - Name (mandatory column)
  - Template Name (mandatory column)
  - Audit Status (mandatory column)
  - Template Applied Via
  - Attribute
  - Enforced Value
  - Controller Value
- Failed Enforcements results
  - Name (mandatory column)
  - Object Name
  - Description
  - Error Message
- NCS Config Discrepancies results
  - Controller Name (mandatory column)
  - Object Name (mandatory column)
  - Audit Status (mandatory column)
  - Attribute (mandatory column)
  - NCS Value
  - Controller Value

## PCI DSS Detailed

This report displays the PCI Data Security Standard (DSS) version 2.0 requirements in detail that are relevant to your wireless network security.

Click **PCI DSS Detailed** from the Report Launch Pad to open the PCI DSS Detailed Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the PCI DSS Detailed Reports page. See the [“Configuring a PCI DSS Detailed Report” section on page 14-72](#) and the [“PCI DSS Detailed Report Results” section on page 14-73](#) for more information.

## Configuring a PCI DSS Detailed Report

This section describes how to configure a PCI DSS Detailed report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By

- Controller—Choose **All Controllers** from the Report Criteria box or click **Edit** to choose specific devices.
- MSE—Choose **All MSEs** from the Report Criteria box or click **Edit** to choose a specific MSE.
- Floor Area—Choose **All Campuses > All Buildings > All Floors** from the Report Criteria box or click **Edit** to choose specific locations.

---

**Note** In the Filter Criteria box, choose the appropriate filter criteria.

---

- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

Click Customize to open the Create Custom Report form, which you can use to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## PCI DSS Detailed Report Results

The following are the results for a PCI DSS Detailed Report (see [Figure 14-23](#)):

Figure 14-23 PCI DSS Detailed Report

**PCI DSS Detailed**  
 Generated: 2011-Jun-21, 13:59:58 IST  
 Reporting Period: Last 7 days  
**Introduction**  
 This detailed report covers sections of the Payment Card Industry (PCI) Data Security Standard (DSS) Version 2.0 (October 2010) requirements that are relevant to your Cisco Unified Wireless Network security. PCI DSS standard requirements are available at <https://www.pcisecuritystandards.org>.

Cisco Prime  
 Network Control System

**Disclaimer**  
 This report and related information provided in the following pages was generated based upon network information gathered by Cisco Prime Network Control System ("NCS"). This report may be helpful in assessing various aspects of the Payment Card Industry (PCI) Data Security Standard (DSS) version 2.0 (October 2010) requirements applicable to a Cisco Unified Wireless Network. This report and information set forth herein should not be used as a substitute for a formal PCI compliance audit. THIS REPORT AND THE INFORMATION AND RESULTS REFLECTED IN THE PAGES THAT FOLLOW ARE PROVIDED WITHOUT WARRANTY. RESULTS SHOULD NOT BE RELIED UPON IN CONFIRMING COMPLIANCE WITH THE PCI DSS STANDARD OR ANY OTHER SECURITY STANDARD. CISCO'S END USER LICENSE AGREEMENT, INCLUDING WITHOUT LIMITATION LIMITED WARRANTY AND DISCLAIMER OF LIABILITIES PROVISIONS APPLY.

**PCI DSS Requirement 2.1.1**  

| PCI DSS Requirement                                                                                                                                                                                                                            | Cisco Interpretation                                                                                                                                                       | Cisco Recommendations                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| For wireless environments connected to the cardholder data environment or transmitting cardholder data, change wireless vendor defaults, including but not limited to default wireless encryption keys, passwords, and SNMP community strings. | Malicious individuals (external and internal to a company) often use vendor default passwords, SNMP community strings, SSID etc to compromise cardholder data environment. | Change the default values to that can impact the security of through unauthorized wireless |

**List of Violations for PCI DSS Requirement 2.1.1**  

| Device Name          | Violation Description                                                       | Device Type |
|----------------------|-----------------------------------------------------------------------------|-------------|
| WCS_Common_1_upgrade | Controller is configured with default community string for SNMP v1/v2       | Controller  |
| WCS_Common_1_upgrade | WLAN 'ze' is configured with weak authentication/encryption method          | Controller  |
| WCS_Common_1_upgrade | WLAN 'SSIDMax233' is configured with weak authentication/encryption method  | Controller  |
| WCS_Common_1_upgrade | WLAN 'SSIDMax3333' is configured with weak authentication/encryption method | Controller  |

330169

## PCI DSS Summary

This report displays a summarized PCI Data Security Standard (DSS) version 2.0 requirements that are relevant to your wireless network security.

Click **PCI DSS Summary** from the Report Launch Pad to open the PCI DSS Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the PCI DSS Summary Reports page. See the [“Configuring a PCI DSS Summary Report”](#) section on page 14-74 and the [“PCI DSS Summary Report Results”](#) section on page 14-75 for more information.

## Configuring a PCI DSS Summary Report

This section describes how to configure a PCI DSS Summary report.

### Settings

- **Report Title**—If you plan to use this as a saved report template, enter a report name.
- **Reporting Period**—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

Click Customize to open the Create Custom Report form, which you can use to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

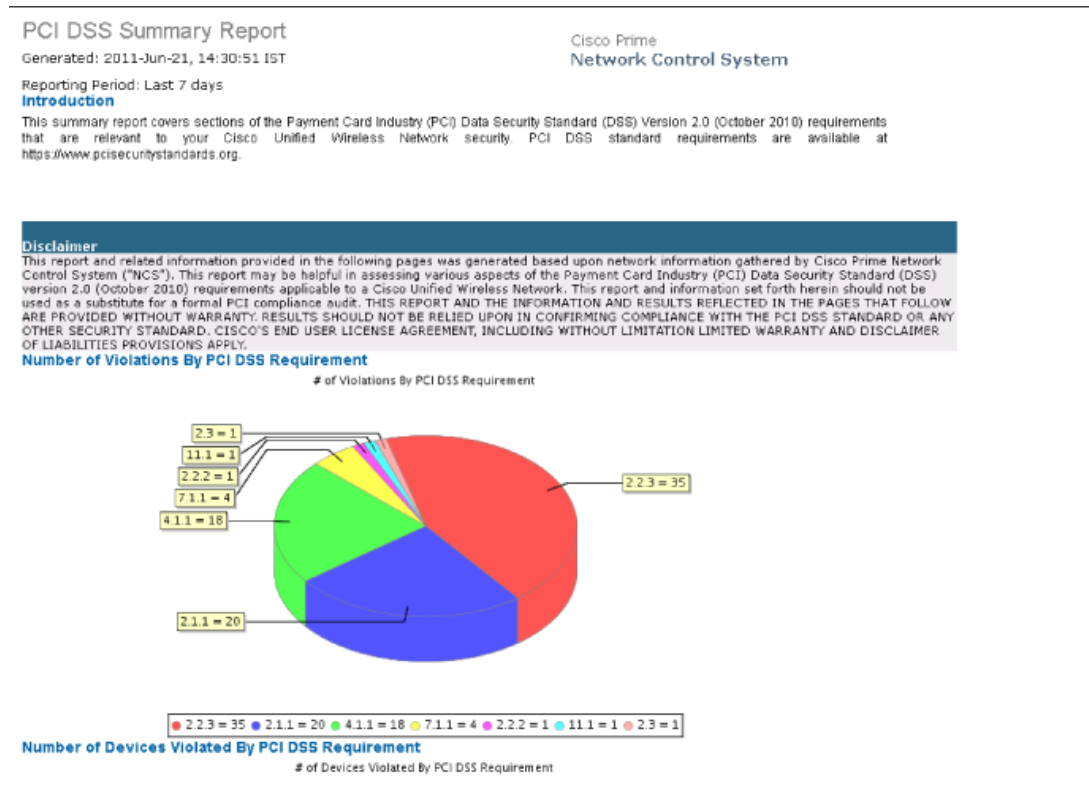

---

## PCI DSS Summary Report Results

The results of PCI DSS Summary Report contains the following information (see [Figure 14-24](#) for a snippet):

- Number of Violations By PCI DSS Requirement
- Number of Devices Violated By PCI DSS Requirement
- Summary By PCI DSS Requirement
- Summary By Devices
- List of Violations

Figure 14-24 PCI DSS Summary Report

330170

# ContextAware Reports

This section lists and describes the various ContextAware reports that you can generate through the NCS Reports Launch Pad.

To generate a ContextAware report, under the ContextAware section, click **New** next to a type to create a new report. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

You can create the following ContextAware Reports:

- [Client Location History](#), page 14-77
- [Client Location Tracking](#), page 14-78
- [Guest Location Tracking](#), page 14-80
- [Location Notifications](#), page 14-81
- [Rogue AP Location Tracking](#), page 14-83
- [Rogue Client Location Tracking](#), page 14-84
- [Tag Location History](#), page 14-86
- [Tag Location Tracking](#), page 14-87

## Client Location History

This report displays Location history of a wireless client detected by an MSE.

This section consists of the following topics:

- [Configuring a Client Location History](#), page 14-77
- [Client Location History Results](#), page 14-78

## Configuring a Client Location History

This section describes how to configure a Client Location History report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Client MAC address.
- Report Criteria—Click **Edit** and enter a valid MAC address as the filter criteria.

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.

Or

- Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Client Location History Results

The results of the Client Location History Report contains the following information:

- Last Located—The place at which the client was last located.
- Client Location—The current position of the client.
- MSE—The name of the MSE to which the client is associated with.
- User—The username of the client.
- Detecting Controllers—The IP address of the detecting controller.
- 802.11 State—The state of 802.11. It could be either Probing.
- IP Address—The IP address of the client.
- AP MAC Address—The MAC address of the associated access point.
- Authenticated—Whether authenticated or not. This could be either Yes or No.
- SSID—The SSID used by the client.
- Protocol—The protocol used to retrieve the information from the client.

## Client Location Tracking

This report displays wireless clients and their locations detected by the MSEs based on your filtering criteria.

This section consists of the following topics:

- [Configuring a Client Location Tracking, page 14-79](#)
- [Client Location Tracking Results, page 14-79](#)

## Configuring a Client Location Tracking

This section describes how to configure a Client Location Tracking report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - MSE By Floor Area.
  - MSE By Outdoor Area
  - MSE
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and choose the required filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Client Location Tracking Results

The results of the Client Location Tracking Report contains the following information:

- Last Located—The place where the client was last located.
- MAC Address—The MAC address of the client.

- Client Location—The current location of the client.
- MSE—The name of the MSE to which the client is associated with.
- User—The username of the client.
- Detecting Controllers—The IP address of the detecting controller.
- 802.11 State—The state of 802.11. It could be either Probing.
- IP Address—The IP address of the client.
- SSID—The SSID used by the client
- Protocol—The protocol used to retrieve the information from the client.

## Guest Location Tracking

This report displays Guest clients and their locations detected by the MSEs based on your filtering criteria.

This section consists of the following topics:

- [Configuring a Guest Location Tracking, page 14-80](#)
- [Guest Location Tracking Results, page 14-81](#)

## Configuring a Guest Location Tracking

This section describes how to configure a Guest Location Tracking report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - MSE By Floor Area.
  - MSE By Outdoor Area
  - MSE
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and choose the required filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

## Guest Location Tracking Results

The results of the Guest Location Tracking Report contains the following information:

- Last Located—The place where the guest client was last located.
- Guest Username—The login name of the guest client user.
- MAC Address—The MAC address of the guest client.
- Guest Location—The current location of the guest client.
- MSE—The name of the MSE to which the guest client is associated with.
- Detecting Controllers—The IP address of the detecting controller.
- IP Address—The IP address of the guest client.
- AP MAC Address—The MAC address of the access point to which the guest client is associated with.
- SSID—The SSID used by the guest clients.
- Protocol—The protocol used to retrieve the information from the guest client.

## Location Notifications

This report displays Context Aware Notifications generated by MSEs.

This section consists of the following topics:

- [Configuring a Location Notification, page 14-81](#)
- [Location Notification Results, page 14-83](#)

## Configuring a Location Notification

This section describes how to configure a Location Notification report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Missing Device Notifications by MSE
  - Missing Device Notifications by Floor Area
  - Missing Device Notifications by Outdoor Area
  - Device In/Out Notifications by MSE
  - Device In/Out Notifications by Floor Area
  - Device In/Out Notifications by Outdoor Area
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and choose the required filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Device Type
  - All
  - Client
  - Tag
  - Rogue Client
  - Rogue AP
  - Interferer
- Reporting Period
  - Select the radio button and a period of time from the drop-down list.Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

## Location Notification Results

The results of Location Notification Report contains the following information:

- Last Seen—The date and time when the device was last located.
- MAC Address—The MAC address of the device.
- Device Type—The type of the device.
- Asset Name—The name of the asset.
- Asset Group—The name of the asset group.
- Asset Category—The name of the asset category.
- Map Location—The map location where the device was located.
- serverName—The name of the server that sends the ContextAware notifications.

## Rogue AP Location Tracking

This report displays Rogue APs and their locations detected by the MSEs based on your filtering criteria.

This section consists of the following topics:

- [Configuring a Rogue AP Location Tracking, page 14-83](#)
- [Rogue AP Location Tracking Results, page 14-84](#)

## Configuring a Rogue AP Location Tracking

This section describes how to configure a Rogue AP Location Tracking report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - MSE By Floor Area.
  - MSE By Outdoor Area
  - MSE
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and choose the required filter criteria.

**Note**

In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.

Or

- Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Rogue AP Location Tracking Results

The results of the Rogue AP Location Tracking Report contains the following information:

- Last Located—The place where the rogue access point was last located.
- MAC Address—The MAC address of the rogue access point.
- Rogue AP Location—The current location of the rogue access point.
- MSE—The name of the MSE to which the rogue access point is associated with.
- State—The state of the location tracking. This could be either Alert or Pending.

## Rogue Client Location Tracking

This report displays Rogue Client APs and their locations detected by the MSEs based on your filtering criteria.

This section consists of the following topics:

- [Configuring a Rogue Client Location Tracking, page 14-84](#)
- [Rogue Client Location Tracking Results, page 14-85](#)

## Configuring a Rogue Client Location Tracking

This section describes how to configure a Rogue Client Location Tracking report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.

- Report by
  - MSE By Floor Area.
  - MSE By Outdoor Area
  - MSE
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and select the required filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Rogue Client Location Tracking Results

The results of Rogue Client Location Tracking Report contains the following information:

- Last Located—The place where the client was last located.
- MAC Address—The MAC address of the rogue client.
- Rogue Client Location—The current location of the rogue client.
- MSE—The name of the MSE to which the rogue client is associated with.
- Rogue AP—The rogue access point to which the rogue client is associated with.
- Detecting Controllers—The IP address of the detecting controller.
- State—The state of the location tracking. This could be either Alert or Pending.

## Tag Location History

This report displays Location history of a tag detected by an MSE.

This section consists of the following topics:

- [Configuring a Tag Location Tracking, page 14-87](#)
- [Tag Location Tracking Results, page 14-88](#)

### Configuring a Tag Location History

This section describes how to configure a Tag Location History report.

#### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Tag MAC address.
- Report Criteria—Click **Edit** and enter a valid Tag MAC address as the filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

#### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

#### Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Tag Location History Results

The results of Tag Location History Report contains the following information:

- Last Located—The place at which the tag was last located.
- Tag Location—The current location of the tag.
- MSE—The name of the MSE to which this client is associated with.
- Detecting Controller—The IP address of the detecting controller.
- Vendor—The name of the vendor for the client.
- Battery Status—The battery status of the client.

## Tag Location Tracking

This report displays tags and their locations detected by the MSEs based on your filtering criteria.

This section consists of the following topics:

- [Configuring a Tag Location Tracking, page 14-87](#)
- [Tag Location Tracking Results, page 14-88](#)

## Configuring a Tag Location Tracking

This section describes how to configure a Tag Location Tracking report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - MSE By Floor Area.
  - MSE By Outdoor Area
  - MSE
- Report Criteria—The report criteria differs based on the Report By option selected. Click **Edit** and select the required filter criteria.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select the radio button and a period of time from the drop-down list.
  - Or
  - Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

---

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Tag Location Tracking Results

The results of the Tag Location Tracking Report contains the following information:

- Last Located—The place at which the tag was last located.
- Tag Location—The current location of the tag.
- MSE—The name of the MSE to which this client is associated with.
- Detecting Controller—The IP address of the detecting controller.
- Vendor—The name of the tag vendor.
- Battery Status—The status of the battery of that tag.

# Device Reports

Click **New** for a Device Report type to create a new report. See the [“Creating and Running a New Report” section on page 14-6](#) for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

You can create the following device reports:

- [AP Image Predownload](#)
- [AP Profile Status](#)
- [AP Summary](#)
- [Busiest APs](#)
- [CPU Utilization](#)
- [Detailed Switch Inventory](#)
- [Identity Capability](#)

- [Inventory](#)
- [Memory Utilization](#)
- [Switch Interface Utilization](#)
- [Uptime](#)
- [Utilization](#)

## AP Image Predownload

This report displays scheduled download software task status.

Click **AP Image Predownload** from the Report Launch Pad to open the AP Image Predownload page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the AP Image Predownload Reports page. See the [“Configuring an AP Image Predownload Report” section on page 14-89](#) and the [“AP Image Predownload Report Results” section on page 14-90](#) for more information.

## Configuring an AP Image Predownload Report

This section describes how to configure a AP Image Predownload report.

### Settings

The following settings can be configured for a AP Image Predownload report:

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose specific devices.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose specific locations or devices.

---

**Note** In the Report Criteria page, you can choose **All Access Points** or **All OfficeExtend Access Points**.

---

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Creating a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Mandatory columns are displayed in blue font and cannot be moved to Available Columns. AP Name, Primary Image, Backup Image, Predownload Version, and Predownload Status are mandatory columns for the AP Image Predownload report.

---

## Command Buttons

Once all report parameters have been set, select from the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- **Save and Run**—Click to save this report setup and to immediately run the report.
- **Run**—Click to run the report without saving the report setup.
- **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
- **Save and Email**—Click to save the report and e-mail the results.
- **Export Now**—Click to export the report results. The supported export formats is PDF and CSV.
- **Cancel**—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## AP Image Predownload Report Results

The following are potential results for an AP Image Predownload report, depending on how the report is customized:

- **AP Name**—Access point name.
- **Primary Image**—Current Primary Image present in the AP.
- **Backup Image**—Current Backup Image present in the AP.
- **Predownload Version**—The image version that is currently downloading to the AP from the controller as part of the predownload process.
- **Predownload Status**—The current status of the image download as part of the predownload process.
- **MAC Address**—MAC Address of the AP.
- **Controller IP Address**—IP address of the controller to which the access point is associated.

## AP Profile Status

This report displays access point load, noise, interference, and coverage profile status.

Click **AP Profile Status** from the Report Launch Pad to open the AP Profile Status Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the AP Profile Status Reports page. See the “[Configuring an AP Profile Report](#)” section on page 14-91 and the “[AP Profile Status Report Results](#)” section on page 14-92 for more information.

## Configuring an AP Profile Report

This section describes how to configure a AP Profile report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose specific devices.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose specific locations or devices.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose specific locations or devices.

**Note** In the Reports Criteria page, you can choose **All Access Points** or All OfficeExtend Access Points.

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Protocol—Select **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

AP Profile Status report results include:

- Time—The date and time at which AP Profile Status is collected.
- AP Name—The access point name.
- AP MAC address—The MAC address of the access point.
- Radio Type—802.11a/n or 802.11b/g/n.
- Load—*True* if the load level exceeds a threshold level, otherwise *false*.
- Noise—*True* if the noise level exceeds a threshold level, otherwise *false*.
- Controller Name—The controller to which the access point is associated.
- Interference—*True* if the interference level exceeds a threshold level, otherwise *false*.
- Coverage—*True* if the coverage level exceeds a threshold level, otherwise *false*.
- Controller IP Address—The IP address of the controller to which the access point is associated.

## AP Profile Status Report Results

The following are potential results for an AP Profile Status report, depending on how the report is customized (see [Figure 14-25](#)):

- Time (mandatory column)—The date and time at which AP Profile Status is collected.
- AP Name (mandatory column)—Access point name.
- AP MAC address—MAC address of the access point.
- Radio Type—802.11a/n or 802.11b/g/n.
- Load—Pass or Fail. Indicates whether or not the load level exceeds a threshold level.
- Noise—Pass or Fail. Indicates whether or not the noise level exceeds a threshold level.
- Interference—Pass or Fail. Indicates whether or not the interference level exceeds a threshold level.
- Coverage—Pass or Fail. Indicates whether or not the coverage level exceeds a threshold level.
- Controller Name—Name of the controller to which the access point is associated.
- Controller IP Address—IP address of the controller to which the access point is associated.

Cisco Prime  
Network Control System

Generated: 2011-May-18, 09:00:14 UTC

Report By: AP By Controller

Protocol: 802.11a/n

Reporting Period: Last 1 day

**AP Profile Status**

## Busiest APs

This report displays the access points with the highest total usage (transmitting, receiving, and channel utilization) on your wireless network.

Click **Busiest APs** from the Report Launch Pad to open the Busiest APs Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Busiest APs Reports page. See the “[Configuring a Busiest APs Report](#)” section on page 14-93 and the “[Configuring a Busiest APs Report](#)” section on page 14-93 for more information.

## Configuring a Busiest APs Report

This section describes how to configure a Busiest APs report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Protocol—Choose **802.11 a/n** or **802.11 b/g/n** from the drop-down list.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Busiest APs report results include:

- AP Name—The access point name.
- Radio Type
- Rx Utilization (%)—The percentage of time that the access point receiver is busy operating on packets. The percentage (0 to 100%) represents a load from 0 to 1.
- Tx Utilization (%)—The percentage of time that the access point transmitter is busy operating on packets. The percentage (0 to 100%) represents a load from 0 to 1.
- Channel Utilization (%)—The percentage of time that an access point channel is busy operating on packets. The percentage (0 to 100%) represents a load from 0 to 1.
- Controller Name
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- Controller IP Address

## Busiest APs Report Results

The following are potential results for a Busiest APs report, depending on how the report is customized (see [Figure 14-26](#)):

- AP Name (mandatory column)
- Radio Type—802.11a/n or 802.11b/g/n.
- Rx Utilization (%)—The percentage of time the access point receiver is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.
- Tx Utilization (%)—This is the percentage of time the access point transmitter is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.

- Channel Utilization (%)—This is the percentage of time an access point channel is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.
- Controller Name and IP Address
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.

**Figure 14-26** Busiest APs Report Results

## CPU Utilization

This report displays CPU utilization switch usage on your network.

Click **CPU Utilization** from the Report Launch Pad to open the CPU Utilization Report page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the CPU Utilization Report page. See the “[Configuring a CPU Utilization Report](#)” section on page 14-95 for more information.

## Configuring a CPU Utilization Report

This section describes how to configure a CPU Utilization report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type:
  - Switch CPU—
  - Top Switch CPU—
- Report By:
  - Switch IP

- Device Name
- Report Criteria—Choose All Switches or click **Edit** to choose specific devices.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select a time period from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Detailed Switch Inventory

This report displays inventory information about the switches in your network.

Click **Detailed Switch Inventory** from the Report Launch Pad to open the Detailed Switch Inventory page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Detailed Switch Inventory page. See the [“Configuring a Detailed Switch Inventory Report” section on page 14-96](#) for more information.

## Configuring a Detailed Switch Inventory Report

This section describes how to configure a Detailed Switch Inventory report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By:
  - Device IP
  - Device Name
- Report Criteria—Choose All Switches or click **Edit** to choose specific devices.

**Note**

In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

The Detailed Switch Inventory report results include:

- Name
- Description
- Device IP Address
- Contact
- Location
- Sys Up Time

## Identity Capability

This report displays the identity capability summary for the switches in your network.

Click **Identity Capability** from the Report Launch Pad to open the Identity Capability Report page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Identity Capability Report page. See the [“Configuring an Identity Capability Report” section on page 14-97](#) for more information.

## Configuring an Identity Capability Report

This section describes how to configure a Identity Capability report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Memory Utilization

This report displays the memory utilization summary for the switches in your network.

Click **Memory Utilization** from the Report Launch Pad to open the report page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Memory Utilization Report page. See the “[Configuring a Memory Utilization Report](#)” section on page 14-98 for more information.

## Configuring a Memory Utilization Report

This section describes how to configure a Memory Utilization report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type:
  - Switch Memory Utilization
  - Top Switch Memory Utilization
- Report By:
  - Switch IP
  - Device Name
- Report Criteria—Choose All Switches or click **Edit** to choose specific devices.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select a time period from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Non-Primary Controller APs

This report displays the access points that are not connected to the configured primary controller.

Click **Non-Primary Controller APs** from the Report Launch Pad to open the report page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Switch Interface Utilization page. See the [“Configuring Switch Interface Utilization Report” section on page 14-100](#) for more information.

## Configuring a Non-Primary Controller APs Report

This section describes how to configure a Non-Primary Controller APs report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by—Choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices).

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Show—Enter the number of records that you want displayed in the report.

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

- Reporting Period
  - Select a time period from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

## Non-Primary Controller APs Report Results

The following are potential results for a Busiest APs report, depending on how the report is customized:

- AP Name—The name of the access point
- Base Radio MAC—The MAC address of the base radio.
- Map Location—The location of the access point in the map.
- Associated Controller Name—The name of the controller to which the access point is associated with.
- Primary Controller Name—The name of the primary controller to which the access point is associated with.

## Switch Interface Utilization

This report displays the devices with the highest utilization on your network.

Click **Switch Interface Utilization** from the Report Launch Pad to open the report page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Switch Interface Utilization page. See the [“Configuring Switch Interface Utilization Report” section on page 14-100](#) for more information.

## Configuring Switch Interface Utilization Report

This section describes how to configure a Switch Interface Utilization report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type:
  - Top-N Rx Utilization
  - Top-N Tx Utilization
  - Bottom-N Rx Utilization
  - Bottom-N Tx Utilization
- Report By:

- Device IP
- Device Name
- Report Criteria—Choose All Switches or click **Edit** to choose specific devices.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Select a time period from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

The Detailed Switch Inventory report results include:

- Device Name
- Device IP Address
- Interface Name
- Min Rx (%)
- Max Rx (%)
- Avg Rx (%)

## Switch Interface Utilization Report Results

The following are potential results for a Switch Interface Utilization report, depending on how the report is customized:

- Device Name
- Device IP Address
- Interface Name
- Min Rx(%)
- Max Rx(%)
- Avg Rx(%)

## AP Summary

This report displays a list of access points which are broadcasting SSID(s). This report allows you to filter the devices by RF group name, mobility group name, access point group name, SSID, location, and other statistics.

### Note

- This report, by default, displays a list of access points that are broadcasting one or more SSIDs; the **All SSIDs** filter is chosen by default. Access points that are broadcasting no SSID are not displayed.
- The AP Summary report does not include Autonomous access points. For Autonomous access points, you need to run an Autonomous AP Summary report.

Click **AP Summary** from the Report Launch Pad to open the AP Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click New from the Report Launch Pad or from the AP Summary Reports page. See the [“Configuring an AP Summary Report” section on page 14-102](#) and the [“AP Summary Report Results” section on page 14-104](#) for more information.

## Configuring an AP Summary Report

This section describes how to configure an AP Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Floor Area—Choose **All Campuses > All Builders > All Floors** from the Report Criteria page, or click **Edit** to choose specific locations.
  - Outdoor Area—Choose **All Campuses > All Outdoor Areas** from the Report Criteria page, or click **Edit** to choose specific locations.
  - OfficeExtend AP—Choose **Enable** from the Report Criteria page, or click **Edit** to choose **Enable** or **Disable**.
  - AP by Controller—Choose **All Controllers > All APs** from the Report Criteria page, or click **Edit** to choose specific devices.

- AP Group—Choose **All AP Groups** from the Report Criteria page, or click **Edit** to choose a specific access point group.
- RF Group—Choose **All RF Groups** from the Report Criteria page, or click **Edit** to choose a specific radio frequency group.
- AP Mode—Choose **All AP Modes** from the Report Criteria page, or click **Edit** to choose a specific access point mode.

---

**Note** This report only returns monitor mode access points if **Report by AP Mode** is selected. Reports run by any other **Report by** selection drop all monitor mode access points from the results.

---

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- SSID—Choose the appropriate SSID from the list. You can choose *None* to show all access points with no SSIDs configured.

---

**Note** The SSID filter is tied to all the criteria in the Report By category. This limits the scope for getting a report of access points by any scope listed in the Report By criteria. For this report to be able to retrieve access points by any Report By criteria, the default selection of All SSIDs should be used.

---

---

**Note** Access points must be broadcasting SSID(s) in order to satisfy the "All SSID" default filter of the report.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

AP Summary report results include:

- AP Name—The access point name.
- Ethernet MAC Address
- Base radio MAC Address
- Model

- Location
- Primary Controller
- Admin Status—Enable/Disable.
- AP group Name
- RF group Name
- Software Version
- Controller Version
- AP Mode—Local, Bridge, Rogue Detector, or H-REAP.
- Associated WLANs—Associated SSIDs.
- 802.11a/n and 802.11b/g/n Status—Up/Down.
- Serial Number
- AP Type—Indicates the type of access point (unified or autonomous).

## AP Summary Report Results

The following are potential results for an AP Summary report, depending on how the report is customized (see [Figure 14-27](#)):

- AP Name (mandatory column)
- Ethernet MAC Address
- Base Radio MAC Address
- Model
- Location
- Primary Controller
- Admin Status—Enabled or disabled.
- AP Group Name
- RF Group Name
- Software Version
- Controller Name
- AP Mode—Access point mode including: Local, Bridge, Rogue Detector, or H-REAP
- Associated WLANs—Associated SSIDs
- 802.11a/n and 802.11b/g/n Status—Up or down
- Serial Number

251883

## Inventory

This report allows you to generate inventory-related information for controllers, access points, and MSEs managed by NCS. This information includes hardware type and distribution, software distribution, CDP information, and other statistics.

Click **Inventory** from the Report Launch Pad to open the Inventory Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Inventory Reports page. See the “[Configuring an Inventory Report](#)” section on page 14-105 and the “[Inventory Report Results](#)” section on page 14-109 for more information.

## Configuring an Inventory Report

This section describes how to configure an Inventory report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Combined Inventory**, **APs**, **Autonomous APs**, **Controllers**, or **MSEs** from the drop-down list.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

**Note**

---

An Inventory report contains the following sections: Count of Controllers by Model, Count of Controllers by Software Version, Controller Inventory, Disassociated AP(s), Count of APs by Model, Count of APs by Software Version.

To customize report results for a particular section, choose the appropriate section from the Customizable Report drop-down list.

---

Available information for Count of Controllers by Model results contain the following:

- Model Name—The name of the model of the controller.
- Number of Controllers—The controller count for each model name.

Available information for Count of Controllers by Software Version results contain the following:

- Software Version—The software version of the controller.
- Number of Controllers—The controller count for each software version.

Available information for Controller Inventory results contain the following:

- Controller Name
- IP Address—The IP address of the controller.
- Location—The user-specified physical location of the controller.
- Interfaces—The names of the interfaces of the controller combined together by commas.
- Reachability Status—*Reachable* if the controller is currently manageable.
- Serial Number—The serial number of the controller.
- Model—The model name of the controller.
- Software Version—The software version of the controller.
- Mobility Group—The name of the mobility group to which the controller is assigned.
- RF Group—The name of the RF group to which the controller is assigned.
- Neighbor Name, Port, and Address—CDP neighbor information including the name, port, and IP address of the neighbor.
- Duplex—The duplex mode of the CDP neighbor interface.

Available information for Count of APs by Model results contain the following:

- Model Name—The name of the model of the access point.
- Number of APs—The access point count for each model name.

Available information for Count of APs by Software Version results contain the following:

- Software Version—The software version of the access point.
- Number of APs—The access point count for each software version.

Available information for AP Inventory results contain the following:

- AP Name—The access point name.
- Ethernet MAC Address—The Ethernet MAC address of the access point.
- IP Address—The IP address of the access point.
- Model—The name of the model of the access point.
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- Controller Name—The name of the controller to which the access point is associated.
- Base radio MAC Address—The MAC address of an access point.
- Software Version—The software version of an access point.
- Location—The user-specified physical location of an access point.
- Primary Controller—The name of the primary controller to which the access point should associate. When the access point is not directly connected to a controller, it tries to find the primary controller and associates with it. If this attribute is empty or an access point is unable to find the controller with this name, it associates with the secondary controller.
- Secondary Controller—The name of the secondary controller to which the access point should associate if the primary controller is unavailable. If the primary and secondary controllers are not available, the access point associates with the tertiary controller.
- Tertiary Controller—The name of the tertiary controller to which the access point should associate if the primary and secondary controller is unavailable. If the primary, secondary, and tertiary switch are unavailable, it associates with the master controller.
- Admin Status—The admin status of the access point.
- AP Mode—The monitor only mode setting of the access point. The options are local, monitor, H-REAP, rogue detector, sniffer, and bridge.
- 802.11 a/n and 802.11 b/g/n Status—The operation state of the respective radio. The options are down, up, not associated, and unknown.
- Gateway—The gateway for the access point.
- Netmask—The netmask of the IP address of the access points.
- IOS and Boot Versions—The version of the IOS Cisco access point, and the major/minor boot version of the access point.
- Certificate Type—The access point certification type options are unknown, manufacture installed, self signed, or local significance.
- Serial Number—The serial number of the access point.
- Neighbor Name, Address, Port, and Advertised Version—The CDP neighbor name, IP address, port, and advertised version information of the access point.

Available information for Disassociated AP(s) results contain the following:

- AP Name—The access point name.
- Ethernet MAC Address—The Ethernet MAC address of the access point.
- IP Address—The IP address of the access point.
- Model—The name of the model of the access point.
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- Controller Name—The name of the controller to which the access point is associated.

- Base radio MAC Address—The MAC address of an access point.
- Software Version—The software version of an access point.
- Location—The user-specified physical location of an access point.
- Primary Controller—The name of the primary controller to which the access point should associate. When the access point is not directly connected to a controller, it tries to find the primary controller and associates with it. If this attribute is empty or an access point is unable to find the controller with this name, it associates with the secondary controller.
- Secondary Controller—The name of the secondary controller to which the access point should associate if the primary controller is unavailable. If the primary and secondary controllers are not available, the access point associates with the tertiary controller.
- Tertiary Controller—The name of the tertiary controller to which the access point should associate if the primary and secondary controller is unavailable. If the primary, secondary, and tertiary switch are unavailable, it associates with the master controller.
- Admin Status—The admin status of the access point.
- AP Mode—The monitor only mode setting of the access point. The options are local, monitor, H-REAP, rogue detector, sniffer, and bridge.
- 802.11 a/n and 802.11 b/g/n Status—The operation state of the respective radio. The options are down, up, not associated, and unknown.
- Gateway—The gateway for the access point.
- Netmask—The netmask of the IP address of the access point.
- IOS and Boot Versions—The version of the IOS Cisco access point, and the major/minor boot version of the access point.
- Certificate Type—The access point certification type options are unknown, manufacture installed, self signed, or local significance.
- Serial Number—The serial number of the access point.
- Neighbor Name, Address, and Port—The CDP neighbor name, IP address, and port information of the access point.
- Duplex—CDP Neighbor interface duplex mode.
- AP Type—Indicates the type of access point (unified or autonomous).

---

**Note** The AP Inventory report displays only associated APs in the network.

---

Available information for Count of MSEs by Version results contain the following:

- Version—The MSE version.
- Number of MSEs—The count of both MSE and Location Servers.

Available information for MSEs results contain the following:

- Device Name—The name of the MSE or Location Server.
- IP Address
- Device Type
- HTTP/HTTPS Port
- HTTPS

- Version
- Start Time

## Inventory Report Results

The following are potential results for an Inventory report, depending on how the report is customized (see [Figure 14-28](#)):

- Count of Controllers by Model results
  - Model Name (mandatory column)—Name of the model of the controller.
  - Number of Controllers (mandatory column)—Controller count for each model name.
- Count of Controllers by Model results
  - Software Version (mandatory column)—Software version of the controller.
  - Number of Controllers (mandatory column)—Controller count for each software version.
- Controller Inventory results
  - Controller Name (mandatory column)
  - IP Address—IP address of the controller.
  - Location—User specified physical location of the controller.
  - Interfaces—The names of the interfaces of the controller combined together by commas.
  - Reachability Status—Reachable if the controller is currently manageable.
  - Serial Number—Serial number of the controller.
  - Model—Model name of the controller.
  - Software Version—Software version of the controller.
  - Mobility Group—The name of the mobility group to which the controller is assigned.
  - RF Group—The name of the RF group to which the controller is assigned.
  - Neighbor Name, Port, and Address—CDP Neighbor information including the name, port and IP address of the neighbor.
  - Duplex—CDP Neighbor interface duplex mode.
- Count of APs by Model results
  - Model Name (mandatory column)—Name of the model of the access point.
  - Number of APs (mandatory column)—Access point count for each model name.
- Count of APs by Software Version results
  - Software Version (mandatory column)—Software version of the access point.
  - Number of APs (mandatory column)—Access point count for each software version.
- AP Inventory results
  - AP Name (mandatory column)
  - Ethernet MAC Address—Ethernet MAC address of the access point.
  - IP Address—IP address of the access point.
  - Model—Name of the model of the access point.

- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- Controller Name—Name of the controller to which the access point is associated.
- Base Radio MAC Address—The MAC address of an access point base radio.
- Software Version—The software version of an access point.
- Location—User specified physical location of the access point.
- Primary Controller—Name of the controller identified as the primary controller of the access point with which the access point should associate. When the access point is not directly connected to a controller, it tries to find the primary controller and associates with it. If this attribute is empty or if the access point is not able to find the controller with this name, then it associates with the secondary controller.
- Secondary Controller—Name of the controller identified as the secondary controller of the access point with which access point should associate if the primary controller is not available.  
If primary and secondary controllers are not available, then the access point associates with the tertiary controller.
- Tertiary Controllers—Name of the controller identified as the tertiary controller of the access point with which access point should associate if the primary or secondary controllers are not available.  
If primary, secondary and tertiary switch are not available, then it associates with the master controller.
- Admin Status—Administrative state of the access point.
- AP Mode—Mode setting of the access point. Possible modes include: Local, Monitor, H-REAP, Rogue Detector, Sniffer, and Bridge.
- 802.11 a/n and 802.11 b/g/n Status—Operation state of the respective radio. Possible statuses include Down, Up, Not Associated, and Unknown.
- Gateway—The gateway for the access point.
- Netmask—The netmask of the access point IP address.
- IOS Version—IOS Version of the Cisco IOS access point.
- Boot Version—Major and Minor boot version of the access point.
- Certificate Type—Access point certification type. Possible types include: Unknown, Manufacture Installed, Self Signed, and Local Significance.
- Serial Number—Serial number of the access point.
- Neighbor Name, Address, Port, and Advertised Version—The access point CDP neighbor name, IP address, port, and advertised version information.
- Inventory results
  - AP Name (mandatory column)
  - Ethernet MAC Address
  - IP Address
  - Model
  - Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
  - 802.11 a/n and 802.11 b/g/n MAC Addresses
  - Software Version

- Location
- Reachability Status
- 802.11 a/n and 802.11 b/g/n Status
- Serial Number

## Uptime

This report displays the access point uptime, the LWAPP uptime, and the LWAPP join time.

Click **Uptime** from the Report Launch Pad to open the Uptime Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Uptime Reports page. See the [“Configuring an Uptime Report” section on page 14-112](#) and the [“Configuring an Uptime Report” section on page 14-112](#) for more information.

## Configuring an Uptime Report

This section describes how to configure an AP Image Predownload report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Show—Enter the number of records that you want displayed in the report.

**Note**

Enter a number between 5 and 1000, or leave the text box blank to display all records.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

Available information for Uptime report results contain the following:

- AP Name—The access point name.
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- AP Uptime—The time duration since the last access point reboot.
- LWAPP Uptime—The time duration since the last access point joined the controller.
- LWAPP Join Taken Time—The time it took for the access point to join the controller. This value could be significant in Mesh environments.

## Uptime Report Results

The following are potential results for an Uptime report, depending on how the report is customized (see [Figure 14-29](#)):

- AP Name
- Map Location—The building, floor area, or outdoor area (as applicable) where the access point is located.
- AP Uptime—The length of time since the access point last rebooted.
- LWAPP Uptime—The length of time since the access point last joined the controller.
- LWAPP Join Taken Time—The amount of time the access point took to join the controller.

**Note**

This could be a significant value in mesh environments.

**Figure 14-29 Uptime Report Results**

Up Time

Generated: 2011-May-18, 09:25:29 UTC

## Utilization

This report displays the controller, AP, and MSE usage on your wireless network. These statistics (such as CPU usage, memory usage, link utilization, and radio utilization) can help identify current network performance and help with capacity planning for future scalability needs.

Click **Utilization** from the Report Launch Pad to open the Utilization Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Utilization Reports page. See the [“Configuring a Utilization Report” section on page 14-113](#) and the [“Utilization Report Results” section on page 14-115](#) for more information.

## Configuring a Utilization Report

This section describes how to configure a Utilization report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Controllers**, **MSEs**, or **Radios** from the drop-down list.
- Report by (Report by options change depending on the report type chosen)

- Controller—If the report type is Controllers, choose **All Controllers** from the Report Criteria page, or click **Edit** to choose specific devices. Depending on the report type selected, you receive either radio or controller utilization results. See the “[Radio, Controller, and MSE Utilization Results](#)” section on page 14-114.
- MSEs—If the report type is MSEs, choose **All MSEs** from the Report Criteria page, or click **Edit** to choose specific devices. Depending on the report type selected, you receive MSE memory and CPU utilization results. See the “[Radio, Controller, and MSE Utilization Results](#)” section on page 14-114.
- Radios—If the report type is Radio, choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices). Depending on the report type chosen, you receive either radio or controller utilization results. See the “[Radio, Controller, and MSE Utilization Results](#)” section on page 14-114.

---

**Note** In the Radios Report Criteria page, you can choose **All Access Points** or **All OfficeExtend Access Points**.

---

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Select **802.11 a/n**, **802.11 b/g/n**, or both. This parameter only appears if the report type is Radios.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Radio, Controller, and MSE Utilization Results

Depending on the report type chosen, you receive either radio, controller, or MSE utilization results.

- Radio Utilization
  - Rx Utilization (%)—The percentage of time that the access point receiver is busy operating on packets. The percentage (from 0 to 100%) represents a load from 0 to 1.
  - Tx Utilization (%)—The percentage of time the access point transmitter is busy operating on packets. The percentage (from 0 to 100%) represents a load from 0 to 1.
  - Channel Utilization (%)—The percentage of time an access point channel is busy operating on packets. The percentage (from 0 to 100%) represents a load from 0 to 1.
- Controller Utilization
  - CPU Utilization—The percentage of CPU utilization.
  - Memory Utilization—The percentage of memory utilization.

- Port Utilization—The percentage of (totalDeltaBits/bandwidth) on a port.
- MSE Utilization
  - CPU Utilization—The percentage of CPU utilization.
  - Memory Utilization—The percentage of memory utilization.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on scheduling a report.

## Utilization Report Results

The following are potential results for a Utilization report (see [Figure 14-30](#)):

- Controller results including CPU, memory, and port utilization.
  - CPU Utilization—The percentage of CPU utilization.
  - Memory Utilization—The percentage of memory utilization.
  - Port Utilization—The percentage of (totalDeltaBits/bandwidth) on a port.
- Radio results including channel, transmitting, and receiving utilization.
  - Channel Utilization—The percentage of time an AP channel is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.
  - Rx Utilization—The percentage of time the AP receiver is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.
  - Tx Utilization—The percentage of time the AP transmitter is busy operating on packets. It is a number from 0-100 representing a load from 0 to 1.
- MSE results including memory utilization, CPU utilization, Context Aware Service statistics.
  - MSE CPU Utilization—The percentage of CPU utilization.
  - MSE Memory Utilization—The percentage of memory utilization.
  - Context Aware Service Statistics—Provides a graph of the count of the number of Clients, Tags, Rogue Client, Rogue APs, and Adhoc Rogue APs over a period of time.

**Figure 14-30 Utilization Report Results**

## Guest Reports

You can create the following guest reports:

- [Guest Accounts Status](#)
- [Guest Association](#)
- [Guest Count](#)
- [Guest User Sessions](#)
- [NCS Guest Operations](#)

## Guest Accounts Status

This report displays guest account status changes in chronological order. The report filters guest accounts by the guest user who created them. One example of a status change is Scheduled to Active to Expired.

Click **Guest Accounts Status** from the Report Launch Pad to open the Guest Accounts Status Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Guest Accounts Status Reports page. See the [“Configuring a Guest Accounts Status Report”](#) section on page 14-116 and the [“Configuring a Guest Accounts Status Report”](#) section on page 14-116 for more information.

## Configuring a Guest Accounts Status Report

This section describes how to configure an Accounts Status report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - NCS User—Choose **All NCS Users** from the Report Criteria page, or click **Edit** to choose a specific NCS user.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Guest Account Status report results contain the following:

- Time
- Guest username
- Created by
- Status

## Guest Account Status Report Results

The following are potential results for a Guest Account Status report, depending on how the report is customized:

- Time
- Guest Username
- Created by

- Status

## Guest Association

This report displays when a guest client associated to and disassociated from a guest profile/SSID over a customizable period of time.

Click **Guest Association** from the Report Launch Pad to open the Guest Association Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Guest Association Reports page. See the [“Configuring a Guest Accounts Status Report”](#) section on page 14-116 and the [“Configuring a Guest Accounts Status Report”](#) section on page 14-116 for more information.

## Configuring a Guest Association Report

This section describes how to configure a Guest Association report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Guest Profile—Choose **All Profiles** from the Report Criteria page, or click **Edit** to choose a specific profile.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on scheduling a report.

### Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Guest Association report results contain the following:

- Time
- Guest user
- Guest MAC address
- Controller IP Address
- AP MAC Address
- Login and Logout Times
- Guest IP address
- Bytes Received
- Bytes Sent

## Guest Association Report Results

The following are potential results for a Guest Association report, depending on how the report is customized:

- Time
- Guest MAC address and username
- Device IP address
- Guest profile
- Status
- AP Name
- Guest IP address
- Session Duration
- Reason—Reason for the disassociation

## Guest Count

This report displays the number of guest clients logged into the network per guest profile/SSID over a customizable period of time.

Click **Guest Count** from the Report Launch Pad to open the Guest Count Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Guest Count Reports page. See the [“Configuring a Guest Count Report” section on page 14-119](#) and the [“Guest Count Report Results” section on page 14-120](#) for more information.

## Configuring a Guest Count Report

This section describes how to configure a Guest Count report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Guest Profile—Choose **All Profiles** from the Report Criteria page, or click **Edit** to choose a specific profile.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Select **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Guest Count Report Results

The Guest Count results contain the following information:

- Authenticated Guest Count—Indicates the number of authenticated guests for each specified guest profile and protocol during the specified period of time.

## Guest User Sessions

This report displays historic session data for a guest user. The session data such as amount of data passed, login and logout time, guest IP address, and guest MAC address is available for one month by default. The data retention period can be configured from the Administration > Background Tasks page. This report can be generated for guest users who are associated to controllers running software version 5.2 or above.

Click **Guest User Sessions** from the Report Launch Pad to open the Guest User Sessions Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Guest User Sessions Reports page. See the [“Configuring a Guest User Sessions Report” section on page 14-121](#) and the [“Guest User Sessions Report Results” section on page 14-121](#) for more information.

## Configuring a Guest User Sessions Report

This section describes how to configure a Guest User Sessions report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - Guest User—Choose **All Guest Users** from the Report Criteria page, or click **Edit** to choose a specific guest user.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Guest User Sessions Report Results

The following are potential results for a Guest User Sessions report, depending on how the report is customized (see [Figure 14-31](#)):

- Time (mandatory column)
- Guest User (mandatory column)
- Guest User MAC Address (mandatory column)
- Controller IP Address
- Login Time
- Logout Time
- Guest IP Address
- Bytes Received
- Bytes Sent

## NCS Guest Operations

This report displays all activities performed by one or all guests, such as creating, deleting, or updating guest user accounts. If a guest user is deleted from NCS, the report still shows an activity performed by the deleted guest user for up to one week after the activity occurred.

Click **NCS Guest Operations** from the Report Launch Pad to open the NCS Guest Operations Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the NCS Guest Operations Reports page. See the [“Configuring a NCS Guest Operations Report” section on page 14-122](#) and the [“NCS Guest Operation Report Results” section on page 14-123](#) for more information.

## Configuring a NCS Guest Operations Report

This section describes how to configure a NCS Guest Operations report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - NCS User—Choose **All NCS Users** from the Report Criteria page, or click **Edit** to choose a specific user.

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

Available information for Guest Operation report results contain the following:

- Time
- Reason
- NCS User
- Guest User
- Operation
- Status

## NCS Guest Operation Report Results

The following are potential results for a NCS Guest Operations report, depending on how the report is customized:

- Time
- NCS User
- Guest User
- Operation
- Status
- Reason

# Identity Services Engine Reports

Cisco ISE 1.0 is a consolidated policy-based access control system that is integrated into the NCS 1.0. ISE helps in the monitoring of endpoint security policy to deliver visibility into compliance based on real-time contextual information from the network, users, and devices across the entire wired and wireless access network.

The following Identity Services Engine reports could be generated using the NCS Report Launch pad:

- Posture Detail Assessment
- Endpoint Profiler Summary
- Top N Endpoint MAC Authentications
- Endpoint MAC Authentication Summary
- User Authentication Summary
- Top N User Authentications
- Radius Accounting
- Radius Authentication

**Note**

- You can view the ISE reports in the Report Launch pad only when an ISE is added to NCS.
- To run the ISE reports, you need to enable the Identity Search Engine permission flag in the NCS > Administration > AAA > Groups > Group Detail menu option for the Super User, Config User, Admin, and System Monitoring user groups.
- When you launch the ISE reports from NCS using Internet Explorer 8, the report does not appear properly. To view the reports properly, refresh the content area (not the browser) by right clicking on the report details and selecting Refresh this frame option.

For more information on these reports, see the Available Reports section of the Reporting chapter of the *Cisco Identity Services Engine User Guide, Release 1.0*:

[http://www.cisco.com/en/US/products/ps11640/products\\_user\\_guide\\_list.html](http://www.cisco.com/en/US/products/ps11640/products_user_guide_list.html)

## Mesh Reports

This section consists of the following reports:

- [Alternate Parent](#)
- [Link Stats](#)
- [Nodes](#)
- [Packet Stats](#)
- [Packet Error Statistics](#)
- [Packet Queue Statistics](#)
- [Stranded APs](#)
- [Worst Node Hops](#)

## Alternate Parent

This report displays the number of alternate parents with the same configured mesh group for each mesh access point. This report can be used to determine an access point capability to handle failures in the mesh path.

Click **Alternate Parent** from the Report Launch Pad to open the Alternate Parent Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Alternate Parent Reports page. See the “[Configuring an Alternate Parent Report](#)” section on page 14-125 and the “[Alternate Parent Report Results](#)” section on page 14-125 for more information.

## Configuring an Alternate Parent Report

This section describes how to configure an Alternate Parent report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

The Customize Report Format allows you to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Alternate Parent report results contain the following:

- AP Name—The access point name.
- MAC address
- Parent AP name
- Number Alternate parents
- Parent MAC address

## Alternate Parent Report Results

The following are potential results for an Alternate Parent report, depending on how the report is customized (see [Figure 14-32](#)):

- AP Name (mandatory column)
- MAC Address—The MAC address of the alternate parent.
- Parent AP Name and MAC Address
- Number of Alternate Parents

## Link Stats

This report displays mesh link and node statistics such as parent access point, link SNR, packet error rate, parent changes, node hops, total transmit packets, mesh path, connected access points, mesh group, data rate, and channel. The mesh link and mesh node statistics can be run individually or combined.

Click **Link Stats** from the Report Launch Pad to open the Link Stats Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Link Stats Reports page. See the “[Configuring a Link Stats Report](#)” section on page 14-126 and the “[Link Stats Report Results](#)” section on page 14-127 for more information.

## Configuring a Link Stats Report

This section describes how to configure a Link Stats report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Link Stats** or **Node Hops** from the drop-down list.
- Report by—Choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices).

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Link Stats report results contain the following:

- Time
- MAC address
- Parent MAC address
- AP Name—The access point name.
- Parent AP name
- Link SNR
- Packet Error Rate
- Parent changes
- Parent changes per minute
- Node hops
- Total Tx Packets
- Total Tx Packets per minute

## Link Stats Report Results

The following are potential results for a Link Stats report, depending on how the report is customized (see [Figure 14-33](#)):

- Time (mandatory column)
- MAC Address (mandatory column)
- Parent MAC Address (mandatory column)

- AP Name
- Parent AP Name
- Link SNR
- Packet Error Rate—Packet error rate percentage = 1 - (number of successfully transmitted packets/number of total packets transmitted)
- Parent Changes and Parent Changes per Minute
- Node hops—The number of hops between access points
- Total Tx Packets and Total Tx Packets per Minute

## Nodes

This report displays mesh tree information for each mesh access point such as hop count, number of directly connected children, number of connected access points, and mesh path.

Click **Nodes** from the Report Launch Pad to open the Mesh Nodes Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Mesh Nodes Reports page. See the “[Configuring a Nodes Report](#)” section on page 14-128 and the “[Configuring a Nodes Report](#)” section on page 14-128 for more information.

## Configuring a Nodes Report

This section describes how to configure a Nodes report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Format allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Node report results contain the following:

- MAC Address—The MAC address of the mesh access point.
- AP Name—The name of the mesh access point.
- Node Hops—The number of node hops for this mesh group.
- Children—The number of children for this access point.
- Connected APs—The number of access points connected to this access point.
- Mesh Path—The path of the mesh access point.
- Controller—The controller to which the mesh access point is associated.
- Mesh Role—Mesh access point (MAP) or Root access point (RAP).
- Mesh Group—The name of the mesh group to which this access point belongs.
- Data Rate—The data rate for this access point.
- Channel—The channel on which this access point is located.

## Nodes Report Results

The following are potential results for a Nodes report, depending on how the report is customized (see [Figure 14-34](#)):

- AP Name (mandatory column).
- AP MAC Address (mandatory column).
- Node Hops—The number of hops between access points.
- Children—The number of children for this access point.
- Connected APs—The number of access points connected to this access point.
- Mesh Path—The path of the mesh access point.
- Controller—The controller to which the mesh access point is associated.
- Mesh Role—Mesh access point (MAP) or Root access point (RAP).
- Mesh Group—The name of the mesh group to which this access point belongs.
- Data Rate—The data rate for this access point.
- Channel—The channel on which this access point is located.

## Packet Stats

This report displays the total number of packets transmitted, packets transmitted per minute, packet queue average, packet dropped count, packets dropped per minute, and errors for packets transmitted by neighbor access points. A report type can be chosen for each data type.

Click **Packet Stats** from the Report Launch Pad to open the Packet Stats Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Packet Stats Reports page. See the “[Configuring a Packet Stats Report](#)” section on page 14-130 and the “[Packet Stats Report Results](#)” section on page 14-131 for more information.

## Configuring a Packet Stats Report

This section describes how to configure a Packet Stats report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Packet Stats** from the drop-down list.
- Report by—Choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices).

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Graph Type—Choose the type of graph you want displayed for these report results (Packet Counts or Packets Per Minute).
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

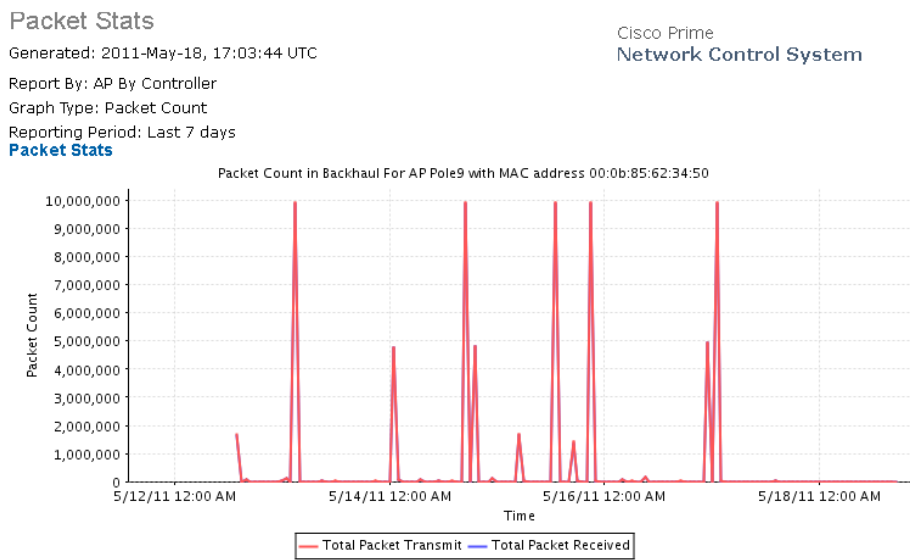

## Packet Stats Report Results

The Packet Stats report generates a graph of packet queue statistics for each access point selected and for each report type selected. The graph types are Packet Queue Average, Packets Dropped Per Minute, and Packet Dropped Count.

The following are potential results for a Packet Stats report, depending on how the report is customized (see [Figure 14-35](#)):

- Packet Stats
  - Packet Count—Total packets transmitted and total packets received.
  - Packets per Minute—Total packets transmitted per minute and total packets received per minute.
- Packet Error Stats
  - Packet error rate percentages for all neighbor access points or for parent/children neighbor access points only.
- Packet Queue Stats
  - Packet Queue Average—Shows the average number of packets for each queue when the MIB was polled. Silver, gold, platinum, bronze, and management.
  - Packets Dropped Count—Contains the counter for the number of packets dropped.
  - Packets Dropped per Minute—Shows the number of packets dropped since the last sample divided by the number of minutes since the sample.

**Figure 14-35 Packet Stats Report Results**

## Packet Error Statistics

This report notes the percentages of packet errors for packets transmitted by the neighbor mesh access point. The packet error rate percentage is 1 minus the number of successfully transmitted packets/numbers of total packets transmitted.

## Configuring a Packet Error Statistics Report

This section describes how to configure a Packet Error Statistics report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Packet Error Stats** from the drop-down list.
- Report by—Choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices).

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

- Neighbor Type—Choose All Neighbors or Parent/Children Only.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.

- From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Packet Error Statistics Report Results

The Packet Error Statistics report contains the following results ([Figure 14-36](#)):

**Figure 14-36 Packet Error Statistics Report Results**

## Packet Queue Statistics

This report generates a graph of the total number of packets transmitted and the total number of packets successfully transmitted by the neighbor mesh access point.

## Configuring a Packet Queue Statistics Report

This section describes how to configure a Packet Queue Statistics report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Packet Queue Stats** from the drop-down list.
- Report by—Choose **AP by Controller**, **AP by Floor Area**, or **AP by Outdoor Area** from the Report by drop-down list and the appropriate selection from the Report Criteria page (or click **Edit** to choose specific devices).

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Graph Type—Choose the type of graph you want displayed for these report results (**Packet Queue Average**, **Packets Dropped Count**, or **Packets Dropped Per Minute**).
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

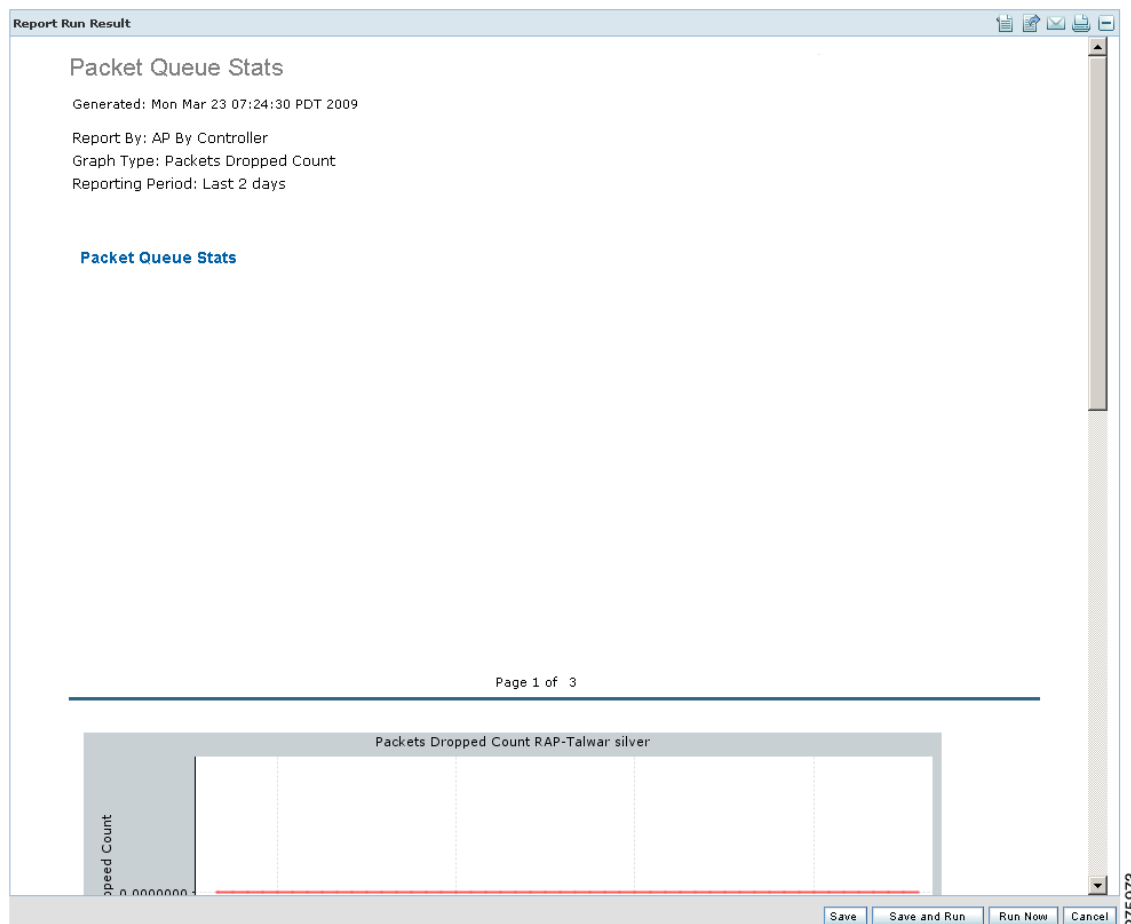

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Packet Queue Statistics Report Results

The Packet Queue Statistics report contains the following results ([Figure 14-37](#)):

Figure 14-37 Packet Queue Statistics Report Results

## Stranded APs

This report displays access points that appear to be stranded. These access points might have joined a controller at one time and are no longer joined to a controller managed by NCS, or they might have never joined a controller managed by NCS.

Click **Stranded APs** from the Report Launch Pad to open the Stranded APs Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Stranded APs Reports page. See the [“Configuring a Stranded APs Report”](#) section on page 14-136 and the [“Stranded APs Report Results”](#) section on page 14-137 for more information.

## Configuring a Stranded APs Report

This section describes how to configure a Stranded APs report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Stranded States—Choose **APs Managed by NCS** or **All**.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note**

---

Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Link Stats report results contain the following:

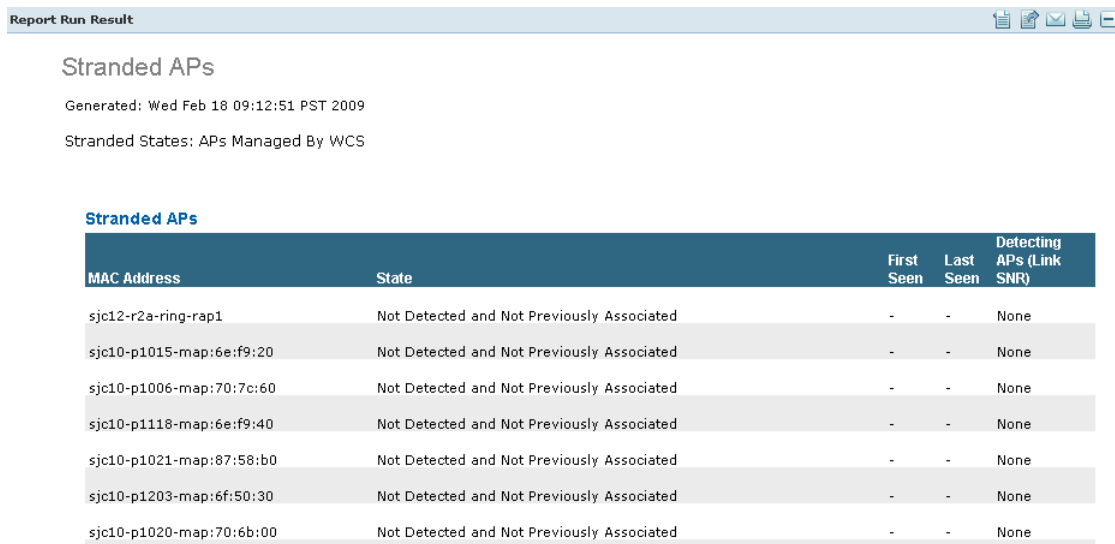

- MAC Address—The MAC address of the stranded access point.
- State—The state of the stranded access point (such as Not Detected and Not Previously Associated).
- First Seen—The date and time this access point was first detected.
- Last Seen—The date and time this access point was last seen.
- Detecting APs (Link SNR)—The access point(s) that detected this stranded access point.

## Stranded APs Report Results

The following are potential results for a Stranded APs report, depending on how the report is customized (see [Figure 14-38](#)):

- MAC Address (mandatory column)—The MAC address of the stranded access point.
- State (mandatory column)—The state of the stranded access point (such as Not Detected and Not Previously Associated).
- First Seen—The date and time this access point was first detected.
- Last Seen—The date and time this access point was last seen.
- Detecting APs (Link SNR)—The access point(s) that detected this stranded access point.

**Figure 14-38 Stranded APs Report Results**

251898

## Worst Node Hops

This report displays the worst node hops or backhaul SNR links for the specified reporting period. The information is displayed in both table and graph form. Report types include worst node hops, worst SNR links for all neighbors, and worst SNR links for parent/children only.

Click **Worst Node Hops** from the Report Launch Pad to open the Worst Node Hops Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Worst Node Hops Reports page. See the [“Configuring a Worst Node Hops Report”](#) section on page 14-138 and the [“Worst Node Hops Report Results”](#) section on page 14-140 for more information.

## Configuring a Worst Node Hops Report

This section describes how to configure a Worst Node Hops report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report Type—Choose **Worst Node Hops** or **Worst SNR Links** from the drop-down list.
- Report Type—When **Worst Node Hops** is chosen from the Report Type above, choose **Table Only** or **Table and Graph** to determine how the report results display.
- Neighbor Type—When **Worst SNR Links** is selected from the Report Type, choose **All Neighbors (Table Only)**, **Parent/Children Only (Table Only)**, **All Neighbors (Table and Graph)**, or **Parent/Children Only (Table and Graph)** to determine how the report results display.
- Reporting Period.

- Last—Select the **Last** radio button and a period of time from the drop-down list.
- From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

- Show—Enter the number of records that you want displayed in the report.

---

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

---

**Note** Worst Node Hops and Worst SNR Links reports are available in both table and graph reports. To customize report results for a particular section, choose the applicable section from the Customizable Report drop-down list.

---

Available information for Worst Node Hops report results contain the following:

- AP Name—The access point name.
- Node Hops—The number of node hops.
- MAC Address—The MAC address of the access point.
- Parent AP Name—The name of the parent access point.
- Parent MAC Address—The MAC address of the parent access point.
- Time (graph only)—The time of the node hop count.

Available information for Worst SNR Links report results contain the following:

- AP Name—The access point name.
- MAC Address—The MAC address of the access point.
- Neigh SNR—The neighbor signal-to-noise ratio.
- Neigh AP Name—The name of the neighbor access point.
- Neigh MAC Address—The MAC address of the neighbor access point.

- Neigh Type—The neighbor type.
- Time (graph only)—The time of the current report statistics.

## Worst Node Hops Report Results

The following are potential results for a Worst Node Hops report, depending on how the report is customized (see [Figure 14-39](#)):

- Worst Node Hops report results (table)
  - AP Name (mandatory column).
  - Node Hops (mandatory column)—The number of hops between access points.
  - MAC Address (mandatory column)—The MAC address of the access point.
  - Parent AP Name and MAC Address
- Worst Node Hops report results (graph)
  - Time (mandatory column)—The time of the node hop count.
  - MAC Address (mandatory column)—The MAC address of the access point.
  - Node Hops (mandatory column)—The number of hops between access points.
  - AP Name (mandatory column).
  - Parent AP Name and MAC Address.
- Worst SNR Links report results
  - AP Name (mandatory column).
  - MAC Address (mandatory column in graph report)—The MAC address of the access point.
  - Neighbor SNR (mandatory column).
  - Neighbor AP Name (mandatory column in graph report).
  - Neighbor MAC Address and Type.
  - Time (graph only)(mandatory column)—The time of the current report statistics.

# Network Summary

Click **New** for a Network Summary Report type to create a new report. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

The section contains the following Network Summary Reports:

- [802.11n Summary](#)
- [Executive Summary](#)

## 802.11n Summary

This report displays a summary of 802.11n clients and client bandwidth usage for a customizable period of time.

Click **802.11n Summary** from the Report Launch Pad to open the 802.11n Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the 802.11n Summary Reports page. See the “[Configuring an 802.11n Summary Report](#)” section on page 14-141 and the “[802.11n Summary Report Results](#)” section on page 14-142 for more information.

## Configuring an 802.11n Summary Report

This section describes how to configure an 802.11n Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## 802.11n Summary Report Results

The following information is displayed for the 802.11n Summary report:

- Number of access points per 802.11n band (pie graph)
- Utilization for 802.11n clients during the specified period of time (line graph)
- Number of associated clients for each protocols during the specified period of time (line graph)

## Executive Summary

This report displays a quick view of your wireless network.

Click **Executive Summary** from the Report Launch Pad to open the Executive Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Executive Summary Reports page. See the “[Configuring an Executive Summary Report](#)” section on page 14-142 and the “[Executive Summary Report Results](#)” section on page 14-142 for more information.

## Configuring an Executive Summary Report

This section describes how to configure an Executive Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box, or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

**Note**

The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Executive Summary Report Results

The following information is displayed in the Executive Summary report (see [Figure 14-40](#)):

- Number of network devices including access points, controllers, and MSEs.
- Number of LWAPP versus autonomous access points (pie graph).
- Number of associated client in the network during the specified period of time (line graph).

- Number of guest client in the network during the specified period of time (line graph).
- Throughput (Kbps) of clients by protocol during the specified period of time.
- Number of associated clients for each protocol during the specified period of time.
- Network utilization (%) during the specified period of time.
- Air Quality vs Time for each interface.
- Top 10 worst 5 GHz interferers in the network.
- Top 10 worst 2.4 GHz interferers in the network.

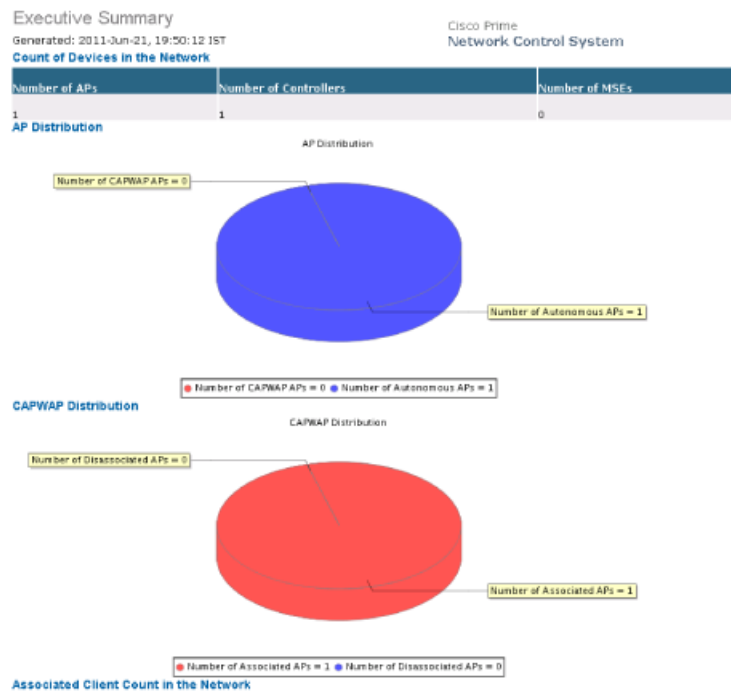

**Note** The Severity 1 refers to the best interferer and Severity 100 refers to the worst interferer in the top 10 worst 5 GHz and 2.4 GHz interferers in the network reports.

**Note** Executive Summary AP count includes disassociated AP(s) so if you have deleted a controller from NCS, the CAPWAP count in the report will also reflect the disassociated AP count.

**Figure 14-40** Executive Summary Report Results

330166

## Performance Reports

Click **New** for a Performance Report type to create a new report. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

This section contains the following performance reports:

- [802.11 Counters](#)
- [Coverage Hole](#)
- [Network Utilization](#)
- [Traffic Stream Metrics](#)
- [Tx Power and Channel](#)
- [VoIP Calls Graph](#)
- [VoIP Calls Table](#)
- [Voice Statistics](#)

## 802.11 Counters

This report displays counters for access points at the MAC layer. Statistics such as error frames, fragment counts, RTS/CTS frame count, and retried frames are generated based on the filtering criteria and can help interpret performance (and problems, if any) at the MAC layer.

Click **802.11 Counters** from the Report Launch Pad to open the 802.11 Counters Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the 802.11 Counters Reports page. See the “[Configuring an 802.11 Counters Report](#)” section on page 14-144 and the “[802.11 Counters Report Results](#)” section on page 14-146 for more information.

## Configuring an 802.11 Counters Report

This section describes how to configure an 802.11 Counters report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for 802.11 Counters report results contain the following:

- Time—The date and time of the count.
- AP Name—The name of the applicable access point.
- Slot—The slot number.
- Radio Type—802.11a/n or 802.11b/g/n.
- Tx Fragment Count—The number of successfully received MPDUs of type Data or Management.
- Rx Fragment Count—The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).
- FCS Error Count—The number of FCS errors detected in a received MPDU.
- Retry Count—The number of MSDUs successfully transmitted after one or more retransmissions.
- Multicast Rx Frame Count—The number of MSDUs received with the multicast bit set in the destination MAC address.
- Multicast Tx Frame Count—The number of times a multicast bit is set in the destination MAC address of a successfully transmitted MSDU. Operating as an STA in an ESS, where these frames are directed to the access point, implies having received an acknowledgment to all associated MPDUs.
- Tx Failed Count—The number of MSDUs successfully transmitted after one or more retransmissions.
- Multiple Retry Count—The number of MSDUs successfully transmitted after more than one retransmission.
- Frame Duplicate Count—The number of times a frame is received that the Sequence Control field indicates is a duplicate.

- Tx Frame Count—The number of successfully transmitted MSDUs.
- RTS Success Count—The number of times a CTS is received in response to an RTS.
- RTS Failure Count—The number of times a CTS is not received in response to an RTS.
- ACK Failure Count—The number of times an ACK is not received when expected.
- WEP Undecryptable Count—The number of times a frame is received with the WEP subfield of the Frame Control field set to one and the WEPOn value for the key mapped to the MAC address of the AT indicates that the frame should not have been encrypted or that frame is discarded due to the receiving STA not implementing the privacy option.

## 802.11 Counters Report Results

The following are potential results for an 802.11 Counters report, depending on how the report is customized (see [Figure 14-41](#)):

- Time (mandatory column)
- AP Name (mandatory column)
- Slot (mandatory column)
- AP MAC Address (mandatory column)
- Radio Type—802.11a/n or 802.11b/g/n.
- Tx Fragment Count—The number of successfully received MPDUs of type Data or Management.
- Rx Fragment Count—The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).
- FCS Error Count—The number of FCS errors detected in a received MPDU.
- Retry Count—The number of MSDUs successfully transmitted after one or more retransmissions.
- Multicast Rx Frame Count—The number of MSDUs received with the multicast bit set in the destination MAC address.
- Multicast Tx Frame Count—The number of time a multicast bit is set in the destination MAC address of a successfully transmitted MSDU. When operating as a STA in an ESS, where these frames are directed to the access point, this implies having received an acknowledgment to all associated MPDUs.
- Tx Failed Count—The number of unsuccessful MSDUs transmissions.
- Multiple Retry Count—The number of MSDUs successfully transmitted after more than one retransmission.
- Frame Duplicate Count—The number of times a frame is received that the Sequence Control field indicates is a duplicate.
- Tx Frame Count—The number of successfully transmitted MSDUs.
- RTS Success Count—The number of times a CTS is received in response to an RTS.
- RTS Failure Count—The number of times a CTS is not received in response to an RTS.
- ACK Failure Count—The number of times an ACK is not received when expected.
- WEP Undecryptable Count—The number of times a frame is received with the WEP subfield of the Frame Control field set to one and the WEPOn value for the key mapped to the AT MAC address indicates that the frame should not have been encrypted or that frame is discarded due to the receiving STA not implementing the privacy option.

## Coverage Hole

This report identifies the location of potential coverage holes in your network and whether they occur more frequently at a given spot. This report can help you modify RRM settings or determine if additional access points are needed to provide coverage in sparsely deployed areas. It runs on the alarm table and shows both the alarm generation time, the cleared time (if cleared), and the state of the alarm (active or cleared).

Click **Coverage Hole** from the Report Launch Pad to open the Coverage Hole Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Coverage Hole Reports page. See the “[Configuring a Coverage Hole Report](#)” section on page 14-147 and the “[Coverage Hole Report Results](#)” section on page 14-148 for more information.

## Configuring a Coverage Hole Report

This section describes how to configure a Coverage Hole report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report”](#) section on page 14-6 for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Coverage Hole report results contain the following:

- Time—The date and time the coverage hole was detected.
- State—Clear or Active.
- AP Base Radio MAC Address—The MAC address of the access point base radio.
- AP Name—The name of the access point on which the coverage hole was detected.
- Radio Type—802.11a/n or 802.11b/g/n.
- Failed Clients.
- Total Clients.
- Threshold RSSI.
- Worst Client MAC.
- Worst Client RSSI.

## Coverage Hole Report Results

The following are potential results for a Coverage Hole report, depending on how the report is customized (see [Figure 14-42](#)):

- Time (mandatory column)—Indicates the date and time that the alarm was generated or cleared (depending on the current state).

- State (mandatory column)—Active or cleared.
- AP Name (mandatory column)—The name of the access point on which the coverage hole was detected.
- Radio Type (mandatory column)—802.11a/n or 802.11b/g/n.
- AP Base Radio MAC Address.
- Failed Clients—The number of clients that have failed due to coverage hole issues.
- Total Clients—The number of total clients associated to this access point.
- Threshold RSSI—The lowest radio signal strength indication limit.
- Worst Client MAC—The MAC address of the client most affected by coverage hole issues.
- Worst Client RSSI—The radio signal strength indication of the client most affected by coverage hole issues.

## Network Utilization

This report shows the overall network utilization based on the aggregated port utilization of all controllers on your network. These statistics can help identify current network performance and help with capacity planning for future scalability needs.

### Note

Average utilization (%) is the percentage of utilization where utilization is calculated as  $((Tx+Rx)/Bandwidth)$ .

Click **Network Utilization** from the Report Launch Pad to open the Network Utilization Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Network Utilization Reports page. See the “[Configuring a Network Utilization Report](#)” section on page 14-150 and the “[Network Utilization Report Results](#)” section on page 14-150 for more information.

## Configuring a Network Utilization Report

This section describes how to configure a Network Utilization report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

The Customize Report Form allows you to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available data fields column.

---

Available information for the Network Utilization report results contain the following:

- Time
- Average Utilization (%)—The average aggregated (totalDeltaBits/bandwidth) on all controllers.
- Average Tx (Mbps)—The average aggregated received Mbps of all ports on all controllers.
- Average Rx (Mbps)—The average aggregated (totalDeltaBits/bandwidth) on all controllers.

## Network Utilization Report Results

Network utilization is based on the average utilization of all the controllers in the network.

The following information is displayed for a Network Utilization report (see [Figure 14-43](#)):

- Time (mandatory column)
- Average Utilization (%) (mandatory column)—Average aggregated (totalDeltaBits/bandwidth) on all controllers.

**Note** Average utilization (%) is the percentage of utilization where utilization is calculated as  $((Tx+Rx)/Bandwidth)$ .

- Average Transmitting (in Mbps)—Average aggregated transmitted Megabytes of all ports on all controllers.
- Average Receiving (in Mbps)—Average aggregated received Megabytes of all ports on all controllers.

## Traffic Stream Metrics

This report can be useful in determining the current and historical quality of service (QoS) for given clients at the radio level. It also displays uplink and downlink statistics such as packet loss rate, average queuing delay, distribution of delayed packets, and roaming delays.

Click **Traffic Stream Metrics** from the Report Launch Pad to open the Traffic Stream Metrics Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Traffic Stream Metrics Reports page. See the “[Configuring a Traffic Stream Metrics Report](#)” section on page 14-151 and the “[Traffic Stream Metrics Report Results](#)” section on page 14-153 for more information.

## Configuring a Traffic Stream Metrics Report

This section describes how to configure a Traffic Stream Metrics report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by

- AP by Controller—Choose **All Controllers** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
- AP by Floor Area—Choose **All Campuses** > **All Buildings** > **All Floors** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
- AP by Outdoor Area—Choose **All Campuses** > **All Outdoor Areas** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

The Customize Report Form allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

Available information for Traffic Stream Metrics report results contain the following:

- Time—Date and time the statistics were recorded.
- MAC address—The MAC address of the access point.
- AP Name—The access point name.
- Radio Type—802.11a/n or 802.11b/g/n.
- Average Queuing Delay (Downlink)—The average queuing delay for downlinks.
- Average Queuing Delay (Uplink)—The average queuing delay for uplinks.
- % Packet with less than 10 ms delay (downlink)—The percentage of packets that have a queuing delay of less than 10 milliseconds for a downlink.
- % Packet with less than 10 ms delay (uplink)—The percentage of packets that have a queuing delay of less than 10 milliseconds for an uplink.

- % Packet with more than 10 < 20 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 10 but less than 20 milliseconds for a downlink.
- % Packet with more than 10 < 20 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 10 but less than 20 milliseconds for an uplink.
- % Packet with more than 20 < 40 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 20 but less than 40 milliseconds for a downlink.
- % Packet with more than 20 < 40 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 20 but less than 40 milliseconds for an uplink.
- % Packet with more than 40 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 40 milliseconds for a downlink.
- % Packet with more than 40 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 40 milliseconds for an uplink.
- Packet Loss Ratio (Downlink)—The ratio of lost packets for downlinks.
- Packet Loss Ratio (Uplink)—The ratio of lost packets for uplinks.
- Total Packet Count (Downlink)—The total number of downlink packets.
- Total Packet Count (Uplink)—The total number of uplink packets.
- Roaming Count—Number of packets exchanged for roaming negotiations in this 90-second metrics page.
- Roaming Delay—Roaming delay in milliseconds.

## Traffic Stream Metrics Report Results

The following are potential results for a Traffic Stream Metrics report, depending on how the report is customized (see [Figure 14-44](#)):

- Time (mandatory column).
- MAC Address (mandatory column).
- AP Name (mandatory column).
- Radio Type (mandatory column).
- Average Queuing Delay (Downlink) (mandatory column).
- Average Queuing Delay (Uplink) (mandatory column).
- % Packet with less than 10 ms delay (downlink)—The percentage of packets that have a queuing delay of less than 10 milliseconds for a downlink.
- % Packet with less than 10 ms delay (uplink)—The percentage of packets that have a queuing delay of less than 10 milliseconds for an uplink.
- % Packet with more than 10 < 20 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 10 but less than 20 milliseconds for a downlink.
- % Packet with more than 10 < 20 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 10 but less than 20 milliseconds for an uplink.
- % Packet with more than 20 < 40 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 20 but less than 40 milliseconds for a downlink.
- % Packet with more than 20 < 40 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 20 but less than 40 milliseconds for an uplink.

- % Packet with more than 40 ms delay (downlink)—The percentage of packets that have a queuing delay of more than 40 milliseconds for a downlink.
- % Packet with more than 40 ms delay (uplink)—The percentage of packets that have a queuing delay of more than 40 milliseconds for an uplink.
- Packet Loss Ratio (Downlink)—The ratio of lost packets for downlinks.
- Packet Loss Ratio (Uplink)—The ratio of lost packets for uplinks.
- Total Packet Count (Downlink)—The total number of downlink packets.
- Total Packet Count (Uplink)—The total number of uplink packets.
- Roaming Count—Number of packets exchanged for roaming negotiations in this 90 seconds metrics page.
- Roaming Delay—Roaming delay in milliseconds.

## Tx Power and Channel

This report displays the channel plan assignment and transmit power level trends of devices based on the filtering criteria used when the report was generated. It helps to identify unexpected behavior or issues with network performance.

Click **Tx Power and Channel** from the Report Launch Pad to open the Tx Power and Channel Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Tx Power and Channel Reports page. See the “[Configuring a Tx Power and Channel Report](#)” section on page 14-155 and the “[Tx Power and Channel Report Results](#)” section on page 14-155 for more information.

## Configuring a Tx Power and Channel Report

This section describes how to configure a Tx Power and Channel report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Tx Power and Channel Report Results

The following information is displayed for a Tx Power and Channel report (see [Figure 14-45](#)):

- Transmit power level for each access point during the specified period of time.
- Channel number for each access point during the specified period of time.

**Figure 14-45 Tx Power and Channel Report Results**

## VoIP Calls Graph

This report helps analyze wireless network usage from a voice perspective by providing details such as the number and duration of VoIP calls (per radio) on the network over time. To be able to gather useful data from this report, VoIP snooping must be enabled on the WLAN. This report displays information in a graph.

Click **VoIP Calls Graph** from the Report Launch Pad to open the VoIP Calls Graph Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the VoIP Calls Graph Reports page. See the [“Configuring a VoIP Calls Graph Report”](#) section on page 14-156 and the [“VoIP Calls Report Results”](#) section on page 14-157 for more information.

## Configuring a VoIP Calls Graph Report

This section describes how to configure a VoIP Calls Graph report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## VoIP Calls Report Results

The following information is displayed for a VoIP Calls Graph report:

- Number of attempted VoIP calls per radio during the specified period of time.
- Duration (in seconds) of VoIP calls.

## VoIP Calls Table

This report helps analyze wireless network usage from a voice perspective by providing details such as the number and duration of VoIP calls (per radio) on the network over time. To be able to gather useful data from this report, VoIP snooping must be enabled on the WLAN. This report displays information in a table.

Click **VoIP Calls Table** from the Report Launch Pad to open the VoIP Calls Table Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the VoIP Calls Table Reports page. See the [“Configuring a VoIP Calls Table Report” section on page 14-157](#) and the [“VoIP Calls Table Results” section on page 14-158](#) for more information.

## Configuring a VoIP Calls Table Report

This section describes how to configure a VoIP Calls Table report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.

- Report by
  - AP by Controller—Choose **All Controllers** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses** > **All Buildings** > **All Floors** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses** > **All Outdoor Areas** > **All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## VoIP Calls Table Results

This report displays the same information as the VoIP Calls Graph report but the information is displayed in a table instead of a graph.

The following information is displayed for a VoIP Calls Table report (see [Figure 14-46](#)):

- Number of attempted VoIP calls per radio during the specified period of time.
- Duration (in seconds) of VoIP calls.

**Figure 14-46 VoIP Calls Table Results**

## Voice Statistics

This report helps analyze wireless network usage from a voice perspective by providing details such as percentage of bandwidth used by voice clients, voice calls, roaming calls, and rejected calls (per radio) on the network. To be able to gather useful data from this report, make sure Call Admission Control (CAC) is supported on voice clients.

### Note

Voice Statistics reports only apply to clients that support Call Admission Control (CAC) and have CAC enabled.

Click **Voice Statistics** from the Report Launch Pad to open the Voice Statistics Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Voice Statistics Reports page. See the [“Configuring a Voice Statistics Report”](#) section on page 14-159 and the [“Voice Statistics Results”](#) section on page 14-160 for more information.

## Configuring a Voice Statistics Report

This section describes how to configure a Voice Statistics report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

- AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
- AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** In the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Protocol—Choose **802.11 a/n**, **802.11 b/g/n**, or both.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

---

**Note** The reporting period is based on the alarm last seen time. The times are in the UTC time zone.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Voice Statistics Results

---

**Note** Voice Statistics reports only apply to clients that support Call Admission Control (CAC) and have CAC enabled.

---

The following information is displayed for a Voice Statistics report (see [Figure 14-47](#)):

- Percentage of bandwidth in use during the specified period of time.
- Total number of non-roaming and roaming calls during the specified period of time.
- Number of rejected calls during the specified period of time. Statistics include:
  - Total number of rejected calls.
  - Number of rejected roaming and non-roaming calls.
  - Number of rejected calls due to insufficient bandwidth, bad parameters, physical rate, and QoS policy.

## Security Reports

Click **New** for a Security Report type to create a new report. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information.

Click a report type to view currently saved report templates. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

This section contains the following Security Reports:

- [Adaptive WIPS Alarm](#)
- [Adaptive WIPS Alarm Summary](#)
- [Adaptive WIPS Top 10 AP](#)
- [Adhoc Rogue Count Summary](#)
- [Adhoc Rogues](#)
- [New Rogue AP Count Summary](#)
- [New Rogue APs](#)
- [Rogue AP Count Summary](#)
- [Rogue APs](#)
- [Security Alarm Trending Summary](#)

## Adaptive wIPS Alarm

This report displays wIPS alarms by selected MSEs, controllers, and access points for each alarm type. Click **Adaptive wIPS Alarms** from the Report Launch Pad to open the Adaptive wIPS Alarms Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adaptive wIPS Alarms Reports page. See the “[Configuring an Adaptive wIPS Alarm Report](#)” section on page 14-162 and the “[Adaptive wIPS Alarm Report Results](#)” section on page 14-163 for more information.

## Configuring an Adaptive wIPS Alarm Report

This section describes how to configure an Adaptive wIPS Alarms report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - MSE with Adaptive wIPS Service—Choose **All MSEs with Adaptive wIPS Service** from the Report Criteria drop-down list, or click **Edit** to choose a specific MSE.
  - Controller by MSE—Choose **All MSEs > All Controllers** from the Report Criteria drop-down list, or click **Edit** to choose a specific controller.
  - AP by MSE—Choose **All MSEs > All Controllers > All APs** from the Report Criteria drop-down list, or click **Edit** to choose a specific access point.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Alarm Category—Choose **All Types, Denial of Service (DoS), or Security Penetration** to determine the types of wIPS alarms to display in the results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

## Adaptive wIPS Alarm Report Results

An Adaptive wIPS Alarm Report potentially contains the following information, depending on how the report is customized (see [Figure 14-48](#)):

- Alarm Name (mandatory column).
- AP Name—The name of the device that detected the alarm.
- Source Device—Identifies the device that initiated the potential attack.
- Target Device—Identifies the device targeted by the potential attack.
- Severity—Indicates the severity of the attack (Critical, Urgent, Warning, Information).
- Channel—The channel on which the alarm occurred.
- Status—The current status of the alarm (Active or Inactive).
- First Seen—The date and time the alarm was first detected.
- Last Seen—The date and time the alarm was last detected.
- AP MAC Address—The MAC address of this access point.
- Target SSID—The Service Set Identifier of the targeted device.
- Alarm Category.
- MSE Name—The name of the MSE to which this device is associated.

**Adaptive wIPS Alarm Report**

This report provides a summarized list of Adaptive wIPS alarms present on the Mobility Services Engine(s) in your network. The report is generated using your selected report filter conditions. Please refer to "wIPS Profiles" under the "Configuration" menu for alarm categories and alarm descriptions. It contains detailed information of potential security threats that Cisco has detected in the WLAN environment. Please refer to the threat knowledgebase in NCS for remediation and mitigation techniques for these events. This report includes:

- \* Name of the alarm
- \* Name of the device that detected the alarm
- \* MAC Address of the Attacking Device
- \* MAC Address of the Attack Target
- \* Severity (Critical, Urgent, Warning and Information)
- \* Channel in which the alarm occurred
- \* The first time the alarm was detected
- \* The last time the alarm was detected

A closely monitored WLAN system with latest security standards implemented is protected against many common WLAN security threats. Cisco ensures WLAN security by monitoring the WLAN and alerting the wireless administrator of early warning signs of security threats. With the comprehensive suite of security monitoring technologies, Cisco alerts the user on more than 120 different threat conditions.

## Adaptive wIPS Alarm Summary

This report displays a summary of all the Adaptive wIPS Alarms on your network.

Click **Adaptive wIPS Alarm Summary** from the Report Launch Pad to open the Adaptive wIPS Alarm Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adaptive wIPS Alarm Summary Reports page. See the [“Configuring an Adaptive wIPS Alarm Summary Report”](#) section on page 14-164 and the [“Adaptive wIPS Alarm Summary Report Results”](#) section on page 14-165 for more information.

## Configuring an Adaptive wIPS Alarm Summary Report

This section describes how to configure an Adaptive wIPS Alarm Summary report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By
  - MSE with Adaptive wIPS Service—Choose **All MSEs with Adaptive wIPS Service** from the Report Criteria drop-down list or click **Edit** to choose a specific MSE.
  - Controller by MSE—Choose **All MSEs > All Controllers** from the Report Criteria drop-down list or click **Edit** to choose a specific controller.
  - AP by MSE—Choose **All MSEs > All Controllers > All APs** from the Report Criteria drop-down list or click **Edit** to choose a specific access point.

**Note** In the Filter Criteria drop-down list, choose the appropriate filter criteria.

- Alarm Category—Choose **All Types**, **Denial of Service (DoS)**, or **Security Penetration** to determine the types of wIPS alarms to be displayed in the results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

- Show—Enter the number of records that you want displayed in the report.

**Note** Enter a number between 5 and 1000, or leave the text box blank to display all records.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information about customizing report results.

**Note** Data fields that appear in blue font cannot be removed from the list of fields to be included.

## Adaptive wIPS Alarm Summary Report Results

An Adaptive wIPS Alarm Summary Report potentially contains the following information, depending on how the report is customized (see [Figure 14-49](#)):

- Alarm Name (mandatory column)

- Category—Alarm category
- Severity Information
  - Critical—The number of critical alarms for this access point.
  - Major—The number of major alarms for this access point.
  - Minor—The number of minor alarms for this access point.
  - Warning—The number of warning alarms for this access point.
- Total—The number of total alarms for this access point.

**Adaptive wIPS Alarm Summary Report**

This report provides a consolidated list of all the alarms categories (Security IDS/IPS and Performance Intrusion) that have occurred in the WLAN environment. An insecure network can usually be fixed by reconfiguring some of the network equipment, by using additional software or hardware and always being in the forefront of implementing the latest security standards to provide good security for sensitive data such as employee salary data or company financial information. A closely monitored and well tuned WLAN system can achieve a higher throughput than a poorly managed one. AirMagnet ensures WLAN performance and efficiency by monitoring the WLAN and alerting the wireless administrator on early warning signs for trouble. This includes reporting the devices which are vulnerable to violations/are violating and actions that can be performed to nullify such violations. With the comprehensive suite of security monitoring technologies, Cisco alerts the user on more 50 different threat conditions. The report includes the different types of policy violations categories, the number of times they have occurred and also breaks it down to the severity level (Critical, Major, Minor and Warning). Please refer to the Configure>wIPS Profiles to view all the possible alarm categories. threat knowledgebase in NCS for remediation and mitigation techniques for these events. A closely monitored WLAN system with latest security standards implemented is protected against many common WLAN security threats. Cisco ensures WLAN security by monitoring the WLAN and alerting the wireless administrator of early warning signs of security threats. With the comprehensive suite of security monitoring technologies, Cisco alerts the user on more than 120 different threat conditions. This report includes the different types of potential security threats, the number of times they have occurred and also breaks it down to the severity level (Critical, Major, Minor and Warning) for each of the Top 10 APs. Please refer to "wIPS Profiles" under the "Configuration" menu to view all detected alarms and their respective category.

| AlarmName                               | Category                        | Critical | Major | Minor | Warning | Total |
|-----------------------------------------|---------------------------------|----------|-------|-------|---------|-------|
| Unauthorized association by vendor list | wIPS - Security Penetration     | 26455    | 0     | 0     | 0       | 26455 |
| Suspicious after-hours traffic detected | wIPS - Security Penetration     | 0        | 0     | 25555 | 0       | 25555 |
| Spoofed MAC address detected            | wIPS - Security Penetration     | 0        | 7829  | 0     | 0       | 7829  |
| DoS: CTS flood                          | wIPS - Denial of Service Attack | 6656     | 0     | 0     | 0       | 6656  |
| DoS: RTS flood                          | wIPS - Denial of Service Attack | 5451     | 0     | 0     | 0       | 5451  |
| Unauthorized association detected       | wIPS - Security Penetration     | 2711     | 0     | 0     | 0       | 2711  |
| Malformed 802.11 packets detected       | wIPS - Security Penetration     | 0        | 2024  | 0     | 0       | 2024  |

## Adaptive wIPS Top 10 AP

This report displays the top ten access points with the highest number of generated Adaptive wIPS alarms.

Click **Adaptive wIPS Top 10 APs** from the Report Launch Pad to open the Adaptive wIPS Top 10 APs Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adaptive wIPS Top 10 APs Reports page. See the “[Configuring an Adaptive wIPS Top 10 AP Report](#)” section on page 14-167 and the “[Adaptive wIPS Top 10 AP Report Results](#)” section on page 14-168 for more information.

### Configuring an Adaptive wIPS Top 10 AP Report

This section describes how to configure a wIPS Top 10 AP report.

#### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By
  - MSE with Adaptive wIPS Service—Choose **All MSEs with Adaptive wIPS Service** from the Report Criteria drop-down list or click **Edit** to choose a specific MSE.
  - Controller by MSE—Choose **All MSEs > All Controllers** from the Report Criteria drop-down list or click **Edit** to choose a specific controller.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Alarm Category—Choose **All Types**, **Denial of Service (DoS)**, or **Security Penetration** to determine the types of wIPS alarms to display in the results.

---

**Note** See the wIPS Policy Alarm Encyclopedia for more information regarding wIPS alarm types.

---

- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

---

#### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

**Note**

Fixed columns appear in blue font and cannot be moved to Available Columns.

### Adaptive wIPS Top 10 AP Report Results

An Adaptive wIPS Top 10 AP report potentially contains the following information, depending on how the report is customized (see [Figure 14-50](#)):

- AP Name (mandatory column)
- Critical—The number of critical alarms for this access point.
- Major—The number of major alarms for this access point.
- Minor—The number of minor alarms for this access point.
- Warning—The number of warning alarms for this access point.
- Total—The number of total alarms for this access point.
- AP MAC Address—The MAC address of this access point.
- MSE Name—The name of the MSE to which this access point is associated.

**Figure 14-50 Adaptive wIPS Top 10 APs Report**

Adaptive wIPS Top 10 AP

Generated: 2011-May-18, 18:41:33 UTC

Report By: MSE with Adaptive wIPS service  
 MSE with Adaptive wIPS Service: All MSEs with Adaptive wIPS Service  
 Alarm Category: All Types  
 Reporting Period: Last 3 days

**Adaptive wIPS Top 10 AP Report**

This report provides a list of the top 10 wIPS monitoring APs that have detected the most security alarms that have occurred in the WLAN environment. These alarms are stored on the Mobility Services Engine(s) installed on your network running Adaptive wIPS. A high number of alarms on a monitoring AP is indicative of "security hot spots" in the network that warrant closer investigation. Please refer to the threat knowledgebase in WCS for remediation and mitigation techniques for these events. A closely monitored WLAN system with latest security standards implemented is protected against many common WLAN security threats. Cisco ensures WLAN security by monitoring the WLAN and alerting the wireless administrator of early warning signs of security threats. With the comprehensive suite of security monitoring technologies, Cisco alerts the user on more than 120 different threat conditions. This report includes the different types of potential security threats, the number of times they have occurred and also breaks it down to the severity level (Critical, Major, Minor and Warning) for each of the Top 10 APs. Please refer to "wIPS Profiles" under the "Configuration" menu to view all detected alarms and their respective category.

Cisco Prime

**Network Control System**

| AP Name           | Critical | Major | Minor | Warning | Total |
|-------------------|----------|-------|-------|---------|-------|
| SJC14-11A-AP-IDS1 | 270      | 5     | 36    | 11      | 322   |

## Adhoc Rogue Count Summary

This report displays a summarized count of all adhoc rogue access points.

Click **Adhoc Rogue Count Summary** from the Report Launch Pad to open the Adhoc Rogue Count Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adhoc Rogue Count Summary Reports page. See the “[Configuring an Adhoc Rogue Count Summary Report](#)” section on page 14-169 and the “[Adhoc Rogue Count Summary Report Results](#)” section on page 14-170 for more information.

## Configuring an Adhoc Rogue Count Summary Report

This section describes how to configure an Adhoc Rogue Count Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

---

**Note** In the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Classification Type—Choose **All Types, Malicious, Friendly, or Unclassified** to determine the type of rogue access point to be displayed in the report results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information about customizing report results.

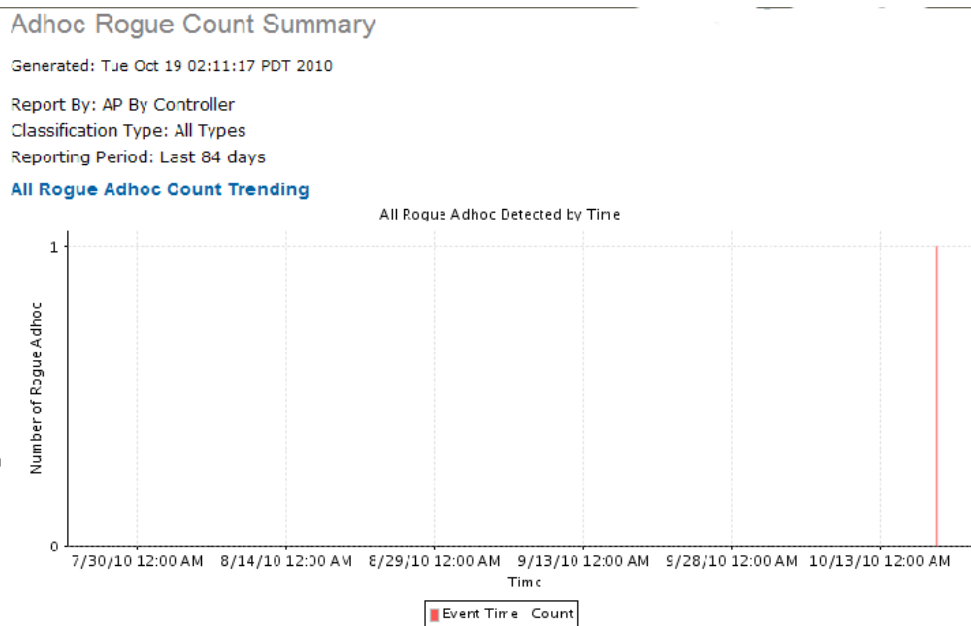

**Note**

Data fields that appear in blue font cannot be removed from the list of fields to be included.

## Adhoc Rogue Count Summary Report Results

The following are potential results for an Adhoc Rogue Count Summary report, depending on how the report is customized (see [Figure 14-51](#)):

**Figure 14-51 Adhoc Rogue Count Summary Report**

Page 1 of 2

**All Rogue Adhoc Count**

| Classification Type | Count |
|---------------------|-------|
| Malicious           | 1     |

282670

## Adhoc Rogue Events

This report displays all adhoc rogue events received by NCS.

The following settings and scheduling parameters are available for this report:

Click **Adhoc Rogue Events** from the Report Launch Pad to open the Adhoc Rogue Events Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports”](#) section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adhoc Rogue Events Reports page. See the “[Configuring an Adhoc Rogue Events Report](#)” section on page 14-171 and the “[Adhoc Rogue Events Report Results](#)” section on page 14-172 for more information.

## Configuring an Adhoc Rogue Events Report

### Settings

The following settings can be configured for an Adhoc Rogue Events report:

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

---

**Note** From the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Reporting Period

---

**Note** Reporting period is based on the alarm Last Seen time.

---

- Last—Select the **Last** radio button and a period of time from the drop-down list.
- From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Creating a Custom Report

The Create Custom Report page allows you to customize the report results. See the “[Creating and Running a New Report](#)” for more information on customizing report results.

---

**Note** Mandatory columns are displayed in blue font and cannot be moved to Available Columns. Last Seen Time, Rogue MAC Address, and Detecting AP Name are mandatory columns for the Adhoc Rogue Events report.

---

## Command Buttons

Once all report parameters have been set, select from the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- **Save and Run**—Click to save this report setup and to immediately run the report.
- **Run**—Click to run the report without saving the report setup.
- **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
- **Save and Email**—Click to save the report and e-mail the results.
- **Export Now**—Click to export the report results. The supported export formats is PDF and CSV.
- **Cancel**—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report”](#) section on page 14-6 for additional information on running or scheduling a report.

---

## Adhoc Rogue Events Report Results

The following are potential results for an Adhoc Rogue Events report, depending on how the report is customized:

- **Last Seen Time** (mandatory column)
- **Rogue MAC Address** (mandatory column)
- **Detecting AP Name** (mandatory column)
- **Radio Type**—802.11a or 802.11b/g.
- **Controller IP Address**—The IP address of the controller on which the adhoc rogue is located.
- **Map Location**—The building, floor area, or outdoor area (as applicable) where the adhoc rogue was detected.
- **SSID**—The user-defined Service Set Identifier name.
- **State**—The radio state relative to the network or port. Adhoc rogue radios appear as “Alert” when first scanned by the port, or as “Pending” when operating system identification is still underway.
- **Channel Number**—The channel number of the adhoc rogue.
- **RSSI (dBm)**—The received signal strength indicator in dBm.

## Adhoc Rogues

This report displays details for all adhoc rogue devices detected by your network access points based on the time they were last seen.

NCS receives updates about adhoc rogues from controllers by using traps or by polling. Last Seen Time is updated anytime a trap for the adhoc rogue is received or the adhoc rogue was seen during the last polling cycle of NCS.

**Note**

---

This report includes rogue access point alarms with clear severity.

---

Click **Adhoc Rogues** from the Report Launch Pad to open the Adhoc Rogues Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Adhoc Rogues Reports page. See the “[Configuring an Adhoc Rogues Report](#)” section on page 14-173 and the “[Adhoc Rogues Report Results](#)” section on page 14-174 for more information.

## Configuring an Adhoc Rogues Report

This section describes how to configure an Adhoc Rogues report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The reporting period is based on the time that the alarm was last seen. The times are shown in the local time of the NCS server.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Adhoc Rogues Report Results

The following are potential results for an Adhoc Rogues report, depending on how the report is customized (see Figure 14-52):

- Last Seen Time—Date and time the ad hoc rogue was last seen.
- Detecting AP Name—The access point that last detected the rogue, when a rogue is detected by multiple access points on one controller. This last detected access point name comes from the controller that supports maximum RSSI.
- Radio Type—802.11a/n or 802.11b/g/n.
- Controller IP Address—The IP address of the controller on which the ad hoc rogue is located.
- Map Location—The building, floor area, or outdoor area (as applicable) where the ad hoc rogue was detected.
- SSID—The user-defined Service Set Identifier name.
- State—The radio state relative to the network or port. Ad hoc rogue radios appear as “Alert” when first scanned by the port, or as “Pending” when operating system identification is still underway.
- Rogue MAC Address—The MAC address of the ad hoc rogue.
- Channel Number—The channel number of the ad hoc rogue.
- RSSI (dBm)—The maximum received signal strength indicator ever reported by any controller for this rogue.

## New Rogue AP Count Summary

This report displays a summarized count of all the new rogue access points.

Click **New Rogue AP Count Summary** from the Report Launch Pad to open the New Rogue AP Count Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the New Rogue AP Count Summary Reports page. See the [“Configuring a New Rogue AP Count Summary Report” section on page 14-175](#) and the [“New Rogue AP Count Summary Report Results” section on page 14-176](#) for more information.

## Configuring a New Rogue AP Count Summary Report

This section describes how to configure a New Rogue AP Count Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report By
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Classification Type—Choose **All Types, Malicious, Friendly, or Unclassified** to determine the type of rogue access point to be displayed in the report results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information about customizing report results.

**Note**

---

Data fields that appear in blue font cannot be removed from the list of fields to be included.

---

## New Rogue AP Count Summary Report Results

The following are potential results for a New Rogue AP Count Summary report, depending on how the report is customized (see [Figure 14-53](#)):

**Figure 14-53** *New Rogue AP Count Summary Report*

## New Rogue APs

This report displays all the new rogues detected for the first time on your network within the selected timeframe for this report. The value in the Created Time column indicates the time at which the rogue was first detected.

**Note**

This report includes rogue access point alarms with clear severity.

Click **New Rogue AP** from the Report Launch Pad to open the New Rogue APs Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the New Rogue APs Reports page. See the [“Configuring a New Rogue AP Report” section on page 14-176](#) and the [“New Rogue AP Report Results” section on page 14-177](#) for more information.

## Configuring a New Rogue AP Report

This section describes how to configure a New Rogue Access Points report.

## Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Classification Type—Choose **All Types, Malicious, Friendly, or Unclassified** to determine the type of rogue access point to display in the report results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

## Customize Report Form

Click Customize to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## New Rogue AP Report Results

The following are potential results for a New Rogue APs report, depending on how the report is customized (see [Figure 14-54](#)):

---

**Note** The results for this report are sorted based on First Time Seen.

---

- First Seen Time—The date and time the rogue access point was first seen.
- Rogue MAC Address—The MAC address of the rogue access point. Click the MAC address link to view the alarm details of the access point.

- Detecting AP Name—The access point that last detected the rogue, when a rogue is detected by multiple access points on one controller. This last detected access point name comes from the controller that supports maximum RSSI.
- Radio Type—802.11a/n or 802.11b/g/n.
- Controller IP Address—The IP address of the controller on which the rogue access point is located.
- Map Location—The building, floor area, or outdoor area (as applicable) where the rogue access point was detected.
- SSID—The user-defined Service Set Identifier name.
- State—The radio state relative to the network or port. Rogue access point radios appear as “Alert” when first scanned by the port, or as “Pending” when operating system identification is still underway.
- Channel Number—The channel number of the rogue access point.
- RSSI (dBm)—The received signal strength indicator in dBm.
- Classification Type—The type of rogue access point (malicious, friendly, or unclassified).
- Switch Port Trace Status—Indicates whether or not the switch port was traced.
- Switch Port Trace Summary—Provides a summary of the switch port trace or remains blank if no switch port was traced.

## Rogue AP Count Summary

This report displays a summarized count of all the rogue access points on your network.

Click **Rogue AP Count Summary** from the Report Launch Pad to open the Rogue AP Count Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Rogue AP Count Summary Reports page. See the “[Configuring a Rogue AP Count Summary Report](#)” section on page 14-179 and the “[Rogue AP Count Summary Report Results](#)” section on page 14-180 for more information.

## Configuring a Rogue AP Count Summary Report

This section describes how to configure a Rogue AP Count Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

---

**Note** From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- Classification Type—Choose **All Types, Malicious, Friendly,** or **Unclassified** to determine the type of rogue access point to be displayed in the report results.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

### Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

### Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information about customizing report results.

---

**Note** Data fields that appear in blue font cannot be removed from the list of fields to be included.

---

## Rogue AP Count Summary Report Results

The following are potential results for a New Rogue AP Count Summary report, depending on how the report is customized (see [Figure 14-55](#)):

- All Rogue AP Count Trending graph
- All Rogue AP Count based on classification type

| Unclassified        | 1237  |

2009038

## Rogue Access Point Events

This report displays all rogue access point events received by NCS and based on the event time.

Any rogue-related trap received by NCS is logged as a rogue event in NCS. A new rogue access point event is created by NCS based on polled data when there is a newly detected rogue access point. In addition, an event is also created by NCS when the user changes the state and classification of the rogue access point through the NCS user interface.

**Note**

---

One rogue can have multiple events. This report is based on the timestamp of the event.

---

Click **Rogue AP Events** from the Report Launch Pad to open the Rogue AP Events Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the [“Managing Current Reports” section on page 14-13](#) for more information.

To create a new report, click **New** from the Report Launch Pad or from the Rogue AP Events Reports page. See the [“Configuring a Rogue Access Point Events Report” section on page 14-181](#) and the [“Rogue AP Events Report Results” section on page 14-182](#) for more information.

## Configuring a Rogue Access Point Events Report

### Settings

The following settings can be configured for a Rogue Access Point Events report:

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Report by
  - AP by Controller—Choose **All Controllers > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Floor Area—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.
  - AP by Outdoor Area—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria page, or click **Edit** to choose a specific device.

**Note**

---

From the Report Criteria page, click **Select** to confirm your filter criteria or **Close** to return to the previous page.

---

- Classification Type—Choose **All Types, Malicious, Friendly,** or **Unclassified** to determine the type of rogue access point to display in the report results.
- Reporting Period
  - Last—Select the **Last** radio button and a period of time from the drop-down list.
  - From—Select the **From** radio button and enter the From and To dates and times. You can type a date in the text box or click the calendar icon to choose a date. Choose the hours and minutes from the drop-down lists.

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Creating a Custom Report

The Create Custom Report page allows you to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

**Note**

---

Mandatory columns are displayed in blue font and cannot be moved to Available Columns. Last Seen Time, Rogue MAC Address, and Detecting AP Name are mandatory columns for the Rogue Access Point Events report.

---

## Command Buttons

Once all report parameters have been set, select from the following:

- **Save**—Click to save this report setup without immediately running the report. The report will automatically run at the scheduled time.
- **Save and Run**—Click to save this report setup and to immediately run the report.
- **Run**—Click to run the report without saving the report setup.
- **Save and Export**—Click to save the report and export the results to either CSV or PDF format.
- **Save and Email**—Click to save the report and e-mail the results.
- **Export Now**—Click to export the report results. The supported export formats is PDF and CSV.
- **Cancel**—Click to return to the previous page without running nor saving this report.

**Note**

---

See the [“Creating and Running a New Report” section on page 14-6](#) for additional information on running or scheduling a report.

---

## Rogue AP Events Report Results

The following are potential results for a Rogue AP Events report, depending on how the report is customized:

- Last Seen Time (mandatory column)
- Rogue MAC Address (mandatory column)
- Detecting AP Name (mandatory column)
- Radio Type—802.11a/n or 802.11b/g/n.
- Controller IP Address—The IP address of the controller on which the rogue is located.
- Map Location—The building, floor area, or outdoor area (as applicable) where the rogue access point was detected.
- SSID—The user-defined Service Set Identifier name.

- **State**—The radio state relative to the network or port. Rogue access point radios appear as “Alert” when first scanned by the port, or as “Pending” when operating system identification is still underway.
- **Channel Number**—The channel number of the rogue access point.
- **RSSI (dBm)**—The received signal strength indicator in dBm.
- **SNR**—The Signal-to-Noise Ratio.
- **Classification Type**—The type of rogue access point (malicious, friendly, or unclassified).

## Rogue APs

NCS gets updates about rogues from controllers by using traps or by polling. The Last Seen Time is updated anytime a trap for the rogue is received or rogue was seen during the last polling cycles of NCS.

This report displays all rogues detected by the access points in your network based on the “last seen time” of the rogue access points and the selected filtering criteria. It orders rogue access points based on the time they were last heard.

### Note

---

The report includes rogue access point alarms with clear severity.

---

Click **Rogue APs** from the Report Launch Pad to open the Rogue APs Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Rogue APs Reports page. See the “[Configuring a Rogue APs Report](#)” section on page 14-183 and the “[Rogue APs Report Results](#)” section on page 14-184 for more information.

## Configuring a Rogue APs Report

This section describes how to configure a Rogue APs report.

### Settings

- **Report Title**—If you plan to use this as a saved report template, enter a report name.
- **Report By**
  - **AP by Controller**—Choose **All Controllers > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - **AP by Floor Area**—Choose **All Campuses > All Buildings > All Floors > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.
  - **AP by Outdoor Area**—Choose **All Campuses > All Outdoor Areas > All Access Points** from the Report Criteria drop-down list or click **Edit** to choose a specific device.

### Note

---

From the Filter Criteria drop-down list, choose the appropriate filter criteria.

---

- **Classification Type**—Choose **All Types**, **Malicious**, **Friendly**, or **Unclassified** to determine the type of rogue access point to display in the report results.

- **Reporting Period**—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

---

**Note** The times are shown in the local time of the NCS server.

---

## Schedule

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on scheduling a report.

## Customize Report Form

Click **Customize** to open the Create Custom Report form, which you can use to customize the report results. See the [“Creating and Running a New Report” section on page 14-6](#) for more information on customizing report results.

---

**Note** Fixed columns appear in blue font and cannot be moved to Available Columns.

---

## Rogue APs Report Results

The following are potential results for a Rogue APs report, depending on how the report is customized (see [Figure 14-56](#)):

---

**Note** The results for this report are sorted by “Last Seen” time.

---

- **Last Seen Time**—The date and time the rogue access point was last detected.
- **Rogue MAC Address**—The MAC address of the rogue access point. Click an item under MAC Address to view Rogue AP details.
- **Detecting AP Name**—The access point that last detected the rogue, when a rogue is detected by multiple access points on one controller. This last detected access point name comes from the controller which supports maximum RSSI.
- **Radio Type**—802.11a or 802.11b/g.
- **Controller IP Address**—The IP address of the controller on which the rogue is located.
- **Map Location**—The building, floor area, or outdoor area (as applicable) where the rogue access point is located.
- **SSID**—The user-defined Service Set Identifier name.
- **State**—The radio state relative to the network or port. Rogue access point radios appear as “Alert” when first scanned by the port, or as “Pending” when operating system identification is still underway.
- **Channel Number**—The channel number of the rogue access point.
- **RSSI (dBm)**—The maximum received signal strength indicator ever reported by any controller for this rogue.
- **Classification Type**—The type of rogue access point (malicious, friendly, or unclassified).

- Switch Port Trace Status—Indicates whether or not the switch port was traced.
- Switch Port Trace Summary—Provides a summary of the switch port trace or remains blank if no switch port was traced.
- On Network—Indicates whether the access point is on the network or not.

## Security Alarm Trending Summary

This report displays a summary of trends of security alarms over a period of time.

Click **Security Alarm Trending Summary** from the Report Launch Pad to open the Security Summary Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See the “[Managing Current Reports](#)” section on page 14-13 for more information.

To create a new report, click **New** from the Report Launch Pad or from the Security Summary Reports page. See the “[Configuring a Security Alarm Trending Summary Report](#)” section on page 14-185 and the “[Security Alarm Trending Summary Report Results](#)” section on page 14-186 for more information.

## Configuring a Security Alarm Trending Summary Report

This section describes how to configure a Security Alarm Trending Summary report.

### Settings

- Report Title—If you plan to use this as a saved report template, enter a report name.
- Reporting Period—Specify the time period for which the report needs to be generated. You can select from a list of choices defined such as Last 1 hour, Last 6 hours, and so on, or specify a custom period by selecting the From and To date and time.

**Note** The times are shown in the local time of the NCS server.

**Schedule**

If you plan to run this report at a later time or as a recurring report, enter the scheduling parameters. See the “[Creating and Running a New Report](#)” section on page 14-6 for more information on scheduling a report.

**Security Alarm Trending Summary Report Results**

The following are potential results for a Security Alarm Trending Summary report, depending on how the report is customized (see [Figure 14-57](#)):

**Figure 14-57 Security Alarm Trending Summary Report**

# CHAPTER 15

## Performing Administrative Tasks

---

The Administration enables you to schedule tasks, administer accounts, and configure local and external authentication and authorization. Also, set logging options, configure mail servers, and data management related to configuring the data retain periods. Information is available about the types of NCS licenses and how to install a license.

This chapter describes the administrative tasks to perform with Cisco NCS. It contains the following sections:

- [Information About Administrative Tasks, page 15-1](#)
- [Performing Background Tasks, page 15-15](#)
- [Importing Tasks Into ACS, page 15-52](#)
- [Configuring Controller Auto Provisioning, page 15-61](#)
- [Configuring Administrative Settings, page 15-72](#)
- [Establishing Logging Options, page 15-67](#)
- [Configuring High Availability, page 15-104](#)
- [Setting User Preferences, page 15-109](#)
- [Viewing Appliance Details, page 15-110](#)
- [Managing Individual Licenses, page 15-112](#)
- [Configuring ACS 5.x, page 15-115](#)
- [Managing Licenses, page 15-123](#)
- [Configuring AAA, page 15-128](#)

## Information About Administrative Tasks

Organizations need an easy and cost-effective method to manage and control wireless network segments using a single management platform. They need a solution that supports limiting an individual administrator to manage or control the wireless LAN.

This section contains the following topics:

- [Background Tasks, page 15-2](#)
- [Configuring Administrative Settings, page 15-3](#)
- [Other Background Tasks, page 15-4](#)
- [Configuring Auto Provisioning for Controllers, page 15-5](#)

- [Configuring Auto Provisioning for Controllers, page 15-5](#)
- [High Availability, page 15-6](#)
- [User Preferences, page 15-7](#)
- [License Center, page 15-8](#)

## Background Tasks

A background task is a scheduled program running in the background with no visible pages or other user interfaces. In NCS background tasks can be anything from data collection to taking backups of the configurations.

### Note

Choose **Administration > Background Tasks** to view several scheduled tasks. The Background Tasks page appears (see [Figure 15-1](#)).

**Figure 15-1** Background Tasks Page

| Task                                                                    | Enabled  | Interval   | Status   | Data Aggregation | Non-Aggregation Data Retain Period | Last Execution Time       | Last Execution Status |
|-------------------------------------------------------------------------|----------|------------|----------|------------------|------------------------------------|---------------------------|-----------------------|
| <input type="checkbox"/> AP Image Pre-Download Status                   | Disabled | 15 Minutes | Disabled | No               | 31 Days                            | --                        | --                    |
| <input type="checkbox"/> Autonomous AP CPU and Memory Utilization       | Enabled  | 15 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:46:19 PDT | Success               |
| <input type="checkbox"/> Autonomous AP Radio Performance                | Enabled  | 15 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:39:03 PDT | Success               |
| <input type="checkbox"/> Autonomous AP Tx Power and Channel Utilization | Enabled  | 30 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:39:47 PDT | Success               |
| <input type="checkbox"/> CAT Switch CPU and Memory Poll                 | Enabled  | 30 Minutes | Idle     | Yes              | 7 Days                             | 2011-Apr-27, 03:46:22 PDT | Success               |
| <input type="checkbox"/> CAT Switch Interface Utilization Poll          | Enabled  | 30 Minutes | Idle     | Yes              | 7 Days                             | 2011-Apr-27, 03:40:51 PDT | Success               |
| <input type="checkbox"/> CleanAir Air Quality                           | Enabled  | 15 Minutes | Idle     | No               | 7 Days                             | 2011-Apr-27, 03:39:03 PDT | Success               |
| <input type="checkbox"/> Client Statistics                              | Enabled  | 15 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:37:15 PDT | Success               |
| <input type="checkbox"/> Controller Performance                         | Enabled  | 30 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:20:31 PDT | Success               |
| <input type="checkbox"/> Guest Sessions                                 | Enabled  | 15 Minutes | Idle     | No               | 31 Days                            | 2011-Apr-27, 03:39:03 PDT | Success               |
| <input type="checkbox"/> Interferers                                    | Enabled  | 15 Minutes | Idle     | Yes              | 7 Days                             | 2011-Apr-27, 03:39:03 PDT | Success               |
| <input type="checkbox"/> Mesh link Performance                          | Enabled  | 10 Minutes | Idle     | Yes              | 31 Days                            | 2011-Apr-27, 03:48:59 PDT | Success               |

You can view the administrative and operating status, task interval, and time of day in which the task occurs. To execute a particular task, select the check box of the desired task and choose **Execute Now** from the Select a command drop-down list. The task executes based on what you have configured for the specific task.

The tasks are listed in tables with the following columns:

- Check box—Select to choose the desired task. Chosen tasks are targets for operations initiated from the Select a command drop-down list including:
  - Execute Now—Run all of the data sets with a selected check box.
  - Enable Collection—Enable the data set to run on its scheduled interval.
  - Disable Collection—Prevent the data set from running on its scheduled interval.

- **Task**—Task name that serves as a link to a configuration page. Click a task name to go to that task configuration page.
- **Enabled**—Indicates that the task is enabled or disabled.
- **Interval**—Time period between executions of task.
- **Status**—Indicates that the task is idle, disabled, or executing.
- **Data Aggregation (Data Collections only)**—If set to Yes, the data set will aggregate data.
- **Non-Aggregation Data Retain Period (Days) (Data Collections only)**—The number of days that non-aggregated data will be retained.

**Note** See the [“NCS Historical Data” section on page 15-81](#) for more information on aggregated and non-aggregated data in NCS.

- **Last Execution Time**—The date and time the task was executed.

**Last Execution Status**—Indicates if the task executed successfully or failed.

This page enables you to view the status of scheduled NCS tasks. Scheduled tasks are divided into two types: [“Data Collection Tasks” section on page 15-18](#) and the [“Other Background Tasks” section on page 15-4](#).

## Configuring Administrative Settings

Within the Settings page, you can indicate the data that you want to generate for reports and e-mails.

- See the [“Configuring Alarms” section on page 15-72](#) to specify how to handle old alarms and how to display assigned and acknowledged alarms in the Alarm Summary page.
- See [“Configuring an Audit” section on page 15-74](#) to configure audit information.
- See the [“Configuring Clients” section on page 15-76](#) to enable client troubleshooting on a diagnostic channel.
- See the [“Configuring Protocols for CLI Sessions” section on page 15-79](#) to establish a Telnet or SSH session.
- See the [“Configuring Controller Upgrade” section on page 15-79](#) for information on controller upgrade settings.
- See the [“Configuring Data Management” section on page 15-81](#) to establish trends for hourly, daily, and weekly data periods.
- See the [“Configuring a Guest Account” section on page 15-82](#) to designate where the scheduled reports will reside and for how long.
- See the [“Configuring Login Disclaimer” section on page 15-83](#) to enter disclaimer information.
- See the [“Configuring the Mail Server” section on page 15-84](#) to set the primary and secondary SMTP server host and port.
- See the [“Configuring the Notification Receiver” section on page 15-85](#) to configure parameters for notification support of guest access functionality.
- See the [“Configuring Server Settings” section on page 15-93](#) to turn FTP, TFTP, HTTP, or HTTPS on or off.
- See the [“Configuring Alarm Severities” section on page 15-93](#) to configure the severity level for newly generated alarms.

- See the [“Configuring SNMP Credentials”](#) section on page 15-94 to specify which credentials to use for tracing the rogue access points.
- See the [“Configuring SNMP Settings”](#) section on page 15-98 to configure global SNMP settings from NCS.
- See the [“Configuring Switch Port Tracing”](#) section on page 15-99 to identify the switch port to which a rogue access point is connected.

## Other Background Tasks

This section lists and describes the other background tasks in NCS:

- See the [“Viewing Appliance Status”](#) section on page 15-20 to view the appliance status polling details.
- See the [“Viewing Autonomous AP Client Status”](#) section on page 15-20 to view the autonomous AP client status polling details.
- See the [“Viewing Autonomous AP Operational Status”](#) section on page 15-21 to view the autonomous AP operational status polling details.
- See the [“Performing a Configuration Sync”](#) section on page 15-22 to perform configuration synchronization.
- See the [“Viewing Lightweight Client Status”](#) section on page 15-24 to discover the Lightweight AP client from the network.
- See the [“Viewing Controller Configuration Backup Status”](#) section on page 15-25 to view all configuration data from the controllers.
- See the [“Viewing Controller Operational Status”](#) section on page 15-26 to view the history and current status of Cisco WLAN Solution configuration backups.
- See the [“Viewing Data Cleanup Status”](#) section on page 15-28 view the history and current status of Cisco WLAN Solution database cleanups.
- See the [“Performing Device Data Collection”](#) section on page 15-28 view the device data collection status.
- See the [“Performing Guest Accounts Sync”](#) section on page 15-29 view the history and current status of Guest Account Synchronization tasks.
- See the [“Viewing Identity Services Engine Status”](#) section on page 15-30 to view the ISE status polling.
- See the [“Updating License Status”](#) section on page 15-31 to view the status of license updates.
- See the [“Lightweight AP Operational Status”](#) section on page 15-33 to view the Lightweight AP operational status polling details.
- See the [“Lightweight AP Client Status”](#) section on page 15-34 to view the Lightweight AP client status polling details.
- See the [“Performing location appliance Backup”](#) section on page 15-35 to schedule a backup of the mobility services engine database.
- See the [“Viewing location appliance Status”](#) section on page 15-36 to view the status of mobility service engine.
- See the [“Performing location appliance Synchronization”](#) section on page 15-37 to synchronize mobility services engine(s).

- See the “[Performing NCS Server Backup](#)” section on page 15-38 to schedule a backup of the NCS Server.
- See the “[Viewing OSS Server Status](#)” section on page 15-39 to view the OSS server status polling details.
- See the “[Viewing the Switch NMSP and Location Status](#)” section on page 15-40 to view the NMSP and Location Status for a Switch.
- See the “[Viewing Switch Operational Status](#)” section on page 15-41 to view the switch operational status polling details.
- See the “[Performing wIPS Alarm Synchronization](#)” section on page 15-42 to perform wIPS alarm synchronization.
- See the “[Wired Client Status](#)” section on page 15-43 to view the wired client status polling details.

## Configuring Auto Provisioning for Controllers

Auto provisioning allows NCS to automatically configure a new or replace a current wireless LAN controller (WLC). The NCS auto provisioning feature can simplify deployments for customers with a large number of controllers.

### Note

For Auto Provisioning privileges, you must have Admin, Root, or SuperUser status.

### Note

To allow or disallow a user Auto Provisioning privileges, edit the permitted tasks using the Administration > AAA > User Groups > *group name* > List of Tasks Permitted section of NCS. Select or unselect the check box to allow or disallow these privileges.

### Note

A controller radio and b/g networks are initially disabled by the NCS downloaded startup configuration file. If desired, you may turn on those radio networks by using a template, which should be included as one of the automated templates.

### Note

To specify the Auto Provision filter contents, you can directly enter the details in the application or import the details from a CSV file. The auto provisioning feature supports the 5500 and non-5500 series of controllers. The non-5500 series controllers have AP manager interface configuration information defined, whereas 5500 series controllers do not have this information.

To access the Auto Provisioning feature, choose **Configure > Controller Auto Provisioning**.

- [Auto Provisioning Device Management \(Auto Provisioning Filter List\)](#)—Allows you to create and edit auto provisioning filters which define the list of allowable devices to be auto provisioned or auto monitored by NCS.
- [Auto Provisioning Primary Search Key Settings](#)—Provides the ability to set the matching criteria search order.

## Auto Provisioning Device Management (Auto Provisioning Filter List)

This feature allows you to create and edit auto provisioning filters which define the list of allowable devices to be auto provisioned or auto monitored by NCS.

Filter parameters include the following:

- Filter Name—Identifies the name of the filter.
- Filter Enable—Indicates whether or not the filter is enabled.

---

**Note** Only enabled filters can participate in the Auto Provisioning process.

---

- Monitor Only—If selected, the WLC defined in this filter is managed by NCS but not configured by NCS if the WLC contacts NCS during the auto provisioning process.
- Filter Mode—Indicates the search mode for this filter (Host Name, MAC Address, or Serial Number).
- Config Group Name—Indicates the Configuration Group name.

---

**Note** All Config-Groups used by auto provision filters should not have any controller defined in them.

---

### Auto Provisioning Options

The Select a command drop-down list has the following options:

- Add Filter—Allows you to add an Auto Provisioning filter. See the [“Adding an Auto Provisioning Filter” section on page 15-61](#) for more information.
- Delete Filter(s)—Allows you to delete the selected Auto Provisioning filter. See [““Deleting an Auto Provisioning Filter\(s\)” section on page 15-64”](#) for more information.
- List Filter(s) Device Info—Allows you to view details for the selected Auto Provisioning filter. See [““Listing Auto Provisioning Filter\(s\) Device Information” section on page 15-65”](#) for more information.
- List All Filter(s) Device Info—Allows you to view details for all of the Auto Provisioning filter. See [““Listing All Auto Provisioning Filter\(s\) Device Information” section on page 15-65”](#) for more information.

## High Availability

To ensure continued operation in case of failure, NCS now provides a high availability (or failover framework). When an active (primary) NCS fails, a secondary NCS takes over operations (in less than two minutes) for the failed primary NCS and continues to provide service. Upon failover, a peer of the failed primary NCS is activated on the secondary NCS using the local database and files, and the secondary NCS runs a fully functional NCS. While the secondary host is in failover mode, the database and file backups of other primary NCSs continue uninterrupted.

If Email Address is specified in the HA Configuration then Mail Server must be configured and reachable in order to succeed in HA configuration.

For more High Availability information, refer to the following sections:

- [Guidelines and Limitations for High Availability, page 15-104](#)
- [Failover Scenario, page 15-105](#)
- [Performing Background Tasks, page 15-15](#)
- [High Availability Status, page 15-105](#)
- [Configuring High Availability on the Primary NCS, page 15-106](#)
- [Deploying High Availability, page 15-107](#)

## User Preferences

Choose Administration > User Preferences to open the User Preferences page. The User Preferences page enables you to control certain display options in NCS.

### List Pages

- **Items Per List**—You can set the number of items, such as controllers or access points, to display in pages that list these items. Choose the number of items to display from the Items Per List Page drop-down list.

### Home Page

- **Refresh Home Page**—Select the check box if you want to configure a time for the home page to automatically refresh.
- **Refresh Home Page Every**—Choose the frequency of the home page refresh from the drop-down list (every 30 seconds, 1 minute, 2 minutes, or 5 minutes).

### User Idle Timeout

- **Logout idle user**—Select the check box if you want to configure the amount of time, in minutes, that a user session can be idle before the server cancels the session.
- **Logout idle user after**—Select the maximum number of minutes that a server waits for an idle user. The default value is 60 minutes. The minimum value is 15 minutes. The maximum value is 120 minutes.

---

**Note** If the Logout idle user check box is unselected, the user session will not be timed out.

---

### Alarms

- **Refresh Map/Alarms page on new alarm**—Select the check box to refresh map and alarm pages each time a new alarm is generated.
- **Refresh Alarm count in the Alarm Summary every**—Choose the frequency of the Alarm Summary refresh from the drop-down list (every 5, seconds, 15 seconds, 30 seconds, 1 minute, 2 minutes, or 5 minutes).
- **Display Alarm Category in Alarm Summary page**—Choose the alarm category that you want to display in the minimized Alarm Summary (Alarm Summary, Malicious AP, Unclassified AP, Coverage Holes, Security, Controllers, Access Points, Mobility Services, Mesh Links, NCS, or Performance).

- **Disable Alarm Acknowledge Warning Message**—When you acknowledge an alarm, a warning displays as a reminder that a recurrence of the problem does not generate another alarm unless this functionality is disabled. Select this check box to stop the warning message from displaying.
- **Select alarms for Alarm Summary Toolbar**—To select alarms for the Alarm Summary Toolbar, click **Edit Alarm Categories** and choose the required alarm categories and sub-categories.

## License Center

The License Center allows you to manage NCS, wireless LAN controllers, and MSE licenses. The License Center is available from the NCS Administration menu. To view the License Center page, choose **Administration > License Center** (see [Figure 15-2](#)).

### Note

Although NCS and MSE licenses can be fully managed from the License Center, WLC licenses can only be viewed. You must use WLC or CLM to manage WLC licenses.

### Tip

To learn more about NCS License Center, go to [Cisco.com](http://Cisco.com) to watch a multimedia presentation. Here you can also find the learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

For more information about NCS licenses, see the [“NCS Licenses” section on page 1-3](#).

**Figure 15-2 License Center**

The screenshot displays the Cisco Prime Network Control System interface. At the top, there is a navigation bar with options like Home, Monitor, Configure, Services, Reports, and Administration. Below this, a sidebar on the left lists 'Summary', 'NCS Licenses', 'Controller', 'MSE', and 'Files'. The main content area is titled 'License Center' and is divided into three sections:

- NCS Licenses:** Shows a permanent license with UDI PRIME-NCS-APL:HMINDNCS225. The device limit is 1000, and the current count is 35 (34 APs and 1 Switch), with 3% used.
- MSE Licenses:** Shows CAS Elements with a permanent limit of 10, an evaluation limit of 0, and a count of 10, with 100% used.
- Controller Licenses:** Shows a controller count of 5, an AP limit of 1036, and a permanent type.

291293

## NCS License Information

The NCS Licenses portion of the License Center page displays the following:

- **Feature**—The type of license. It can be NCS or DEMO.
- **Device Limit**—The total number of licensed access points and switches.

- Device Count—The current number of access points and switches using licenses.

**Note** AP count includes both associated and unassociated access points. When you are near the AP limit, you can delete any unassociated access points to increase available license capacity. For a demo license, you can click the “If you do not have a Product Authorization Key (PAK), please click here for available licenses” link and choose **Wireless Control System Trial License**.

**Note** Autonomous access points are not counted towards the total device count for your license.

- % Used—The percentage of access points and switches licensed across NCS. If the percentage drops to 75%, the value appears in red. At this level, a message also appears indicating that both associated and unassociated access points are part of the AP count.
- Type—Permanent if all licenses are permanent. If any licenses are evaluations (or demos), it shows the number of days remaining on the license that has the fewest number of days until expiration.

**Note** To obtain a new license for NCS, go to the Product License Registration link

(<https://tools.cisco.com/SWIFT/Licensing/PrivateRegistrationServlet>)

and provide your Product Authorization Key (PAK) and host name.

**Note** If you choose **Summary > NCS** from the left sidebar menu, only the NCS license information is displayed.

See the *Cisco Wireless Control System Licensing and Ordering Guide* at this URL:

[http://www.cisco.com/en/US/prod/collateral/wireless/ps5755/ps6301/ps6305/product\\_data\\_sheet0900aec804b4646.html#wp9000156](http://www.cisco.com/en/US/prod/collateral/wireless/ps5755/ps6301/ps6305/product_data_sheet0900aec804b4646.html#wp9000156).

It covers selecting the correct SKU, ordering the SKU, installing the software, registering the PAK certificate, and installing the license file on the server.

See the “[NCS Licenses](#)” section on [page B-1](#) for more information on licensing enforcement, PAK certificates, license types, and installing and managing NCS licenses.

## WLC Controller License Information

The Controller Licensing portion of the License Center page provides the following information for both WPLUS and Base licenses:

- Controller Count—The current number of licensed controllers.

**Note** Only 5500 series controllers are included in the count. NCS provides only an inventory view and issues warnings if a license is expiring.

---

**Note** Clicking the number in this column is the same as choosing **Summary > Controller** from the left sidebar menu, except that it is sorted by the feature you select. This page provides a summary of active controllers.

---

- AP Limit—The total number of licensed access points.
- Type—The four different types of licenses are as follows:

---

**Note** For any controllers with a type other than Permanent, the least number of days left to expiration is shown.

---

- Permanent—Licenses are node-locked and have no usage period associated with them. They are issued by the licensing portal of Cisco and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.
- Evaluation—Licenses are non-node-locked and are valid only for a limited period. They are used only when no permanent, extension, or grace period licenses exist. Before using an evaluation license, you must accept an End User License Agreement (EULA). Even though they are non-node-locked, their usage is recorded on the device. The number of days remaining on the evaluation license that has the fewest number of days until expiration is shown.
- Extension—Licenses are node-locked and metered. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Before using an extension license, you must accept a EULA during installation.
- Grace Period—Licenses are node-locked and metered. These licenses are issued by licensing portal of Cisco as part of the permission ticket to rehost a license. They are installed on the device as part of the rehost operation, and you must accept a EULA as part of the rehost operation.

If you need to revoke a license from one controller and install it on another, it is called *rehosting*. You might want to rehost a license in order to change the purpose of a controller. See the [Chapter 4, “Performing Maintenance Operations,”](#) of the *Cisco Wireless LAN Controller Configuration Guide* for information on rehosting a license.

---

**Note** The licensing status is updated periodically. To initiate an immediate update, choose **Administration > Background Tasks** and run the Controller License Status task.

---

If your network contains various Cisco licensed devices, you might want to consider using the Cisco License Manager (CLM) to manage all of the licenses using a single application. CLM is a secure client/server application that manages Cisco software licenses network wide. You can download the CLM software and access user documentation at this URL: <http://www.cisco.com/go/clm>. You can either register a PAK certificate with CLM or with the licensing portal found at <https://tools.cisco.com/SWIFT/Licensing/PrivateRegistrationServlet>.

## WLC Controller License Summary

If you want to see more details about controller licensing, choose the **Summary > Controller** option from the left sidebar menu. The License Center page appears (see [Figure 15-3](#)). All currently active licenses on the controller are summarized.

Figure 15-3 License Center (Edit View) Page

The screenshot displays the Cisco Prime Network Control System interface. The main content area is titled "License Center" and includes a navigation menu on the left with options like "Summary", "NCS Licenses", "Controller", "MSE", and "Files". The main area shows a table of controllers with the following data:

| Controller Name | Controller IP  | Model         | Feature | AP Limit | AP Count | % Used | Type      | Status |
|-----------------|----------------|---------------|---------|----------|----------|--------|-----------|--------|
| RBS500          | 9.1.120.11     | AIR-CT5508-K9 | base    | 12       | 1        | 8%     | Permanent | In Use |
| SR5508          | 9.1.105.40     | AIR-CT5508-K9 | base    | 500      | 4        | 1%     | Permanent | In Use |
| COMMON-5500-2   | 9.1.192.50     | AIR-CT5508-K9 | base    | 12       | 0        | 0%     | Permanent | In Use |
| RK5508          | 9.1.73.50      | AIR-CT5508-K9 | base    | 500      | 2        | 1%     | Permanent | In Use |
| vjavyaq         | 10.104.173.178 | AIR-CT5508-K9 | base    | 12       | 11       | 11%    | Permanent | In Use |

All licensed controllers and their information in the bulleted list below are displayed. If you want to change how the controller results are displayed, click **Edit View**. In the Edit View page, highlight License Status, and click **Hide** to remove the column from the display.

Above the Controller Summary list is a series of filters that allow you to filter the list by Controller Name, Feature, Type, or Greater Than Percent Used. For example, if you enter 50, the list shows any WLCs that have more than 50% of its licenses used.

**Note** You can also use the **Advanced Search** link to sort the list of controllers.

- Controller Name—Provides a link to the Files > Controller Files page.
- Controller IP—The IP address of the controller.
- Model—The controller model type.
- Feature—The type of license, either Base or WPLUS. The Base license supports the standard software set, and the WPLUS license supports the premium Wireless Plus (WPLUS) software set. The WPLUS software set provides the standard feature set as well as added functionality for OfficeExtend access points, CAPWAP data encryptions, and enterprise wireless mesh.
- AP Limit—The maximum capacity of access points allowed to join this controller.
- AP Count—The current number of access points using licenses.
- % Used—The percentage of licensed access points that are being used. If the percentage is greater than 75%, the bar appears red to indicate that the limit is being approached.
- Type—The three different types of licenses are as follows:

**Note** For any controllers with a type other than Permanent, the least number of days left to expiration is shown.

- Permanent—Licenses are node-locked and have no usage period associated with them. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.

- Evaluation—Licenses are non-node-locked and are valid only for a limited time period. They are used only when no permanent, extension, or grace period licenses exist. Before using an evaluation license, you must accept an End User License Agreement (EULA). Even though they are non-node-locked, their usage is recorded on the device. The number of days remaining on the evaluation license which has the fewest number of days until expiration is shown.
- Extension—Licenses are node-locked and metered. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Before using an extension license, you must accept a EULA during installation.

**Note** If a license shows as expired, the controller does not stop functioning. Only upon a reboot will the controller with the expired license become inactive.

- Status—In Use, Not in Use, Inactive, or EULA Not Accepted.
  - Inactive—The license level is being used, but this license is not being used.
  - Not In Use—The license level is not being used and this license is not currently recognized.
  - Expired In Use—The license is being used, but is expired and will not be used upon next reboot.
  - Expired Not In Use—The license has expired and can no longer be used.
  - Count Consumed—The ap-count license is In Use.

## Mobility Services Engine (MSE) License Information

There are three types of licenses:

- Permanent—Licenses are node-locked and have no usage period associated with them. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.
- Evaluation—Licenses are non-node-locked and are valid only for a limited time period. They are used only when no permanent, extension, or grace period licenses exist. Before using an evaluation license, you must accept an End User License Agreement (EULA). Even though they are non-node-locked, their usage is recorded on the device. The number of days remaining on the evaluation license which has the fewest number of days until expiration is shown.
- Extension—Licenses are node-locked and metered. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Before using an extension license, you must accept a EULA during installation.

The MSE Licenses portion of the License Center page provides information for each service. See (Table 15-1).

**Table 15-1** MSE License Information

| Field               | Description                                                |
|---------------------|------------------------------------------------------------|
| <b>CAS Elements</b> |                                                            |
| Permanent Limit     | The total number of CAS elements with permanent licenses.  |
| Evaluation Limit    | The total number of CAS elements with evaluation licenses. |

**Table 15-1 MSE License Information (continued)**

| Field                                                                                                                                                                    | Description                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>CAS Elements</b>                                                                                                                                                      |                                                                     |
| Count                                                                                                                                                                    | The number of CAS elements currently licensed across MSEs.          |
| % Used                                                                                                                                                                   | The percentage of CAS elements licensed across MSEs.                |
| <b>wIPS Monitor Mode APs</b>                                                                                                                                             |                                                                     |
| Permanent Limit                                                                                                                                                          | The total number of wIPS Monitor Mode APs with permanent licenses.  |
| Evaluation Limit                                                                                                                                                         | The total number of wIPS Monitor Mode APs with evaluation licenses. |
| Count                                                                                                                                                                    | The number of wIPS Monitor Mode APs currently licensed across MSEs. |
| % Used                                                                                                                                                                   | The percentage of wIPS Monitor Mode APs licensed across MSEs.       |
| Under wIPS Monitor Mode Aps or wIPS Local Mode Aps, an active link takes you to a list of licensed access points. You cannot access a list of licensed clients and tags. |                                                                     |
| <b>wIPS Local Mode APs</b>                                                                                                                                               |                                                                     |
| Permanent Limit                                                                                                                                                          | The total number of wIPS Local Mode APs with permanent licenses.    |
| Evaluation Limit                                                                                                                                                         | The total number of wIPS Local Mode APs with evaluation licenses.   |
| Count                                                                                                                                                                    | The number of wIPS Local Mode APs currently licensed across MSEs.   |
| % Used                                                                                                                                                                   | The percentage of wIPS Local Mode APs licensed across MSEs.         |
| Under wIPS Monitor Mode APs or wIPS Local Mode APs, an active link takes you to a list of licensed access points. You cannot access a list of licensed clients and tags. |                                                                     |

**Note**

- When a license is deleted, the mobility services engine automatically restarts to load the new license limits.
- If Partner tag engine is up, then the MSE license information will consist of information on tag licenses as well.

For more information on MSE licenses, see the [“MSE License Overview” section on page 16-76](#).

## Mobility Services Engine (MSE) License Summary

If you want to see more details about MSE licensing, choose **Summary > MSE** from the left sidebar menu. The License Center page appears (see [Figure 15-4](#)).

Figure 15-4 License Center Page

| MSE Name (UDI)                                                                                                      | Type                  | Limit | License Type         | Status  | Count | Unlicensed Count | % Used |
|---------------------------------------------------------------------------------------------------------------------|-----------------------|-------|----------------------|---------|-------|------------------|--------|
|  MSE (AIR-MSE-3355-K9-W01:KQZYBDT) | CAS Elements          | 100   | Evaluation (Expired) | Expired | 10    | 117              | 100%   |
|  wIPS Monitor Mode APs             | wIPS Monitor Mode APs | 10    | Evaluation (Expired) | Expired | 0     | 0                | 0%     |
|  wIPS Local Mode APs               | wIPS Local Mode APs   | 10    | Evaluation (Expired) | Expired | 0     | 0                | 0%     |

All licensed MSEs are listed in the following columns:

- **MSE Name**—Provides a link to the MSE license file list page.

#### Note

The icon to the left of the MSE Name/UDI indicates whether the mobility services engine is low-end or high-end.

A high-end mobility services engine (3350) has a higher memory capacity and can track up to 18,000 clients and tags. A low-end mobility services engine (3310) can track up to 2000 clients and tags.

- **Type**—Specifies the type of MSE.

#### Note

Under wIPS Monitor Mode APs or wIPS Local Mode APs, an active link takes you to a list of licensed access points. You cannot access a list of licensed clients or tags.

- **Limit**—Displays the total number of client elements licensed across MSEs.
- **Count**—Displays the number of client elements that are currently licensed across MSEs.
- **Unlicensed Count**—Displays the number of client elements that are not licensed.

#### Note

wIPS service does not process the alarms generated from these unlicensed access points.

- **% Used**—Displays the percentage of clients used across all MSEs.
- **License Type**—The three different types of licenses are as follows:
  - **Permanent**—Licenses are node-locked and have no usage period associated with them. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.
  - **Evaluation**—Licenses are non-node-locked and are valid only for a limited time period. They are used only when no permanent, extension, or grace period licenses exist. Before using an evaluation license, you must accept an End User License Agreement (EULA). Even though they are non-node-locked, their usage is recorded on the device. The number of days remaining on the evaluation license which has the fewest number of days until expiration is shown.

- Extension—Licenses are node-locked and metered. They are issued by licensing portal of Cisco and must be installed using management interfaces on the device. Before using an extension license, you must accept a EULA during installation.
- Status
  - Active—License is installed and being used by a feature.
  - Inactive—License is installed but not being used by a feature.
  - Expired—License has expired.
  - Corrupted—License is corrupted.

For more information on MSE licenses, see the [“MSE License Overview” section on page 16-76](#).

## Performing Background Tasks

This section contains procedures for crucial background tasks:

- [Performing a Data Collection Task, page 15-15](#)
- [Performing Other Background Tasks, page 15-19](#)

For more information on the Data Collection and Other Background Tasks, see [“Data Collection Tasks” section on page 15-18](#) and [“Other Background Tasks” section on page 15-44](#).

## Performing a Data Collection Task

Data collection tasks are data-set tasks that collect and organize information that may be useful for creating reports.

### Note

---

All tasks related to collecting data or any other background task would be handled in a similar manner.

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page (see [Figure 15-1](#)). This page displays the following information:

- Enabled—Whether the tasks have been enabled or disabled.
- Interval—Indicates the time period (in minutes) between task executions. You can set the interval from the data collection configuration page for the task.
- Status—The present state of the task.
- Data Aggregation (Data Collection Tasks only)—If set to Yes, the data set combines data.
- Non-Aggregation Data Retain Period (Days) (Data Collection Tasks only)—The number of days that the non-aggregated data is retained. You can set the retention period from the data collection configuration page of the task.
- Last Execution Time—The time and date when the task was last run.
- Last Execution Status—The status after the last task was run.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now**, and click **Go**.

- Enable the task.

Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task changes from unavailable to active after enabling is complete.

- Disable the task.

Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out after the disabling is complete.

- View details of a task.

Click a URL in the Data Collection Tasks or Other Background Tasks column to view a specific task. The details on that task appear. Data collections are data-set tasks that collect and organize a specific type of information useful for creating reports. For more information on the various Data Collection Tasks, see [“Data Collection Tasks” section on page 15-18](#).

To go to the configuration page of a data set, select the name of the data set in the Data Collection page. Each data set configuration page displays a table of the executions of the data set. The table has following columns:

- Executed task information includes the following:
  - Last Execution Start Time—Indicates the date and time that the data-set task began running.
  - End Time—Indicates the date and time that the data-set task stopped running.
  - Elapsed Time (secs)—Indicates the amount of time (in seconds) it took to complete the task.
  - Result—Indicates the success or failure of the task.
  - Additional Information—Provides any additional information regarding a specific task.

Each data set configuration page contains the following parameters and information under Collection Set Details:

- Description—Provides a brief read-only description of the data set.
- Data Aggregation—Indicates whether or not data collected by the data set is aggregated.
- Used By Report(s)—Displays names of the reports that use the data set.
  - CleanAir Air Quality—This data set is used for Worst Air Quality APs and Air Quality versus Time reports.
  - Interferers—This data set is used for Worst Interferers reports.
- Collection Status—Select the **Enabled** check box to enable data collection.

Interval (min.)—Enter the time (in minutes) for the data set execution interval. Valid value is 1 to 120 minutes.

Each data set configuration page contains the following parameters under Data Management:

- Non-Aggregation Data Retain Period (Days)—Enter the number of days to retain non-aggregated data collected by the data set. Valid value is 1 to 31 days.
- Retain Aggregation Raw Data—Select the **Enable** check box to enable the retention of aggregated raw data.

---

**Note** The Aggregation Raw Data Retain Period setting is for polled raw data. To configure the retention period for aggregated trend data, choose **Administration > Settings**, then choose **Data Management** from the left sidebar menu.

---

---

**Note** See the “[Configuring Auto Provisioning for Controllers](#)” section on page 15-5 for more information on aggregated and non-aggregated data.

---

---

**Note** For this example, performing an NCS server backup was selected as the task. The screens and fields to enter on the detailed screens vary based on the task you choose.

---

**Step 3** Select the **Enabled** check box to enable it.

**Step 4** Select the **Report History Backup** check box.

**Step 5** In the Max Backups to Keep text box, enter the maximum number of backup files to save on the server.

Range: 7 to 50

Default: 7

---

**Note** To prevent the NCS platform from running out of disk space, the server automatically deletes old backup files when the number of files exceeds the value entered for this text box.

---

**Step 6** In the Interval (Days) text box, enter the number of days between each backup. For example, 1 = a daily backup, 2 = a backup every other day, 7 = a weekly backup, and so on.

Range: 1 to 360

Default: 7

**Step 7** In the Time of Day text box, enter the back-up start time. It must be in this format: *hh:mm AM/PM* (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

---

**Note** Backing up a large database affects the performance of the NCS server. Therefore, we recommend that you schedule backups to run when the NCS server is idle (such as, in the middle of the night).

---

**Step 8** Click **Submit** to save your settings. The backup file is saved as a .zip file in the *ftp-install-dir/ftp-server/root/NCSBackup* directory using this format: *dd-mmm-yy\_hh-mm-ss.zip* (for example, 11-Nov-05\_10-30-00.zip).

---

## Data Collection Tasks

Table 15-2 lists and describes the various data collection tasks in NCS.

**Table 15-2 Data Collection Tasks**

| Task Name                                      | Task Status | Default Schedule | Description                                                                                                                                                                                                                                  |
|------------------------------------------------|-------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Image Pre-Download Status                   | Disabled    | 15 minutes       | This task is used to see the Image Predownload-status of the associated APs in the Controllers. To see the status of the access points, the Pre-download software to APs option should be selected while downloading software to Controller. |
| Autonomous AP CPU and Memory Utilization       | Enabled     | 15 minutes       | This task is used to collect information about Memory and CPU Utilization of Autonomous APs.                                                                                                                                                 |
| Autonomous AP Radio Performance                | Enabled     | 15 minutes       | This task is used to collect information about Radio Performance information as well as radio up or down status for Autonomous APs.                                                                                                          |
| Autonomous AP Tx Power and Channel Utilization | Enabled     | 30 minutes       | This task is used to collect information about Radio Performance of Autonomous APs.                                                                                                                                                          |
| CAT Switch CPU and Memory Poll                 | Enabled     | 30 minutes       | This task is used to collect information about CAT Switch CPU and Memory Poll.                                                                                                                                                               |
| CAT Switch Interface Utilization Poll          | Enabled     | 30 minutes       | This task is used to collect information about CAT Switch Interface Utilization Poll.                                                                                                                                                        |
| CleanAir Air Quality                           | Enabled     | 15 minutes       | This task is used to collect information about CleanAir Air Quality.                                                                                                                                                                         |
| Client Statistics                              | Enabled     | 15 minutes       | This task helps you to get the statistical information for the Autonomous and Lightweight clients.                                                                                                                                           |
| Controller Performance                         | Enabled     | 30 minutes       | This task is used to collect performance information for Controllers.                                                                                                                                                                        |
| Guest Sessions                                 | Enabled     | 15 minutes       | This task is used to collect information about the Guest sessions.                                                                                                                                                                           |
| Interferers                                    | Enabled     | 15 minutes       | This task is used to collect information about the Interferers.                                                                                                                                                                              |
| Mesh link Performance                          | Enabled     | 10 minutes       | This task is used to collect information about the performance of Mesh links.                                                                                                                                                                |
| Mesh Link Status                               | Enabled     | 5 minutes        | This task is used to collect status of the Mesh links.                                                                                                                                                                                       |
| Mobility Service Performance                   | Enabled     | 15 minutes       | This task is used to collect information about the performance of mobility service engines.                                                                                                                                                  |
| Radio Performance                              | Enabled     | 15 minutes       | This task is used to collect statistics from wireless radios.                                                                                                                                                                                |
| Rogue AP                                       | Enabled     | 120 minutes      | This task is used to collect information about the Rogue access points.                                                                                                                                                                      |
| Traffic Stream Metrics                         | Enabled     | 8 minutes        | This task helps you to get traffic stream metrics for the clients.                                                                                                                                                                           |

**Table 15-2 Data Collection Tasks**

| <b>Task Name</b>              | <b>Task Status</b> | <b>Default Schedule</b> | <b>Description</b>                                                                    |
|-------------------------------|--------------------|-------------------------|---------------------------------------------------------------------------------------|
| V5 Client Statistics          | Disabled           | 60 minutes              | This task is used to collect the Dot11 and Security statistics for CCX clients >= v5. |
| Wired Switch Inventory        | Enabled            | Daily at midnight.      | This task is used to collect inventory information for wired switches.                |
| Wireless Controller Inventory | Disabled           | Daily at midnight.      | This task is used to collect inventory information for wireless Controllers.          |

## Performing Other Background Tasks

You can also perform other background tasks using NCS Administration.

This section contains the procedures for the other NCS background tasks:

- [Viewing Appliance Status, page 15-20](#)
- [Viewing Autonomous AP Client Status, page 15-20](#)
- [Viewing Autonomous AP Operational Status, page 15-21](#)
- [Performing a Configuration Sync, page 15-22](#)
- [Viewing Lightweight Client Status, page 15-24](#)
- [Viewing Controller Configuration Backup Status, page 15-25](#)
- [Viewing Controller Operational Status, page 15-26](#)
- [Viewing Data Cleanup Status, page 15-28](#)
- [Performing Device Data Collection, page 15-28](#)
- [Performing Guest Accounts Sync, page 15-29](#)
- [Viewing Identity Services Engine Status, page 15-30](#)
- [Updating License Status, page 15-31](#)
- [Lightweight AP Operational Status, page 15-33](#)
- [Lightweight AP Client Status, page 15-34](#)
- [Performing location appliance Backup, page 15-35](#)
- [Viewing location appliance Status, page 15-36](#)
- [Performing location appliance Synchronization, page 15-37](#)
- [Performing NCS Server Backup, page 15-38](#)
- [Viewing OSS Server Status, page 15-39](#)
- [Viewing the Switch NMSP and Location Status, page 15-40](#)
- [Viewing Switch Operational Status, page 15-41](#)
- [Performing wIPS Alarm Synchronization, page 15-42](#)
- [Wired Client Status, page 15-43](#)

For more information on the Other background tasks, see [Other Background Tasks, page 15-44](#).

## Viewing Appliance Status

Follow these steps to view the appliance status:

- 
- Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.
- Step 2** On this page, perform one of the following:
- Execute the task now.  
Select the **Appliance Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.  
or
  - Enable the task.  
Select the **Appliance Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.  
or
  - Disable the task.  
Select the **Appliance Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out in the Enabled column after the disabling is complete.
- Step 3** To modify the task, click the **Appliance Status** link in the Background Tasks column. The Task > Appliance Status page appears.
- Step 4** Click the background task in the Task column to open the task details page.  
The Appliance Status page displays the following information:
- Last Execution Information
    - Start and end times.
    - Elapsed time (in seconds) of the task.
    - Result—Success or error.
    - Message—Text message regarding this task.
- Step 5** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Enabled—Select the check box to enable this task.
  - Interval—Indicates the frequency (in minutes) of the task.
- Step 6** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
- 

## Viewing Autonomous AP Client Status

Follow these steps to view the Autonomous AP Client Status:

- 
- Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.
- Step 2** On this page, perform one of the following:
- Execute the task now.

Select the **Autonomous AP Client Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Autonomous AP Client Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Autonomous AP Client Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out in the Enabled column after the disabling is complete.

**Step 3** To modify the task, click the **Autonomous AP Client Status** link in the Background Tasks column. The Task > Autonomous AP Client Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

The Autonomous AP Client Status page displays the following information:

- Last Execution Information
  - Start and end times.
  - Elapsed time (in seconds) of the task.
  - Result—Success or error.
  - Message—Text message regarding this task.

**Step 5** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select the check box to enable this task.
- Interval—Indicates the frequency (in minutes) of the task.

**Step 6** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Viewing Autonomous AP Operational Status

Follow these steps to view the Autonomous AP Operational Status:

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Autonomous AP Operational Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Autonomous AP Operational Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Autonomous AP Operational Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out in the Enabled column after the disabling is complete.

**Step 3** To modify the task, click the **Autonomous AP Operational Status** link in the Background Tasks column. The Task > Autonomous AP Operational Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

The Appliance Status page displays the following information:

- Last Execution Information
  - Start and end times.
  - Elapsed time (in seconds) of the task.
  - Result—Success or error.
  - Message—Text message regarding this task.

**Step 5** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select the check box to enable this task.
- Interval—Indicates the frequency (in minutes) of the task.

**Step 6** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Performing a Configuration Sync

Follow these steps to perform a configuration sync:

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Configuration Sync** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Configuration Sync** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Configuration Sync** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out in the Enabled column after the disabling is complete.

- Step 3** To modify the task, click the **Configuration Sync** link in the Background Tasks column. The Task > Configuration Sync page appears (see [Figure 15-5](#)).

**Figure 15-5** Task > Configuration Sync

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is Administration > Background Tasks > Other Background Tasks > Configuration Sync. Below the navigation is a section for 'Last Execution Information' with a table of execution records. Below that is an 'Edit Task' form with various configuration options.

| Start Time                | End Time                  | Elapsed Time (Seconds) | Result  | Message |
|---------------------------|---------------------------|------------------------|---------|---------|
| 2011-Apr-26, 04:00:00 PDT | 2011-Apr-26, 04:00:31 PDT | 31                     | Success |         |
| 2011-Apr-27, 00:37:10 PDT | 2011-Apr-27, 00:37:42 PDT | 31                     | Success |         |
| 2011-Apr-27, 04:00:00 PDT | 2011-Apr-27, 04:00:30 PDT | 30                     | Success |         |

**Edit Task**

Description: Configuration Sync  
 Used By Report(s): Network Configuration Audit  
 Enabled:  Enabled  
 Network Audit:  Enabled  
 Security Index Calculation:  Enabled  
 RRM Audit:  Enabled  
 Interval: 1 (Days)  
 Time of Day: 04:00 (hh:mm AM|PM)  
 Save Cancel

- Step 4** Click the background task in the Task column to open the task details page.

The Configuration Sync page displays the following information:

- Last Execution Information
  - Start and end times.
  - Elapsed time (in seconds) of the task.
  - Result—Success or error.
  - Message—Text message regarding this task.

- Step 5** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Used By Report(s)—Indicates the NCS reports that use these task results.
- Enabled—Select the check box to enable this task.
- Network Audit—Select the check box to enable the secondary network audit.
- Security Index Calculation—Select the check box to enable security index calculation. The Security Index is available in the Monitor > Security page.
- RRM Audit—Select the check box to enable an RRM audit.

**Note** The Controller audit will find the discrepancies between the values in NCS Database with the device.

**Note** To Query the SNMP Values from the device, you can use the `https://<NCS-IP>/webacs/manObjDiagQueryAction.do` URL in NCS.

**Note** The Network Audit audits on all controllers in the network, and also runs RRM audit and Security audit. These options are selectable from the **Administration > Background Tasks > Other Background Tasks > Configuration Sync** page.

- Time of Day (hh:mm AM/PM)—Indicate the time of day (AM or PM) for the execution of this task.

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

- Step 6** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing Lightweight Client Status

Choose **Administration > Background Tasks**, then click **Lightweight Client Status** to access this page.

This page enables you to view the history and current status of lightweight client status polling backups.

In the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
  - or
  - Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
  - or

- Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.

To modify the task, follow these steps:

**Step 1** Click the background task in the Task column to open the task details page.

The Lightweight Client Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 2** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval—Indicates the frequency (in days) of the task.

**Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing Controller Configuration Backup Status

Choose **Administration > Background Tasks**, then click **Controller Configuration Backup** to access this page.

This page enables you to view the history and current status of Cisco WLAN Solution configuration backups.

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

**Step 1** Choose **Administration > Background Tasks**.

**Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.

**Step 3** Use the Select a command drop-down list to perform one of the following tasks:

- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.

or

- Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
- or
- Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.

To modify the task, follow these steps:

**Step 1** Click the background task in the Task column to open the task details page.

The Controller Configuration Backup page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 2** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval—Indicates the frequency (in days) of the task.
- Time of Day (hh:mm AM/PM)

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

- TFTP Server—Choose the server or Default Server from the drop-down list.

**Note** TFTP must be enabled in Administration > Settings > Server Settings for 'Default Server' options.

**Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing Controller Operational Status

Device status polls controller reachability and WiSM peer information.

Choose **Administration > Background Tasks**, then click **Controller Operational Status** to access this page.

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable Controller Operational Status task from the Administration > Background Tasks page, follow these steps:

- 
- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the **Controller Operational Status** check box to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
  - or
  - Enable the task—Select the **Controller Operational Status** check box. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
  - or
  - Disable the task—Select the **Controller Operational Status** check box. From the Select a command drop-down list, choose **Disable Task** and click **Go**.
- 

To modify the Controller Operational Status task, follow these steps:

- 
- Step 1** Click the Controller Operational Status background task in the Task column to open the task details page. The Controller Operational Status page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds
    - Result—Success or error.
    - Message—Text message regarding the task execution.
- Step 2** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Enabled—Select this check box to enable NCS execute the task at the specified interval.
-  **Note** If the Enabled check box is not selected, the task is not executed at the specified time.
- 
- Interval—Indicates the frequency (in minutes) of the task.
- Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
-

## Viewing Data Cleanup Status

Choose **Administration > Background Tasks**, then click **Database Cleanup** to access this page.

This page enables you to view the history and current status of Cisco WLAN Solution database cleanups.

To modify this task, follow these steps:

- 
- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Click the background task in the Task column to open the task details page.  
The Data Cleanup page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds
    - Result—Success or error.
    - Message—Text message regarding the task execution.
- Step 3** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Time of Day (hh:mm AM/PM)

---

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

---

- Step 4** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
- 

## Performing Device Data Collection

Follow these steps to perform a device data collection:

- 
- Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.
- Step 2** On this page, perform one of the following:
- Execute the task now.  
Select the **Device Data Collection** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.  
or
  - Enable the task.  
Select the **Device Data Collection** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.  
or

- Disable the task.  
Select the **Device Data Collection** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task is grayed out in the Enabled column after the disabling is complete.
- Step 3** To modify the task, click the **Device Data Collection** link in the Background Tasks column. The Task > Device Data Collector page appears.
- Step 4** Click the background task in the Task column to open the task details page.  
The Device Data Collector page displays the following information:
- Last Execution Information
    - Start and end times.
    - Elapsed time (in seconds) of the task.
    - Result—Success or error.
    - Message—Text message regarding this task.
- Step 5** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Enabled—Select the check box to enable this task.
  - Controller IP address—The IP address of the Controller to collect data from.
  - CLI Commands—Enter the CLI commands separated by comma, which you would want to run on the specified Controller.
  - Clean Start—Select or unselect this option to enable or disable a clean start before data collection.
  - Repeat—Enter the number of times you would want the data collection to happen.
  - Interval—Enter the interval in days that you would want the data collection to happen. Valid range: 1 to 360 days.
- Step 6** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
- 

## Performing Guest Accounts Sync

Choose **Administration > Background Tasks**, then click **Guest Accounts Sync** to access this page. This page enables you to view the history and current status of Guest Accounts Synchronization tasks. From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

---

- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.

or

- Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.

or

- Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.

To modify the task, follow these steps:

**Step 1** Click the background task in the Task column to open the task details page.

The Guest Accounts Synchronization page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 2** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval—Indicates the frequency (in days) of the task.
- Time of Day (hh:mm AM/PM)

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

**Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing Identity Services Engine Status

Follow these steps to update the identity services engine status:

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Identity Services Engine Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Identity Services Engine Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from dimmed to active in the Enabled column.

or

- Disable the task.

Select the **Identity Services Engine Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from dimmed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the Identity Services Engine Status task, click the **Identity Services Engine Status** link in the Background Tasks column. The Identity Services Engine Status page appears.

**Step 4** Click the Identity Services Engine Status background task in the Task column to open the task details page.

**Step 5** The Identity Services Engine Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

**Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Updating License Status

Follow these steps to update the license status:

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **License Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **License Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **License Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

- Step 3** To modify the controller license reset task, click the **License Status** link in the Background Tasks column. The License Status page appears (see [Figure 15-6](#)).

**Figure 15-6 License Status Page**

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Administration > Background Tasks > Other Background Tasks > License Status. Below the breadcrumb is a section titled "Last Execution Information" containing a table with the following data:

| Start Time                | End Time                  | Elapsed Time (Seconds) | Result  | Message |
|---------------------------|---------------------------|------------------------|---------|---------|
| 2011-Apr-27, 08:39:53 PDT | 2011-Apr-27, 08:39:55 PDT | 1                      | Success |         |
| 2011-Apr-27, 12:39:55 PDT | 2011-Apr-27, 12:39:56 PDT | 1                      | Success |         |
| 2011-Apr-27, 16:39:56 PDT | 2011-Apr-27, 16:39:57 PDT | 1                      | Success |         |
| 2011-Apr-27, 20:39:57 PDT | 2011-Apr-27, 20:39:59 PDT | 1                      | Success |         |
| 2011-Apr-28, 00:39:59 PDT | 2011-Apr-28, 00:40:00 PDT | 1                      | Success |         |

Below the table is an "Edit Task" section with the following details:

- Description: License Status polling
- Enabled:  Enabled
- Interval:  (Hours)

Buttons for "Save" and "Cancel" are visible at the bottom of the edit task section.

291299

This page shows when the latest license resynchronizations occurred. By default, it runs every 4 hours. From this page, you can disable this task or change the interval.

- Step 4** Click the background task in the Task column to open the task details page.

- Step 5** The License Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

- Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

**Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Lightweight AP Operational Status

Follow these steps to view the Lightweight AP Operational status:

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Lightweight AP Operational Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Lightweight AP Operational Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Lightweight AP Operational Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the controller license reset task, click the **Lightweight AP Operational Status** link in the Background Tasks column. The License Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

**Step 5** The Lightweight AP Operational Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

**Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Lightweight AP Client Status

Follow these steps to view the Lightweight AP Client status:

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Lightweight AP Client Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Lightweight AP Client Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Lightweight AP Client Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the controller license reset task, click the **Lightweight AP Client Status** link in the Background Tasks column. The License Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

**Step 5** The Lightweight AP Client Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

- Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
- 

## Performing location appliance Backup

Choose **Administration > Background Tasks**, then click **location appliance Backup** to access this page.

This page enables you to schedule a backup of the mobility services engine database.

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

- 
- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
  - or
  - Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
  - or
  - Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.
- 

To modify the task, follow these steps:

- 
- Step 1** Click the background task in the Task column to open the task details page.
- The Mobility Service Backup page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds
    - Result—Success or error.
    - Message—Text message regarding the task execution.
- Step 2** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Max backups to keep—Enter the maximum number of location backups to be kept on the backup server.
- Interval (days)—Enter the frequency of backup.
- Time of the Day (hh:mm AM/PM)—Enter the time at which the backup starts on the scheduled day.

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

- When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing location appliance Status

Choose **Administration > Background Tasks**, then click **location appliance Status** to access this page.

This page displays the status of the mobility services engine.

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

- 
- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
  - or
  - Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
  - or
  - Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.
- 

To modify the task, follow these steps:

- 
- Step 1** Click the background task in the Task column to open the task details page.
- The Mobility Service Status page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds

- Result—Success or error.
- Message—Text message regarding the task execution.

**Step 2** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval (days)—Enter the frequency of backup.

**Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Performing location appliance Synchronization

Choose **Administration > Background Tasks**, then click **location appliance Synchronization** to access this page.

This page enables you to synchronize mobility services engine(s).

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

**Step 1** Choose **Administration > Background Tasks**.

**Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.

**Step 3** Use the Select a command drop-down list to perform one of the following tasks:

- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
- or
- Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
- or
- Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.

To modify the task, follow these steps:

**Step 1** Click the background task in the Task column to open the task details page.

The Mobility Service Synchronization page displays the following information:

- Last Execution Information
  - Start and end times

- Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.
- Step 2** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Out of Sync Alerts—When enabled, this generates minor alarms when location server is not synchronized with the NCS changes that you have made.
  - Auto Synchronization—Use this setting to enable auto synchronization of the location server. This ensures that when you make changes to NCS, the location server auto synchronizes with the changes.
  - Interval (minutes)—Specify the auto synchronization interval.
- Step 3** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.
- 

## Performing NCS Server Backup

Choose **Administration > Background Tasks**, then click **NCS Server Backup** to access this page.

This page enables you to schedule a backup of the NCS server.

From the Administration > Background Tasks page, you can execute, enable, or disable this task. To execute, enable, or disable this task from the Administration > Background Tasks page, follow these steps:

- 
- Step 1** Choose **Administration > Background Tasks**.
- Step 2** Select the check box(es) of the Background Task(s) that you want to execute, enable, or disable.
- Step 3** Use the Select a command drop-down list to perform one of the following tasks:
- Execute the task now—Select the check box of the task you want to execute. From the Select a command drop-down list, choose **Execute Now** and click **Go**. The status changes in the Enabled column.
  - or
  - Enable the task—Select the check box of the task you want to enable. From the Select a command drop-down list, choose **Enable Task** and click **Go**.
  - or
  - Disable the task—Select the check box of the task you want to disable. From the Select a command drop-down list, choose **Disable Task** and click **Go**.
- 

To modify the task, follow these steps:

- 
- Step 1** Click the background task in the Task column to open the task details page.
- The NCS Server Backup page displays the following information:
- Last Execution Information

- Start and end times
- Elapsed time in seconds
- Result—Success or error.
- Message—Text message regarding the task execution.

**Step 2** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Report History Backup—Select the check box to enable NCS to back up report histories.
- Max Backups to Keep—Enter the maximum number of NCS server backups to be kept on the backup server.
- Interval (days)—Enter a value between 1 and 360. The NCS server data is backed up every *n* days, where *n* is the value that you have specified in this field.
- Time of the Day (hh:mm AM/PM)—Enter the time at which the backup starts on the scheduled day.

**Note** Time of Day (hh:mm AM/PM) must be in this format: hh:mm AM/PM (for example: 03:00 AM). If no AM/PM notation is designated, the entered hour is always AM. If you want to specify 5PM, you can enter 17:00 or 5:00 PM. When the page is revisited after saving, the time is displayed as hh:mm (in this case 17:00), without the PM designation.

- When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing OSS Server Status

Follow these steps to view the OSS Server status:

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **OSS Server Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **OSS Server Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **OSS Server Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

- Step 3** To modify the controller license reset task, click the **OSS Server Status** link in the Background Tasks column. The OSS Server Status page appears.
- Step 4** Click the background task in the Task column to open the task details page.
- Step 5** The OSS Server Status page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds
    - Result—Success or error.
    - Message—Text message regarding the task execution.
- Step 6** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.
  - Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval—Indicates the frequency (in days) of the task.
- Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing the Switch NMSP and Location Status

You can view the Switch NMSP and Location Status using the Switch NMSP and Location Status option under Cisco NCS Administration.

To view the Switch NMSP and Location Status, follow these steps:

- Step 1** Choose **NCS > Administration > Background Tasks**.
- Step 2** From the Other Background Tasks table, click the **Switch NMSP and Location Status** link. The Switch NMSP and Location Status page appears. The Switch NMSP and Location Status page displays the following information:
- Last Execution Information
    - Start and end times
    - Elapsed time in seconds
    - Result—Success or error.
    - Message—Text message regarding the task execution.
- Step 3** View or modify the following in the Edit Task group box:
- Description—Read-only. Displays the name of the task.

- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

- Interval (hours)—Enter the frequency of backup.

**Step 4** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Viewing Switch Operational Status

Follow these steps to view the Switch Operational status:

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Switch Operational Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Switch Operational Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Switch Operational Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the Switch Operational Status task, click the **Switch Operational Status** link in the Background Tasks column. The Switch Operational Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

**Step 5** The Switch Operational Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

**Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Performing wIPS Alarm Synchronization

Follow these steps to perform wIPS Alarm Synchronization:

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **wIPS Alarm Sync** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **wIPS Alarm Sync** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **wIPS Alarm Sync** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the wIPS Alarm Sync task, click the **wIPS Alarm Sync** link in the Background Tasks column. The wIPS Alarm Sync page appears.

**Step 4** Click the background task in the Task column to open the task details page.

**Step 5** The wIPS Alarm Sync page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

---

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Indicates the frequency (in days) of the task.

**Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

---

## Wired Client Status

Follow these steps to view the Wired Client status:

---

**Step 1** Choose **Administration > Background Tasks** to display the Background Tasks page.

**Step 2** On this page, perform one of the following:

- Execute the task now.

Select the **Wired Client Status** check box. From the Select a command drop-down list, choose **Execute Now**, and click **Go**. You see the status change in the Enabled column.

or

- Enable the task.

Select the **Wired Client Status** check box. From the Select a command drop-down list, choose **Enable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column.

or

- Disable the task.

Select the **Wired Client Status** check box. From the Select a command drop-down list, choose **Disable Task**, and click **Go**. The task converts from grayed out to active in the Enabled column after the disabling is complete.

**Step 3** To modify the Wired Client Status task, click the **Wired Client Status** link in the Background Tasks column. The Wired Client Status page appears.

**Step 4** Click the background task in the Task column to open the task details page.

**Step 5** The Wired Client Status page displays the following information:

- Last Execution Information
  - Start and end times
  - Elapsed time in seconds
  - Result—Success or error.
  - Message—Text message regarding the task execution.

**Step 6** View or modify the following in the Edit Task group box:

- Description—Read-only. Displays the name of the task.
- Enabled—Select this check box to enable Cisco NCS execute the task at the specified interval.

**Note** If the Enabled check box is not selected, the task is not executed at the specified time.

---

- Interval—Enter the interval in hours that you would want the wired client status polling to happen. Valid range: 1 to 8640 hours.

- Major Polling—Specify two time periods at which you would want the major pollings to happen. Valid format: hh:mm AM|PM. Example: 12:49 AM.

For wired clients, NCS polls managed switches at regular interval to discover new clients or changes to the existing clients. To find this, NCS caches the last change time of the interface. In the next poll, it checks the new value of the change time of the interface with the cached value to determine whether there is any change on any interface. Then polling happens only for the interfaces where there is a change. If there is no change on an interface between the polling, no polling happens for that interface. When polling happens during major polling schedule, a complete polling is done irrespective of whether there is a change on the interface or not. The reason for having major and minor polling is because, polling the switches for wired clients on all interfaces is expensive and resource-intensive for NCS and switches. So, the major polling happens only twice a day.

- Step 7** When finished, click **Submit** to confirm task changes or **Cancel** to return to the Administration > Background Tasks page with no changes made.

## Other Background Tasks

Table 15-3 lists and describes the other background tasks that are available in NCS:

**Table 15-3** Other Background Tasks

| Task Name                        | Default Schedule | Description                                                                | Editable Options                                                                                                                                                         |
|----------------------------------|------------------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Appliance Status                 | 5 minutes        | This task is used to view the details of the Appliance polling.            | Default: Enabled<br>Interval - Valid interval - 1 - 10080<br>For more information, see <a href="#">“Viewing Appliance Status” section on page 15-20.</a>                 |
| Autonomous AP Client Status      | 5 minutes        | This task helps you to discover the Autonomous AP client from the network. | Default: Enabled.<br>For more information, see <a href="#">“Viewing Autonomous AP Client Status” section on page 15-20.</a>                                              |
| Autonomous AP Operational Status | 5 minutes        | This task helps you to view the Autonomous AP operational status polling.  | Default: Enabled<br>Interval - Valid interval - 1 - 10080<br>For more information, see <a href="#">“Viewing Autonomous AP Operational Status” section on page 15-21.</a> |

Table 15-3 Other Background Tasks (continued)

| Task Name          | Default Schedule | Description                                                  | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|------------------|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Sync | Daily at 4 am.   | This task is used to view the Configuration Synchronization. | <p>Enable—Select or unselect this option to enable or disable Configuration Synchronization. Default: Enabled.</p> <p>Enable—Select or unselect this option to enable or disable Network Audit. Default: Enabled.</p> <p>Enable—Select or unselect this option to enable or disable Security Index calculation. Default: Enabled.</p> <p>Enable—Select or unselect this option to enable or disable RRM audit. Default: Enabled.</p> <p>Interval—Enter the interval in days that you would want the configuration synchronization to happen. Valid range: 1 to 360 days.</p> <p>Time of Day—Enter the time of the day at which you would want the configuration synchronization to happen. Valid format: hh:mm AM PM. Example: 12:49 AM.</p> <p>For more information, see <a href="#">“Performing a Configuration Sync”</a> section on page 15-22.</p> |

Table 15-3 Other Background Tasks (continued)

| Task Name                       | Default Schedule | Description                                                               | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Controller Configuration Backup | Daily at 10 pm   | This task is used to view the Controller Configuration Backup activities. | <p>Enable—Select or unselect this option to enable or disable Controller Configuration Backup. Default is Disabled.</p> <p>Interval—Enter the interval in days that you would want the configuration synchronization to happen. Valid range: 1 to 360 days.</p> <p>Time of Day—Enter the time of the day at which you would want the configuration synchronization to happen. Valid format: hh:mm AM/PM. Example: 12:49 AM.</p> <p>TFTP Server—Select the IP address of the server to which you want to backup the Controller Configuration.</p> <p>For more information, see <a href="#">“Viewing Controller Configuration Backup Status”</a> section on page 15-25.</p> |
| Controller Operational Status   | 5 minutes        | This task is used to schedule and view the Controller Operational Status. | <p>Enable—Select or unselect this option to enable or disable Controller Configuration Backup. Default is enabled.</p> <p>Interval—Enter the interval in days that you would want the configuration synchronization to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Viewing Controller Operational Status”</a> section on page 15-26.</p>                                                                                                                                                                                                                                                                                            |
| Data Cleanup                    | Daily at 2 am.   | This task is used to schedule a data cleanup                              | <p>Time of Day—Enter the time of the day at which you would want the data cleanup to happen. Valid format: hh:mm AM/PM. Example: 12:49 AM. Default is Enabled.</p> <p>For more information, see <a href="#">“Viewing Data Cleanup Status”</a> section on page 15-28.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 15-3 Other Background Tasks (continued)

| Task Name             | Default Schedule | Description                                                                                                        | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Data Collector | 30 minutes       | This task is used to schedule a data collection based on the specified CLI commands at a configured time interval. | <p>Enabled—Select or unselect this option to enable or disable data collection for a specified Controller. Default is Disabled.</p> <p>Controller IP address—The IP address of the Controller to collect data from.</p> <p>CLI Commands—Enter the CLI commands separated by comma, which you would want to run on the specified Controller.</p> <p>Clean Start—Select or unselect this option to enable or disable a clean start before data collection.</p> <p>Repeat—Enter the number of times you would want the data collection to happen.</p> <p>Interval—Enter the interval in days that you would want the data collection to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Performing Device Data Collection”</a> section on page 15-28.</p> |
| Guest Accounts Sync   | Daily at 1 am.   | This task is used to schedule Guest Account polling and synchronization.                                           | <p>Enable—Select or unselect this option to enable or disable guest account synchronization. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the guest account synchronization to happen. Valid range: 1 to 360 days.</p> <p>Time of Day—Enter the time of the day at which you would want the guest account synchronization to happen. Valid format: hh:mm AM PM. Example: 12:49 AM.</p> <p>For more information, see <a href="#">“Performing Guest Accounts Sync”</a> section on page 15-29.</p>                                                                                                                                                                                                                                                    |

Table 15-3 Other Background Tasks (continued)

| Task Name                         | Default Schedule | Description                                                                | Editable Options                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|------------------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identity Services Engine Status   | 15 minutes       | This task is used to schedule the Identity Services Engine polling.        | <p>Enable—Select or unselect this option to enable or disable Identity Services Engine polling. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the Identity Services Engine polling to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Viewing Identity Services Engine Status”</a> section on page 15-30.</p>             |
| License Status                    | 4 hours.         | This task is used to schedule the license status polling.                  | <p>Enable—Select or unselect this option to enable or disable license status polling. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the license status polling to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Updating License Status”</a> section on page 15-31.</p>                                                 |
| Lightweight AP Operational Status | 5 minutes.       | This task helps you to view the Lightweight AP operational status polling. | <p>Enable—Select or unselect this option to enable or disable Lightweight AP Operational Status polling. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the Lightweight AP Operational Status polling to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Lightweight AP Operational Status”</a> section on page 15-33.</p> |

Table 15-3 Other Background Tasks (continued)

| Task Name                 | Default Schedule      | Description                                                                 | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lightweight Client Status | 5 minutes.            | This task helps you to discover the Lightweight AP client from the network. | <p>Enable—Select or unselect this option to enable or disable Lightweight Client Status polling. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the Lightweight Client Status polling to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Lightweight AP Client Status”</a> section on page 15-34.</p>                                                                                                                                                  |
| Mobility Service Backup   | Every 7 days at 1 am. | This task is used to schedule mobility services backup polling.             | <p>Enable—Select or unselect this option to enable or disable mobility service backup. Default is disabled.</p> <p>Interval—Enter the interval in days that you would want the mobility services backup to happen. Valid range: 1 to 360 days.</p> <p>Time of Day—Enter the time of the day at which you would want the mobility services backup to happen. Valid format: hh:mm AM PM. Example: 12:49 AM.</p> <p>For more information, see <a href="#">“Performing location appliance Backup”</a> section on page 15-35.</p> |
| Mobility Service Status   | 5 minutes.            | This task is used to schedule mobility services status polling.             | <p>Enable—Select or unselect this option to enable or disable mobility services status polling. Default is Enabled.</p> <p>Interval—Enter the interval in days that you would want the mobility services status polling to happen. Valid range: 1 to 360 days.</p> <p>For more information, see <a href="#">“Viewing location appliance Status”</a> section on page 15-36.</p>                                                                                                                                               |

Table 15-3 Other Background Tasks (continued)

| Task Name                        | Default Schedule      | Description                                                      | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|-----------------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mobility Service Synchronization | 60 minutes.           | This task is used to schedule mobility services synchronization. | <p>Out of Sync Alerts—Select this option if you want to enable out of sync alerts.</p> <p>Smart Synchronization—Select this option if you want to enable smart synchronization. Default is Enabled.</p> <p>Interval—Enter the interval in minutes that you would want the mobility services synchronization to happen. Valid range: 1 to 10080 minutes.</p> <p>For more information, see <a href="#">“Performing location appliance Synchronization”</a> section on page 15-37.</p>              |
| NCS Server Backup                | Every 7 days at 1 am. | This task is used to schedule the NCS server backup.             | <p>Enable—Select or unselect this option to enable or disable NCS server backup. Default is Disabled.</p> <p>Interval—Enter the interval in days that you would want the NCS server backup to happen. Valid range: 1 to 360 days.</p> <p>Time of Day—Enter the time of the day at which you would want the NCS server backup to happen. Valid format: hh:mm AM/PM. Example: 12:49 AM.</p> <p>For more information, see <a href="#">“Performing NCS Server Backup”</a> section on page 15-38.</p> |
| OSS Server Status                | 5 minutes.            | This task is used to schedule OSS server status polling.         | <p>Enable—Select or unselect this option to enable or disable OSS Server polling. Default is Enabled.</p> <p>Interval—Enter the interval in minutes that you would want the OSS server polling to happen. Valid range: 1 to 10080 minutes.</p> <p>For more information, see <a href="#">“Viewing OSS Server Status”</a> section on page 15-39.</p>                                                                                                                                               |

Table 15-3 Other Background Tasks (continued)

| Task Name                       | Default Schedule                       | Description                                                               | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch NMSP and Location Status | 4 hours                                | This task is used to schedule the Switch NMSP and Civic Location Polling. | <p>Enable—Select or unselect this option to enable or disable Switch NMSP and Civic Location polling. Default is Enabled.</p> <p>Interval—Enter the interval in minutes that you would want the Switch NMSP and Civic Location Polling to happen. Valid range: 1 to 10080 minutes.</p> <p>For more information, see <a href="#">“Viewing the Switch NMSP and Location Status”</a> section on page 15-40.</p>                                                                          |
| Switch Operational Status       | 5 minutes.<br>Full poll is 15 minutes. | This task is used to schedule switch operational status polling.          | <p>Enable—Select or unselect this option to enable or disable Switch NMSP and Civic Location polling.</p> <p>Interval—Enter the interval in minutes that you would want the Switch NMSP and Civic Location Polling to happen. Valid range: 1 to 10080 minutes.</p> <p>Full operational status interval—Enter the interval in minutes. Valid range: 1 to 1440 minutes.</p> <p>For more information, see <a href="#">“Viewing Switch Operational Status”</a> section on page 15-41.</p> |

Table 15-3 Other Background Tasks (continued)

| Task Name           | Default Schedule | Description                                                | Editable Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wIPS Alarm Sync     | 120 minutes.     | This task is used to schedule wIPS alarm synchronization.  | <p>Enable—Select or unselect this option to enable or disable wIPS alarm synchronization. Default is Enabled.</p> <p>Interval—Enter the interval in minutes that you would want the wIPS alarm synchronization to happen. Valid range: 1 to 10080 minutes.</p> <p>For more information, see <a href="#">“Performing wIPS Alarm Synchronization”</a> section on page 15-42.</p>                                                                                                                              |
| Wired Client Status | 2 hours.         | This task is used to schedule wired client status polling. | <p>Enable—Select or unselect this option to enable or disable wired client status polling. Default is Enabled.</p> <p>Interval—Enter the interval in hours that you would want the wired client status polling to happen. Valid range: 1 to 8640 hours.</p> <p>Major Polling—Specify two time periods at which you would want the major pollings to happen. Valid format: hh:mm AM/PM. Example: 12:49 AM.</p> <p>For more information, see <a href="#">“Wired Client Status”</a> section on page 15-43.</p> |

## Importing Tasks Into ACS

To import tasks into Cisco Secure ACS server, you must add NCS to an ACS server (or non-Cisco ACS server). This section contains the following topics:

- [Adding NCS to an ACS Server, page 15-53](#)
- [Adding NCS as a TACACS+ Server, page 15-53](#)
- [Adding NCS User Groups into ACS for TACACS+, page 15-54](#)
- [Adding NCS to an ACS Server for Use with RADIUS, page 15-56](#)
- [Adding NCS User Groups into ACS for RADIUS, page 15-57](#)
- [Adding NCS to a Non-Cisco ACS Server for Use with RADIUS, page 15-60](#)

## Adding NCS to an ACS Server

To add NCS to an ACS server, follow these steps:

### Note

The instructions and illustrations in this section pertain to ACS version 4.1 and may vary slightly for other versions or other vendor types. See the CiscoSecure ACS documentation or the documentation for the vendor you are using.

- Step 1** Click **Add Entry** in the Network Configuration page of the ACS server (see [Figure 15-7](#)).

**Figure 15-7** ACS Server Network Configuration Page

**Network Configuration**

### Add AAA Client

AAA Client Hostname:

AAA Client IP Address:

Shared Secret:

Authenticate Using:

**RADIUS Key Wrap**

Key Encryption Key:

Message Authenticator Code Key:

Key Input Format:  ASCII  Hexadecimal

Log Update/Watchdog Packets from this AAA Client

**RADIUS Option**

Replace RADIUS Port info with Username from this AAA Client

Log RADIUS Tunneling Packets from this AAA Client

Match Framed-IP-Address with user IP address for accounting packets from this AAA Client

- [AAA Client Hostname](#)
- [AAA Client IP Address](#)
- [Shared Secret](#)
- [Network Device Group](#)
- [Authenticate Using](#)
- [RADIUS Key Wrap](#)
- [Log Update / Watchdog Packets from this Access Server](#)
- [RADIUS Options](#)
- [TACACS+ Options](#)
- [TACACS+ login/enable authentication](#)

**AAA Client Hostname**

The AAA Client Hostname is the name assigned to the AAA client.

[\[Back to Top\]](#)

**AAA Client IP Address**

The AAA Client IP Address is the IP address assigned to the AAA client.

If you want to designate more than one AAA client with a single AAA client entry in ACS, you can specify the IP address for each AAA client to be represented by this AAA client entry. To separate each IP address, press **Enter**.

You can use the wildcard asterisk (\*) for an octet in the IP address. For example, if you want every AAA client in your 192.168.13.1 Class C network to be represented by a single AAA client entry, enter 192.168.13.\* in the AAA Client IP Address box.

- Step 2** In the AAA Client Hostname text box, enter the NCS hostname.
- Step 3** Enter the NCS IP address in the AAA Client IP Address text box.
- Step 4** In the Key text box, enter the shared secret that you wish to configure on both the NCS and ACS servers.
- Step 5** Choose **TACACS+** in the Authenticate Using drop-down list.
- Step 6** Click **Submit + Apply**.

## Adding NCS as a TACACS+ Server

To add NCS to a TACACS+ server, follow these steps:

- Step 1** Go to the TACACS+ (Cisco IOS) Interface Configuration page (see [Figure 15-7](#)).

**Step 2** In the New Services portion of the page, add NCS in the Service column heading.

**Step 3** Enter **HTTP** in the Protocol column heading.

**Note** HTTP must be in uppercase.

**Step 4** Select the check box in front of these entries to enable the new service and protocol.

**Step 5** Click **Submit**.

## Adding NCS User Groups into ACS for TACACS+

To add NCS User Groups into an ACS Server for use with TACACS+ servers, follow these steps:

**Step 1** Log into NCS.

**Step 2** Choose **Administration > AAA > User Groups**. The User Groups page appears (see [Figure 15-8](#)).

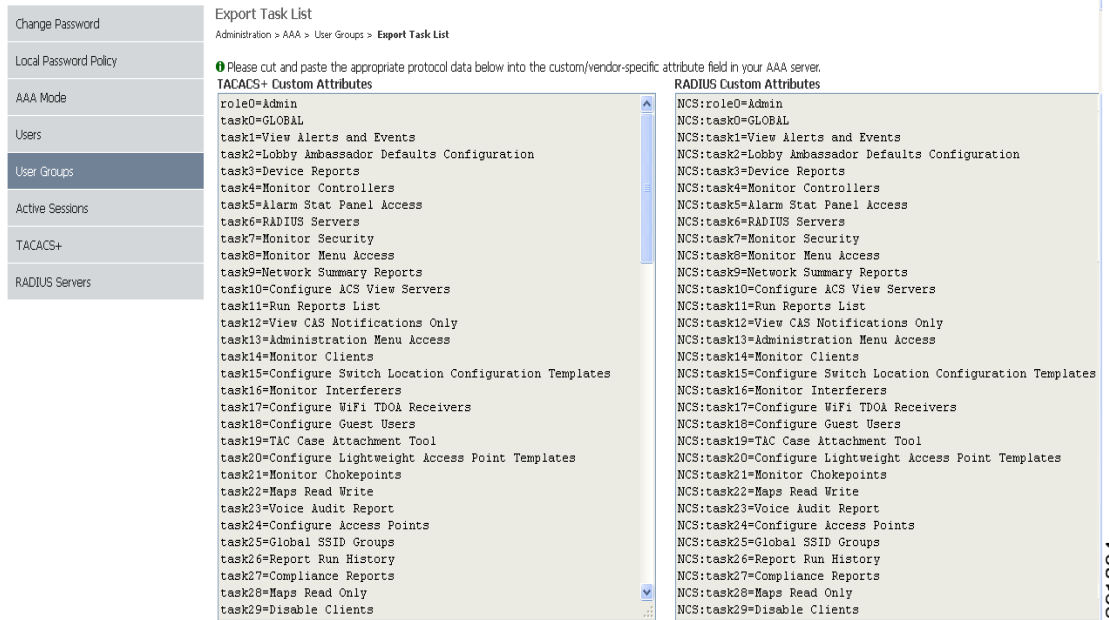

**Figure 15-8** User Groups Page

| Group Name        | Members                    | Audit Trail | Export    |
|-------------------|----------------------------|-------------|-----------|
| Admin             | User_admin baspatil bas123 |             | Task List |
| Config Managers   | User_cm                    |             | Task List |
| Lobby Ambassador  | User_la                    |             | Task List |
| Monitor Lite      | User_ml                    |             | Task List |
| North Bound API   | User_nb                    |             | Task List |
| Root              | root                       |             | Task List |
| Super Users       | User_su                    |             | Task List |
| System Monitoring | User_sm                    |             | Task List |
| User Assistant    | User_ua                    |             | Task List |
| User Defined 1    |                            |             | Task List |
| User Defined 2    |                            |             | Task List |
| User Defined 3    |                            |             | Task List |
| User Defined 4    |                            |             | Task List |

291300

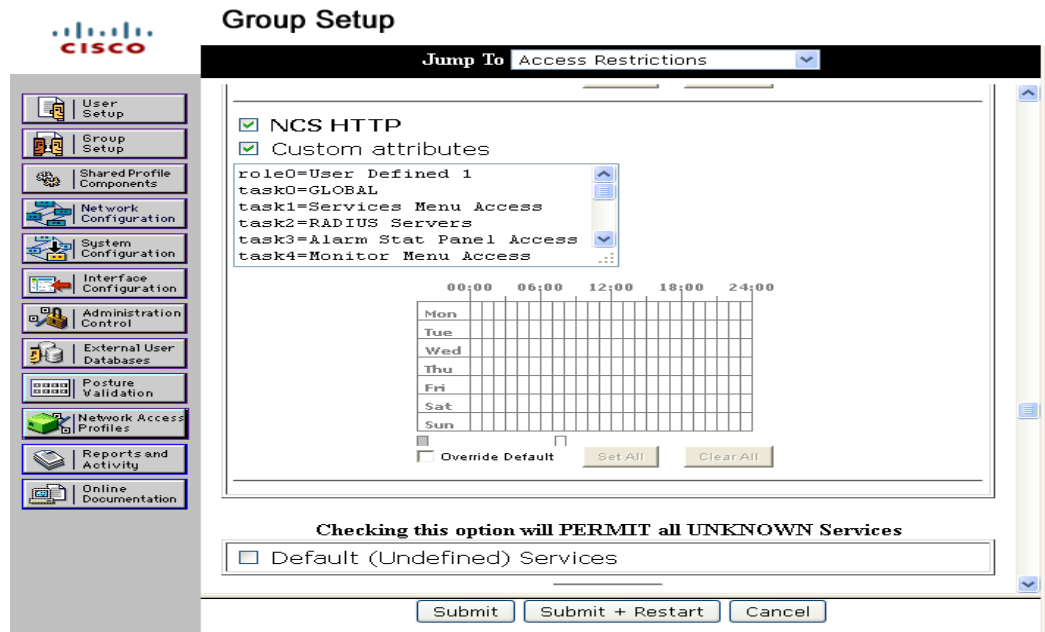

**Step 3** Click the Task List link (the Export right-most column) of the User Group that you wish to add to ACS. The Export Task List page appears (see [Figure 15-9](#)).

Figure 15-9 Export Task List Page

- Step 4** Highlight the text inside of the TACACS+ Custom Attributes, go to the menu of your browser, and choose **Edit > Copy**.
- Step 5** Log in to ACS.
- Step 6** Go to Group Setup. The Group Setup page appears (see [Figure 15-10](#)).

Figure 15-10 Group Setup Page on ACS Server

- Step 7** Choose which group to use and click **Edit Settings**. NCS HTTP appears in the TACACS+ setting.
- Step 8** Use the Edit > Paste in your browser to place the TACACS+ custom attributes from NCS into this text box.

---

**Note** When you upgrade NCS, any permissions on the TACACS+ or RADIUS server must be re-added.

---

- Step 9** Select the check boxes to enable these attributes.

- Step 10** Click **Submit + Restart**.

You can now associate ACS users with this ACS group.

---

**Note** To enable TACACS+ in NCS, see the “[Configuring TACACS+ Servers](#)” section on page 15-137. For information on configuring ACS view server credentials, see the “[Configuring ACS View Server Credentials](#)” section on page 9-229. For information on adding NCS Virtual Domains into ACS for TACACS+, see the “[Virtual Domain RADIUS and TACACS+ Attributes](#)” section on page 18-9.

---

---

**Note** From NCS 1.0 release and later, you are required to add a virtual domain in ACS when exporting the task list to ACS. This may be the default ROOT-DOMAIN virtual domain. For more information on virtual domains, see [Chapter 18, “Configuring Virtual Domains”](#).

---

## Adding NCS to an ACS Server for Use with RADIUS

To add NCS to an ACS server for use with RADIUS servers, follow these steps. If you have a non-Cisco ACS server, see the “[Adding NCS to a Non-Cisco ACS Server for Use with RADIUS](#)” section on page 15-60.

- 
- Step 1** Go to Network Configuration on the ACS server (see [Figure 15-11](#)).

Figure 15-11 Network Configuration Page on ACS Server

**Network Configuration**

**Add AAA Client**

AAA Client Hostname: ncs-1.cisco.com

AAA Client IP Address: 209.165.200.234

Shared Secret: secret

Authenticate Using: TACACS+ (Cisco IOS)

**RADIUS Key Wrap**

Key Encryption Key: [ ]

Message Authenticator Code Key: [ ]

Key Input Format:  ASCII  Hexadecimal

Log Update/Watchdog Packets from this AAA Client

**RADIUS Option**

Replace RADIUS Port Info with Username from this AAA Client

Log RADIUS Tunneling Packets from this AAA Client

Match Framed-IP-Address with user IP address for accounting packets from this AAA Client

**AAA Client Hostname**  
The AAA Client Hostname is the name assigned to the AAA client.  
[\[Back to Top\]](#)

**AAA Client IP Address**  
The AAA Client IP Address is the IP address assigned to the AAA client.  
If you want to designate more than one AAA client with a single AAA client entry in ACS, you can specify the IP address for each AAA client to be represented by this AAA client entry. To separate each IP address, press **Enter**.  
You can use the wildcard asterisk (\*) for an octet in the IP address. For example, if you want every AAA client in your 192.168.13.1 Class C network to be represented by a single AAA client entry, enter 192.168.13.\* in the AAA Client IP Address box.

- Step 2** Click **Add Entry**.
- Step 3** In the AAA Client Hostname text box, enter the NCS hostname.
- Step 4** In the AAA Client IP Address text box, enter the NCS IP address.
- Step 5** In the Key text box, enter the shared secret that you wish to configure on both the NCS and ACS servers.
- Step 6** Choose **RADIUS (Cisco IOS/PIX 6.0)** from the Authenticate Using drop-down list.
- Step 7** Click **Submit + Apply**.

You can now associate ACS users with this ACS group.

**Note** To enable RADIUS in NCS, see the “[Configuring RADIUS Servers](#)” section on page 15-139. For information on configuring ACS view server credentials, see the “[Configuring ACS View Server Credentials](#)” section on page 9-229.

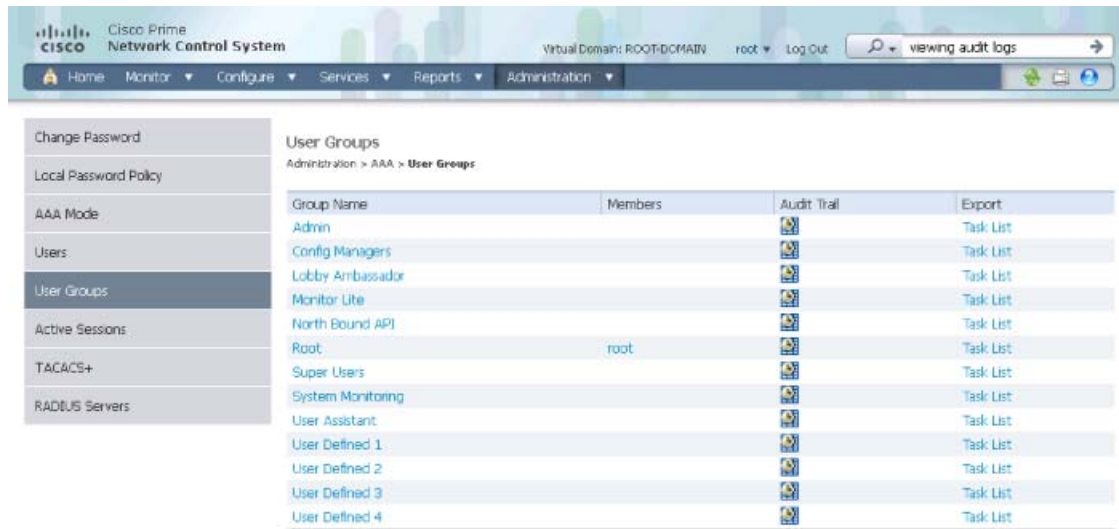

**Note** From NCS 1.0 release and later, you are required to add a virtual domain in ACS when exporting the task list to ACS. This may be the default ROOT-DOMAIN virtual domain. For more information on virtual domains, see [Chapter 18, “Configuring Virtual Domains”](#).

## Adding NCS User Groups into ACS for RADIUS

To add NCS User Groups into an ACS Server for use with RADIUS servers, follow these steps:

- Step 1** Log into NCS.
- Step 2** Choose **Administration > AAA > User Groups**. The All Groups page appears (see [Figure 15-12](#)).

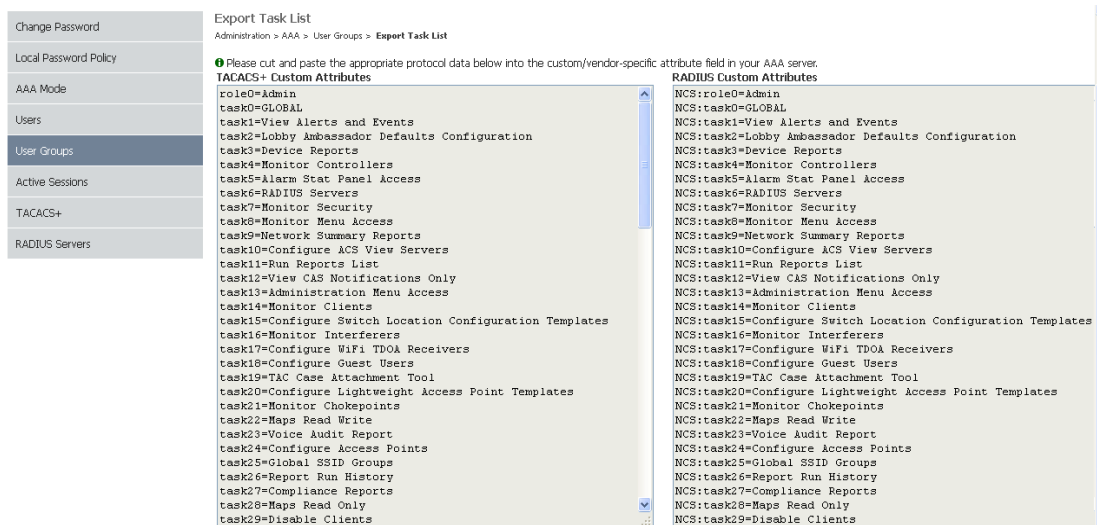

**Figure 15-12** User Groups Page

330174

- Step 3** Click the Task List link (the Export right-most column) of the User Group that you wish to add to ACS. The Export Task List page appears (see [Figure 15-13](#)).

**Figure 15-13** Export Task List Page

291304

- Step 4** Highlight the text inside of the RADIUS Custom Attributes, go to the menu of your browser, and choose **Edit > Copy**.

**Note** When you upgrade NCS, any permissions on the TACACS+ or RADIUS server must be re-added.

**Step 5** Log in to ACS.

**Step 6** Go to Group Setup. The Group Setup page appears (see [Figure 15-14](#)).

**Figure 15-14** Group Setup Page on ACS Server

**Step 7** Choose which group to use, and click **Edit Settings**. Find [009\001]cisco-av-pair under Cisco IOS/PIX 6.x RADIUS Attributes.

**Step 8** Edit > Paste in your browser to place the RADIUS custom attributes from NCS into this text box.

**Note** When you upgrade NCS, any permissions on the TACACS+ or RADIUS server must be re-added.

**Step 9** Select the check boxes to enable these attributes.

**Step 10** Click **Submit + Restart**.

You can now associate ACS users with this ACS group.

**Note** To enable RADIUS in NCS, see the [“Configuring RADIUS Servers”](#) section on page 15-139. For information on configuring ACS view server credentials, see the [“Configuring ACS View Server Credentials”](#) section on page 9-229. For information on adding NCS Virtual Domains into ACS for TACACS+, see the [“Virtual Domain RADIUS and TACACS+ Attributes”](#) section on page 18-9.

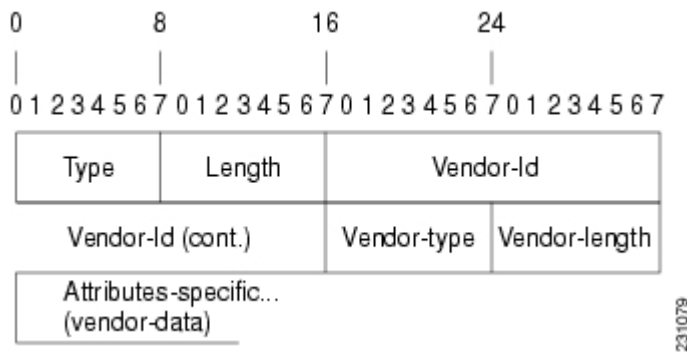

**Note** From NCS 1.0 release and later, you are required to add a virtual domain in ACS when exporting the task list to ACS. This may be the default ROOT-DOMAIN virtual domain. For more information on virtual domains, see [Chapter 18, “Configuring Virtual Domains”](#).

## Adding NCS to a Non-Cisco ACS Server for Use with RADIUS

When you use a RADIUS server to log into NCS, the AAA server sends back an access=accept message with a usergroup and a list of available tasks, after the username and password were verified. The access=accept message comes back as a fragmented packet because of the large number of tasks in some user groups. You can look in the following file to see the tasks associated with a given user group: C:\Program Files\NCS\webnms\webacs\WEB-INF\security\usergroup-map.xml. The tasks are passed back as a vendor specific attribute (VSA), and NCS requires authorization information using the VSA (IETF RADIUS attribute number 26). The VSA contains the NCS RADIUS task list information (see [Figure 15-15](#)).

**Figure 15-15** Extracting Task List

The content of the VSA is as follows:

- Type = 26 (IETF VSA number)
- Vendor Id = 9 (Cisco vendor ID)
- Vendor Type = 1 (Custom attributes)
- Vendor Data = The NCS task information (for example NCS: task0 = Users and Group)

Each line from the NCS RADIUS task list should be sent in its own RADIUS VSA.

In the data portion of the access=access packet, the truncated output sometimes shows only one role sent back for an Admin user group login. The tasks associated with the role start with task0 and increment with task1, task2, and so on. [Table 15-4](#) defines what these attributes in the access=access packet example signify.

```

**Table 15-4** Access=Access Packet Example

| Attribute                | Description                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------|
| 1a (26 in decimal)       | Vendor attribute                                                                                       |
| 2b (43 bytes in decimal) | Length as the total number of bytes to skip and still reach the next TLV (for task0, Users and Groups) |
| 4-byte field             | Vendor Cisco 09                                                                                        |
| 01                       | Cisco AV pair - a TLV for NCS to read                                                                  |
| 25 (37 bytes in decimal) | Length                                                                                                 |
| hex text string          | NCS:task0=Users and Groups                                                                             |
|                          | The next TLV until the data portion is completely processed.                                           |
| 255.255.255.255          | TLV: RADIUS type 8 (framed IP address)                                                                 |
| Type 35 (0x19)           | A class, which is a string                                                                             |
| Type 80 (0x50)           | Message authenticator                                                                                  |

To troubleshoot, perform the following steps:

- Verify if the RADIUS packet is an access accept.
- Verify the task names for the user group in the access accept.
- Look at the different length fields in the RADIUS packet.

## Configuring Controller Auto Provisioning

This section contains the following topics:

- [Adding an Auto Provisioning Filter, page 15-61](#)
- [Editing an Auto Provisioning Filter, page 15-64](#)
- [Deleting an Auto Provisioning Filter\(s\), page 15-64](#)
- [Listing Auto Provisioning Filter\(s\) Device Information, page 15-65](#)
- [Exporting Auto Provisioning Filter\(s\), page 15-66](#)
- [Exporting All Auto Provisioning Filter\(s\), page 15-66](#)
- [Auto Provisioning Primary Search Key Settings, page 15-67](#)

### Adding an Auto Provisioning Filter

To add an Auto Provisioning Filter, follow these steps:

- Step 1** Choose **Configure > Controller Auto Provisioning**. The Auto Provisioning Filter List page appears
- Step 2** From the Select a command drop-down list, choose **Add Filter**.

- Step 3** Click **Go**.
- Step 4** Click **Go**. The Auto Provisioning Filters > New Filter page appears.
- Step 5** Configure the following information:

- General
  - Enable Filter—Select the check box to enable the new filter.

---

**Note** Only enabled filters can participate in the Auto Provisioning process.

---

- Filter Name—Enter a filter name.
- Filter Properties
  - Monitor Only—If selected, the WLC defined in this Filter is managed by NCS but not configured by NCS if the WLC contacts NCS during the auto provisioning process.
  - Filter Mode—From the drop-down list, choose **Host Name**, **MAC Address**, **Serial Number** to indicate the search mode for this filter.
  - Config Group Name—From the drop-down list, choose a config group name.
- Filter Member Management - Add Member
  - Input Type—From the drop-down list, choose **Single Device** or **CSV File**.  
 If Single Device is selected, enter the host name, enable LAG configuration (if applicable), and enter the following: management interface IP Address, management interface netmask, management interface gateway, AP manager interface IP address, AP manager interface netmask, AP manager interface gateway, and DHCP IP address.  
 If CSV File is selected, enter the CSV file or use the **Browse** button to navigate to the applicable CSV File.

---

**Note** You can choose the **Download a sample CSV File** link to download a sample CSV file to your computer and customize the various configurations.

---

---

**Note** Because MS-Excel can insert additional commas when you edit a CSV file, ensure that you edit the CSV file using a normal text editor application.

---

A CSV file contains the following sections:

**\*\* The first part is the General Config section that contains parameters which are used to construct controller's startup config file.**

**\*\* The first line in the CSV file must be keyword**

```
"!!deviceId, LAG, managementIP, managementVlanId, managementNetmask,
managementGateway, apManagerIP, apManagerVlanId, apManagerNetmask,
apManagerGateway, dhcpServerIP"
```

deviceId—it can be Host name, Mac address, or Serial number.

LAG—controller's LAG configuration (true/false).

managementIP—controller's Management interface IP address.

managementVlanId—controller's Management interface VLAN Id (0=untagged).

managementNetmask—controller's Management interface Network mask.

managementGateway—controller's Management interface Gateway IP.

apManagerIP—controller's AP Manager Interface IP address, optional for 5500 series controller.  
 apManagerVlanId—controller's AP Manager Interface VLAN Id (0=untagged), optional for 5500 series controller.  
 apManagerNetmask—controller's AP Manager Interface Netmask, optional for 5500 series controller.  
 apManagerGateway—controller's AP Manager Interface Gateway, optional for 5500 series controller.  
 dhcpServerIP—controller's DHCP IP address.

**\*\* The second part is the Dynamic Interface section that contains dynamic interface parameters for a controller. This is an optional section.**

**\*\* To configure a dynamic interface, the first eight parameters are mandatory and the last four parameters are optional.**

"!!deviceId, interfaceName, vlanId, quarantineVlanId, interfaceIP, interfaceNetmask, gateway, primaryPort, secondaryPort, primaryDHCP, secondaryDHCP, aclName"

deviceId—this deviceId must be defined previously in section 1.

interfaceName—name of the dynamic interface.

vlanId—vlan ID used by this interface.

quarantineVlanId—quarantine vlan ID used by this interface.

interfaceIP—IP address of the dynamic interface.

interfaceNetmask—Network Mask of the dynamic interface.

gateway—Gateway IP address of the dynamic interface.

primaryPort—physical primary port number used by the dynamic interface.

secondaryPort—physical secondary port number used by the dynamic interface, this is an optional parameter.

primaryDHCP—the IP address of the primary DHCP used by the dynamic interface, this is an optional parameter.

secondaryDHCP—IP address of the secondary DHCP used by the dynamic interface, this is an optional parameter.

**\*\* The third part is the Device Specific Config section, contains other device specific configuration parameters which are optional during auto provisioning.**

"!!deviceId, countryCode, mobilityGroupName, mobilityGroupMembers"

deviceId—this deviceId must be defined previously in section 1.

countryCode—country code for the controller, this is an optional parameter.

mobilityGroupName—default name of the mobility group this controller belongs to, this is an optional parameter. If this attribute is not specified then the existing default mobility group name will be used.

mobilityGroupMembers—IP addresses, Mac Addresses and mobility group name of the mobility group members of the controller, which are separated by semi colon, this is an optional parameter. Both IP address and Mac Address are required for a mobility group member, they are separated by forward slash. Mobility group name is an optional attribute in this field. If mobility group name is not present then the default mobility group name for this controller will be used.

- If you select the Single Device option, specify the following options:
  - Device Type—From the drop-down list, choose **5500 Controller** or **non-5500 Controller**.
  - Host Name
  - LAG Configuration: Enabled or Disabled.
  - Management Interface IP Address

- Management Interface VLAN Id (0=untagged)
- Management Interface Netmask
- Management Interface Gateway
- AP Manager Interface IP Address
- AP Manager Interface VLAN Id (0=untagged)
- AP Manager Interface Netmask
- AP Manager Interface Gateway
- DHCP IP Address—When the controller comes up after a reset, it uses this IP address to get a DHCP address, and identifies its TFTP server from where the configuration file needs to be picked.
- Virtual IP Address—An address which is not routable and usually configured as 209.105.170.1, as a DHCP server at the virtual IP Address to wireless clients.

**Step 6** Click **Submit**.

**Note** You can specify the Dynamic Interface configuration and Device Specific configuration details only when you input a CSV file. These two configurations cannot be performed using the GUI.

## Editing an Auto Provisioning Filter

To edit a Auto Provisioning filter, follow these steps:

- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** Select the Filter Name of the filter you want to edit.
- Step 3** Make the necessary changes to the current filter parameters.

**Note** To view detailed information for a filter member, select the **Device ID** of the member you want to view.  
To delete a filter member, select the check box for the member you want to delete in the Filter Member Management - Delete Member section. When you click **Submit**, that member is deleted.

**Step 4** Click **Submit**.

## Deleting an Auto Provisioning Filter(s)

To delete an Auto Provisioning Filter, follow these steps:

- Step 1** Choose **Configure > Controller Auto Provisioning**.

- Step 2** Select the check box of the filter you want to delete.
- Step 3** From the Select a command drop-down list, choose **Delete Filter(s)**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the deletion.
- 

## Listing Auto Provisioning Filter(s) Device Information

To view details for an individual Auto Provisioning Filter, follow these steps:

- 
- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** Select the check box of the filter you want to view.
- Step 3** From the Select a command drop-down list, choose **List Filter(s) Device Info**.
- Step 4** Click **Go**. The Detailed Auto Provisioning Device Information page appears.

The following information is provided for the selected filter:

- Filter Name—Indicates the filter name.
  - Device ID—Indicates the device ID.
  - LAG—Indicates the controller LAG status as true or false.
  - Management IP—Indicates the management interface IP address of the controller.
  - Management VlanId—Indicates the management VLAN Id of the controller.
  - Management Netmask—Indicates the netmask mask of the management interface of the controller.
  - Management Gateway—Indicates the netmask gateway of the management interface of the controller.
  - AP Mgr IP—Indicates the IP address of the access point manager.
  - AP Mgr Vlan Id—Indicates the VLAN identifier of the access point manager.
  - AP Mgr Netmask—Indicates the netmask mask of the access point manager.
  - AP Mgr Gateway—Indicates the gateway IP address of the access point manager.
  - Status—Idle, Trap Received, Failed In Trap Processing, Failed In Applying Templates, Failed In Discovery Switch, Managed, Managed partially applied templates, or Unknown Error.
  - Country—Indicates the country.
  - Mobility Grp—Indicates the name of the mobility group.
  - Mobility Grp Members—Indicates the members of the mobility group.
  - Timestamp—Indicates the date and time of the information.
- 

## Listing All Auto Provisioning Filter(s) Device Information

To view details for all Auto Provisioning Filters, follow these steps:

- 
- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** From the Select a command drop-down list, choose **List All Filter(s) Device Info**.
- Step 3** Click **Go**.

The following information is provided for the selected filter:

- Filter Name—Indicates the filter name.
  - Device ID—Indicates the device ID.
  - LAG—Indicates the controller LAG status as true or false.
  - Management IP—Indicates the management interface IP address of the controller.
  - Management VlanId—Indicates the management Vlan Id of the controller.
  - Management Netmask—Indicates the netmask mask of the management interface of the controller.
  - Management Gateway—Indicates the netmask gateway of the management interface of the controller.
  - AP Mgr IP—Indicates the IP address of the access point manager.
  - AP Mgr Vlan Id—Indicates the Vlan identifier of the access point manager.
  - AP Mgr Netmask—Indicates the netmask mask of the access point manager.
  - AP Mgr Gateway—Indicates the gateway IP address of the access point manager.
  - Status—Idle, Trap Received, Failed In Trap Processing, Failed In Applying Templates, Failed In Discovery Switch, Managed, Managed partially applied templates, or Unknown Error.
  - Country—Indicates the country.
  - Mobility Grp—Indicates the name of the mobility group.
  - Mobility Grp Members—Indicates the members of the mobility group.
  - Timestamp—Indicates the date and time of the information.
- 

## Exporting Auto Provisioning Filter(s)

To export an Auto Provisioning Filter, follow these steps:

- 
- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** Select the check box of the filter(s) you want to export.
- Step 3** From the Select a command drop-down list, choose **Export Filter(s) Config (CSV)**.
- Step 4** Click **Go**.
- Step 5** In the File Download dialog box that appears, click **Save** to save the file to a location on the computer.
- 

## Exporting All Auto Provisioning Filter(s)

To export all Auto Provisioning Filters, follow these steps:

- 
- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** From the Select a command drop-down list, choose **Export All Filter(s) Config (CSV)**.
- Step 3** Click **Go**.
- Step 4** In the File Download dialog box that appears, click **Save** to save the file to a location on the computer.
- 

## Auto Provisioning Primary Search Key Settings

The Primary Search Key Setting enables you to set the matching criteria search order. To indicate the Search Key Order, follow these steps:

- 
- Step 1** Choose **Configure > Controller Auto Provisioning**.
- Step 2** From the left sidebar menu, choose **Setting**.
- Step 3** Click to highlight the applicable search key.
- Step 4** Use the **Move Up** or **Move Down** buttons to move the search key to a higher or lower priority.
- Step 5** Click **Save** to confirm or **Cancel** to cancel the changes.
- 

## Establishing Logging Options

Choose Administration > Logging to access the Administer Logging Options page. The logging for controller syslog information can be done in the Controller > Management > Syslog page. The following log settings can be configured:

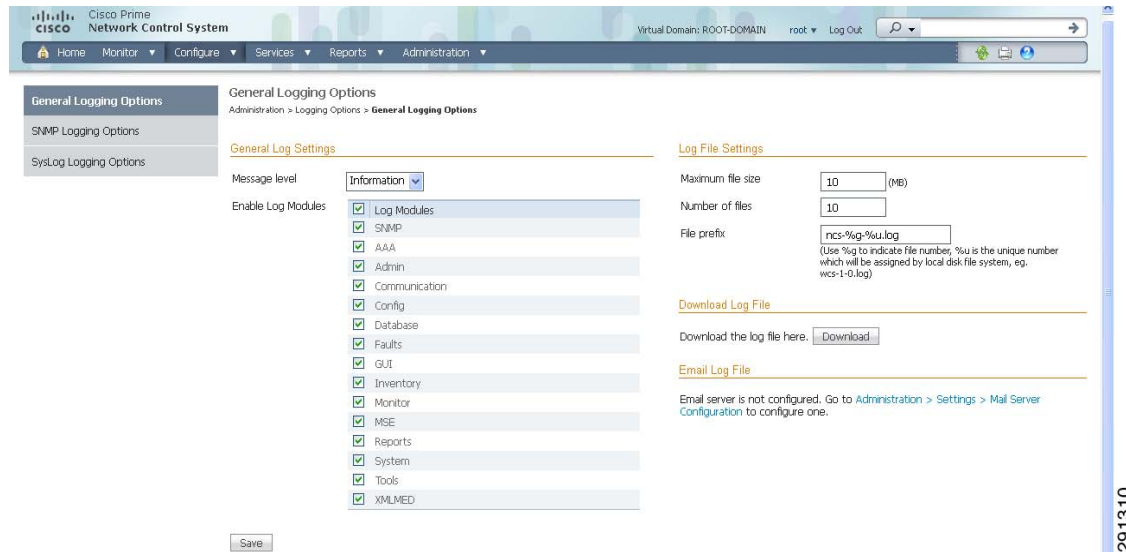

- [General Logging Options, page 15-67](#)
- [SNMP Logging Options, page 15-69](#)
- [Syslog Options, page 15-70](#)

## General Logging Options

To enable e-mail logging, follow these steps. The settings you establish are stored and are used by the e-mail server.

- 
- Step 1** Choose **Administration > Logging**. The General Logging Options page appears (see [Figure 15-16](#)).
- Step 2** Choose **General Logging Options** from the left sidebar menu.

Figure 15-16 General Logging Options Page

**Step 3** Choose a message level option of **Trace**, **Information**, or **Error**.

**Step 4** Select the check boxes within the Enable Log Module option to enable various administration modules:

- **Message Level**—Select the minimum level of the messages that will be logged including **Error**, **Information**, or **Trace**.
- **Enable Log Module**—You can enable logging for the following administration modules:
  - **Log Modules**—Select this option to select all the modules.
  - **SNMP**—Captures logs for all SNMP communication between NCS and controllers.
  - **AAA**—Captures AAA related logs for NCS.
  - **Admin**—Contains Adminsitration based logs, where all the configuration changes performed using the administration console is logged.
  - **Communication**—Contains logs related to the protocols used in communication.
  - **Config**—Used to log controller configurations that you make from NCS.

**Note** To get complete controller configuration logs, also enable the General log module.

**Note** To get the configuration values that the NCS sends in logs to controllers, enable Trace Display Values (Administration > Settings > SNMP Settings > Trace Display Value).

- **Database**—Contains logs to debug important database-related operations in NCS.

**Note** Some functions should be used only for short periods of time during debugging so that the performance is not degraded. For example, trace mode and SNMP meditation should be enabled only during debugging because a lot of log information is generated.

- **Faults**—Used by the event and alert subsystem.

- GUI—Contains generic UI validation logs.
- Inventory—Captures all Inventory-related logs.
- Monitor—Used for Alarms, Spectrum Intelligence, CCXV5, Clients/Tags, Client Radio Measurements, SSO, and Mesh.
- MSE—Used for MSE-related operations such as adding or deleting an MSE and changing parameters on the MSE. It also enables logging for MSE synchronization including NW designs and controllers.
- Reports—Used to log messages related to creating, saving, scheduling, and running reports. This module also contains a list of scheduled and saved reports.
- System—Captures all System-related logs.
- Tools—Contains logs related to different plug-in tools.
- XMLMED—Used to enable trace for the communication between MSE and NCS.

**Step 5** In the Log File Settings portion, enter the following settings. These settings will be effective after restarting NCS.

- Max. file size—Maximum number of MBs allowed per log file.
- Number of files—Maximum number of log files allowed.
- File prefix—Log file prefix, which can include the characters “%g” to sequentially number of files.

**Step 6** Click the Download button to download the Log File to your local machine.

**Note** The logs.zip filename includes a prefix with the host name, date, and time so that you can easily identify the stored log file. Included in the zip file is an html file that documents the log files.

**Step 7** Enter the Email ID or Email IDs separated by commas to send the Log file.

**Note** To send the log file in a mail you must have Email Server Configured.

**Step 8** Click **Submit**.

## SNMP Logging Options

To enable SNMP Tracing, follow these steps. The settings you establish are stored and are used by the SNMP server.

**Note** SNMP server is nothing but the NCS server which uses these settings for SNMP logging.

**Step 1** Choose **Administration > Logging**. The Logging Options page appears (see [Figure 15-17](#)).

**Step 2** Choose the **SNMP Logging Options** from the left sidebar menu.

Figure 15-17 SNMP Logging Options Page

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is Administration > Logging Options > SNMP Logging Options. The left sidebar has three options: General Logging Options, SNMP Logging Options (selected), and Syslog Logging Options. The main content area is titled 'SNMP Log Settings' and contains the following configuration options:

- Enable SNMP Trace:** A checked checkbox labeled 'Enable'.
- Display Values:** An unchecked checkbox labeled 'Enable'.
- Trace IP Addresses:** Radio buttons for 'All IP Addresses' and 'Selected IP Addresses (up to 10)'. The 'Selected IP Addresses' option is selected, and there is an empty text box with 'Add' and 'Remove' buttons.
- SNMP Log File Settings:**
  - Maximum SNMP file size: 10 (MB)
  - Number of SNMP files: 5
  - A 'Save' button is located below these fields.

201311

- Step 3** Select the **Enable SNMP Trace** check box to enable sending SNMP messages (along with traps) between controller and NCS.
- Step 4** Select the **Display Values** check box to see the SNMP Message values.
- Step 5** Configure the IP address or IP addresses to trace the SNMP traps. You can add up to a maximum of 10 IP addresses in the text box.
- Step 6** You can configure the maximum SNMP file size and the number of SNMP files.

## Syslog Options

The Syslog protocol is simply designed to transport event messages from the generating device to the collector. Various devices generate syslog messages for system information and alerts. To configure Syslog for NCS, follow these steps:

- Step 1** Choose **Administration > Logging**. The Logging Options page appears (see [Figure 15-16](#)).
- Step 2** Choose the **Syslog Options** from the left sidebar menu.

Figure 15-18 Syslog Options Page

The screenshot shows the Cisco Prime Network Control System interface. The top navigation bar includes Home, Monitor, Configure, Services, Reports, and Administration. The main content area is titled 'SysLog Logging Options' and contains a sidebar with 'General Logging Options', 'SNMP Logging Options', and 'SysLog Logging Options'. The 'SysLog Logging Options' section is expanded to show 'SysLog Settings'. The settings include: 'Enable SysLog' with an unchecked checkbox, 'SysLog Host' with an empty text input field, and 'SysLog Facility' with a dropdown menu set to 'USER'. A 'Save' button is located at the bottom of the settings section.

291312

- Step 3** Select the **Enable Syslog** check box to enable collecting and processing system logs.
- Step 4** Configure the Syslog Server IP address of the interface from which the message is to be transmitted.
- Step 5** Choose the **Syslog Facility**. You can choose any of the eight local use facilities for sending syslog messages. The local use facilities are not reserved and are available for general use.

## Using Logging Options to Enhance Troubleshooting

The logging screen allows you to customize the amount of data NCS collects in order to debug an issue. For easily reproduced issues, follow these steps prior to contacting TAC. These steps may create a smoother troubleshooting session:

- Step 1** Choose **Administration > Logging**.
- Step 2** From the Message Level drop-down list, choose **Trace**.
- Step 3** Select each check box to enable all log modules.
- Step 4** Reproduce the current problem.
- Step 5** Return to the Logging Options page.
- Step 6** Click **Download** from the Download Log File section.

**Note** The logs.zip filename includes a prefix with the host name, date, and time so that you can easily identify the stored log file. Included in the zip file is an html file that documents the log files.

- Step 7** After you have retrieved the logs, choose **Information** from the Message Level drop-down list.

**Note** Leaving the Message Level at *Trace* can adversely affect performance over a long period of time.

# Configuring Administrative Settings

Settings contains options for managing the NCS data retention functions. The following sets of options are available:

- “Configuring Alarms” section on page 15-72
- “Configuring an Audit” section on page 15-74
- “Configuring Clients” section on page 15-76
- “Configuring Protocols for CLI Sessions” section on page 15-79
- “Configuring Controller Upgrade” section on page 15-79
- “Configuring Data Management” section on page 15-81
- “Configuring a Guest Account” section on page 15-82
- “Configuring Login Disclaimer” section on page 15-83
- “Configuring the Mail Server” section on page 15-84
- “Configuring the Notification Receiver” section on page 15-85
- “Configuring Reports” section on page 15-92
- “Configuring Server Settings” section on page 15-93
- “Configuring Alarm Severities” section on page 15-93
- “Configuring SNMP Credentials” section on page 15-94
- “Configuring SNMP Settings” section on page 15-98
- “Configuring Switch Port Tracing” section on page 15-99

## Configuring Alarms

This Alarms page enables you to handle old alarms and display assigned and acknowledged alarms in the Alarm Summary page.

To open this page, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
  - Step 2** From the left sidebar menu, choose **Alarms**. The Administration > Settings > Alarms page appears (see [Figure 15-19](#)).

Figure 15-19 Settings &gt; Alarms Page

The screenshot shows the Cisco Prime Network Control System interface. The top navigation bar includes Home, Monitor, Configure, Services, Reports, and Administration. The main content area is titled 'Alarms' and is divided into three sections: Alarm Cleanup Options, Alarm Display Options, and Alarm Email Options. The Alarm Cleanup section has three rows of settings, each with a checkbox and a text input field followed by '(days)'. The Alarm Display section has a checked checkbox for 'Hide acknowledged alarms' and three unchecked checkboxes. The Alarm Email section has two checked checkboxes, two unchecked checkboxes, and two text input fields for custom text.

**Step 3** Add or modify the following Alarms parameters:

- Alarm Cleanup Options
  - Delete active and cleared alarms after—Enter the number of days after which active and cleared alarms are deleted. This option can be disabled by unselecting the check box.
  - Delete cleared security alarms after—Enter the number of days after which Security, Rogue AP, and Adhoc Rogue alarms are deleted.
  - Delete cleared non-security alarms after—Enter the number of days after which non-security alarms are deleted. Non-security alarms include all alarms that do not fall under the Security, Rogue AP, or Adhoc Rogue categories.

**Note** Data cleanup tasks run nightly to delete old alarms. In addition to the data cleanup task, NCS has an hourly task to check alarm table size. When the alarm table size exceeds 300 K, the task deletes the oldest cleared alarms until the alarm table size is within 300 K.

- Alarm Display Options

**Note** These preferences only apply to the Alarm Summary page. Quick searches or alarms for any entity display all alarms regardless of the acknowledged or assigned state.

- Hide acknowledged alarms—When the check box is selected, Acknowledged alarms do not appear on the Alarm Summary page. This option is enabled by default.

---

**Note** E-mails are not generated for acknowledged alarms regardless of severity change.

---

- Hide assigned alarms—When the check box is selected, assigned alarms do not appear in the Alarm Summary page.
- Add controller name to alarm messages—Select the check box to add the name of the controller to alarm messages.
- Add NCS address to email notifications—Select the check box to add the NCS address to email notifications.
- Alarm Email Options
  - Include alarm severity in the email subject line—Select the check box to include alarm severity in the email subject line.
  - Include alarm Category in the email subject line—Select the check box to include alarm category in the email subject line.
  - Include prior alarm severity in the email subject line—Select the check box to include prior alarm severity in the email subject line.
  - Include custom text in the email subject line—Select the check box to add custom text in the email subject line. You can also replace the email subject line with custom text by selecting the Replace the email subject line with custom text check box.
  - Include custom text in body of email—Select the check box to add custom text in the body of email.
  - Include alarm condition in body of email—Select the check box to include alarm condition in the body of email.
  - Add link to Alarm detail page in body of email—Select the check box to add a link to the Alarm detail page in the body of email.
  - Enable Secure Message Mode—Select the check box to enable a secure message mode. If you select the Mask IP Address and Mask Controller Name check boxes, the alarm emails are sent in secure mode where all the IP addresses and controller names are masked.

**Step 4** Click **Save**.

---

## Configuring an Audit

The Settings > Audit page allows you to determine the type of audit and on which parameters the audit is performed.

- **Audit Mode**—Choose between basic auditing and template based auditing.
- **Audit On**—Choose to audit on all parameters or on selected parameters for a global audit.

### Audit Mode

The audit mode group box allows you to choose between basic auditing and template based auditing. Basic audit is selected by default.

- **Basic Audit**—Audits the configuration objects in the NCS database against current WLC device values. Prior to the 5.1.0.0 version of NCS, this was the only audit mode available.

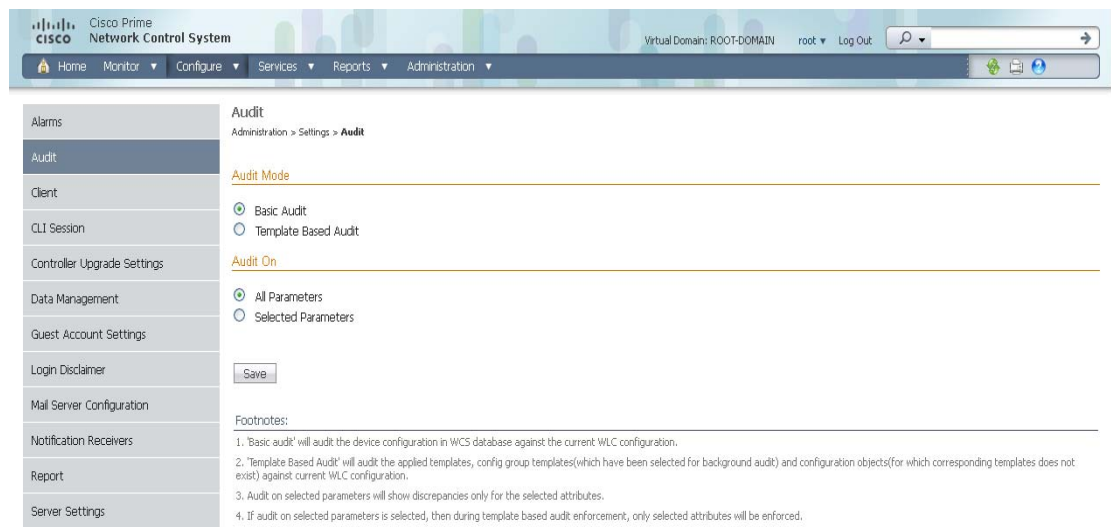

**Note** Configuration objects refer to the device configuration stored in the NCS database.

- **Template-based Audit**—Audits on the applied templates, config group templates (which have been selected for the background audit), and configuration audits (for which corresponding templates do not exist) against current WLC device values.

To indicate the type of audit you want to perform, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Audit**. The Audit Setting page appears (see [Figure 15-20](#)).

**Figure 15-20 Audit Settings Page**

291314

- Step 3** Select the **Basic Audit** or **Template Based Audit**. A basic audit audits the device configuration in the NCS database against the current WLC configuration. A template-based audit audits the applied templates, config group templates, and configuration objects (for which corresponding templates do not exist) against current WLC configuration.
- Step 4** Choose if you want the audit to run on all parameters or only on selected parameters. If you select the Selected Parameters radio button, you can access the Configure Audit Parameters configuration page. (See the [“Configuring Audit Parameters”](#) section on page 15-76). The Select audit parameters URL appears.
- The selected audit parameters are used during network and controller audits.
- Step 5** Click **Save**.

**Note** These settings are in effect when the controller audit or network audit is performed.

## Audit On

The Audit On group box allows you to audit on all parameters or to select specific parameters for an audit. When the Selected Parameters radio button is selected, you can access the Select Audit Parameters configuration page.

The selected audit parameters are used during network and controller audits.

### Configuring Audit Parameters

To configure the audit parameters for a global audit, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
  - Step 2** From the left sidebar menu, choose **Audit**.
  - Step 3** Select the **Selected Parameters** radio button to display the Select Audit Parameters link.
  - Step 4** Click **Save**.
  - Step 5** Click **Select Audit Parameters** to choose the required parameters for the audit in the Audit Configuration > Parameter Selection page.
  - Step 6** Select the parameters that you want audited from each of the tabs. The tabs include System, WLAN, Security, Wireless, and Selected Attributes.
  - Step 7** When all desired audit parameters are selected, click **Submit** to confirm the parameters or click **Cancel** to close the page without saving any audit parameters.

Once you click **Submit**, the selected audit parameters display on the Selected Attributes tab.

A current Controller Audit Report can be accessed from the Configure > Controllers page by selecting an object from the Audit Status column.

#### Note

You can audit a controller by choosing **Audit Now** from the Select a command drop-down list in the Configure > Controllers page, or by clicking **Audit Now** directly from the Controller Audit report. See the [“Viewing Audit Status \(for Access Points\)”](#) section on page 9-187.

---

## Configuring Clients

You can configure the following client processes to improve NCS performance and scalability:

- [Processing Diagnostic Trap, page 15-77](#)
- [Host Name Lookup, page 15-78](#)
- [Data Retention, page 15-78](#)
- [Client Traps and Syslogs, page 15-79](#)
- [Autonomous Client Traps, page 15-79](#)

To confirm changes to these client configurations, click **Save** at the bottom of the page.

**Note**

See the “[Client Troubleshooting Dashlet](#)” section on page 10-4 for further information on client troubleshooting.

## Processing Diagnostic Trap

The Settings > Client page allows you to enable automatic client troubleshooting on a diagnostic channel.

**Note**

Automatic client troubleshooting is only available for a CCXV5 client.

To enable this automatic client troubleshooting, follow these steps:

**Step 1** Choose **Administration > Settings**.

**Step 2** From the left sidebar menu, choose **Client**. The Client page appears (see [Figure 15-21](#)).

**Figure 15-21 Administration > Settings > Client Page**

The screenshot shows the Cisco Prime Network Control System Administration > Settings > Client page. The page is divided into several sections:

- Process Diagnostic Trap:** A checkbox for "Automatically troubleshoot client on diagnostic channel" is currently unchecked.
- Host Name Lookup:** A checkbox for "Lookup client host names from DNS server" is unchecked. Below it, "Cache host name" is set to 7 days.
- Data Retention:** "Clients" is set to 7 days, "Clients" is set to 250000 records, and "Client session history" is set to 32 days.
- Controller Client Traps:** "Save client association and disassociation traps as events" is unchecked. "Poll clients when client traps received" is unchecked.
- Autonomous Client Traps:** "Save 802.1x and 802.11 client authentication fail traps as events" is unchecked. "Interval Time" is set to 60 seconds.

A "Save" button is located at the bottom of the configuration area. The page footer shows "Tools | Help" and "Alarm Browser | Alarm Summary 63 0 700".

**Step 3** Select the **Automatically troubleshoot client on diagnostic channel** check box.

**Note**

If the check box is selected, NCS processes the diagnostic association trap. If it is not selected, NCS raises the trap, but automated troubleshooting is not initiated.

**Note** While processing the diagnostic association trap, the NCS invokes a series of tests on the client. The client is updated on all completed tasks. The automated troubleshooting report is placed in `dist/acs/win/webnms/logs`. When the test is complete, the location of the log is updated in client details pages:V5 tab:Automated Troubleshooting Report group box. An export button allows you to export the logs.

**Step 4** Click **Save**.

---

## Host Name Lookup

DNS lookup can take a considerable amount of time. Because of this, you can enable or disable the DNS lookup for client host name. It is set to `Disable` by default.

To enable host name lookup, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Client**.
- Step 3** Select the **Lookup client host names from DNS server** check box.
- Step 4** Enter the number of days that you want the host name to remain in the cache.
- Step 5** Click **Save**.
- 

## Data Retention

Client association history can take a lot of database and disk space. This can be an issue for database backup and restore functions. The retaining duration of a client association history can be configured to help manage this potential issue.

To configure data retention parameters, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Client**.
- Step 3** Enter or edit the following data retention parameters:
- **Dissociated Clients (days)**—Enter the number of days that you want NCS to retain the data. The default is 7 days. The valid range is 1 to 30 days.
  - **Client session history (days)**—Enter the number of days that you want NCS to retain the data. The default is 32 days. The valid range is 7 to 365 days.
- Step 4** Click **Save**.
- 

## Client Discovery

If you select the **Poll clients when client traps/syslogs received** check box, NCS polls clients to quickly identify client sessions. In a busy network, you may want to disable polling while the client traps are received. This option is disabled by default.

## Client Traps and Syslogs

In some deployments, NCS may receive large amounts of client association and disassociation traps. Saving these traps as events may cause a slight performance issue. In such cases, other events that may be useful may be aged out sooner than expected.

To ensure that NCS does not save client association and disassociation traps as events, unselect the **Save client association and disassociation traps as events** check box. Click **Save** to confirm this configuration change. This option is disabled by default.

For more information on traps and syslogs, see [Enabling Traps and Syslogs on Switches for Wired Client Discovery, page 9-198](#).

## Autonomous Client Traps

Select the **Save 802.1x and 802.11 client authentication fail traps as events** option if you want to save the Save 802.1x and 802.11 client authentication failed traps as events.

Interval Time—Enter the time interval in seconds to poll for the failed traps.

## Configuring Protocols for CLI Sessions

Many NCS features such as autonomous access point and controller CLI templates, along with migration templates require executing CLI commands on the autonomous access point or controller. These CLI commands can be executed by establishing Telnet or SSH sessions. The CLI session page allows you to select the session protocol. SSH is the default.

**Note** In CLI templates, you are not required to answer the question responses (such as *Yes* or *No* answer to a command, *Press enter to continue*, and so on.). This is automatically performed by NCS.

To configure the protocols for CLI sessions, follow these steps:

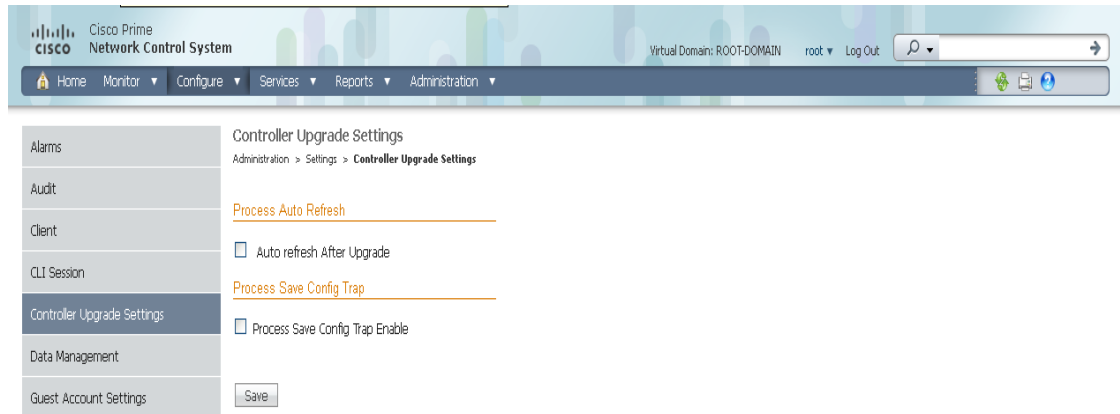

- 
- Step 1** Choose **Administration > Settings**.
  - Step 2** From the left sidebar menu, choose **CLI Session**.
  - Step 3** The default controller session protocol SSH is selected. To choose Telnet, select that radio button.
  - Step 4** The default autonomous access point session protocol SSH is selected. To choose Telnet, select the radio button.
  - Step 5** The **Run Autonomous AP Migration Analysis on discovery** option is set to **No** by default. Choose **Yes** if you want to discover the autonomous APs as well as perform migration analysis.
  - Step 6** Click **Save**.
- 

## Configuring Controller Upgrade

The Controller Upgrade Settings page allows you to auto-refresh after a controller upgrade. To perform an auto-refresh, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Controller Upgrade Settings** (see [Figure 15-22](#)).

**Figure 15-22** Controller Upgrade Settings

291316

- Step 3** Select the **Auto refresh After Upgrade** check box to automatically restore the configuration whenever there is a change in the WLC image.
- Step 4** Determine the action NCS will take when a save config trap is received. When this option is enabled, you can choose to retain or delete the extra configurations present on the device but not on NCS. The setting is applied to all controllers managed by NCS.

**Note** If you select the Auto Refresh on Save Config Trap check box in the Configure > Controllers > Properties > Settings page, it overrides this global setting.

**Note** It may take up to three minutes for the automatic refresh to occur.

- Step 5** Click **Save**.

Whenever a save config trap is received by NCS this option when enabled will determine the action taken by NCS.

When this option is enabled user can choose to retain or delete the extra configurations present on device and not on NCS.

This setting will be applied to all of the controllers managed by NCS. The setting in the controller > properties page for processing the save config trap will override this global setting.

When there is a change in the WLC image, the configuration from the controller is automatically restored.

## Configuring Data Management

To set retention periods for aggregated data used in timed calculations and network audit calculations, follow these steps. You can configure retention periods on an hourly, daily, and weekly basis.

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Data Management**. The Data Management page appears (see [Figure 15-23](#)).

**Figure 15-23 Data Management Page**

The screenshot shows the Cisco Prime Network Control System interface. The top navigation bar includes Home, Monitor, Configure, Services, Reports, and Administration. The left sidebar menu is expanded to show Data Management. The main content area is titled 'Data Management' and contains two sections: 'Trend Data Retain Periods' and 'Network Audit Data Retain Period'. The 'Trend Data Retain Periods' section has three input fields: 'Hourly Aggregated Data Retain Period' with a value of 31 (days), 'Daily Aggregated Data Retain Period' with a value of 90 (days), and 'Weekly Aggregated Data Retain Period' with a value of 54 (weeks). The 'Network Audit Data Retain Period' section has one input field: 'Audit Data Retain Period' with a value of 90 (days). A 'Save' button is located at the bottom of the configuration area.

- Step 3** Specify the number of days to keep the hourly data. The valid range is 1 to 31. The default is 31 days.
- Step 4** Specify the number of days to keep the daily data. The valid range is 7 to 365. The default is 90 days.
- Step 5** Specify the number of weeks to keep the weekly data. The valid range is 2 to 108. The default is 54 weeks.
- Step 6** Specify the number of days to retain the audit data collected by the Network Audit background task before purging. The limit is 365 days, and the minimum cleanup interval is 7 days. The default is 90 days.

**Note** For the best interactive graph data views, change the default settings to the maximum possible: 90 days for daily aggregated data and 54 weeks for weekly aggregated data. You must also make the appropriate measures to increase RAM and CPU capacity to compensate for these adjustments.

- Step 7** Click **Save**.

## NCS Historical Data

There are two types of historical data in NCS, including the following:

- Aggregated historical data—Numeric data that can be gathered as a whole and aggregated to minimum, maximum, or average. Client count is one example of aggregated historical data.

Use the **Administration > Settings > Data Management** page to define the aggregated data retention period. Aggregation types include hourly, daily, and weekly.

The retention period for these aggregation types are defined as Default, Minimum, and Maximum (see [Table 15-5](#)).

**Table 15-5** Aggregated Data Retention Periods

| Aggregated Data | Default  | Minimum | Maximum   |
|-----------------|----------|---------|-----------|
| Hourly          | 31 days  | 1 day   | 31 days   |
| Daily           | 90 days  | 7 days  | 365 days  |
| Weekly          | 54 weeks | 2 weeks | 108 weeks |

- Non-aggregated historical data—Numeric data that cannot be gathered as a whole (or aggregated). Client association history is one example of non-aggregated historical data.

You can define a non-aggregated retention period in each data collection task and other settings.

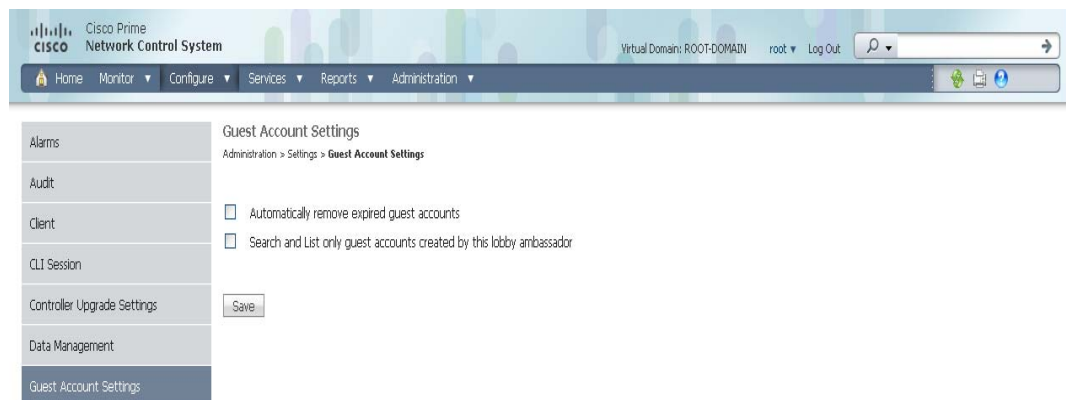

For example, you define the retention period for client association history in **Administration > Settings > Client**. By default, the retention period is 31 days or 1 million records. This retention period can be increased to 365 days.

## Configuring a Guest Account

The Guest Account Settings page allows you to globally remove all expired templates. To configure guest account settings, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Guest Account Settings** (see [Figure 15-24](#)).

**Figure 15-24** Guest Account Settings Page

- Step 3** When the **Automatically remove expired guest accounts option** is selected, the guest accounts whose lifetime has ended are not retained, and they are moved to the Expired state. Those accounts in the expired state are deleted from NCS.

291318

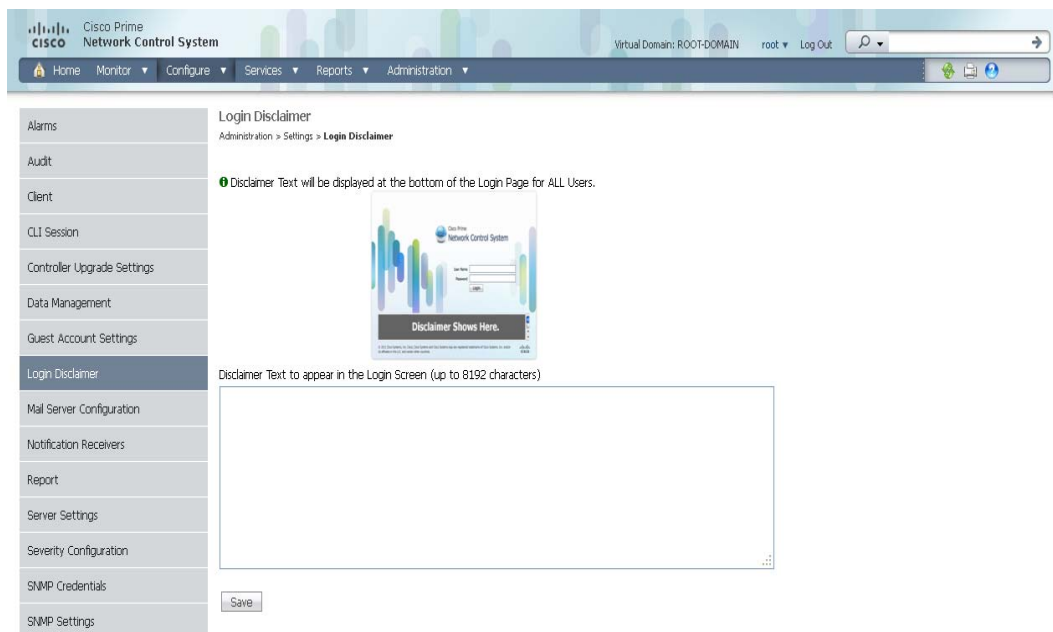

- Step 4** By default, NCS Lobby Ambassador can access all guest accounts irrespective of who created them. If you select the **Search and List only guest accounts created by this lobby ambassador** check box, the Lobby Ambassadors can access only the guest accounts that have been created by them.
- Step 5** Click **Save**.

## Configuring Login Disclaimer

The Login Disclaimer page allows you to enter disclaimer text at the top of the Login page for all users. To enter Login Disclaimer text, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Login Disclaimer**. The Login Disclaimer page appears (see [Figure 15-25](#)).

**Figure 15-25** Login Disclaimer Page

- Step 3** Enter your Login Disclaimer text in the available text box.
- Step 4** Click **Save**.

291319

## Configuring the Mail Server

You can configure global e-mail parameters for sending e-mails from NCS reports, alarm notifications, and so on. This mail server page enables you to configure e-mail parameters in one place. The Mail Server page enables you to set the primary and secondary SMTP server host and port, the e-mail address of the sender, and the e-mail addresses of the recipient.

To configure global e-mail parameters, follow these steps.

### Note

You must configure the global SMTP server before setting global e-mail parameters.

**Step 1** Choose **Administration > Setting**.

**Step 2** From the left sidebar menu, choose **Mail Server Configuration**. The page in [Figure 15-26](#) appears.

**Figure 15-26 Mail Server Configuration Page**

**Step 3** Enter the host name of the primary SMTP server.

**Step 4** Provide a password for logging on to the SMTP server and confirm it.

**Step 5** Provide the same information for the secondary SMTP server (only if a secondary mail server is available).

**Step 6** The From text box in the Sender and Receivers portion of the page is populated with *NCS@<NCS server IP address>*. You can change it to a different sender.

**Step 7** Enter the e-mail addresses of the recipient in the To text box. The e-mail address you provide serves as the default value for other functional areas, such as alarms or reports. Multiple e-mail addresses can be added and should be separated by commas.

---

**Note** Global changes you make to the recipient e-mail addresses in Step 7 are disregarded if e-mail notifications were set.

---

You must indicate the primary SMTP mail server and fill the From address text boxes.

If you want all alarm categories applied to the provided recipient list, select the **Apply recipient list to all alarm categories** check box.

**Step 8** Enter the text that you want to append to the email subject.

**Step 9** If you click the Configure email notification for individual alarm categories link, you can specify the alarm categories and severity levels you want to enable. Email notifications are sent when an alarm occurs that matches categories and the severity levels you select.

---

**Note** You can set each alarm severity by clicking the alarm category, choosing Critical, Major, Minor, or Warning, and providing an email address.

---

**Step 10** Click the **Test** button to send a test e-mail using the parameters you configured. The results of the test operation appear on the same screen. The test feature checks the connectivity to both primary and secondary mail servers by sending an e-mail with a "NCS test e-mail" subject line.

If the test results were satisfactory, click **Save**.

---

## Configuring the Notification Receiver

The Notification Receiver page displays current notification receivers that support guest access. Alerts and events are sent as SNMPv2 notifications to configured notification receivers.

In this page, you can view current or add additional notification receivers.

This section contains the following topics:

- [Adding a Notification Receiver to NCS, page 15-86](#)
- [Removing a Notification Receiver, page 15-87](#)

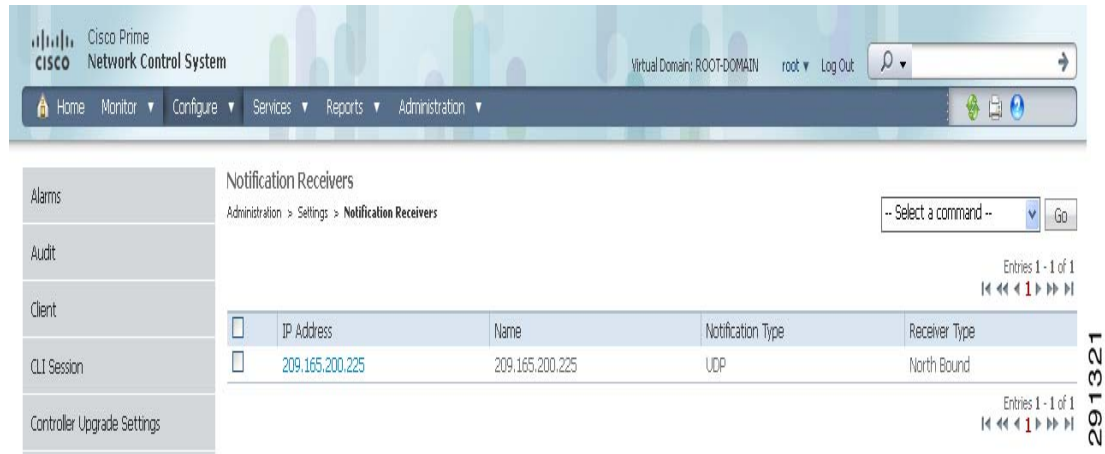

To access the Notification Receiver page, follow these steps:

---

**Step 1** Choose **Administration > Settings**.

**Step 2** From the left sidebar menu, choose **Notification Receivers**. All currently configured servers appear in this page. If you want to add one, choose **Add Notification Receiver** from the Select a command drop-down list, and click **Go** (see [Figure 15-27](#)).

Figure 15-27 Notification Receiver Page

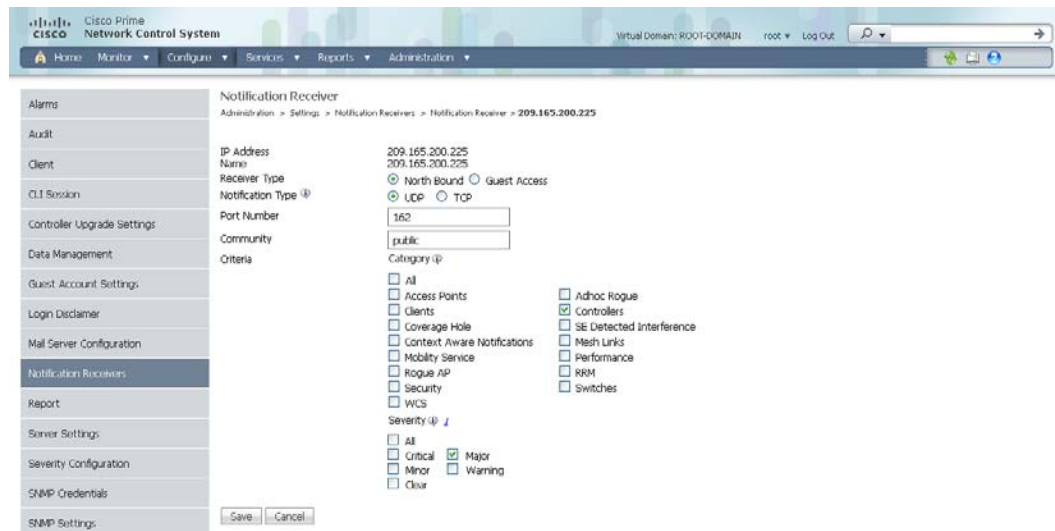

## Adding a Notification Receiver to NCS

To view current or add additional notification receivers, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Notification Receivers**. All currently configured servers appear on this page.
- Step 3** From the Select a command drop-down list, choose **Add Notification Receiver**.
- Step 4** Click **Go** (see Figure 15-27).

Figure 15-28 Notification Receiver Page

- Step 5** Enter the server IP address and name.
- Step 6** Select either the **North Bound** or **Guest Access** radio button.  
The Notification Type automatically defaults to UDP.
- Step 7** Enter the UDP parameters including Port Number and Community.

---

**Note** The receiver that you configure should be listening to UDP on the same port that is configured.

---

- Step 8** If you selected North Bound as the receiver type, specify the criteria and severity.

---

**Note** Alarms for only the selected category will be processed.

---

---

**Note** Alarms with only the selected severity matching the selected categories will be processed.

---

- Step 9** Click **Save** to confirm the Notification Receiver information.

- 
- Note**
- By default, only INFO level events will be processed for the selected Category.
  - Only SNMPV2 traps will be considered for North Bound notification.
- 

## Removing a Notification Receiver

To delete a notification receiver, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Notification Receivers**. All currently configured servers appear on this page.
- Step 3** Select the check box(es) of the notification receiver(s) that you want to delete.
- Step 4** From the Select a command drop-down list, click **Remove Notification Receiver**.
- Step 5** Click **Go**.
- Step 6** Click **OK** to confirm the deletion.

The sample display from a North Bound SNMP receiver that has received event traps from NCS follows:

**Figure 15-29** Sample Display from a North Bound SNMP Receiver

254166

The following sample output shows the log file generated by NCS. This log file is located in the log file directory on the NCS server (/opt/NCS 1.x/webnms/logs). The log output helps you troubleshoot when alarms are not being received by the North Bound SNMP receiver.

## MIB to NCS Alert/Event Mapping

Table 15-6 summarizes the Cisco-NCS-Notification-MIB to NCS alert/event mapping.

**Table 15-6** Cisco-NCS-Notification-MIB to NCS Alert/Event Mapping

| Field Name and Object ID            | Data Type   | NCS Event/Alert field                                   | Description                                                               |
|-------------------------------------|-------------|---------------------------------------------------------|---------------------------------------------------------------------------|
| cWNotificationTimestamp             | DateAndTime | createTime -<br>NmsAlert<br><br>eventTime -<br>NmsEvent | Creation time for alarm/event.                                            |
| cWNotificationUpdatedTimes-<br>tamp | DateAndTime | modTime -<br>NmsAlert                                   | Modification time for Alarm.<br><br>Events do not have modification time. |

Table 15-6 Cisco-NCS-Notification-MIB to NCS Alert/Event Mapping (continued)

| Field Name and Object ID    | Data Type                     | NCS Event/Alert field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|-------------------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cwNotificationCategory      | CWirelessNotificationCategory | NA                                          | It is the category of the Events/Alarms and the possible values are: <ul style="list-style-type: none"> <li>• unknown</li> <li>• accessPoints</li> <li>• adhocRogue</li> <li>• clients</li> <li>• controllers</li> <li>• coverageHole</li> <li>• interference</li> <li>• contextAwareNotifications</li> <li>• meshLinks</li> <li>• mobilityService</li> <li>• performance</li> <li>• rogueAP</li> <li>• rrm</li> <li>• security</li> <li>• wcs</li> <li>• switch</li> <li>• ncs</li> </ul> |
| cWNotificationSubCategory   | OCTET STRING                  | Type field in alert and eventType in event. | This object represents the subcategory of the alert.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| cWNotificationServerAddress | InetAddress                   | N/A                                         | NCS IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 15-6 Cisco-NCS-Notification-MIB to NCS Alert/Event Mapping (continued)**

| Field Name and Object ID               | Data Type       | NCS Event/Alert field                   | Description                                                                                                                                                                                                                         |
|----------------------------------------|-----------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cWNotificationManagedObjectAddressType | InetAddressType | N/A                                     | The type of Internet address by which the managed object is reachable. Possible values:<br>0 - unknown<br>1 - IPv4<br>2 - IPv6<br>3 - IPv4z<br>4 - IPv6z<br>16 - DNS<br>Always set to "1" because NCS only supports ipv4 addresses. |
| cWNotificationManagedObjectAddress     | InetAddress     | getNode() value is used if present      | getNode is populated for events and some alerts. If it is not null, then it will be used for this field.                                                                                                                            |
| cWNotificationSourceDisplayName        | OCTET STRING    | sourceDisplayName field in alert/event. | This object represents the display name of the source of the notification.                                                                                                                                                          |
| cWNotificationDescription              | OCTET STRING    | Text - NmsEvent<br>Message - NmsAlert   | Alarm description string.                                                                                                                                                                                                           |
| cWNotificationSeverity                 | INTEGER         | severity - NmsEvent,<br>NmsAlert        | Severity of the alert/event<br>critical(1),<br>major(2),<br>minor(3),<br>warning(4),<br>clear(5),<br>info(6),<br>unknown(7).                                                                                                        |

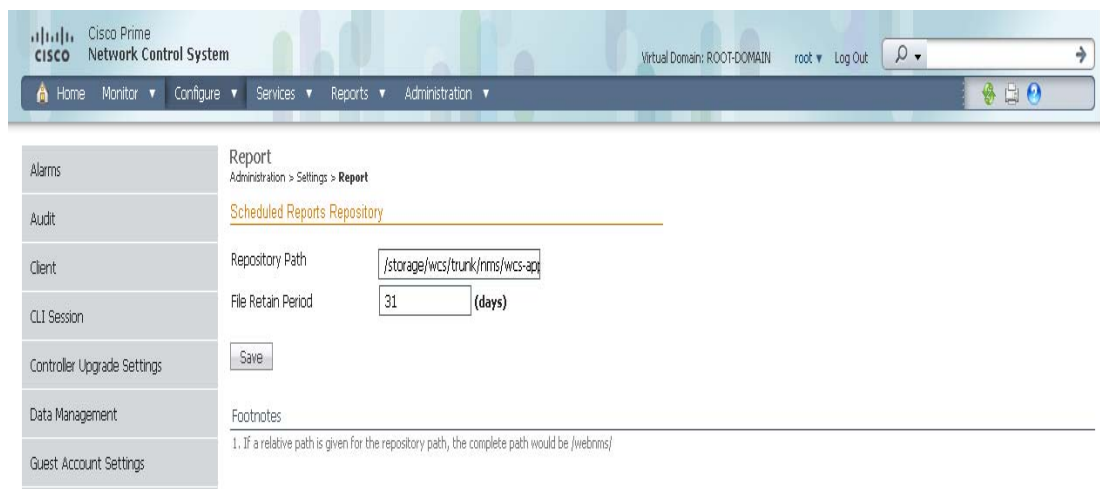

**Table 15-6** Cisco-NCS-Notification-MIB to NCS Alert/Event Mapping (continued)

| Field Name and Object ID        | Data Type    | NCS Event/Alert field                                                      | Description                                                                                                                                                                                                  |
|---------------------------------|--------------|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cWNotificationSpecialAttributes | OCTET STRING | All the attributes in alerts/events apart from the base alert/event class. | This object represents the specialized attributes in alerts like APAssociated, APDisassociated, RogueAPAlert, CoverageHoleAlert, and so on. The string is formatted in 'property=value' pairs in CSV format. |
| cWNotificationVirtualDomains    | OCTET STRING | N/A                                                                        | Virtual Domain of the object that caused the alarm. This field is not populated for running release and this will be populated with empty string.                                                            |

## Configuring Reports

Follow these steps to indicate where the scheduled reports will reside and for how many days:

- Step 1** Choose **Administration > Setting**.
- Step 2** From the left sidebar menu, choose **Report**. The Report page appears (see [Figure 15-30](#)).

**Figure 15-30** Report Page

- Step 3** Enter the path for saving report data files on a local PC. You can edit the existing default path.
- Step 4** Specify the number of days to retain report data files.

**Step 5** Click **Save**.

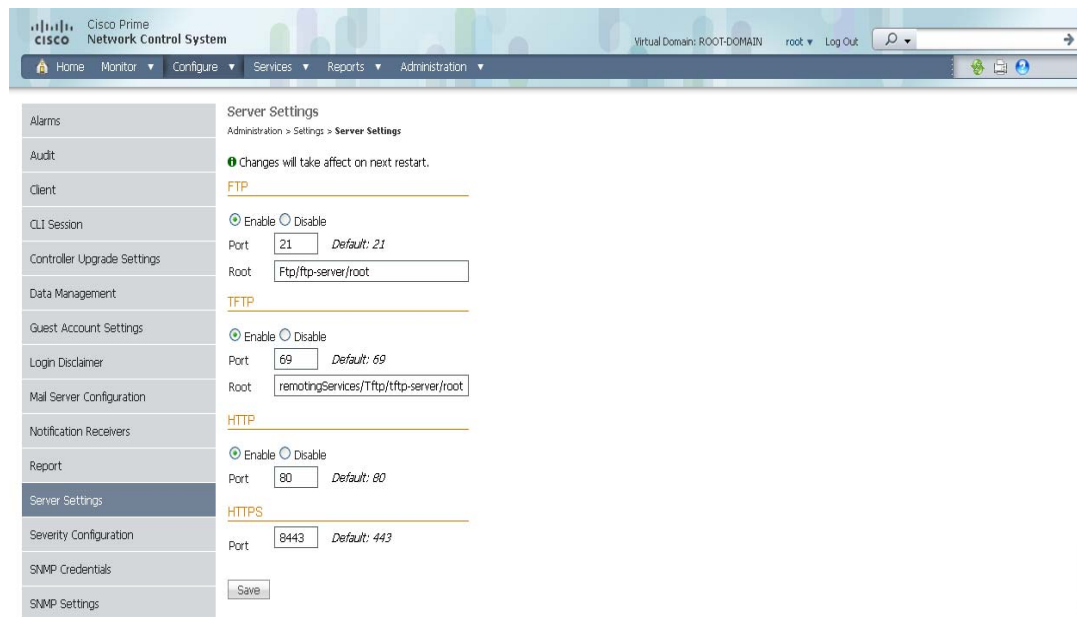

## Configuring Server Settings

To turn TFTP, FTP, HTTP, or HTTPS on or off, follow these steps:

**Step 1** Choose **Administration > Settings**.

**Step 2** From the left sidebar menu, choose **Server Setting**. The Server Settings page appears (see [Figure 15-31](#)).

**Figure 15-31** Server Settings Page

**Step 3** If you want to modify the FTP and TFTP directories or the HTTP and HTTPS ports that were established during installation, enter the port number (or port number and root where required) that you want to modify and click **Enable** or **Disable**.

The changes are reflected after a restart.

## Configuring Alarm Severities

You can change the severity level for newly generated alarms.

**Note**

Existing alarms remain unchanged.

To change the severity level of newly generated alarms, follow these steps:

- Step 1** Choose **Administration > Setting**.
- Step 2** Choose **Severity Configuration** from the left sidebar menu. The Severity Configuration page appears (see [Figure 15-32](#)).

**Figure 15-32 Severity Configuration Page**

| Alarm Condition                                                                                       | Alarm Category | Configured Severity |
|-------------------------------------------------------------------------------------------------------|----------------|---------------------|
| <input type="checkbox"/> Alarm Condition                                                              |                |                     |
| <input type="checkbox"/> A high watermark of percentage of capacity for transparent requests redirect | Switch         | Warning             |
| <input type="checkbox"/> A port transitions from Learning state to Forwarding state                   | Switch         | Warning             |
| <input type="checkbox"/> A reboot scheduled on the controller "{0}" has been canceled                 | Controller     | Informational       |
| <input type="checkbox"/> A reboot scheduled on the controller "{0}" has been failed                   | Controller     | Informational       |
| <input type="checkbox"/> A repeater reset has completed                                               | Switch         | Informational       |
| <input type="checkbox"/> AP Authorization Failure                                                     | Access Points  | Critical            |
| <input type="checkbox"/> AP Detected Duplicate IP                                                     | Security       | Critical            |
| <input type="checkbox"/> AP IP fallback                                                               | Access Points  | Warning             |
| <input type="checkbox"/> AP associated with controller                                                | Access Points  | Informational       |
| <input type="checkbox"/> AP attempted to join Controller with licensed AP count exceeded              | Controller     | Critical            |
| <input type="checkbox"/> AP big nav DOS attack                                                        | Security       | Critical            |
| <input type="checkbox"/> AP contained as rogue                                                        | Access Points  | Critical            |
| <input type="checkbox"/> AP disassociated from controller                                             | Access Points  | Critical            |
| <input type="checkbox"/> AP functionality license expired                                             | Controller     | Critical            |
| <input type="checkbox"/> AP has no radios                                                             | Access Points  | Critical            |
| <input type="checkbox"/> AP impersonation detected                                                    | Security       | Critical            |
| <input type="checkbox"/> AP maximum rogue count exceeded                                              | Access Points  | Critical            |
| <input type="checkbox"/> AP radio interface down due to configuration changes                         | Access Points  | Informational       |
| <input type="checkbox"/> AP radio interface down due to failure                                       | Access Points  | Critical            |
| <input type="checkbox"/> AP reboot reason                                                             | Access Points  | Informational       |
| <input type="checkbox"/> AP regulatory domain mismatch                                                | Access Points  | Critical            |
| <input type="checkbox"/> APPLIANCE_FAN_BAD_OR_MISSING                                                 | NCS            | Warning             |
| <input type="checkbox"/> APPLIANCE_POWER_SUPPLY_BAD_OR_MISSING                                        | NCS            | Warning             |

- Step 3** Select the check box of the alarm condition whose severity level you want to change.
- Step 4** From the **Configure Severity Level** drop-down list, choose the new severity level (**Critical**, **Major**, **Minor**, **Warning**, **Informational**, **Reset to Default**).
- Step 5** Click **Go**.
- Step 6** Click **OK** to confirm the change.

## Configuring SNMP Credentials

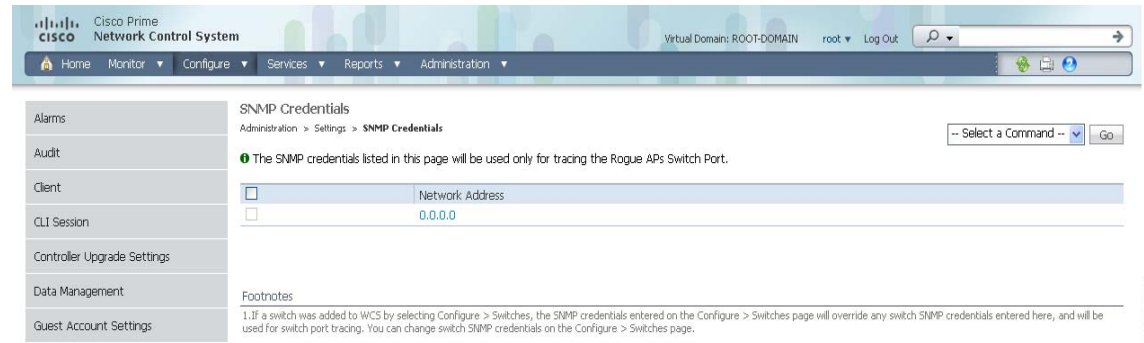

The SNMP Credentials page allows you to specify credentials to use for tracing the rogue access points. Use this option when you cannot find a specific entry using a number-based entry. When a switch credential is not added to NCS, you can use SNMP credentials on this page to connect to the switch.

To configure SNMP credentials, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **SNMP Credentials**. The SNMP Credentials page appears (see [Figure 15-33](#)).
- Step 3** To view or edit details about a current SNMP entry, click the **Network Address** link. See the [“Viewing Current SNMP Credential Details”](#) section on page 15-95 for more information.

**Note**

The default network address is 0.0.0.0 which indicates the entire network. An SNMP credential is defined per network so only network addresses are allowed. 0.0.0.0 is the SNMP credential default and is used when no specific SNMP credential is defined. The default community string is *private* for both read and write. You should update the pre-populated SNMP credential with your own SNMP information.

**Figure 15-33** SNMP Credentials Page

291327

- Step 4** To add a new SNMP entry, choose **Add SNMP Entries** from the Select a command drop-down list and click **Go**. See the [“Adding a New SNMP Credential Entry”](#) section on page 15-96 for more information.

## Viewing Current SNMP Credential Details

To view or edit details for current SNMP credentials, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **SNMP Credentials**.
- Step 3** Click the Network Address link to open the SNMP Credential Details page. The details page displays the following information:

### General Parameters

- Add Format Type—Read-only. See the [“Adding a New SNMP Credential Entry”](#) section on page 15-96 for more information regarding Add Format Type.
- Network Address
- Network Mask

SNMP Parameters—Select the applicable version(s) for SNMP parameters. The SNMP credentials are validated according to which SNMP version(s) are selected.

**Note**

Enter SNMP parameters for write access, if available. With read-only access parameters, the switch is added but you will not be able to modify its configuration in NCS. Device connectivity tests use the SNMP retries and timeout parameters configured in Administration > Settings > SNMP Settings.

- Retries—The number of times that attempts are made to discover the switch.
- Timeout—The session timeout value in seconds. This determines the maximum amount of time allowed for a client before it is forced to reauthenticate.
- SNMP v1 Parameters or v2 Parameters—If selected, enter the applicable community in the available text box.
- SNMP v3 Parameters—If selected, configure the following parameters:
  - Username
  - Auth. Type
  - Auth. Password
  - Privacy Type
  - Privacy Password

---

**Note** If SNMP v1 or v2 with default community is configured, the network is open to easy attacks because default communities are well known. SNMP v1 or v2 with a non-default community is more secure than a default community, but SNMP v3 with Auth and Privacy type and no default user is the most secure SNMP connection.

---

- Step 4** Click **OK** to save changes or **Cancel** to return to the SNMP Credentials page without making any changes to the SNMP credential details.
- 

## Adding a New SNMP Credential Entry

To add a new SNMP credential entry, follow these steps:

---

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **SNMP Credentials**.
- Step 3** From the Select a command drop-down list, choose **Add SNMP Entries**.
- Step 4** Click **Go**. The SNMP Credentials page opens (see [Figure 15-33](#)).
- Step 5** Choose one of the following:
  - To manually enter SNMP credential information, leave the Add Format Type drop-down list at SNMP Credential Info. To add multiple network addresses, use a comma between each address. Go to [Step 7](#).
  - If you want to add multiple switches by importing a CSV file, choose **File** from the Add Format Type drop-down list. The CSV file allows you to generate your own import file and add the devices you want. Go to [Step 6](#).
- Step 6** If you chose File, click **Browse** to find the location of the CSV file you want to import. Skip to [Step 11](#).
  - The first row of the CSV file is used to describe the columns included. The IP Address column is mandatory.
  - Sample File:

```
ip_address,snmp_version,snmp_community,snmpv3_user_name,snmpv3_auth_type,snmpv3_auth_password,snmpv3_privacy_type,snmpv3_privacy_password,network_mask
1.1.1.0,v2,private,user1,HMAC-MD5,12345,DES,12345,255.255.255.0
2.2.2.0,v2,private,user1,HMAC-MD5,password3,DES,password4,255.255.255.0
10.77.246.0,v2,private,user1,HMAC-MD5,12345,DES,12345,255.255.255.0
```

The CSV file can contain the following fields:

- ip\_address:IP address
- snmp\_version:SNMP version
- network\_mask:Network mask
- snmp\_community:SNMP V1/V2 community
- snmpv3\_user\_name:SNMP V3 username
- snmpv3\_auth\_type:SNMP V3 authorization type. Can be None or HMAC-MD5 or HMAC-SHA
- snmpv3\_auth\_password:SNMP V3 authorization password
- snmpv3\_privacy\_type:SNMP V3 privacy type. Can be None or DES or CFB-AES-128
- snmpv3\_privacy\_password:SNMP V3 privacy password
- snmp\_retries:SNMP retries
- snmp\_timeout:SNMP timeout

- Step 7** If you chose SNMP Credential Info, enter the IP address of the switch you want to add. If you want to add multiple switches, use a comma between the string of IP addresses.
- Step 8** In the Retries parameter, enter the number of times that attempts are made to discover the switch.
- Step 9** Provide the session timeout value in seconds. This determines the maximum amount of time allowed for a client before it is forced to reauthenticate.
- Step 10** Select the applicable version(s) for SNMP parameters. The SNMP credentials are validated according to which SNMP version(s) are selected.
- If SNMP v1 Parameters or v2 Parameters is selected, enter the applicable community in the available text box.
  - If SNMP v3 Parameters is selected, configure the following parameters:
    - Username
    - Auth. Type
    - Auth. Password
    - Privacy Type
    - Privacy Password

**Note** If SNMP v1 or v2 with default community is configured, the network is open to easy attacks because default communities are well known. SNMP v1 or v2 with a non-default community is more secure than a default community, but SNMP v3 with Auth and Privacy type and no default user is the most secure SNMP connection.

- Step 11** Click **OK**.

If NCS can use the SNMP credential listed to access the switch, the switch is added for later use and will appear in the Configure > Ethernet Switches page.

**Note**

If you manually added switches through the Configure > Ethernet Switches page, then switch port tracing will use the credentials from that page, not the ones listed in the SNMP Credentials page. If the manually-added switch credentials have changed, you need to update them from the Configure > Ethernet page.

## Configuring SNMP Settings

The SNMP Settings page allows you to configure global SNMP settings from NCS.

**Note**

Any changes you make on this screen globally effect NCS. The changes are saved across restarts as well as across backups and restores.

To configure global SNMP settings, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **SNMP Settings**. The SNMP Settings page appears (see [Figure 15-34](#)).

**Figure 15-34** *SNMP Settings Page*

| Configuration Option         | Value                               |
|------------------------------|-------------------------------------|
| Trace Display Values         | <input type="checkbox"/>            |
| Backoff Algorithm            | Exponential                         |
| Use Reachability Parameters  | <input checked="" type="checkbox"/> |
| Reachability Retries         | 2                                   |
| Reachability Timeout         | 2                                   |
| Maximum VarBinds per Get PDU | 30                                  |
| Maximum VarBinds per Set PDU | 50                                  |
| Maximum Rows per Table       | 50000                               |

- Step 3** If the Trace Display Values check box is selected, mediation trace-level logging shows data values fetched from the controller using SNMP. If unselected, the values do not appear.

**Note**

The default is unselected for security reasons.

- Step 4** For the Backoff Algorithm, choose either **Exponential** or **Constant Timeout** from the drop-down list. If you choose Exponential (the default value), each SNMP try waits twice as long as the previous try, starting with the specified timeout for the first try. If you choose Constant Timeout, each SNMP try waits the same, specified amount of time.

---

**Note** Constant Timeout is useful on unreliable networks (such as satellite networks) where the desired number of retries is large. Because it does not double the timeout per try, it does not take as long to timeout with a high number of retries.

---

**Step 5** Determine if you want to use reachability parameters. If selected, the NCS defaults to the global Reachability Retries and Timeout that you configure. If unselected, NCS always uses the timeout and retries specified per-controller or per-IOS access point. The default is selected.

---

**Note** Adjust this setting downward if switch port tracing is taking a long time to complete.

---

**Step 6** For the Reachability Retries parameter, enter the number of global retries used for determining device reachability. The default number is 2. This parameter is only available if the Use Reachability Parameters check box is selected.

---

**Note** Adjust this setting downward if switch port tracing is taking a long time to complete.

---

**Step 7** For the Reachability Timeout parameter, enter a global timeout used for determining device reachability. The default number is 2. This parameter is only available if the Use Reachability Parameters check box is selected.

**Step 8** At the Maximum VarBinds per PDU parameter, enter a number to indicate the largest number of SNMP variable bindings allowed in a request or response PDU. The default is 100.

---

**Note** For customers who have issues with PDU fragmentation in their network, this number can be reduced to 50, which typically eliminates the fragmentation.

---

**Step 9** The maximum rows per table parameter is configurable and the default value is 50000 rows. The configured value is retained even if you upgrade the NCS version.

**Step 10** Click **Save** to confirm these settings.

---

## Configuring Switch Port Tracing

Currently, NCS provides rogue access point detection by retrieving information from the controller. The rogue access point table is populated with any detected BSSID addresses from any frames that are not present in the neighbor list. At the end of a specified interval, the contents of the rogue table are sent to the controller in a CAPWAP Rogue AP Report message. With this method, NCS would simply gather the information received from the controllers; but with software release 5.1, you can now incorporate switch port tracing of Wired Rogue Access Point Switch Ports. This enhancement allows you to react to found wired rogue access points and prevent future attacks. The trace information is available only in the NCS log and only for rogue access points, not rogue clients.

---

**Note** Rogue Client connected to the Rogue Access point information is used to track the switch port to which the Rogue Access point is connected in the network.

---

**Note**

---

If you try to set tracing for a friendly or deleted rogue, a warning message appears.

---

**Note**

---

For Switch Port Tracing to successfully trace the switch ports using and v3, all of the OIDs should be included in the SNMP v3 view and VLAN content should be created for each VLAN in the SNMP v3 group.

---

**Note**

---

See the “[Configuring Switch Port Tracing](#)” section on page 15-99 for information on configuring Switch Port Tracing settings.

---

The Switch Port Trace page allows you to run a trace on detected rogue access points on the wire.

To correctly trace and contain rogue access points, you must correctly provide the following information.

- Reporting APs—A rogue access point has to be reported by one or more managed access points.
- AP CDP Neighbor—Access point CDP neighbor information is required to determine the seed switches.
- Switch IP address and SNMP credentials—All switches to be traced must have a management IP address and SNMP management enabled. You can add network address based entries instead of only adding individual switches. The correct write community string must be specified to enable/disable switch ports. For tracing, read community strings are sufficient.
- Switch port configuration—Trunking switch ports must be correctly configured. Switch port security must be turned off.
- Only Cisco Ethernet switches are supported.
- Switch VLAN settings must be properly configured.
- CDP protocol must be enabled on all switches.
- An Ethernet connection must exist between the rogue access point and the Cisco switch.
- You should have some traffic between rogue access points and the Ethernet switch.
- The rogue access point must be connected to a switch within the max hop limit. The default hop count is 2, and the maximum is 10.
- If SNMPv3 is chosen, use the context option and create one for each VLAN, in addition to the one for the main group (which is required for non-VLAN-based MIBs).

To specify options for switch port tracing, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Switch Port Trace** (see [Figure 15-35](#)).

Figure 15-35 Switch Port Trace Page

**Step 3** Configure the following basic settings as needed:

- **MAC address +/-1 search**—Select the check box to enable.  
This search involves the MAC address +/-1 convention where the wired-side MAC address of the rogue access point is obtained by adding or subtracting the radio MAC address by one.
- **Rogue client MAC address search**—Select the check box to enable.  
When a rogue access point client exists, the MAC address of the client is added to the searchable MAC address list.
- **Vendor (OUI) search**—Select the check box to enable. OUI refers to Organizational Unique Identifier search which searches the first 3 bytes in a MAC address.
- **Exclude switch trunk ports**—Select the check box to exclude switch trunk ports from the switch port trace.

**Note** When more than one port is traced for a given MAC address, additional checks are performed to improve accuracy. These checks include: trunk port, non-AP CDP neighbors present on the port, and whether or not the MAC address is the only one on this port.

- **Exclude device list**—Select the check box to exclude additional devices from the trace. Enter into the device list text box each device that you want to exclude from the switch port trace. Separate each device names with commas.
- **Max hop count**—Enter the maximum number of hops for this trace. Keep in mind that the greater the hop count, the longer the switch port trace will take to perform.

- Exclude vendor list—Enter in the vendor list text box any vendors that you want to exclude from the switch port trace. Separate vendor names with commas. The vendor list is not case sensitive.

**Step 4** Configure the following advanced settings as needed:

- TraceRogueAP task max thread—Switch port tracing uses multiple threads to trace rogue access points. This field indicates the maximum number of rogue access points that can be traced on parallel threads.
- TraceRogueAP max queue size—Switch port tracing maintains a queue to trace rogue access points. Whenever you select a rogue access point for tracing, it is queued for processing. This field indicates the maximum number of entries that you can store in the queue.
- SwitchTask max thread—Switch port tracing uses multiple threads to query switch devices. This field indicates the maximum number of switch devices that you can query on parallel threads.

**Note** The default value for these parameters should be good for normal operations. These parameters directly impact the performance of switch port tracing and NCS. Unless required, We do not recommend that you alter these parameters.

- Select CDP device capabilities—Select the check box to enable.

**Note** NCS uses CDP to discover neighbors during tracing. When the neighbors are verified, NCS uses the CDP capabilities field to determine whether or not the neighbor device is a valid switch. If the neighbor device is not a valid switch, it is not traced.

**Step 5** Click **Save** to confirm changes made. Click **Reset** to return the page to the original settings. Click **Factory Reset** to return settings to the factory defaults.

## Establishing Switch Port Tracing

To establish switch port tracing, follow these steps:

- Step 1** In the NCS home page, click the **Security** dashboard.
- Step 2** In the Rogue APs and Adhoc Rogues section, click the number URL which specifies the number of rogues in the last hour, last 24 hours, or total active.
- Step 3** Choose for which rogue you are setting switch port tracking by clicking the URL in the MAC Address column. The **Alarms > Rogue AP details** page opens.
- Step 4** From the Select a command drop-down list, choose **Trace Switch Port**. The Trace Switch Port page opens and NCS runs a switch port trace.

When one or more searchable MAC addresses are available, the NCS uses CDP to discover any switches connected up to two hops away from the detecting access point. The MIBs of each CDP discovered switch is examined to see if it contains any of the target MAC addresses. If any of the MAC addresses are found, the corresponding port number is returned and reported as the rogue switch port.

The SNMP communities for the switches are provided in the [“Configuring Switches”](#) section on page 9-190.

See the “[Switch Port Tracing Details](#)” section on page 15-103 for additional information on the Switch Port Tracing Details dialog box.

---

## Switch Port Tracing Details

In the Switch Port Tracing Details dialog box, you can enable or disable switch ports, trace switch ports, and view detail status of the access point switch trace. For more information on Switch Port Tracing, see the following topics:

- [Configuring Switch Port Tracing](#)—Provides information on configuring switch port trace settings.
- [Configuring Switches](#)—Provides information on configuring SNMP switches.
- [Configuring SNMP Credentials](#)—Provides information on configuring SNMP switch credentials.

In the Switch Port tracing Details dialog box, do one of the following:

- Click **Enable/Disable Switch Port(s)**—Enables or disables any selected ports.
- Click **Trace Switch Port(s)**—Runs another switch port trace.
- Click **Show Detail Status**—Displays details regarding the switch port traces for this access point.
- Click **Close**.

## Switch Port Tracing Troubleshooting

Switch Port Tracing (SPT) works on a best-effort-basis. SPT depends on the following information to correctly trace and contain rogue APs:

- Reporting access points—A rogue access point must be reported by one or more managed access points.
- Access point CDP neighbor—Access point CDP neighbor information is required to determine the seed switches.
- Switch IP address and SNMP credentials
  - All the switches that need to be traced should have a management IP address and SNMP management enabled.
  - With the new SNMP credential changes, instead of adding the individual switches to NCS, network address based entries can be added.
  - The new SNMP credential feature will have a default entry 0.0.0.0 with default community string as 'private' for both read/write.
  - Correct write community string has to be specified to enable/disable switch ports. For tracing, read community string should be sufficient.
- Switch port configuration
  - Switch ports that are trunking should be correctly configured as trunk ports.
  - Switch port security should be turned off.
- Only Cisco Ethernet switches are supported.

---

**Note** The following switches are supported: 3750, 3560, 3750E, 3560E, and 2960.

---

- Switch VLAN settings should be properly configured.
- CDP protocol should be enabled all the switches.
- An Ethernet connection should exist between the rogue access point and the Cisco switch.
- There should be some traffic between the rogue access point and the Ethernet switch.
- The rogue access point should be connected to a switch within the max hop limit. Default hop is 2. Max hop is 10.
- If SNMPv3 is used, then make sure you use the context option and create one for each VLAN in addition to the one for the main group (which is required for non-VLAN based MIBs).

## Configuring High Availability

This section contains the following topics:

- [Guidelines and Limitations for High Availability, page 15-104](#)
- [Failover Scenario, page 15-105](#)
- [High Availability Status, page 15-105](#)
- [Configuring High Availability on the Primary NCS, page 15-106](#)
- [Deploying High Availability, page 15-107](#)
- [Adding a New Primary NCS, page 15-108](#)
- [Removing a Primary NCS, page 15-109](#)

## Guidelines and Limitations for High Availability

Before initiating failover, you must consider the following prerequisites and limitations:

- You must have the extra hardware identical to the primary NCS to run a stand-by instance of NCS.
- NCS supports High Availability on both the physical and virtual appliance deployment models.
- A reliable high-speed wired network must exist between the primary NCS and its backup NCS.
- The primary and secondary NCS must be running the same NCS software release.
- Failover should be considered temporary. The failed primary NCS should be restored to normal as soon as possible, and failback will be re-initiated. The longer it takes to restore the failed primary NCS, the longer the other NCSs sharing that secondary NCS must run without failover support.
- The latest controller software must be used.
- The primary and secondary host are not required to share the same subnet. They can be geographically separated.
- If a secondary host fails for any reason, all the primary instances are affected, and they run in stand-alone mode without any failover support.
- The ports over which the primary and secondary NCSs communicate must be open (not blocked with network firewalls, application firewalls, gateways, and so on). The tomcat port is configurable during installation, and its default port is 8082. You should reserve solid database ports from 1315 to 1319.
- Any access control lists imposed between the primary and secondary NCS must allow traffic to go between the primary and secondary NCSs.

- In a 2:1 high availability scenario, the secondary NCS must be a high-end PC with more memory than the two primary PCs.

### NCS 1.0 updates to High Availability

- In NCS 1.0 release, a secondary NCS can only support one primary NCS.
- When High Availability is enabled for the first time, the sync up of the servers will take a considerable amount of time. The time it would take would be in the order of 30 minutes or more depending on the size of the database.

## Failover Scenario

When a failure of a primary NCS is automatically detected, the following events take place:

**Note**

---

One physical secondary NCS can back many primary devices (NCS).

---

1. The primary NCS is confirmed as non-functioning (hardware crash, network crash, or the like) by the health monitor on the secondary NCS.
2. If automatic failover has been enabled, NCS is started on the secondary as described in Step 3. If automatic failover is disabled, an email is sent to the administrator asking if they want to manually start failover.
3. The secondary NCS instance is started immediately (using the configuration already in place) and uses the corresponding database of the primary. After a successful failover, the client should point to the newly activated NCS (the secondary NCS). The secondary NCS updates all controllers with its own address as the trap destination.

**Note**

---

The redirecting of web traffic to the secondary NCS does not occur automatically. You must use your infrastructure tools to properly configure this redirection.

---

4. The result of the failover operation is indicated as an event in the Health Monitor UI, or a critical alarm is sent to the administrator and to other NCS instances.

## High Availability Status

To view High Availability details, follow these steps:

- 
- Step 1** Choose **Administration > High Availability**.
- Step 2** Choose **HA Status** from the left sidebar menu. The following information is displayed:
- Current status
  - Time, state, and description of each event
-

# Configuring High Availability on the Primary NCS

**Note**

When database transaction logs grow to 1/3 of the database partition disk space, set the database to "Standalone" mode to prevent transaction logs from keep growing. But it requires a complete *netcopy* next time when the database synchronization occurs.

Follow these steps to configure high availability on the primary NCS. You must specify the NCS role (either standalone, primary, or secondary) during installation. See the [“Deploying the NCS Virtual Appliance”](#) section on page 2-5 to see the installation steps.

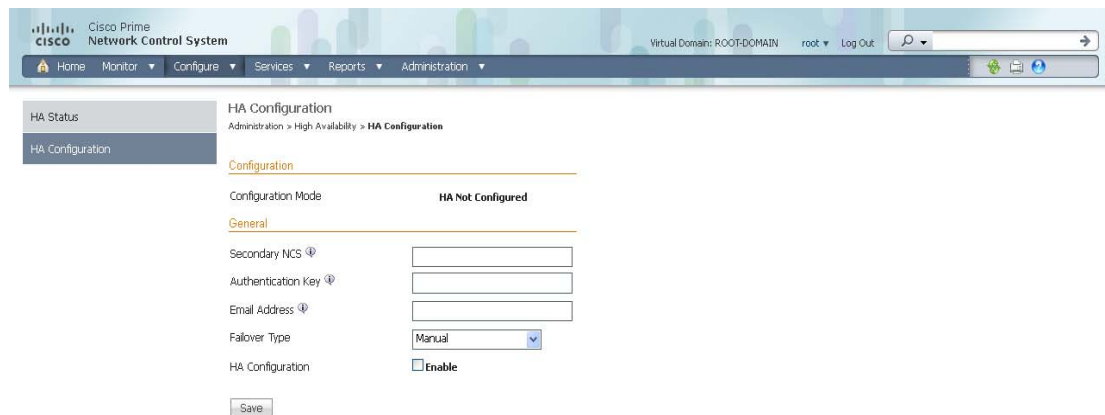

**Note**

- Before you configure high availability, you must configure a mail server. See the [“Configuring the Mail Server”](#) section on page 15-84 for steps on configuring a mail server.
- If you specify an e-mail address in the HA Configuration page then ensure a mail server is configured and reachable.

**Step 1** Choose **Administration > High Availability**.

**Step 2** Choose **HA Configuration** from the left sidebar menu. The High Availability Configuration page appears (see [Figure 15-36](#)).

**Figure 15-36 High Availability Configuration Page**

291330

The current status of high availability is shown in the upper portion of the page.

**Step 3** Enter the IP address or hostname of the secondary NCS.

**Step 4** Enter the authentication key specified during the installation of the secondary NCS.

**Step 5** The default admin e-mail address that you configured in Administration > Settings > Email Server is automatically supplied. You can make any necessary changes. Any changes you make to these email addresses must also be entered in the Secondary SMTP Server section of the Administration > Settings > Mail Server page.

---

**Note** You must enter an email address when configuring high availability. NCS tests the email server configuration, and if the test fails (because the mail server cannot connect), NCS does not allow the high availability configuration.

---

**Step 6** Choose either a manual or automatic failover option. If you choose manual, you can trigger the failover operation with a button in the secondary HealthMonitor GUI or with the URL specified in the email which the administrator receives upon failure of the primary NCS. If you choose automatic, the secondary NCS initiates a failover on its own when a failure is detected on the primary.

**Step 7** If you have installed NCS 1.0, then click **Save Only** to retain the configuration but not enable high availability at the current time, or click **Save & Enable** to enable high availability.

---

**Note** You can configure the high availability feature now but enable it at a later time.

---

Or

If you have installed NCS 1.0.2.x, then click **Save** to retain the configuration and enable high availability, or click **Remove** to disable high availability and its settings.

---

**Note** The Remove button is only available if high availability is already configured.

---

At this point, the secondary is either reachable with the database, and files are synchronized between health monitors, or the secondary is unreachable, and an error is returned because secondary installation did not occur.

---

From the NCS GUI (Administration > High Availability) after high availability has been enabled, you can perform the following functions:

- **Update**—Use the Update function to make changes to the Report Repository path (Administration > Settings > Report) or FTP/TFTP root directory (Administration > Settings > Server Settings) and to appropriately synchronize the files.
- **Disable**—Use the Disable function to break the connection between the primary and secondary NCSs. The database and files stop synchronizing.  
This check box is not available in NCS Release 1.0.2.x.
- **Delete**—Use the Delete operation to decommission the primary NCS from the secondary NCS. The Delete button is replaced by Remove in NCS Release 1.0.2.x.
- **Cancel**—Use the Cancel operation to cancel any modifications you made to the high availability configuration. You are returned to the High Availability Status page after you choose Cancel.

## Deploying High Availability

To deploy high availability on an existing NCS installation, follow these steps:

---

**Step 1** Identify and prepare the hardware to run the secondary NCS.

- Step 2** Ensure that network connectivity between the primary and secondary NCS is functioning, and all necessary ports are open.
- Step 3** Install the secondary NCS with the same version of NCS that is installed on the primary. See the [“Deploying the NCS Virtual Appliance” section on page 2-5](#).
- Step 4** Start the secondary NCS as a standby server. In this mode, the NCS application does not start. At the same time, the Health Monitor is started on the secondary NCS.
- Step 5** On every primary NCS that needs to use this secondary NCS, stop the NCS.
- Step 6** On the primary host, install the new version of NCS and perform all necessary upgrade steps.
- Step 7** Start the primary NCS (as a primary). The Health Monitor also starts.
- Step 8** Configure the high availability parameters described in the [“Configuring High Availability on the Primary NCS” section on page 15-106](#).
- Step 9** Click **Activate** to activate high availability on the primary. NCS primary first copies its database to the secondary NCS and then connects to the secondary. The following files are copied over from the primary to the secondary NCS:
- DB password file
  - all auto provisioning startup config files
  - all domain maps
  - all history reports which are generated by scheduled report tasks

High availability deployment is complete. Use **https://<NCSip>:8082** to access the HealthMonitor UI. Within the HealthMonitor UI, use the root password to login.

To modify the health monitor authentication key, enter **hadmin [-options] authKey [pass]**.

To view the current status of the health monitor, enter **hadmin [-options] status**.

---

## Adding a New Primary NCS

Follow these steps to add a new primary NCS to an existing setup. This new primary NCS uses the existing secondary as the failover server.

---

- Step 1** Ensure that network connectivity between the new primary and secondary is functioning and that all necessary ports are open.
- Step 2** Make sure that the same NCS release that is loaded on the other primary NCS and secondary NCS is loaded on the new primary NCS.
- Step 3** Install the correct version of NCS on the primary NCS.
- Step 4** Upgrade the primary NCS. The Health Monitor also starts.
- Step 5** Follow the steps in the [“Configuring High Availability” section on page 15-104](#).
- Step 6** After the primary NCS connects to the secondary, the Health Monitor on the primary connects to the secondary Health Monitor. They mutually acknowledge each other and start the monitoring.

High availability deployment is now complete.

---

## Removing a Primary NCS

When a primary NCS instance is removed from a group, you must disable the peer database instance on the secondary NCS and remove the Health Monitor for that primary. (To remove the primary NCS from high availability, use the Remove button on the High Availability configuration page.) The secondary NCS disables the database instance and removes the uninstalled primary NCS from its Health Monitor.

## Setting User Preferences

This page contains user-specific settings you may want to adjust.

To change the user-specific settings, follow these steps:

- Step 1** Choose **Administration > User Preferences**. The User Preferences Page appears (see [Figure 15-37](#)).

**Figure 15-37** User Preferences Page

- Step 2** Use the Items Per List Page drop-down list to configure the number of entries shown on a given list page (such as alarms, events, AP list, and so on.).
- Step 3** Specify how often you want the home page refreshed by selecting the **Refresh home page** check box and choosing a time interval from the Refresh home page every drop-down list.
- Step 4** Select the **Logout idle user** check box and configure the Logout idle user after text box, in minutes, that a user session can be idle before the server cancels the session.

- Step 5** If you want the maps and alarms page to automatically refresh when a new alarm is raised by NCS, select the **Refresh Map/Alarms page on new alarm** check box in the Alarms portion of the page.
- Step 6** From the **Refresh Alarm count in the Alarm Summary every** drop-down list choose a time interval to specify how often to reset.
- Step 7** If you do not want the alarm acknowledge warning message to appear, select the **Disable Alarm Acknowledge Warning Message** check box.
- Step 8** Use the **Edit Alarm Categories** to select the alarm categories to display in the Alarm Summary page.
- Step 9** In the Select Alarms page, choose the default category to display from the drop-down list, and select the alarm categories and sub categories to display from the alarm toolbar. Click **Save** to save the alarm category list. The selected alarm category and sub categories appears in the User Preferences page.
- Step 10** Click **Save** to save the User Preference settings.

## Viewing Appliance Details

This section provides the Appliance details. This section contains the following topics:

- [Viewing Appliance Status Details, page 15-110](#)
- [Viewing Appliance Interface Details, page 15-112](#)

## Viewing Appliance Status Details

To view the appliance status, perform the following steps:

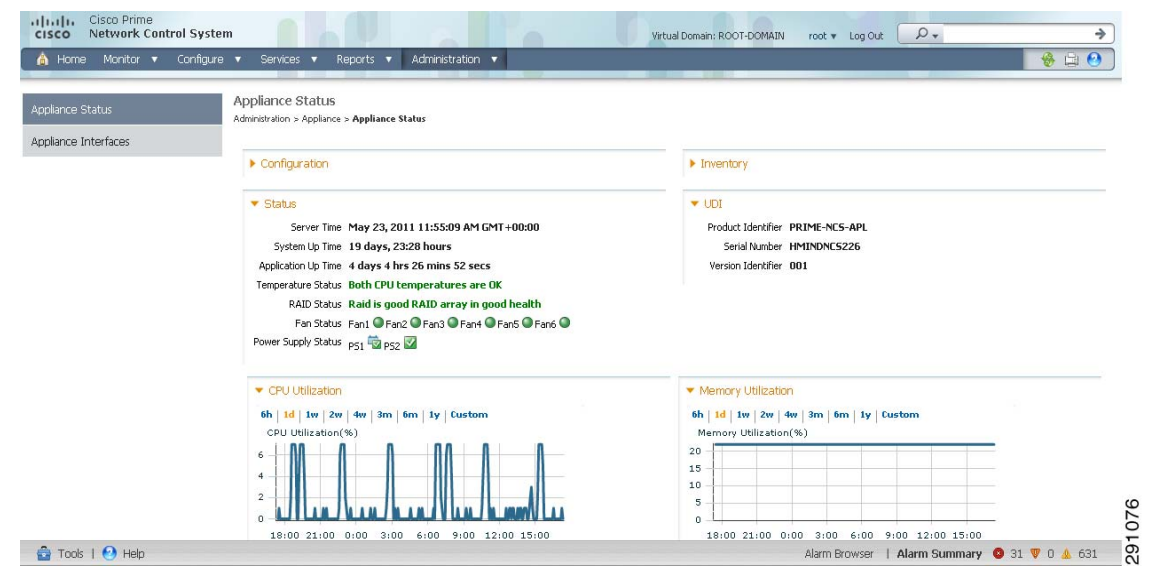

- Step 1** Choose **Administration > Appliance**.
- Step 2** Choose **Appliance Status** from the left sidebar menu. The Appliance status page appears (see [Figure 15-38](#)) with the following details, refer [Table 15-7](#) for more information.

**Table 15-7 Appliance Status details**

| Parameter                | Description                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configure Details</b> |                                                                                                                                                           |
| Host Name                | The hostname of the machine. If the hostname of the user machine is not in DNS, the IP address is displayed.                                              |
| Domain Name              | Domain Name of the server.                                                                                                                                |
| Default Gateway          | IP address of the default gateway for the network environment in which you belong.                                                                        |
| DNS Server(s)            | Enter the IP address of the DNS server(s). Each DNS server must be able to update a client DNS entry to match the IP address assigned by this DHCP scope. |
| NTP Host(s)              | Enter the IP address of the NTP server(s).                                                                                                                |
| <b>Status Details</b>    |                                                                                                                                                           |

**Table 15-7 Appliance Status details**

| Parameter           | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Server Time         | The System time of the server.                                                                           |
| System Up Time      | It is a measure of the time since the server has been up without any downtime.                           |
| Application Up Time | It is a measure of the time since the NCS has been up without any downtime.                              |
| Temperature Status  | The temperature status of the server.                                                                    |
| RAID Status         | The RAID status of the server.                                                                           |
| Fan Status          | The status of the cooler fans of the server.                                                             |
| Power Supply Status | The status of the power supply units of the server.                                                      |
| CPU Utilization     | CPU Utilization of the server.                                                                           |
| Memory Utilization  | Memory Utilization of the server.                                                                        |
| Inventory Details   | Detailed inventory report.                                                                               |
| <b>UDI Details</b>  |                                                                                                          |
| Product Identifier  | The Product ID identifies the type of device.                                                            |
| Serial Number       | The Serial Number is an 11 digit number which uniquely identifies a device.                              |
| Version Identifier  | The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. |

**Figure 15-38 Appliance Status details**

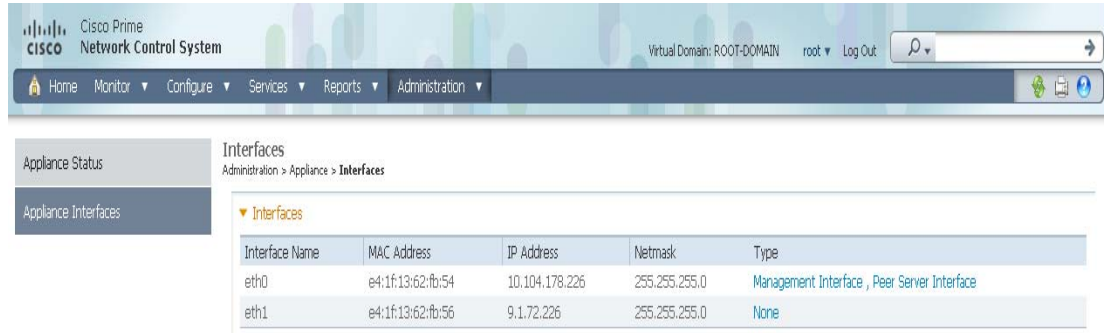

291076

## Viewing Appliance Interface Details

To view the Appliance Interface details, perform the following details:

- Step 1** Choose **Administration > Appliance**.
- Step 2** Choose **Appliance Interface** from the left sidebar menu. The Interface page appears (see [Figure 15-39](#)).

**Figure 15-39 Appliance Interface Details**

291077

**Table 15-8 Appliance Interface Details**

| Parameter      | Description                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | User-defined name for this interface                                                                                               |
| MAC Address    | MAC address of the interface                                                                                                       |
| IP Address     | Local network IP address of the interface                                                                                          |
| Netmask        | A range of IP addresses defined so that only machines with IP addresses within the range are allowed to access an Internet service |
| Type           | Static (Management, Peer, AP-Manager, Service-Port, and Virtual interfaces) or Dynamic (operator-defined interfaces)               |

- Step 3** Click on the **Interface Type** to configure if the interface belongs to peer server or to the management interfaces.

## Managing Individual Licenses

This section contains the following topics:

- [Managing Controller Licenses, page 15-113](#)
- [Managing NCS Licenses, page 15-114](#)
- [Managing MSE Licenses, page 15-115](#)

## Managing Controller Licenses

Choose **Files > Controller Files** from the left sidebar menu to monitor the controller licenses.

**Note** NCS does not directly manage controller licenses. It simply monitors the licenses. You can manage the licenses using CLI, WebUI, or Cisco License Manager (CM) at the following URL:

<https://tools.cisco.com/SWIFT/Licensing/PrivateRegistrationServlet>.

The page displays the following information:

- Controller Name
- Controller IP
- Feature—The feature options are wplus-ap-count, wplus, base-ap-count, and base. Two are active at any one time for an enable feature level of WPLUS or Base and the AP count (base-ap-count or wplus-ap-count), which determines the number of access points that the controller supports (12, 25, 50, 100, or 250). For every physical license installed, two license files show up in the controller as a feature level license and an ap-count license. For example, if you install a WPlus 500 license on the controller, you see a wplus or wplus-ap-count feature.

**Note** You can have both a WPLUS and Base license, but only one can be active at a time.

- AP Limit—The number of access points that the controller supports.
- EULA Status—Whether the End User License Agreement has been accepted or not.
- Comments—Any user-entered comments about the license when it is installed.
- Type—Permanent, evaluation, or extension.

**Note** For any controllers with a type other than Permanent, the number of days left to expiration is shown. A license is not in use does not incur the reduction in count until it is in use.

- Status —The status can be described as follows:
  - Inactive—The license level is being used, but this license is not in use.
  - Not In Use—The license level is not being used, and this license is currently unrecognized.
  - Expired in Use—The license is being used, but it is expired and will not be used upon next reboot.
  - Expired Not in Use—The license has expired and can no longer be used.
  - Count Consumed—The ap-count license is In Use.

All licensed controllers and their information are displayed. If you want to change how the controller results are displayed, click **Edit View**. In the Edit View page, use the **Show** and **Hide** buttons to determine how the columns appear.

Above the Controller Summary list is a series of filters that allow you to sort the list by Controller Name, Feature, or Type.

## Managing NCS Licenses

To manage NCS licenses, follow these steps. For information on deciding on a license, types of licenses, installing a license, and backing up and restoring NCS licenses, see the [“NCS Licenses” section on page B-1](#).

- 
- Step 1** Choose **Administration > License Center** to access the License Center page. It provides information about the NCS licenses, the controller license, and elements of MSE licenses.

For NCS licenses, the following is displayed:

- Type
- UDI
- Product Id
- Serial Number
- Device Limit
- Device Count
- % Used

For controller licensing, the following is displayed:

- Controller Count
- AP Limit
- Type

For tag elements, client elements, wIPS Local Mode APs and wIPS Monitor Mode APs within MSE, the following is displayed:

- Permanent Limit
- Evaluation Limit
- Count
- % Used

- Step 2** Choose the **Files** left sidebar menu to view the license information for NCS, Controllers and MSE:

For NCS licenses, the following is displayed:

- License ID
- Feature
- Device Limit
- Type

For Controller licenses, the following is displayed:

- Controller Name
- Controller IP
- Feature
- AP Limit
- EULA Status
- Comments

- Type
- Status
- 

For NCS licenses, the following is displayed:

- MSE License File
- MSE
- Type
- Limit
- License Type

You can select the check box of the desired license and either add or delete it.

---

## Managing MSE Licenses

To manage MSE license, choose **Files > MSE Files** from the left sidebar menu. The page displays the MSE licenses found and includes the following information:

- MSE License File
- MSE Name
- Element Type
- Limit
- License Type

**Note** Evaluation extension and tag licenses are not displayed in this page.

---

With full NCS support, the complete functionality of CLM is embedded within NCS. You therefore have a single point of management for devices and their licenses.

If you need to search for a particular license file, you can choose an element type from the drop-down box, and click **Go**. For example, if you choose Client, and click Go, all license files with client licenses are returned.

## Configuring ACS 5.x

This section provides instructions for configuring ACS 5.x to work with NCS.

This section contains the following topics:

- [Creating Network Devices and AAA Clients, page 15-116](#)
- [Adding Groups, page 15-116](#)
- [Adding Users, page 15-117](#)

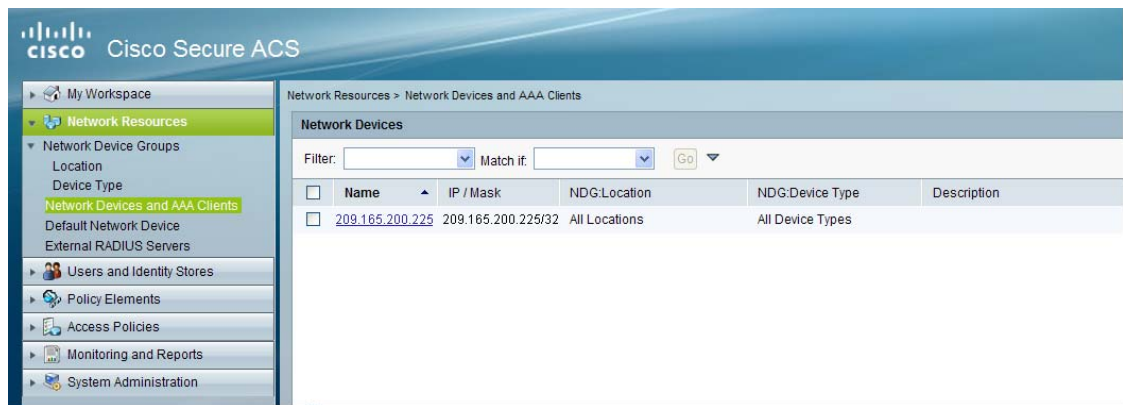

- [Creating Policy Elements or Authorization Profiles, page 15-118](#)
- [Creating Authorization Rules, page 15-119](#)
- [Configuring Access Services, page 15-121](#)

## Creating Network Devices and AAA Clients

To create Network Devices and AAA Clients, follow these steps:

- 
- Step 1** Choose **Network Resources > Network Devices and AAA Clients**.

**Figure 15-40** Network Devices Page

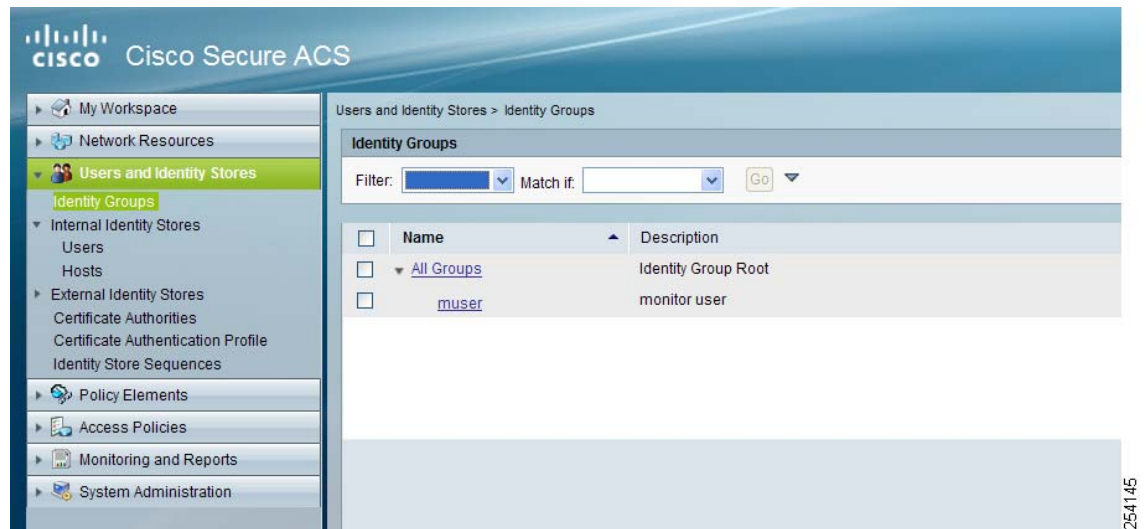

- Step 2** Enter an IP Address.
- 

## Adding Groups

To add groups, follow these steps:

- 
- Step 1** Choose **Users and Identity Stores > Identity Groups**.

Figure 15-41 Identify Groups Page

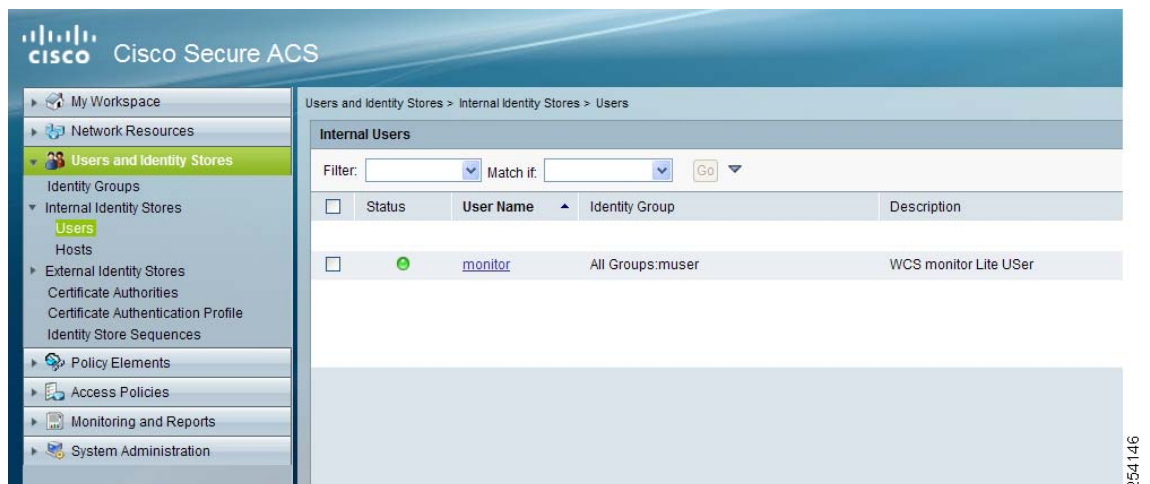

**Step 2** Create a Group.

## Adding Users

To add users, follow these steps:

**Step 1** Choose **Users and Identity Stores > Internal Identity Stores > Users**.

Figure 15-42 Internal Users Page

**Step 2** Add a user, and then map to group to that user.

## Creating Policy Elements or Authorization Profiles

This section contains the following topics:

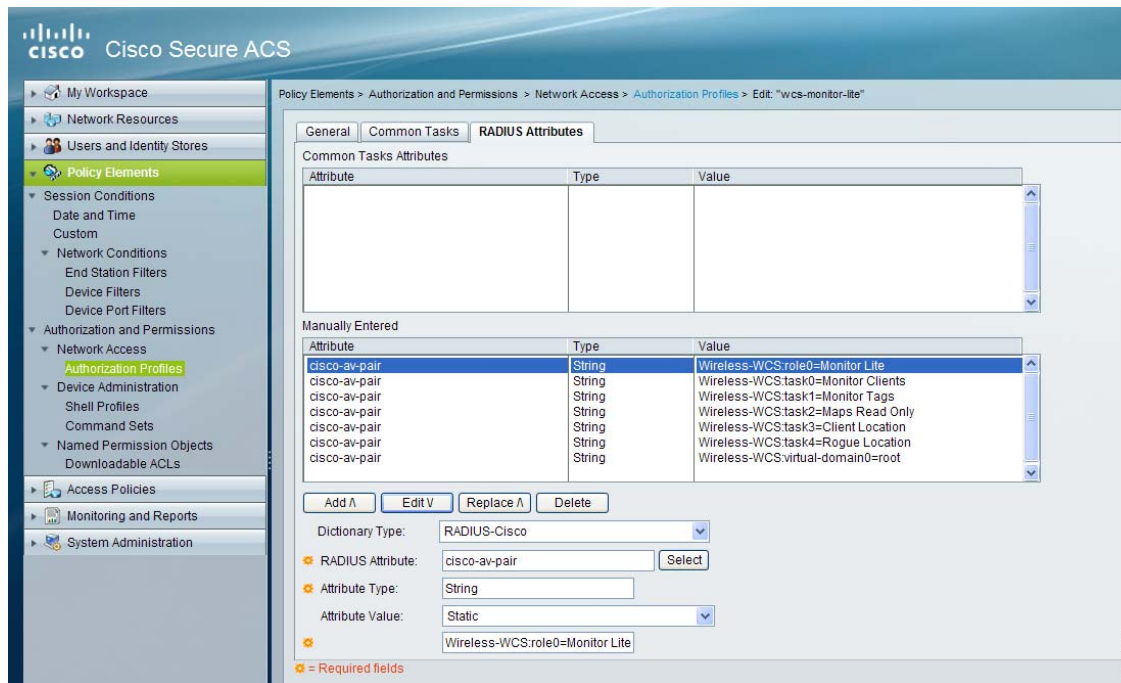

- “Creating Policy Elements or Authorization Profiles for RADIUS” section on page 15-118
- “Creating Policy Elements or Authorization Profiles For TACACS” section on page 15-118

### Creating Policy Elements or Authorization Profiles for RADIUS

To create policy elements or authorization profiles for RADIUS, perform the following steps:

- Step 1** Choose **Policy Elements > Authorization and Permissions > Network Access > Authorization Profiles**.
- Step 2** Click **Create**.
- Step 3** Enter a Name and Description.
- Step 4** Select the **RADIUS Attributes** tab.
- Step 5** Add RADIUS Attributes one by one (see [Figure 15-43](#)).

**Figure 15-43 Authorization Profiles Page**

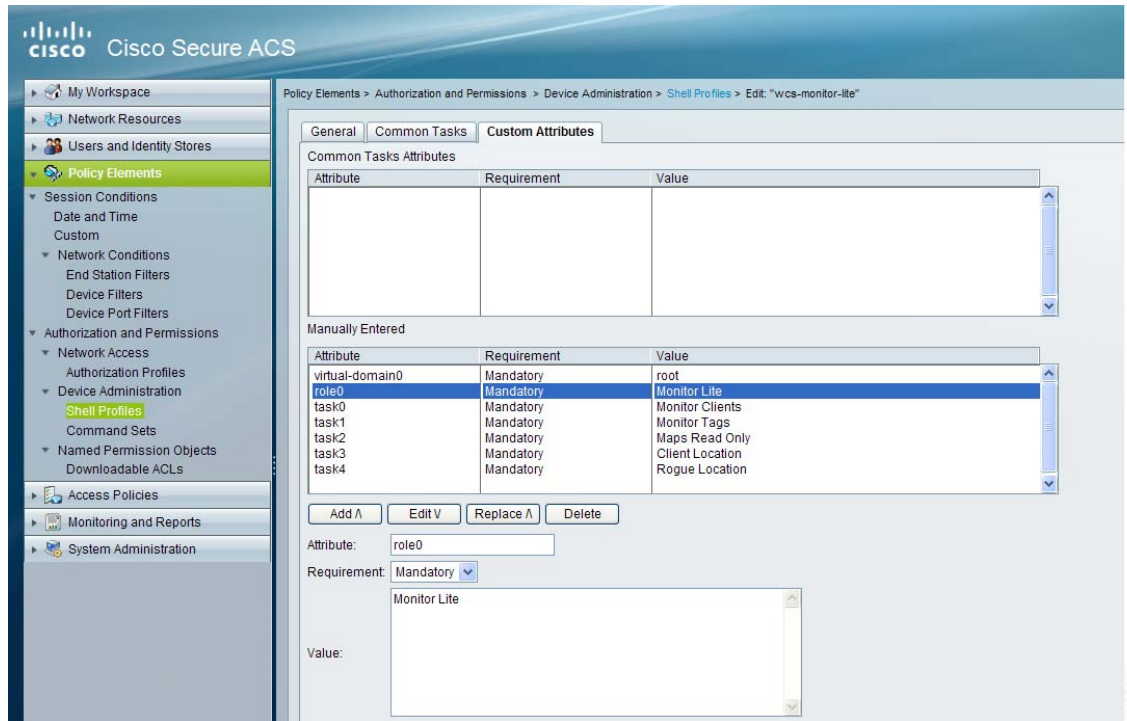

- Step 6** Click **Submit**.

### Creating Policy Elements or Authorization Profiles For TACACS

To create policy elements or authorization profiles for RADIUS, perform the following steps:

- Step 1** Choose **Policy Elements > Authorization and Permissions > Device Administration > Shell Profiles**.
- Step 2** Click **Create**.
- Step 3** Enter a Name and Description.
- Step 4** Select the **Custom Attributes** tab.
- Step 5** Add the TACACS Attributes one by one (see [Figure 15-44](#)).

**Figure 15-44 Shell Profiles Page**

- Step 6** Click **Submit**.

## Creating Authorization Rules

This section provides instructions for configuring authorization for RADIUS and TACACS.

This section contains the following topics:

- [“Creating Service Selection Rules for RADIUS” section on page 15-119](#)
- [“Creating Service Selection Rules for TACACS” section on page 15-120](#)

## Creating Service Selection Rules for RADIUS

To create service selection rules for RADIUS, perform the following steps:

- Step 1** Choose **Access Policies > Access Services > Service Selection Rules**.

- Step 2** Click **Create**.
- Step 3** Select the protocol as **Radius** and choose **Default Network Access** from the Service drop-down list. (see [Figure 15-45](#)).

**Figure 15-45 Service Selection Page**

- Step 4** Click **OK**.

## Creating Service Selection Rules for TACACS

To create service selection rules for TACACS, follow these steps:

- Step 1** Choose **Access Policies > Access Services > Service Selection Rules**.
- Step 2** Click **Create**.
- Step 3** Select the protocol as **TACACS** and choose **Default Device Admin** from the Service drop-down list. (see [Figure 15-46](#)).

Figure 15-46 Service Selection Page

**Step 4** Click OK.

## Configuring Access Services

This section provides instructions for configuring access services for RADIUS and TACACS.

This section contains the following topics:

- [Configuring Access Services for RADIUS, page 15-121](#)
- [Configuring Access Services for TACACS, page 15-122](#)

## Configuring Access Services for RADIUS

To configure access services for RADIUS, perform the following steps:

**Step 1** Login to the ACS 5.x Server and choose **Access Policies > Access Services > Default Network Access**.

**Step 2** From the General tab, select the Policy Structure you want to use. By default all the three policy structures are selected.

**Step 3** From the Allowed Protocols, select the protocols you want to use.

**Note** You can retain the defaults for identity and group mapping.

**Step 4** To create an authorization rule for RADIUS, choose **Access Policies > Access Services > Default Network Access > Authorization**. (see [Figure 15-47](#))

**Step 5** Click **Create**.

**Step 6** In Location, select **All Locations** or you can create a rule based on the location.

**Step 7** In Group, select the group that you created earlier.

**Step 8** In Device Type, select **All Device Types** or you can create a rule based on the Device Type.

**Step 9** In Authorization Profile, select the authorization profile created for RADIUS.

**Figure 15-47 Authorization Page**

**General**  
Name: Rule-3 Status: Enabled

The Customize button in the lower right area of the policy rules screen controls which policy conditions and results are available here for use in policy rules.

**Conditions**

NDG:Location: in All Locations

Identity Group: in All Groups:muser

NDG:Device Type: in All Device Types

**Results**  
Authorization Profiles:

wcs-monitor-lite

You may select multiple authorization profiles. Attributes defined in multiple profiles will use the value from the first profile defined.

254152

**Step 10** Click **OK**.

**Step 11** Click **Save**.

## Configuring Access Services for TACACS

To configure access services for TACACS, follow these steps:

**Step 1** Choose **Access Policies > Access Services > Default Device Admin**.

**Step 2** In the General tab, select the Policy Structure you want to use. By default all the three will be selected. Similarly, in Allowed Protocols, select the protocols you want to use.

**Note** You can retain the defaults for identity and group mapping.

**Step 3** To create an authorization rule for TACACS, choose **Access Policies > Access Services > Default Device Admin > Authorization**. (see [Figure 15-48](#)).

**Step 4** Click **Create**.

**Step 5** In Location, select All Locations or you can create a rule based on the location.

**Step 6** In Group, select the group that you created earlier.

- Step 7** In Device Type, select All Device Types or you can create a rule based on the Device Type.
- Step 8** In Shell Profile, select the shell profile created for TACACS.

**Figure 15-48 Authorization Page**

**General**  
 Name: Rule-1 Status: Enabled

The Customize button in the lower right area of the policy rules screen controls which policy conditions and results are available here for use in policy rules.

**Conditions**

Identity Group: in All Groups:muser Select

NDG:Location: in All Locations Select

NDG:Device Type: in All Device Types Select

Time And Date: -ANY-

**Results**  
 Shell Profile: wcs-monitor-lite Select

254154

- Step 9** Click **OK**.
- Step 10** Click **Save**.

## Managing Licenses

This section contains the following topics:

- [Managing NCS Licenses, page 15-123](#)
- [Monitoring Controller Licenses, page 15-124](#)
- [Managing Mobility Services Engine \(MSE\) Licenses, page 15-125](#)

## Managing NCS Licenses

If you choose Files > NCS Files from the left sidebar menu, you can manage the NCS licenses. This page displays the following information:

- Product Activation Key (PAK)
- Feature
- Access point limit
- Type

## Adding a New NCS License File

To add a new NCS license file, follow these steps:

- 
- Step 1** In the License Center > Files > NCS Files page, click **Add**.
- Step 2** In the Add a License File dialog box, enter or browse to the applicable license file.
- Step 3** Once displayed in the License File text box, click **Upload**.
- 

## Deleting an NCS License File

To delete a NCS license file, follow these steps:

- 
- Step 1** In the License Center > Files > NCS Files page, select the check box of the NCS license file that you want to delete.
- Step 2** Click **Delete**.
- Step 3** Click **OK** to confirm the deletion.
- 

## Monitoring Controller Licenses

If you choose Files > Controller Files from the left sidebar menu, you can monitor the controller licenses.

### Note

NCS does not directly manage controller licenses, rather it simply monitors the licenses. To manage the licenses you can use CLI, WebUI or Cisco License Manager (CLM) [[Link to product page](#)].

This page displays the following parameters:

- Controller Name
- Controller IP—The IP address of the controller.
- Feature—License features include wplus-ap-count, wplus, base-ap-count, and base.

For every physical license installed, two license files display in the controller: a feature level license and an ap-count license. For example if you install a “WPlus 500” license on the controller, “wplus” and “wplus-ap-count” features display. There are always two of these features active at any one time that combine to enable the feature level (WPlus or Base) and the AP count.

### Note

You can have both a WPlus and Base license, but only one can be active at any given time.

- AP Limit—The maximum capacity of access points allowed to join this controller.
- EULA status—Displays the status of the End User License Agreement and is either Accepted or Not Accepted.
- Comments—User entered comments when the license is installed.
- Type—The four different types of licenses are as follows:
  - Permanent—Licenses are node locked and have no usage period associated with them. They are issued by Cisco licensing portal and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.

- Evaluation—Licenses are non-node locked and are valid only for a limited time period. They are used only when no permanent, extension, or grace period licenses exist. Before using an evaluation license, you must accept an End User License Agreement (EULA). Even though they are non-node locked, their usage is recorded on the device. The number of days left displays for the evaluation license with the fewest number of remaining active license days.
- Extension—Licenses are node locked and metered. They are issued by Cisco licensing portal and must be installed using management interfaces on the device. Before using an extension license, you must accept a EULA during installation.
- Grace Period—Licenses are node locked and metered. These licenses are issued by Cisco licensing portal as part of the permission ticket to rehost a license. They are installed on the device as part of the rehost operation, and you must accept a EULA as part of the rehost operation.

---

**Note** Types other than Permanent display the number of days left until the license expires. Licenses not currently in use do not have their counts reduced until they become “In Use”.

---

- Status
  - In Use—The license level and the license are in use.
  - Inactive—The license level is being used, but this license is not being used.
  - Not In Use—The license level is not being used and this license is not currently recognized.
  - Expired In Use—The license is being used, but is expired and will not be used upon next reboot.
  - Expired Not In Use—The license has expired and can no longer be used.
  - Count Consumed—The ap-count license is In Use.

---

**Note** If you need to filter the list of license files, you can enter a controller name, feature, or type and click **Go**.

---

## Managing Mobility Services Engine (MSE) Licenses

If you choose Files > MSE Files from the left sidebar menu, you can manage the mobility services engine licenses.

This section contains the following topics:

- [Registering Product Authorization Keys, page 15-126](#)
- [Installing Client and wIPS License Files, page 15-127](#)
- [Deleting a Mobility Services Engine License File, page 15-128](#)

The page displays the mobility services engine licenses found and includes the following information:

---

**Note** Because tag licenses are added and managed using appropriate vendor applications, tag licenses are not displayed in this page. Refer to the following URL for more information:  
<http://support.aeroscout.com>.  
 Evaluation (demo) licenses are also not displayed.

---

Tag licenses are installed using the *AeroScout System Manager* only if the tags are tracked using Partner engine. Otherwise the tags will be counted along with the CAS element license.

- MSE License File—Indicates the MSE License.
- MSE—Indicates the MSE name.
- Type—Indicates the type of mobility services engine (client elements, wIPS local mode or wIPS monitor mode access points).
- Limit—Displays the total number of client elements or wIPS monitor mode access points licensed across the mobility services engine.
- License Type—Permanent licenses are the only license types displayed on this page.
  - Permanent—Licenses are node locked and have no usage period associated with them. They are issued by Cisco licensing portal and must be installed using management interfaces on the device. Upon installation of these licenses, you have the necessary permissions across different versions.

## Registering Product Authorization Keys

You receive a product authorization key (PAK) when you order a client, wIPS, or tag license from Cisco. You must register the PAK to receive the license file for install on the mobility services engine. License files are emailed to you after successfully registering a PAK.

Client and wIPS PAKs are registered with Cisco.

### Note

Tag PAKs are registered with AeroScout. To register your tag PAK, go to this URL:  
<http://www.aeroscout.com/content/support>

To register a product authoritative key (PAK) to obtain a license file for install, follow these steps:

**Step 1** Open a browser page and go to [www.cisco.com/go/license](http://www.cisco.com/go/license).

### Note

You can also access this site by clicking the Product License Registration link located on the License Center page of NCS.

**Step 2** Enter the PAK and click **SUBMIT**.

**Step 3** Verify the license purchase. Click **Continue** if correct. The licensee entry page appears.

### Note

If the license is incorrect, click the **TAC Service Request Tool** link to report the problem.

**Step 4** At the Designate Licensee page, enter the mobility service engine UDI in the host ID text box. This is the mobility services engine on which the license will be installed.

### Note

UDI information for a mobility services engine is found in the General Properties group box at Services > Mobility Services Engine > *Device Name* > *System*.

**Step 5** Select the **Agreement** check box. Registrant information appears beneath the Agreement check box. Modify information as necessary.

**Note** Ensure that the phone number does not include any characters in the string for the registrant and end user. For example, enter 408 555 1212 rather than 408.555.1212 or 408-555-1212.

- Step 6** If registrant and end user are not the same person, select the **Licensee (End-User)** check box beneath registrant information and enter the end user information.
- Step 7** Click **Continue**. A summary of entered data appears.
- Step 8** At the Finish and Submit page, review registrant and end user data. Click **Edit Details** to correct information, if necessary.
- Step 9** Click **Submit**. A confirmation page appears.

## Installing Client and wIPS License Files

You can install CAS element licenses and wIPS licenses from NCS.

**Note** Tag licenses are installed using the *AeroScout System Manager*. Refer to the following URL for additional information:  
<http://support.aeroscout.com>.

To add a client or wIPS license to NCS after registering the PAK, follow these steps:

- Step 1** Choose **Administration > License Center**.
- Step 2** From the left sidebar menu, choose **Files > MSE Files**.
- Step 3** From the License Center > Files > MSE Files page, click **Add** to open the Add a License File dialog box.
- Step 4** From the MSE Name drop-down list, choose the mobility services engine to which you want to add the license file.

**Note** Verify that the UDI of the selected mobility services engine matches the one you entered when registering the PAK.

- Step 5** Enter the license file in the License File text box or browse to the applicable license file.
- Step 6** Once displayed in the License File text box, click **Upload**. Newly added license appears in mobility services engine license file list.

**Note** A Context Aware Service (CAS) restarts if a client or tag license is installed; a wIPS service restarts if a wIPS license is installed.

**Note** Services must come up before attempting to add or delete another license.

## Deleting a Mobility Services Engine License File

To delete a mobility services engine license file, follow these steps:

- 
- Step 1** From the License Center > Files > MSE Files page, select the check box of the mobility services engine license file that you want to delete.
- Step 2** Click **Delete**.
- Step 3** Click **OK** to confirm the deletion.
- 

For more information on Licenses, see [“Getting Started” section on page 2-1](#).

## Configuring AAA

From **Administration** > **AAA**, authentication, authorization, and accounting (AAA) can be configured for NCS. The only username that has permissions to configure NCS AAA is *root* or SuperUser. Any changes to local users accounts will be in effect when configured for local mode. If using external authentication, for example RADIUS or TACACS+, the user changes must be done on the remote server.

This section contains the following topics:

- [Changing Password, page 15-128](#)
- [Configuring Local Password Policy, page 15-130](#)
- [Configuring AAA Mode, page 15-129](#)
- [Configuring Users, page 15-130](#)
- [Configuring Groups, page 15-134](#)
- [Viewing Active Sessions, page 15-136](#)
- [Configuring TACACS+ Servers, page 15-137](#)
- [Configuring RADIUS Servers, page 15-139](#)
- [Authenticating AAA Users Through RADIUS Using Cisco Identity Services Engine \(ISE\), page 15-141](#)

## Changing Password

Choose **Administration** > **AAA** > **Change Password** from the left sidebar menu to access this page.

This page enables you to change the password for current logged in User.

- User—Applies to login logged in User.
- Old Password—Current password.
- New Password—Enter the new password using ASCII characters.
- Confirm password—Reenter the new password.
- Submit—Click **Submit** to confirm password change.

## Configuring AAA Mode

Choose **Administration > AAA > AAA Mode** from the left sidebar menu to access this page.

This page enables you to configure the authentication mode for all users.

- AAA Mode Settings
  - Local—Authenticate users to a local database.
  - RADIUS—Authenticate users to an external RADIUS server.
  - TACACS+—Authenticate users to an external TACACS+ server.
- Enable fallback to Local—If an external authentication server is down, this provides the option to authenticate users locally. This option is only available for RADIUS and TACACS+.
  - Choose **ONLY on no server response** or **on auth failure or no server response** from the drop-down list.

See also the “[Configuring TACACS+ Servers](#)” section on page 15-137 and the “[Configuring RADIUS Servers](#)” section on page 15-139.

### AAA Mode Settings

To choose a AAA mode, follow these steps:

- 
- Step 1** Choose **Administration > AAA**.
- Step 2** Choose **AAA Mode** from the left sidebar menu. The AAA Mode Settings page appears (see [Figure 15-49](#)).

**Figure 15-49 AAA Mode Settings Page**

291341

- Step 3** Choose which AAA mode you want to use. Only one can be selected at a time.

Any changes to local user accounts are effective only when you are configured for local mode (the default). If you use remote authentication, changes to the credentials are made on a remote server. The two remote authentication types are RADIUS and TACACS+. RADIUS requires separate credentials for different locations (East and West Coast). TACACS+ is an effective and secure management framework with a built-in failover mechanism.

- Step 4** Select the **Enable Fallback to Local** check box if you want the administrator to use the local database when the external AAA server is down.

**Note** This option is unavailable if *Local* was selected as a AAA mode type.

**Step 5** Click **OK**.

---

## Configuring Local Password Policy

Choose **Administration > AAA > Local Password Policy** from the left sidebar menu to access this page. This page enables you to determine your local password policy.

you can enable or disable the following policies for your local password:

- Set the minimum length of your password. By default it is set as 8.
- Password cannot be the username or the reverse of the username.
- Password cannot be the word cisco or ocsic (cisco reversed) or any special characters replaced for the same.
- Root password cannot be the word public.
- No character can be repeated more than three time consecutively in the password.
- Password must contain character from three of the character classes: upper case, lower case, digits, and special characters.

Click **Save** to confirm the Local Password Policy changes.

## Configuring Users

This section describes how to configure a NCS user. Besides complete access, you can give administrative access with differentiated privileges to certain user groups.

Choose **Administration > AAA > Users** from the left sidebar menu to access this page. You can use this page to view the User details, create a User, delete a User as well as edit User details.

This section contains the following topics:

- [Viewing User Details, page 15-130](#)
- [Edit Current Users - Passwords and Assigned Groups, page 15-131](#)
- [Edit Current Users - Permitted Tasks, page 15-131](#)
- [Edit Current Users - Groups Assigned to this User, page 15-131](#)
- [Adding a New User, page 15-132](#)
- [Add User Name, Password, and Groups, page 15-132](#)
- [Assign a Virtual Domain, page 15-133](#)

## Viewing User Details

You can view details of Users in NCS using this option. The following information is available in the Administration > AAA > Users page:

- Current User Names
- Member Of—Groups with which the user is associated. Click an item in the **Member Of** column to view permitted tasks for this user.
- Audit Trail—Click the Audit Trail icon for a specific user to view or clear current audit trails. See the [“Audit User Operations” section on page 15-134](#).

**Note**

---

NCS supports a maximum of 25 concurrent User logins at any point of time.

---

### Edit Current Users - Passwords and Assigned Groups

To edit current user account passwords and assigned groups, follow these steps:

- 
- Step 1** Choose **Administration > AAA**.
  - Step 2** From the left sidebar menu, choose **Users**.
  - Step 3** Select a specific user from the User Name column.
  - Step 4** Enter and confirm a new password, if necessary (optional).
  - Step 5** If necessary, make changes to the Groups Assigned to this User check box selections.

**Note**

---

If the user belongs to Lobby Ambassador, Monitor Lite, North Bound API, or User Assistant group, the user cannot belong to any other group.

---

- Step 6** Select **Submit** to confirm the changes or **Cancel** to close the page without activating any changes.
- 

### Edit Current Users - Permitted Tasks

To edit the permitted tasks for this user account, follow these steps:

- 
- Step 1** Choose **Administration > AAA**.
  - Step 2** From the left sidebar menu, choose **Users**.
  - Step 3** Select the applicable group(s) from the Member Of column.
  - Step 4** From the List of Tasks Permitted column, select or deselect the applicable tasks to permit or disallow them.

**Note**

---

The list of available tasks changes depending on the type of group.

---

- Step 5** Select **Submit** to confirm the changes or **Cancel** to close the page without activating any changes.
- 

### Edit Current Users - Groups Assigned to this User

To edit the groups assigned to this user, follow these steps:

- 
- Step 1** Choose **Administration > AAA**.
  - Step 2** From the left sidebar menu, choose **Users**.
  - Step 3** Select a specific user from the User Name column.
  - Step 4** Select the check box(es) of the groups to which this user will be assigned.

**Note** If the user belongs to Lobby Ambassador, Monitor Lite, North Bound API, or User Assistant group, the user cannot belong to any other group.  
**Root** is only assignable to 'root' user and that assignment cannot be changed.

**Note** For more information on assigned groups, see Step 7 in the “[Adding a New User](#)” section on [page 15-132](#) section.

**Step 5** Select **Submit** to confirm the changes or **Cancel** to close the page without activating any changes.

## Adding a New User

The Add User page allows the administrator to set up a new user login including username, password, groups assigned to the user, and virtual domains for the user. For more information on assigning virtual domains, see [Assign a Virtual Domain, page 15-133](#).

**Note** By assigning virtual domains to a user, the user is restricted to information applicable to those virtual domains.

**Note** You must have SuperUser status to access this page.

## Add User Name, Password, and Groups

To add a new user, follow these steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **Users**.
- Step 3** From the **Select a command** drop-down list, choose **Add User**.
- Step 4** Click **Go**.
- Step 5** Enter a new Username.
- Step 6** Enter and confirm a password for this account.
- Step 7** Select the check box(es) of the groups to which this user will be assigned.

**Note** If the user belongs to Lobby Ambassador, Monitor Lite, North Bound API, or User Assistant group, the user cannot belong to any other group.

- Admin—Allows users to monitor and configure NCS operations and perform all system administration tasks except administering NCS user accounts and passwords.
- Config Managers—Allows users to monitor and configure NCS operations.

- Lobby Ambassador—Allows guest access for configuration and management only of user accounts. If Lobby Ambassador is selected, a Lobby Ambassador Defaults tab appears. See the “[Managing Lobby Ambassador Accounts](#)” section on page 7-16 for more information on setting up a Lobby Ambassador account.
- Monitor Lite—Allows monitoring of assets location.
- North Bound API User—Group used only with NCS Web Service consumers.

**Note** Note North Bound API Users cannot be assigned a Virtual Domain. When a North Bound API group is selected, the Virtual Domains tab is not available.

- Root—This group is only assignable to 'root' user and that assignment cannot be changed.
- Super Users—Allows users to monitor and configure NCS operations and perform all system administration tasks including administering NCS user accounts and passwords. Superuser tasks can be changed.
- System Monitoring—Allows users to monitor NCS operations.
- User Assistant—Allows local net user administration only.
- User Defined.

## Assign a Virtual Domain

To assign a virtual domain to this user, follow these steps:

**Step 1** Select the **Virtual Domains** tab. This page displays all virtual domains available and assigned to this user.

**Note** The Virtual Domains tab enables the administrator to assign virtual domains for each user. By assigning virtual domains to a user, the user is restricted to information applicable to those virtual domains.

**Note** North Bound API Users cannot be assigned a Virtual Domain. When a North Bound API group is selected, the Virtual Domains tab is not available.

**Step 2** Click to highlight the virtual domain in the Available Virtual Domains list that you want to assign to this user.

**Note** You can select more than one virtual domain by pressing the Shift or Control key.

**Step 3** Click **Add**. The virtual domain moves from the Available Virtual Domains to the Selected Virtual Domains list.

To remove a virtual domain from the Selected Virtual Domains list, click to highlight the domain in the Selected Virtual Domains list and click **Remove**. The virtual domain moves from the Selected Virtual Domains to the Available Virtual Domains list.

- Step 4** Select **Submit** to or **Cancel** to close the page without adding or editing the current user.
- 

## Audit User Operations

To view or clear audit information for this account, follow these steps:

---

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **Users**.
- Step 3** Click the **Audit Trail** icon for the applicable account.

**Note** You must have SuperUser status to access this page.

---

This page enables you to view a list of user operations over time.

- User—User login name.
  - Operation—Type of operation audited.
  - Time—Time operation was audited.
  - Status—Success or Failure.
  - Reason—Reason is applicable only for failure.
  - Configuration Changes—This field provides a Details link if there are any configuration changes. Click on the Details link for more information on the configuration changes done by an individual user. The entries will list out the change of values for individual parameters between NCS and Controller. For more information on Audit Trail Details, see [“Audit Trail Details Page” section on page 7-9](#).
- Step 4** To clear an audit trail, select the check box for the applicable audit, select Clear Audit Trail from the Select a command drop-down list, click **Go**, and click **OK** to confirm.
- 

## Configuring Groups

This page provides you with a list of all current groups and their associated members.

- Group Name—Click a specific group to view or edit the permitted tasks for this group. The available tasks change depending on the type of group. See the [“Edit Current Users - Permitted Tasks” section on page 15-131](#) for more information.
- Members—Click a specific user under the Member column to view or edit that user. See the [“Edit Current Users - Passwords and Assigned Groups” section on page 15-131](#) for more information.
- Audit Trail—Click the Audit Trail icon to view or clear audit for this group. See the [“Audit User Operations” section on page 15-134](#) for more information.
- Export—Click to export the task list associated with this group.

To access the Groups page, follow these steps:

---

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **User Group**.

**Note**

You must have SuperUser status to access this page.

## Viewing or Editing User Group Information

Follow these steps to see specific tasks the user is permitted to do within the defined group or make changes to the tasks.

- Step 1** Choose **Administration > AAA**.
- Step 2** Choose **User Groups** from the left sidebar menu.
- Step 3** Click in the **Group Name** column. The Group Detail: *User Group* page appears (see [Figure 15-50](#)).

**Note**

The detailed page varies based on what group you choose. [Figure 15-50](#) shows the detailed page of the superuser.

**Figure 15-50 Detailed User Groups Page**

| Group Name        | Members                    | Audit Trail | Export    |
|-------------------|----------------------------|-------------|-----------|
| Admin             | User_admin baspatil bas123 |             | Task List |
| Config Managers   | User_cm                    |             | Task List |
| Lobby Ambassador  | User_la                    |             | Task List |
| Monitor Lite      | User_ml                    |             | Task List |
| North Bound API   | User_nrb                   |             | Task List |
| Root              | root                       |             | Task List |
| Super Users       | User_su                    |             | Task List |
| System Monitoring | User_sm                    |             | Task List |
| User Assistant    | User_ua                    |             | Task List |
| User Defined 1    |                            |             | Task List |
| User Defined 2    |                            |             | Task List |
| User Defined 3    |                            |             | Task List |
| User Defined 4    |                            |             | Task List |

291342

You can see the specific tasks the user is permitted to do within the defined group.

- Step 4** Click Audit Trail to view the audit trail information for the corresponding User group. For more information on Audit Trail Details, see [“Audit Trail Details Page”](#) section on page 7-9
- Step 5** Make any necessary changes to the tasks.

**Table 15-9 Default User Groups**

| User Group       | Description                                                                |
|------------------|----------------------------------------------------------------------------|
| Admin            | Group for NCS Administration.                                              |
| Config Managers  | Group for monitoring and configuration tasks.                              |
| Lobby Ambassador | Group to allow Guest user administration only. This Group is not editable. |

**Table 15-9** Default User Groups

| User Group        | Description                                                               |
|-------------------|---------------------------------------------------------------------------|
| Monitor Lite      | Group to allow monitoring of assets only. Group is not editable.          |
| North Bound API   | Group to allow access to North Bound API's. Group is not editable.        |
| Root              | Group for root user. Group is not editable.                               |
| Super Users       | Group to allow all NCS tasks.                                             |
| System Monitoring | Group for monitoring only tasks.                                          |
| User Assitant     | Group to allow Local Net user administration only. Group is not editable. |
| User Defined 1    | User definable group.                                                     |
| User Defined 2    | User definable group.                                                     |
| User Defined 3    | User definable group.                                                     |
| User Defined 4    | User definable group.                                                     |

**Step 6** Click **Submit**.

## Viewing Active Sessions

Choose **Administration > AAA > Active Sessions** from the left sidebar menu to open this page.

This page displays a list of users currently logged in. The user highlighted in red represents your current login.

### Note

You must be logged into a user account with SuperUsers privileges to see active sessions.

If a column heading is a hyperlink, click the heading to sort the list of active sessions in descending or ascending order along that column. The sort direction is toggled each time the hyperlink is clicked.

The Active Sessions page has the following columns:

- Username—The User ID of the User who is logged in.
- IP/Host Name—The IP address or the hostname of the machine on which the browser is running. If the hostname of the user machine is not in DNS, the IP address is displayed.
- Login Time—The time at which the user logged in to NCS. All times are based on the NCS server machine time.
- Last Access Time—The time at which the user browser accessed NCS. All times are based on the NCS server machine time.

### Note

The time displayed in this column is usually a few seconds behind the current system time because Last Access Time is updated frequently by the updates to the alarm status panel. However, if a user navigates to a non NCS web page in the same browser, the disparity in time will be greater. Alarm counts are not updated when the browser is not displaying NCS web pages.

- Login Method—The login method can be either of the following:

- Local
- Radius
- TACACS+
- User Groups—The list of groups the user belongs to.
- Audit trail icon—Link to page that displays the audit trail (previous login times) for that user.
- 

## Configuring TACACS+ Servers

This section describes how to add and delete TACACS+ servers. TACACS+ servers provide an effective and secure management framework with built-in failover mechanisms. If you want to make configuration changes, you must be authenticated.

The TACACS+ page shows the IP address, port, retransmit rate, and authentication type (Password Authentication Protocol (PAP)) or Challenge Handshake Authentication Protocol (CHAP) of the TACACS+ server. The TACACS+ servers are tried based on how they were configured.

### Note

In order to activate TACACS+ servers, you must enable them as described in the “[Importing Tasks Into ACS](#)” section on page 15-52.

To configure TACACS+, follow these steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **TACACS+**. The TACACS+ page appears (see [Figure 15-51](#)).

**Figure 15-51 TACACS+ Page**

The screenshot displays the Cisco Prime Network Control System interface. The top navigation bar includes Home, Monitor, Configure, Services, Reports, and Administration. The left sidebar menu is expanded to show TACACS+ under the Administration section. The main content area is titled 'Add TACACS+ Server' and contains the following configuration fields:

- Server Address: 209.75.200.165
- Port: 49
- Shared Secret Format: ASCII
- Shared Secret: (empty field)
- Confirm Shared Secret: (empty field)
- Retransmit Timeout: 5 (secs)
- Retries: 1
- Authentication Type: PAP
- Local Interface IP: 64.103.253.52

Buttons for 'Save' and 'Cancel' are located at the bottom of the form.

- Step 3** The TACACS+ page shows the IP address, port, retransmit rate, and authentication type (Password Authentication Protocol (PAP)) or Challenge Handshake Authentication Protocol (CHAP) TACACS+ server. The TACACS+ servers are tried based on how they were configured.

---

**Note** If you need to change the order of how TACACS+ servers are tried, delete any irrelevant TACACS+ servers and re-add the desired ones in the preferred order.

---

- Step 4** Use the drop-down list in the upper right-hand corner to add or delete TACACS+ servers. You can click an IP address if you want to make changes to the information.
- Step 5** The current server address and port are displayed. Use the drop-down list to choose either ASCII or hex shared secret format.
- Step 6** Enter the TACACS+ shared secret used by your specified server.
- Step 7** Re-enter the shared secret in the Confirm Shared Secret text box.
- Step 8** Specify the time in seconds after which the TACACS+ authentication request times out and a retransmission is attempted by the controller.
- Step 9** Specify the number of retries that will be attempted.
- Step 10** In the Authentication Type drop-down list, choose a protocol: PAP or CHAP.
- Step 11** Click **Submit**.

---

**Note** The RADIUS/TACACS server IP address and other credentials created in the 7.0.x releases are not migrated to NCS 1.0. You need to add them again after the migration from 7.0.x to NCS 1.0 is complete.

---

---

**Note** See the [“Configuring ACS 5.x”](#) section on page 15-115 for more information on Configuring ACS 5.x.

---

## Select a command

- Add TACACS+ Server—See [“Add TACACS+ Server”](#) section on page 15-138.
- Delete TACACS+ Server—Select a server or servers to be deleted, select this command and click **Go** to delete the server(s) from the database.

## Add TACACS+ Server

Choose **Administration > AAA > TACACS+** from the left sidebar menu to access this page. From the Select a command drop-down list choose **Add TACACS+ Server** and click **Go** to access this page.

This page allows you to add a new TACACS+ server to NCS.

- Server Address—IP address of the TACACS+ server being added.
- Port—Controller port.
- Shared Secret Format—ASCII or Hex.
- Shared Secret—The shared secret that acts as a password to log in to the TACACS+ server.
- Confirm Shared Secret—Reenter TACACS+ server shared secret.
- Retransmit Timeout—Specify the time in seconds after which the TACACS+ authentication request will time out and the controller will retransmit.

- Retries—Number of retries allowed for authentication request. You can specify a value between 1 and 9.
- Authentication Type—Two authentication protocols are provided. Password Authentication Protocol (PAP) and Challenge Handshake Authentication Protocol (CHAP).

### Command Buttons

- Submit
- Cancel

#### Note

- Enable the TACACS+ server with the AAA Mode Settings. See the [“Configuring AAA Mode” section on page 15-129](#).
- You can add only three servers at a time in NCS.
- 

## Configuring RADIUS Servers

This section describes how to add and delete RADIUS servers. You must enable RADIUS servers and have a template set up for them in order to make configuration changes.

RADIUS provides authentication of users accessing the network. Authentication requests are sent to a RADIUS server that contains all user authentication and network access information. Passwords are encrypted using RADIUS.

In the event the configured RADIUS server(s) is down, NCS will fall back to local authentication and authorization if the fallback to local option is configured. See the [“Configuring AAA Mode” section on page 15-129](#).

#### Note

In order to activate RADIUS servers, you must enable them as described in the [“Importing Tasks Into ACS” section on page 15-52](#).

To configure a RADIUS server, follow these steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **RADIUS**. The RADIUS page appears (see [Figure 15-52](#)).

Figure 15-52 RADIUS Page

291344

**Step 3** The RADIUS page shows the server address, authentication port, retransmit timeout value, and authentication type for each RADIUS server that is configured. The RADIUS servers are tried based on how they were configured.

**Note** If you need to change the order of how RADIUS servers are tried, delete any irrelevant RADIUS servers, and re-add the desired ones in the preferred order.

**Step 4** Use the drop-down list in the upper right-hand corner to add or delete RADIUS servers. You can click an IP address if you want to make changes to the information.

**Step 5** The current authentication port appears. Use the drop-down list to choose either ASCII or hex shared secret format.

**Step 6** Enter the RADIUS shared secret used by your specified server.

**Step 7** Re-enter the shared secret in the Confirm Shared Secret text box.

**Step 8** Specify the time in seconds after which the RADIUS authentication request times out and a retransmission is attempted by the controller.

**Step 9** Specify the number of retries that will be attempted.

**Step 10** From the Authentication Type drop-down list, choose a protocol: PAP or CHAP.

**Step 11** Click **Submit**.

### Select a command

- Add RADIUS Server—See the “Adding RADIUS Server” section on page 15-140.
- Delete RADIUS Server—Select a server or servers to be deleted, select this command and click **Go** to delete the server(s) from the database.

### Adding RADIUS Server

Choose **Administration > AAA > RADIUS** from the left sidebar menu to access this page. From the Select a command drop-down list choose **Add RADIUS Server** and click **Go** to access this page.

This page allows you to add a new RADIUS server to NCS.

- Server Address—IP Address of the RADIUS server being added.
- Port—Controller port.
- Shared Secret Format—ASCII or Hex.
- Shared Secret—The shared secret that acts as a password to log in to the RADIUS server.
- Confirm Shared Secret—Reenter RADIUS server shared secret.
- Retransmit Timeout—Specify the time in seconds after which the RADIUS authentication request will time out and the controller will retransmit.
- Retries—Number of retries allowed for authentication request. You can specify a value between 1 to 9.

### Command Buttons

- Submit
- Cancel

#### Note

- Enable the RADIUS server with the AAA Mode Settings. See the “[Configuring AAA Mode](#)” section on page 15-129.
- You can add only three servers at a time in NCS.
- 

## Authenticating AAA Users Through RADIUS Using Cisco Identity Services Engine (ISE)

You can integrate an NCS with ISE. This section explains the NCS user authentication through Radius protocol using ISE.

This authentication helps you in setting up Users in ISE who are configured locally and not from external sources such as Active Directory and LDAP.

#### Note

Only RADIUS server authentication is supported in ISE.

To authenticate AAA through RADIUS server using ISE, following steps:

- Step 1** Add NCS as an AAA client in ISE. For more information, see [Adding NCS as an AAA client in ISE](#), page 15-142.
- Step 2** Create a new User group in ISE. For more information, see [Creating a New User Group in ISE](#), page 15-142.
- Step 3** Create a new User in ISE and add that User to the User group created in ISE. For more information, see [Creating a New User and Adding to a User Group in ISE](#), page 15-143.
- Step 4** Create a new Authorization profile. For more information, see [Creating a New Authorization Profile in ISE](#), page 15-143.

- Step 5** Create an Authorization policy rule. For more information, see [Creating an Authorization Policy Rule in ISE, page 15-143](#).
- Step 6** Configure AAA in NCS. For more information, see [Configuring AAA in NCS, page 15-144](#).
- 

## Adding NCS as an AAA client in ISE

To add NCS as an AAA client in ISE, follow these steps:

---

- Step 1** Login to ISE.
- Step 2** Choose **Administration > Network Devices**.
- Step 3** From the left side-bar menu, click the arrow next to Network Devices to expand that option.  
The expanded list would show the already added devices.
- Step 4** Click any device to view its details.
- Step 5** From the left side-bar menu, click the arrow next to  icon and choose **Add new device** option.
- Step 6** In the right pane, enter the following details for the device you want to add:
- Name—Name of the device.
  - Description—Description about the device.
  - IP Address—NCS server IP address. For example, enter 209.165.200.225 as the IP address.
- Step 7** Enter the Shared key in the **Shared Secret** text box.  
Click **Save** to add the device.
- 

## Creating a New User Group in ISE

You can create a new User group in ISE. This helps you to classify different privileged NCS Users and also create authorization policy rules on User Groups.

To create a new User group in ISE, follow these steps:

---

- Step 1** Choose **ISE > Administration > Groups**.
- Step 2** From the left side-bar menu, choose **User Identity Groups**.  
The User Identity Groups page appears on the right pane.
- Step 3** Click **Add**.  
The Identity Group details page appears.
- Step 4** Enter the name and description for the group.  
For example, create a User Group *NCS-SystemMonitoring-Group*.
- Step 5** Click **Save**.
-

## Creating a New User and Adding to a User Group in ISE

You can create a new User in ISE and map that User to a User group.

To create a new User and map that User to a User group in ISE, follow these steps:

- 
- Step 1** Choose **ISE > Administration > Identity Management > Identities**.
  - Step 2** From the left side-bar menu, choose **Identities > Users**.  
The Network Access Users page appears on the right pane.
  - Step 3** Click **Add**.  
The Network Access User page appears.
  - Step 4** Enter the Username, password and re-enter password for the User.  
For example, create a User *ncs-sysmon*.
  - Step 5** Select the required User Group from the **User Group** drop-down list and click **Save**.  
The new User is added to the required User Group.

---

**Note** You can also integrate ISE with external sources such as Active Directory and LDAP.

---

## Creating a New Authorization Profile in ISE

You can create authorization profiles in ISE. To create a new authorization profile, follow these steps:

- 
- Step 1** Choose **ISE > Policy > Policy Elements > Results**.
  - Step 2** From the left side-bar menu, choose **Authorization > Authorization Profiles**.  
The Standard Authorization Profiles page appears on the right pane.
  - Step 3** Click **Add**.  
The details page appears.
  - Step 4** Enter the name and description for the profile.  
For example, create an authorization profile *NCS-SystemMonitor*.
  - Step 5** Choose the ACCESS\_ACCEPT access type from the **Access Type** drop-down list.
  - Step 6** Under Advanced Attribute Settings, add NCS User Group Radius Custom attributes one after another along with Virtual Domain attributes at the end. Select cisco - av - pair and paste NCS User Group Radius custom attribute next to it. Keep adding one after another. Repeat the same for Virtual Domain attributes as well.
  - Step 7** Save the authorization profile.
- 

## Creating an Authorization Policy Rule in ISE

To create an authorization policy rule, follow these steps:

- 
- Step 1** Choose **ISE > Policy > Authorization**.
- Step 2** From the Authorization Policy page, choose **Insert New Rule Above** from the Actions drop-down list. Create a rule which would be used for NCS User login.
- Step 3** Enter a name for the rule in the **Rule Name** text box.
- Step 4** Choose the required identity group from the **Identity Groups** drop-down list. Example, choose NCS-SystemMonitoring-Group. For more information on creating Identity User Groups, see [Creating a New User Group in ISE, page 15-142](#).
- Step 5** Choose a permissions from the **Permissions** drop-down list. The permissions are the Authorization profiles. Example, choose the *NCS-SystemMonitor* authorization profile. For more information on creating Authorization profiles, see [Creating a New Authorization Profile in ISE, page 15-143](#). So in the above example, we define a rule where all Users belonging to NCS System Monitoring Identity Group will receive an appropriate Authorization Policy with System monitoring custom attributes defined.
- Step 6** Click **Save** to save the Authorization Rule.

---

**Note** You can also monitor successful and failed authentication using the ISE > Monitor > Authentications option.

---

## Configuring AAA in NCS

To configure AAA in NCS, follow these steps:

- 
- Step 1** Login to NCS as *root*.
- Step 2** Choose **NCS > Administration > AAA > RADIUS Servers**.
- Step 3** Add a new RADIUS Server with the ISE IP address. For example, enter 209.165.200.230 as the IP address.
- Step 4** Click **Save** to save the changes.
- Step 5** Choose **ISE > Administration > AAA > AAA Mode Settings**. The AAA Mode Settings page appears.
- Step 6** Select **RADIUS** as the AAA Mode.
- Step 7** Click **Save**. The AAA mode is set to RADIUS in NCS.
- Step 8** Logout of NCS.
- Step 9** Login again into NCS as an AAA user, defined in ISE. For example, login as User *ncs-sysmon*.

For more information on creating Users in ISE, see [Creating a New User and Adding to a User Group in ISE, page 15-143](#).

---

# CHAPTER 16

## NCS Services

---

This chapter contains the following sections:

- [Mobility Services, page 16-1](#)
- [Identity Services, page 16-80](#)

## Mobility Services

This section briefly describes the CAS or wIPS services that Cisco NCS supports and provides steps for mobility procedures that are common across all services. See the Cisco Context-Aware Services documentation with the provided links for additional CAS and wIPS configuration and management details.

### CAS

Context Aware Services (CAS) allows a mobility services engine to simultaneously track thousands of mobile assets and clients by retrieving contextual information such as location, temperature, and availability from Cisco access points.

#### Note

You must purchase licenses from Cisco to retrieve contextual information on tags and clients from access points. Licenses for tags and clients are offered independently. For details on tag and client licenses, refer to the *Cisco 3350 Mobility Services Engine Release Note* at the following URL:

[http://www.cisco.com/en/US/products/ps9742/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps9742/tsd_products_support_series_home.html).

### wIPS

Cisco Adaptive Wireless IPS (wIPS) is an advanced approach to wireless threat detection and performance management. Cisco Adaptive wIPS combines network traffic analysis, network device and topology information, signature-based techniques and anomaly detection to deliver highly accurate and complete wireless threat prevention.

#### Note

wIPS functionality is not supported for non-root partition users.

This section contains the following topics:

- Planning for and Configuring Context-Aware Software, page 16-78
- wIPS Planning and Configuring, page 16-80

## Accessing Services Installation Guides

See the following URLs to view MSE installation guide:

MSE 3350 Installation guide:

[http://www.cisco.com/en/US/docs/wireless/mse/3350/quick/guide/mse\\_qsg.html](http://www.cisco.com/en/US/docs/wireless/mse/3350/quick/guide/mse_qsg.html)

MSE 3310 Installation guide:

[http://www.cisco.com/en/US/docs/wireless/mse/3310/quick/guide/MSE3310\\_GSG.html](http://www.cisco.com/en/US/docs/wireless/mse/3310/quick/guide/MSE3310_GSG.html)

## MSE Services Co-Existence

With MSE 6.0 and later, you can enable multiple services (Context Aware and wIPS) to run concurrently. Prior to version 6.0, mobility services engines could only support one active service at a time.

The following must be considered with co-existence of multiple services:

- Co-existence of services may be impacted by license enforcement. As long as the license is not expired, you can enable multiple services.

**Note** Limits for individual services differ. For example, a low-end mobility services engine (MSE-3310) tracks a total of 2,000 CAS elements; a high-end mobility services engine (MSE-3350) tracks a total of 18,000 CAS elements.  
A low-end mobility services engine has a maximum limit of 2000 wIPS elements; a high-end mobility services engine has a maximum limit of 3000 wIPS elements.  
Refer to the license order guide for the valid combination matrix.

- Expired evaluation licenses prevent the service from coming up.
- If a CAS license is added or removed, this process restarts all services on the mobility services engine including wIPS. If a wIPS license is added or removed, the process does not impact CAS; only wIPS restarts.
- Other services can be enabled in evaluation mode even if a permanent license for the maximum number of elements has been applied.

Whenever one of the services has been enabled to run with its maximum license, another service can not be enabled to run concurrently because the capacity of the MSE would not be sufficient to support both services concurrently. For example, on MSE-3310, if you install a wIPS license of 2000, then you can not enable CAS to run concurrently. However, evaluation licenses are not subject to this limitation.

**Note**

See the [“Mobility Services Engine \(MSE\) License Information”](#) section on page 15-12 for more information on mobility services engine licensing.

## Viewing Current Mobility Services

To view a list of current Mobility Services, choose **Services > Mobility Services**.

The Mobility Services page provides the following information and features for each device:

- **Device Name**—User-assigned name for the mobility services engine. Click the device name to view and manage mobility services engine details. See the [“Managing System Properties for a Mobility Services Engine”](#) section on page 16-20” for more information.
- **Device Type**—Indicates the type of mobility services engine (for example, Cisco 3310 Mobility Services Engine).
- **IP Address**—Indicates the IP address for the mobility services engine.
- **Version**—Indicates the version number of the mobility services engine.
- **Reachability Status**—Indicates whether or not the mobility services engine is reachable.
- **Mobility Service information:**
  - **Name**—Indicates the name of the mobility service.
  - **Admin Status**—Indicates whether the mobility service is enabled or disabled.
  - **Version**—Indicates the version number of the mobility service.
  - **Service Status**—Indicates whether the mobility service is currently up or down.
- Select a command drop-down list:

- Add Location Server
- Add Mobility Services Engine—Includes Context Aware service and Cisco Adaptive Wireless IPS (wIPS) service.
- Delete Service(s)
- Synchronize Servers
- Synchronization History

**Note**

---

Location and mobility services engine features of NCS do not support partitioning.

---

## Adding a Mobility Services Engine

### Tip

To learn more about Cisco Adaptive wIPS features and functionality, go to [Cisco.com](http://Cisco.com) to watch a multimedia presentation. Here you will also find the learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

### Note

The 1.0 release of NCS will recognize and support MSE 3355 appropriately.

To add a Cisco 3300 Series Mobility Services Engine to NCS, follow these steps:

- Step 1** Verify that you can ping the mobility service engine that you want to add from NCS.
- Step 2** Choose **Services > Mobility Services** to display the Mobility Services page.
- Step 3** From the Select a command drop-down list, choose **Add Mobility Services Engine**, and click **Go**.
- Step 4** Enter the following information:
  - Device Name—User-assigned name for the mobility services engine.
  - IP Address—The IP address of the mobility service engine.

### Note

A mobility services engine is added only if a valid IP address is entered. The Device Name helps you distinguish between devices if you have multiple NCSs with multiple mobility services engines, but it is not considered when validating a mobility services engine.

- Contact Name (optional)—The mobility service engine administrator.
- User Name—The default username is admin.
- Password—The default password is admin.

### Note

If you changed the username and password during the automatic installation script, enter those values here. If you did not change the default passwords, We recommend that you rerun the automatic installation script and change the username and password.

- HTTP—When enabled, HTTP is used for communication between the NCS and mobility services engine.

### Note

For HTTP communication with a mobility services engine, HTTP must be enabled explicitly on the mobility services engine.

- Select the **Delete synchronized service assignments** check box if you want to permanently remove all service assignments from the mobility services engine.

This option is applicable for network designs, wired switches, controllers and event definitions. The existing location history data is retained, however you must use manual service assignments to do any future location calculations.

- Step 5** Click **Next**. The Select Mobility Service page opens.

---

**Note** If you click Cancel, the mobility services engine is added.

---

**Step 6** To enable a service on the mobility services engine, select the check box next to the service. Services include Context Aware and wIPS.

If you select Context Aware Service then you would have to select a Location engine to perform location calculation.

You can choose CAS to track clients, rogues, interferers, wired clients, and tags.

Choose either of the following engines to track tags:

- Cisco Tag Engine
- or
- Partner Tag Engine

---

**Note** Cisco Tag Engine is the default option.

---

---

**Note** With MSE 6.0 and later, you can enable multiple services (CAS and wIPS) simultaneously. Prior to version 6.0, mobility services engines could only support one active service at a time. See the [“MSE Services Co-Existence” section on page 16-2](#) for more information.

---

**Step 7** Click **Save**. The Mobility Services Engine Added page appears. See the [“Mobility Services Engine Added Page” section on page 16-6](#) for more information.

The mobility service engine is now added to NCS.

---

**Note** After adding a mobility services engine, it must be synchronized with NCS. You can synchronize network designs (campus, building, floor, and outdoor maps), event groups, or wired switches on the local mobility services engine. You can also choose to synchronize the mobility services engine with a specific controller. You can do this synchronization immediately after adding a new mobility services engine or at a later time. See the [“Synchronizing Services” section on page 16-10](#) for more information.

---

### Mobility Services Engine Added Page

The Mobility Services Engine Added page displays all controllers, network designs, and event groups that must be synchronized.

Click **Go to Synchronize** to synchronize these devices. See the [“Synchronizing Services” section on page 16-10](#) for more information.

## Deleting a Mobility Services Engine from Cisco NCS

To delete a mobility services engine from the NCS database, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services** to display the Mobility Services page.
- Step 2** Select the mobility services engine(s) to be deleted by selecting the corresponding check box(es).
- Step 3** From the Select a command drop-down list, choose **Delete Service(s)**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm that you want to delete the selected mobility services engine from the NCS database.
- Step 6** Click **Cancel** to stop the deletion.
- 

## Registering Product Authorization Keys

You receive a product authorization key (PAK) when you order a CAS element, wIPS, or tag license from Cisco. You must register the PAK to receive the license file for install on the mobility services engine. License files are emailed to you after successfully registering a PAK.

CAS element and wIPS PAKs are registered with Cisco.

Tag PAKs are registered with AeroScout.

**Note** If you do not have PAK, you can use the sales order number to retrieve the PAK. See the [“Retrieving a PAK” section on page 16-8](#) for more information.

---

To register a Product Authorization Key (PAK) to obtain a license file for install, follow these steps:

- 
- Step 1** Open a browser page and enter [www.cisco.com/web/go/license/index.html](http://www.cisco.com/web/go/license/index.html).
- Step 2** Enter the PAK, and click **SUBMIT**.
- Step 3** Verify the license purchase. Click **Continue** if correct. The licensee entry page appears.

**Note** If the license is incorrect, click **TAC Service Request Tool** link to report the problem.

---

- Step 4** At the Designate Licensee page, enter the UDI of the mobility service engine in the host ID text box. This is the mobility services engine on which the license will be installed.

**Note** UDI information for a mobility services engine is found in the General Properties dashlet at **Services > Mobility Services Engine > Device Name > System**.

---

- Step 5** Select the **Agreement** check box. Registrant information appears beneath the Agreement check box. Modify information as necessary.

**Note** Ensure that the phone number does not include any characters in the string for the registrant and end user. For example, enter 408 555 1212 rather than 408.555.1212 or 408-555-1212.

---

- Step 6** If registrant and end user are not the same person, select the **Licensee (End-User)** check box beneath registrant information and enter the end user information.
  - Step 7** Click **Continue**. A summary of entered data appears.
  - Step 8** In the Finish and Submit page, review registrant and end-user data. Click **Edit Details** to correct any information, if necessary.
  - Step 9** Click **Submit**. A confirmation page appears.
- 

## Retrieving a PAK

If you do not have a PAK, you can use the sales order number to retrieve the PAK:

- Step 1** Go to the Sales Order Status Tool at the following URL:  
<http://tools.cisco.com/qtc/status/tool/action/LoadOrderQueryScreen>.
  - Step 2** After logging in, choose **Sales Order (SO)** from the Type of Query drop-down list.
  - Step 3** Enter the sales order number in the Value text box.
-  **Note** The Date Submitted fields are not required for this inquiry.
- Step 4** Select the **Show Serial Number** check box.
  - Step 5** Select the **Orders** radio button, if not already selected.
  - Step 6** Choose **Screen** from the Deliver Via drop-down list.
  - Step 7** Click **Search**. Detailed information on the mobility services engine order appears.
  - Step 8** Click **Line 1. 1** in the table.
  - Step 9** Under Product column (second line), copy the PAK number (starts with 3201J) that you want to register to obtain the license.
- 

## Installing Device and wIPS License Files

You can install device and wIPS licenses from NCS.

- Note** Tag licenses are installed using the *AeroScout System Manager*. To register your tag PAK, go to this URL:  
<http://www.aeroscout.com/content/support>
- 

To add a client or wIPS license to NCS after registering the PAK, follow these steps:

- Step 1** Choose **Administration > Licensing**.
- Step 2** Choose **Files > MSE Files** (left pane).
- Step 3** Click **Add**. A pop-up dialog box appears.
- Step 4** Select **MSE Name**.

---

**Note** Verify that the UDI of the selected mobility services engine matches the one you entered when registering the PAK.

---

**Step 5** Click **Choose File** to browse and to select the license file.

**Step 6** Click **Upload**. The newly added license appears in the mobility services engine license file list.

---

## Adding a Location Server

To add a location server, follow these steps:

---

**Step 1** Choose **Services > Mobility Services**.

**Step 2** From the Select a command drop-down list, choose **Add Location Server**.

**Step 3** Click **Go**.

**Step 4** Enter the required information including the following:

- Server Name
- IP Address
- Contact Name
- User Name
- Password
- Port
- HTTPS—When enabled, HTTPS is used for communication between the NCS and location server.

**Step 5** Select the **Delete synchronized service assignments** check box if you want to permanently remove all service assignments from the mobility services engine.

This option is applicable for network designs, wired switches, controllers, and event definitions. The existing location history data is retained, however, you must use manual service assignments to perform any future location calculations.

**Step 6** Click **Save**.

---

**Note** After adding a location server, it must be synchronized with NCS. See the [“Synchronizing Services” section on page 16-10](#) for more information.

---

---

**Note** Location and mobility services engine features of NCS do not support partitioning.

---

## Synchronizing Services

This section describes how to synchronize Cisco wireless LAN controllers and NCS with mobility services engines and contains the following topics:

- [Keeping Mobility Services Engines Synchronized, page 16-10](#)
- [Synchronizing NCS and a Mobility Services Engine, page 16-10](#)
- [Synchronizing Controllers with Mobility Services Engines, page 16-12](#)
- [Working with Third-Party Elements, page 16-13](#)
- [Setting and Verifying the Timezone on a Controller, page 16-14](#)
- [Configuring Smart Mobility Services Engine Database Synchronization, page 16-15](#)
- [Out-of-Sync Alarms, page 16-17](#)
- [Viewing Mobility Services Engine Synchronization Status, page 16-18](#)

### Keeping Mobility Services Engines Synchronized

This section describes how to synchronize NCS and mobility services engines manually and automatically.

After adding a mobility service engine to NCS, you can push (synchronize) network designs (campus, building, floor, and outdoor maps), event groups, controller information (name and IP address), or wired switches to the mobility services engine.

**Note**

Be sure to verify software compatibility between the controller, NCS, and the mobility services engine before performing synchronization. Refer to the latest mobility services engine release notes at the following URL:

[http://www.cisco.com/en/US/products/ps9742/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps9742/tsd_products_support_series_home.html)

**Note**

Communication between the mobility services engine, NCS, and the controller is in Coordinated Universal Time (UTC). Configuring NTP on each system provides devices with the UTC time. The mobility services engine and its associated controllers must be mapped to the same NTP server and the same Cisco NCS server. An NTP server is required to automatically synchronize time between the controller, Cisco NCS, and the mobility services engine.

### Synchronizing NCS and a Mobility Services Engine

This section describes how to synchronize Cisco NCS and mobility services engines manually and smartly.

After adding a mobility services engine to Cisco NCS, you can synchronize network designs (campus, building, floor, and outdoor maps), controllers (name and IP address), specific Catalyst Series 3000 and 4000 switches, and event groups with the mobility services engine.

- **Network Design**—Is a logical mapping of the physical placement of access points throughout facilities. A hierarchy of a single campus, the buildings that comprise that campus, and the floors of each building constitute a single network design.
- **Controller**—A selected controller that is associated and regularly exchanges location information with a mobility services engine. Regular synchronization ensures location accuracy.

- Switches (wired)—Wired Catalyst switches that provide an interface to wired clients on the network. Regular synchronization ensures that location tracking of wired clients in the network is accurate.
  - The mobility services engine can be synchronized with Catalyst stackable switches (3750, 3750-E, 3560, 2960, IE-3000 switches), switch blades (3110, 3120, 3130, 3040, 3030, 3020), and switch ports.
  - The mobility services engine can also be synchronized with the following Catalyst 4000 series: WS-C4948, WS-C4948-10GE, ME-4924-10GE, WS-4928-10GE, WS-C4900M, WS-X4515, WS-X4516, WS-X4013+, WS-X4013+TS, WS-X4516-10GE, WS-X4013+10GE, WS-X45-SUP6-E, and WS-X45-SUP6-LE
- Event Groups—A group of predefined events that define triggers that generate an event. Regular synchronization ensures that the latest defined events are tracked.

**Note**

Be sure to verify software compatibility between the controller, Cisco NCS, and the mobility services engine before synchronizing. See the latest mobility services engine release notes at the following URL: [http://www.cisco.com/en/US/products/ps9742/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps9742/tsd_products_support_series_home.html).

**Note**

Communication between the mobility services engine and NCS and the controller is in Coordinated Universal Time (UTC). Configuring NTP on each system provides devices with the UTC time. The mobility services engine and its associated controllers must be mapped to the same NTP server and the same Cisco NCS server. An NTP server is required to automatically synchronize time between the controller, Cisco NCS, and the mobility services engine.

To synchronize NCS network designs, controllers, wired switches, or event groups with the mobility services engine, follow these steps:

- Step 1** Choose **Services > Synchronize Services**.
- Step 2** Choose the appropriate menu option (Network Designs, Ccontrollers, Wired Switches, or Event Groups).
- Step 3** To assign a network design to a mobility services engine, From the left sidebar menu, choose **Network Designs**.
- Step 4** Choose all the maps to be synchronized with the mobility services engine.

**Note**

Through 6.0, you can assign only up to a campus level to a mobility services engine. Beginning with 7.0 this option is granular to a floor level. For example, you can choose to assign floor1 to MSE 1, floor2 to MSE 2, and floor3 to MSE 3.

- Step 5** Click **Change MSE Assignment**.
- Step 6** Select the mobility services engine to which the maps are to be synchronized.
- Step 7** Click either of the following in the dialog box:
  - **Save**—Saves the mobility services engine assignment. The following message appears in the Messages column of the Network Designs page:
 

```
To be assigned - Please synchronize.
```

- **Cancel**—Discards the changes to the mobility services engine assignment and returns to the Network Designs page.

You can also click **Reset** to undo the mobility services engine assignments.

**Note** A network design may include a floor in a campus or a large campus with several buildings, each monitored by a different mobility services engine. Because of this, you may need to assign a single network design to multiple mobility services engines.

**Step 8** Click **Synchronize** to update the mobility services engine(s) database(s).

When items are synchronized, a green two-arrow icon appears in the Sync. Status column for each synchronized entry.

You can use the same procedure to assign wired switches or event groups to a mobility services engine. To assign a controller to a mobility services engine, see the “[Synchronizing Controllers with Mobility Services Engines](#)” section on page 16-12 for more information.

**Note** Event groups can also be created by third-party applications. For more information on Third-party application-created event groups, see the “[Working with Third-Party Elements](#)” section on page 16-13.

To unassign a network design, controller, wired switch, or event group from a mobility services engine, follow these steps:

- Step 1** On the respective tabs, select one or more elements, and click **Change MSE Assignment**. The Choose Mobility Services Engine dialog box appears.
- Step 2** Deselect the mobility services engine check box if you do not want the elements to be associated with that mobility services engine.
- Step 3** Click **Save** to save the changes to the assignments.
- Step 4** Click **Synchronize**. The Sync Status column appears blank.

## Synchronizing Controllers with Mobility Services Engines

You can assign an MSE to any wireless controller on a per-service (CAS or wIPS) basis.

To assign an MSE service to wireless controllers, follow these steps:

- Step 1** In the synchronization page, choose **Controllers**.
- Step 2** Choose the controllers to be assigned to the mobility services engine.
- Step 3** Click **Change MSE Assignment**.
- Step 4** Choose the mobility services engine to which the controllers must be synchronized.
- Step 5** Click either of the following in the dialog box:
  - **Save**—Saves the mobility services engine assignment. The following message appears in the Messages column of the Controllers page:

To be assigned - Please synchronize.

- **Cancel**—Discards the changes to the mobility services engine assignment and returns to the Controllers page.

You can also click **Reset** to undo the yellow button assignments.

**Step 6** Click **Synchronize** to complete the synchronization process.

**Step 7** Check if the mobility services engine is communicating with each of the controller for only the chosen service. This can be done by clicking the **NMSP status** link in the status page.

**Note**

- After Synchronizing a controller, verify that the timezone is set on the associated controller. See the [“Setting and Verifying the Timezone on a Controller” section on page 16-14](#) section.
- Controller names must be unique for synchronizing with a mobility services engine. If you have two controllers with the same name, only one will be synchronized.

To unassign a network design, controller, wired switch, or event group from a mobility services engine, follow these steps:

**Step 1** On the respective tabs, select one or more elements, and click **Change MSE Assignment**. The Choose Mobility Services Engine dialog box appears.

**Step 2** Deselect the mobility services engine check box if you do not want the elements to be associated with that mobility services engine.

**Step 3** Click **Save** to save the changes to the assignments.

**Step 4** Click **Synchronize**. A two-arrow icon appears in the Sync Status column.

## Working with Third-Party Elements

When you synchronize elements with MSE, there might be event groups on the MSE that have been created by third-party applications. You can either delete the unused elements or mark them as third-party elements.

To delete the elements or mark them as third-party elements:

**Step 1** In the synchronization page, choose **Third Party Elements** from the left sidebar menu.

The Third Party Elements page appears.

**Step 2** Choose one or more elements.

**Step 3** Click one of the following buttons:

- **Delete Event Groups**—Deletes the selected event groups.
- **Mark as 3rd Party Event Group(s)**—Marks the selected event groups as third-party event groups.

## Setting and Verifying the Timezone on a Controller

For controller releases 4.2 and later, if a mobility services engine (release 5.1 or greater) is installed in your network, it is mandatory that the time zone be set on the controller to ensure proper synchronization between the two systems.

Greenwich Mean Time (GMT) is used as the standard for setting the time zone system time of the controller.

You can automatically set the time zone during initial system setup of the controller or manually set it on a controller already installed in your network.

To manually set the time and time zone on an existing controller in your network using the CLI, follow these steps:

**Step 1** Configure the current local time in GMT on the controller by entering the following commands:

```
(Cisco Controller) >config time manual 09/07/07 16:00:00
(Cisco Controller) >config end
```

**Note** When setting the time, the current local time is entered in terms of GMT and as a value between 00:00 and 24:00. For example, if it is 8 AM Pacific Standard Time (PST) in the US, you enter 16:00 (4 PM PST) as the PST time zone is 8 hours behind GMT.

**Step 2** Verify that the current local time is set in terms of GMT by entering the following command:

```
(Cisco Controller) >show time
Time..... Fri Sep 7 16:00:02 2007
Timezone delta..... 0:0
```

**Step 3** Set the local time zone for the system by entering the following commands:

**Note** When setting the time zone, you enter the time difference of the local current time zone with respect to GMT (+/-). For example, Pacific Standard Time (PST) in the United States (US) is 8 hours behind GMT (UTC) time. Therefore, it is entered as -8.

```
(Cisco Controller) >config time timezone -8
(Cisco Controller) >config end
```

**Step 4** Verify that the controller displays the current local time with respect to the local time zone rather than in GMT by entering the following command:

```
(Cisco Controller) >show time
Time..... Fri Sep 7 08:00:26 2007
Timezone delta..... -8:0
```

**Note** The time zone delta parameter in the **show time** command displays the difference in time between the local time zone and GMT (8 hours). Prior to configuration, the parameter setting is 0.0.

## Configuring Smart Mobility Services Engine Database Synchronization

Manual synchronization of NCS and mobility services engine databases provides immediate synchronization. However, future deployment changes (such as making changes to maps and access point positions), can yield incorrect location calculations and asset tracking until resynchronization reoccurs.

To prevent out-of-sync conditions, use NCS to carry out synchronization. This policy ensures that synchronization between NCS and mobility services engine databases is triggered periodically and any related alarms are cleared.

Any change to one or more of any synchronized components will be automatically synchronized with the mobility services engine. For example, if a floor with access points is synchronized with a particular mobility services engine and then one access point is moved to a new location on the same floor or another floor which is also synchronized with the mobility services engine, then the changed location of the access point will be automatically communicated.

To further ensure that NCS and MSE are in sync, smart synchronization happens in the background.

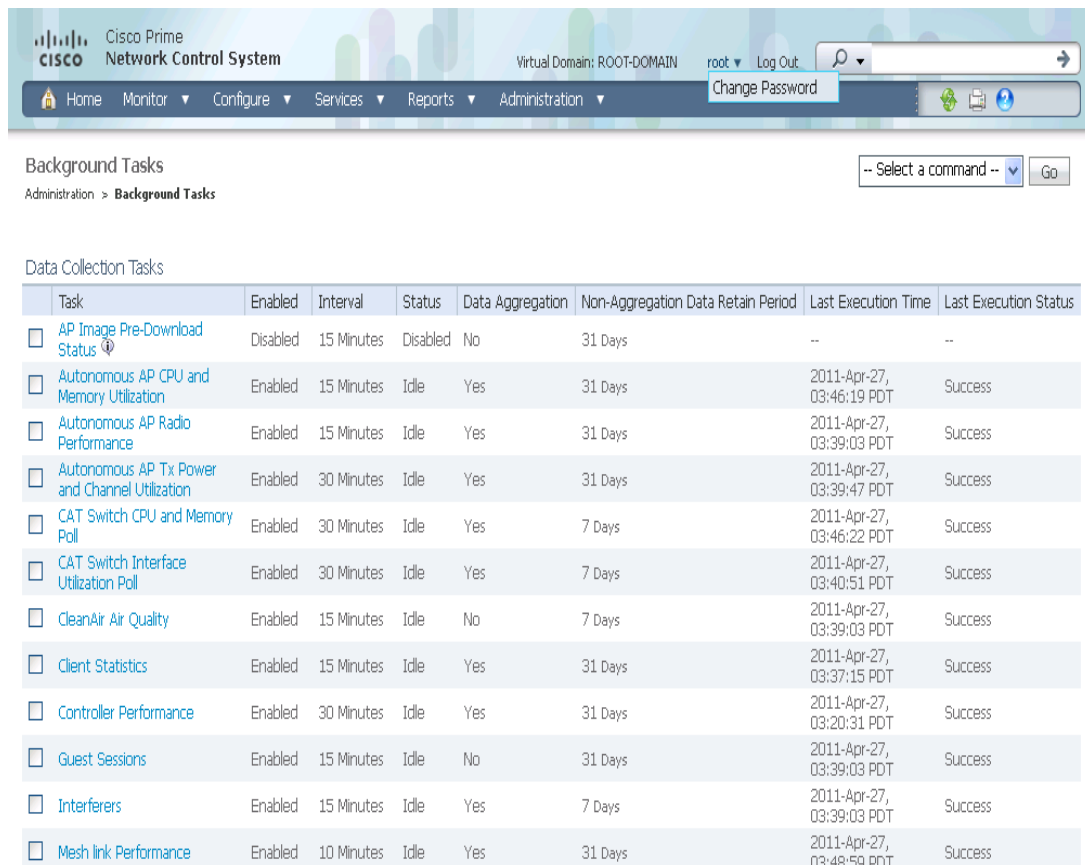

To configure smart synchronization, follow these steps:

---

**Step 1** Choose **Administration > Background Tasks**.

The Background Tasks summary page appears (see [Figure 16-1](#)).

Figure 16-1 Administration > Background Tasks

291228

- Step 2** Select the **Mobility Service Synchronization** check box.
- Step 3** Click the **Mobility Service Synchronization** link.  
The Task > Mobility Service Synchronization page appears.
- Step 4** To set the mobility services engine to send out-of-sync alerts, select the **Enabled** check box in the Out of Sync Alerts section or area.
- Step 5** To enable smart synchronization, select the Smart Synchronization **Enabled** check box.

**Note**

- Smart synchronization does not apply to elements (network designs, controllers, or event groups) that have not yet been assigned to a mobility services engine. However, out-of-sync alarms will still be generated for these unassigned elements. For smart synchronization to apply to these elements, you need to manually assign them to a mobility services engine.
- When a mobility services engine is added to an NCS, the data in the NCS is always treated as the primary copy that is synchronized with the mobility services engine. All synchronized network designs, controllers, event groups and wired switches that are present in the mobility services engine and not in the NCS are removed automatically from mobility services engine.

- Step 6** Enter the time interval in minutes that the smart synchronization is to be performed.  
By default, smart-sync is disabled.

**Step 7** Click **Submit**.

For Smart controller assignment and selection scenarios, see the [“Smart Controller Assignment and Selection Scenarios”](#) section on page 16-17.

**Smart Controller Assignment and Selection Scenarios****Scenario 1**

If a floor having at least one access point from a controller is chosen to be synchronized with the mobility services engine from the Network Designs section of the Synchronization page, then the controller to which that access point is connected is automatically selected to be assigned to the mobility services engine for CAS service.

**Scenario 2**

When at least one access point from a controller is placed on a floor that is synchronized with mobility services engine, the controller to which the access point is connected is automatically assigned to the same mobility services engine for CAS service.

**Scenario 3**

An access point is added to a floor and is assigned to a mobility services engine. If that access point is moved from controller A to controller B, then controller B is automatically synchronized to the mobility services engine.

**Scenario 4**

If all access points placed on a floor which is synchronized to the mobility services engine are deleted then that controller is automatically removed from mobility services engine assignment or unsynchronized.

**Out-of-Sync Alarms**

Out-of-sync alarms are of Minor severity (yellow) and are raised in response to the following conditions:

- Elements have been modified in NCS (the auto-sync policy will push these elements).
- Elements have been modified in mobility services engine.
- Elements except controllers exist in the mobility services engine database but not in NCS.
- Elements have not been assigned to any mobility services engine (the auto-sync policy does not apply).

Out-of-sync alarms are cleared when the following occurs:

- Mobility services engine is deleted

**Note** When you delete a mobility services engine, the out-of-sync alarms for that system are also deleted. In addition, if you delete the last available mobility services engine, the alarms for “elements not assigned to any server” will also be deleted.

- Elements are synchronized manually or automatically
- User manually clears the alarms (although the alarms may reappear in the future when the scheduled task is next executed)

**Note** By default, out-of-sync alarms are enabled. You can disable them in NCS by choosing **Administration > Scheduled Tasks**, clicking **Mobility Service Synchronization**, unselecting the **Auto Synchronization** check box, and clicking **Submit**.

## Viewing Mobility Services Engine Synchronization Status

You can use the Synchronize Servers command in NCS to view the status of network design, controller, and event group synchronization with a mobility services engine.

To view synchronization status, follow these steps:

- Step 1** Choose **Services > Synchronize Services**.
- Step 2** Choose the applicable menu option (Network Designs, Controllers, or Event Groups).  
For each of the elements, the Sync. Status column shows the synchronization status. A green two-arrow icon indicates that its corresponding element is synchronized with the specified server such as a mobility services engine. A gray two-arrow icon with a red circle indicates that its corresponding item is not synchronized with a given server.

**Note** A green two-arrow icon does not indicate the NMSP connection status for a Controller.

You can also view the synchronization status and assign or unassign from campus view and building view along with floor view.

To access this page, choose **Monitor > Maps > System Campus > Building > Floor** where *Building* is the building within the Campus and *Floor* is a specific floor in that campus building. On the left sidebar there is a menu option called MSE Assignment. This shows which mobility services engine the floor is currently assigned to. You can also change mobility services engine assignment from this page.

## Viewing Synchronization History

You can use the Synchronization History command in NCS to view the synchronization history for the last 30 days for a mobility services engine. This is especially useful when automatic synchronization is enabled as alarms are automatically cleared. Synchronization History provides a summary of those cleared alarms.

To view synchronization history, follow these steps:

- Step 1** Choose **Services > Synchronization History**.
- Step 2** [Table 16-1](#) lists and describes the fields that appear in the Synchronization History.

**Table 16-1 Synchronization History**

| Field          | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| Timestamp      | The date and time at which the synchronization has happened.                |
| Server         | The mobility services engine server.                                        |
| Element Name   | The name of element that was synchronized.                                  |
| Type           | The type of element that was synchronized.                                  |
| Sync Operation | The sync operation that was performed.<br>It could either be Update or Add. |
| Generated By   | The method of synchronization.<br>It could either be Manual or Automatic.   |
| Status         | The status of the synchronization. It could be either Success or Failed.    |
| Message        | Any additional message about the synchronization.                           |

You can click the column headers to sort the entries.

## Viewing Notification Statistics

You can view the notification statistics for a specific mobility services engine. To view the Notification Statistics for a specific mobility services engine:

Go to **Services > Mobility Services > MSE-name > Context Aware Service > Notification Statistics**, where *MSE-name* is the name of a mobility services engine.

[Table 16-2](#) describes the fields in the Notification statistics page.

**Table 16-2 Notification Statistics fields**

| Field                                  | Description                                                                                    |
|----------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Summary</b>                         |                                                                                                |
| Destinations                           |                                                                                                |
| Total                                  | Total destinations count.                                                                      |
| Unreachable                            | Unreachable destinations count.                                                                |
| <b>Notification Statistics Summary</b> |                                                                                                |
| Track Definition Status                | Status of the track definition. Track notification status could be either Enabled or Disabled. |
| Track Definition                       | Track definition can be either Nothbound or CAS event notification.                            |
| Destination IP Address                 | The destination IP address to which the notifications are sent.                                |

**Table 16-2 Notification Statistics fields (continued)**

| Field              | Description                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary</b>     |                                                                                                                                                       |
| Destination Port   | The destination port to which the notifications are sent.                                                                                             |
| Destination Type   | The type of the destination. Example: SOAP_XML                                                                                                        |
| Destination Status | Status of the destination device. The status is either Up or Down.                                                                                    |
| Last Sent          | The date and time at which the last notification was sent to the destination device.                                                                  |
| Last Failed        | The date and time at which the notification failed.                                                                                                   |
| Total Count        | The total count of notifications sent to the destination. Click the count link to view the notification statistics details of the destination device. |

## Managing System Properties for a Mobility Services Engine

You can manage the system properties of a mobility services engine using the NCS. This section describes the various system properties of a mobility services engine and contains the following topics:

- [Editing General Properties for a Mobility Services Engine, page 16-20](#)
- [Editing NMSP Parameters for a Mobility Services Engine, page 16-22](#)
- [Viewing Active Session Details for a Mobility Services Engine, page 16-24](#)
- [Viewing and Adding Trap Destinations for a Mobility Services Engine, page 16-24](#)
- [Editing Advanced Parameters for a Mobility Services Engine, page 16-25](#)
- [Working with Logs, page 16-27](#)
- [Managing User and Group Accounts for a Mobility Services Engine, page 16-29](#)
- [Monitoring Status Information for a Mobility Services Engine, page 16-32](#)
- [Managing Maintenance for Mobility Services, page 16-35](#)

### Editing General Properties for a Mobility Services Engine

You can use NCS to edit the general properties of a mobility services engine registered in the NCS database. General properties include contact name, username, password, and HTTP.

To edit the general properties of a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services** to display the Mobility Services page.
  - Step 2** Click the name of the mobility services engine that you want to edit. The General Properties page (with a General tab and Performance tab) opens.

In the General tab displays the following read-only server details:

- Device Name

- Device Type
- Device UDI

---

**Note** For licensing, the Device UID is the string between double quote characters (including spaces in the end if any). Exclude the double quote characters using copy-paste.

---

- Version
- Start Time
- IP Address

**Step 3** From the General Properties page, modify the following Server Details as necessary:

- Contact Name—Enter a contact name for the mobility service.
- Username—Enter the login username for the NCS server that manages the mobility service.
- Password—Enter the login password for the NCS server that manages the mobility service.
- HTTP—Select the **HTTP enable** check box to enable HTTP.

---

**Note** When you have a non-default port or HTTPS turned on, you must pass the correct information along with the command. For example, *getserverinfo* must include *-port <<port>> -protocol <<HTTP/HTTPS>>*. Similarly, for stopping the server, *stoplocserver -port <<port>> -protocol <HTTP/HTTPS>>*.

---

- Legacy Port—8001
- Legacy HTTPS—Select the check box to enable the legacy HTTPS.
- Delete synchronized service assignments and enable synchronization—Select the **Delete synchronized service assignments** check box if you want to permanently remove all service assignments from the mobility services engine. This option will show up only when the delete synchronized service assignments check box was unselected while adding an mobility services engine.

---

**Note** NCS always uses HTTPS to communicate with a mobility services engine.

---

---

**Note** The following tcp ports are in use on a mobility services engine (MSE) in Release 6.0: tcp 22: MSE SSH port, tcp 80: MSE HTTP port, tcp 443: MSE HTTPS port, tcp 1411: AeroScout, tcp 1999: AeroScout internal port, tcp 4096: AeroScout notifications port, tcp 5900X: AeroScout (X could vary from 1 to 10), and tcp 8001: Legacy port. Used for location APIs.

---

---

**Note** The following udp ports are in use on a mobility services engine (MSE) in release 6.0: udp 123: NTPD port (open after NTP configuration), udp 162: AeroScout SNMP, udp/tcp 4000X: AeroScout proxy (X could vary from 1 to 5), udp 12091: AeroScout devices (TDOA Wi-Fi Receivers, chokepoints), udp 12092: AeroScout devices (TDOA Wi-Fi Receivers, chokepoints), udp 32768: Location internal port, udp 32769: AeroScout internal port, and udp 37008: AeroScout internal port.

---

**Step 4** In the Mobility Services dialog box, select the **Admin Status** check box to enable the applicable (Context Aware Service or wIPS).

If you select Context Aware Service then you must select a location engine to perform location calculation.

Choose either:

- Cisco Tag Engine
- or
- Partner Tag Engine

---

**Note** With MSE 6.0, you can enable multiple services (CAS and wIPS) simultaneously. Prior to version 6.0, mobility services engines could only support one active service at a time.

---

The Mobility Services dialog box also displays the following:

- Service Name
- Service Version
- Service Status
- License Type

---

**Note** Use the **Click here** link to view mobility services engine licensing details. See the “[Mobility Services Engine \(MSE\) License Information](#)” section on page 15-12 for more information.

---

**Step 5** Click **Save** to update the Cisco NCS and mobility service databases.

---

**Note** Use the **Click here** link to view mobility services engine licensing details.

---

**Step 6** Click the **Performance** tab to view a graph of CPU and memory utilization percentages.

---

## Editing NMSP Parameters for a Mobility Services Engine

Network Mobility Services Protocol (NMSP) manages communication between the mobility service and the controller. Transport of telemetry, emergency, and RSSI values between the mobility service and the controller is managed by this protocol.

**Note**

- The NMSP parameter is supported in mobility services installed with release 3.0 through 7.0.105.0. It is not supported on releases later than 7.0.105.0.
- NMSP replaces the LOCP term introduced in release 3.0.
- Telemetry and emergency information is only seen on controllers and NCS installed with release 4.1 software or greater and on mobility services running release 3.0 or later software.

- The TCP port (16113) that the controller and mobility service communicate over **MUST** be open (not blocked) on any firewall that exists between the controller and mobility service for NMSP to function.

The NMSP Parameters dialog box of NCS enables you to modify NMSP parameters such as echo and neighbor dead intervals as well as response and retransmit periods.

To configure NMSP parameters, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the mobility services engine whose properties you want to edit.
- Step 3** From the left sidebar menu, choose **System > NMSP Parameters**.
- Step 4** Modify the NMSP parameters as appropriate.

**Note** No change in the default parameter values is recommended unless the network is experiencing slow response or excessive latency.

NMSP parameters include the following:

- **Echo Interval**—Defines how frequently an echo request is sent from a mobility service to a controller. The default value is 15 seconds. Allowed values range from 1 to 120 seconds.

**Note** If a network is experiencing slow response, you can increase the values of the echo interval, neighbor dead interval and the response timeout values to limit the number of failed echo acknowledgements.

- **Neighbor Dead Interval**—The number of seconds that the mobility service waits for a successful echo response from the controller before declaring the neighbor dead. This timer begins when the echo request is sent.

The default values is 30 seconds. Allowed values range from 1 to 240 seconds.

**Note** This value must be at least two times the echo interval value.

- **Response Timeout**—Indicates how long the mobility service waits before considering the pending request as timed out. The default value is one second. Minimum value is one (1). There is no maximum value.
- **Retransmit Interval**—Interval of time that the mobility service waits between notification of a response time out and initiation of a request retransmission. The default setting is 3 seconds. Allowed values range from 1 to 120 seconds.
- **Maximum Retransmits**—Defines the maximum number of retransmits that are done in the absence of a response to any request. The default setting is 5. Allowed minimum value is zero (0). There is no maximum value.

- Step 5** Click **Save** to update the NCS and mobility service databases.
-

## Viewing Active Session Details for a Mobility Services Engine

The Active Sessions dialog box of NCS enables you to view active user sessions on the mobility services engine.

To view active user sessions, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility service.
  - Step 3** From the left sidebar menu, choose **System > Active Sessions**.

NCS displays a list of active mobility service sessions. For every session, NCS displays the following information:

- Session identifier
  - IP address from which the mobility service is accessed
  - Username of the connected user
  - Date and time when the session started
  - Date and time when the mobility service was last accessed
  - How long the session was idle for since the last access
- 

## Viewing and Adding Trap Destinations for a Mobility Services Engine

The Trap Destinations dialog box of NCS enables you to specify which NCS or Cisco Security Monitoring, Analysis, and Response System (CS-MARS) network management platform is the recipient of SNMP traps generated by the mobility services engine.

To view or manage trap destination for a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility service.
  - Step 3** From the left sidebar menu, choose **System > Trap Destinations**.

NCS displays a list of current trap destinations including the following information:

- IP address
- Port number
- Community
- Destination type
- SNMP Version

Use the Select a command drop-down list to add or delete a trap destination.

---

To add a trap destination, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.

- Step 2** Click the name of the mobility service.
- Step 3** From the left sidebar menu, choose **System > Trap Destinations**.
- Step 4** Choose **Add Trap Destination** from the command drop-down list.  
The New Trap Destination page appears.
- Step 5** Enter the following details (see [Table 16-3](#)).

**Table 16-3 Add Trap Destination**

| Field                                                                         | Description                                                                          |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| IP Address                                                                    | IP address for the trap destination                                                  |
| Port Number                                                                   | Port number for the trap destination. The default port number is 162.                |
| Destination Type                                                              | This field is not editable and has a value <b>Other</b> .                            |
| SNMP Version                                                                  | Select either v2c or v3                                                              |
| The following set of fields appear only if you select v3 as the SNMP version. |                                                                                      |
| User Name                                                                     | Username for the SNMP version 3.                                                     |
| Security Name                                                                 | Security name for the SNMP version 3.                                                |
| Authentication Type                                                           | Select one of the following:<br>HMAC-MD5<br>HMAC-SHA                                 |
| Authentication Password                                                       | Authentication password for the SNMP version 3.                                      |
| Privacy Type                                                                  | Select one of the following:<br>CBC-DES<br>CFB-AES-128<br>CFB-AES-192<br>CFB-AES-256 |
| Privacy Password                                                              | Privacy password for the SNMP version 3.                                             |

- Step 6** Click **Save** to save the changes or **Cancel** to discard the changes.

## Editing Advanced Parameters for a Mobility Services Engine

The Advanced Parameters dialog box of NCS enables you to set the number of days events are kept, set session time out values, set an absent data interval cleanup interval, and enable or disable Advanced Debug.

**Note** You can use NCS to modify troubleshooting parameters for a mobility services engine.

To edit advanced parameters for a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the mobility service whose properties you want to edit.
- Step 3** From the left sidebar menu, choose **System > Advanced Parameters**.
- Step 4** View or modify the advanced parameters as necessary.
- General Information
  - Advanced Parameters

---

**Caution** Because advanced debugging slows the mobility service down, enable advanced debugging only under the guidance of TAC personnel.

---

- Number of Days to keep Events—Enter the number of days to keep logs. Change this value as required for monitoring and troubleshooting.
  - Session Timeout—Enter the number of minutes before a session times out. Change this value as required for monitoring and troubleshooting. Currently this option appears dimmed.
  - Cisco UDI
    - Product Identifier (PID)—The Product ID of the mobility services engine.
    - Version Identifier (VID)—The version number of the mobility services engine.
    - Serial Number (SN)—Serial number of the mobility services engine.
  - Advanced Commands
    - Reboot Hardware—Click to reboot the mobility service hardware. See the [“Rebooting the Mobility Services Engine Hardware”](#) section on page 16-26 for more information.
    - Shutdown Hardware—Click to turn off the mobility service hardware. See the [“Shutting Down the Mobility Services Engine Hardware”](#) section on page 16-27 for more information.
    - Clear Database—Click to clear the mobility services database. See the [“Clearing the Mobility Services Engine Database”](#) section on page 16-27 for more information. Unselect the **Retain current service assignments in NCS** check box to remove all existing service assignments from NCS and MSE. The resources have to be reassigned from **Services > Synchronize Services** page. This option is selected by default.
- Step 5** Click **Save** to update the NCS and mobility service databases.
- 

## Rebooting the Mobility Services Engine Hardware

If you need to restart a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the mobility services engine that you want to reboot.
- Step 3** Click **System**.
- Step 4** Click **Advanced Parameters**.
- Step 5** In the Advanced Commands dialog box, click **Reboot Hardware**.
- Step 6** Click **OK** to confirm that you want to reboot the mobility services engine hardware.

The rebooting process takes a few minutes to complete.

---

## Shutting Down the Mobility Services Engine Hardware

If you need to shut down a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine that you want to shut down.
  - Step 3** Click **System**.
  - Step 4** Click **Advanced Parameters**.
  - Step 5** In the Advanced Commands dialog box, click **Shutdown Hardware**.
  - Step 6** Click **OK** to confirm that you want to shut down the mobility services engine.
- 

## Clearing the Mobility Services Engine Database

To clear a mobility services engine configuration and restore its factory defaults, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine you want to configure.
  - Step 3** Click **System**.
  - Step 4** Click **Advanced Parameters**.
  - Step 5** In the Advanced Commands dialog box, unselect the **Retain current service assignments in NCS** check box to remove all existing service assignments from NCS and MSE.  
  
The resources have to be reassigned in the Services > Synchronize Services page. By default, this option is selected.
  - Step 6** In the Advanced Commands dialog box, click **Clear Database**.
  - Step 7** Click **OK** to clear the mobility services engine database.
- 

## Working with Logs

This section describes how to configure logging options and how to download log files and contains the following topics:

- [Configuring Logging Options, page 16-27](#)
- [Downloading Mobility Services Engine Log Files, page 16-29](#)

### Configuring Logging Options

You can use NCS to specify the logging level and types of messages to log.

To configure logging options, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine that you want to configure.
  - Step 3** Choose **System > Logs**. The advanced parameters for the selected mobility services engine appear.
  - Step 4** Choose the appropriate options from the Logging Level drop-down list.

There are four logging options: Off, Error, Information, and Trace.

All log records with a log level of Error or above are logged to a new error log file `locserver-error-%u-%g.log`. This is an additional log file maintained along with the location server `locserver-%u-%g.log` log file. The error log file consists of logs of Error level along with their context information. The contextual information consists of 25 log records prior to the error. You can maintain upto 10 error log files. The maximum size allowed for each log file is 10 MB.

**Caution** Use Error and Trace only when directed to do so by Cisco Technical Assistance Center (TAC) personnel.

---

- Step 5** Select the **Enabled** check box next to each element listed in that section to begin logging its events.
  - Step 6** Select the **Enable** check box in the Advanced Parameters dialog box to enable advanced debugging. By default, this option is disabled.
  - Step 7** To download log files from the server, click **Download Logs**. For more information, see the [“Downloading Mobility Services Engine Log Files”](#) section on page 16-29.
  - Step 8** In the Log File Parameters section, enter the following:
    - The number of log files to be maintained in the mobility services engine. You can maintain a minimum of 5 log files and a maximum of 20 log files in the mobility services engine.
    - The maximum log file size in MB. The minimum log file size is 10 MB and the maximum is 50 MB.
  - Step 9** In the MAC Address Based Logging Parameters section, do the following:
    - Select the **Enable** check box to enable MAC address logging. By default, this option is disabled.
    - Add one or more MAC addresses for which you want to enable logging. You can also remove MAC addresses that you have already added by selecting the MAC address from the list and clicking **Remove**.

For more information on MAC Address-based logging, see the [“MAC Address-based Logging”](#) section on page 16-28.
  - Step 10** Click **Save** to apply your changes.
- 

## MAC Address-based Logging

This feature allows you to create log files that are specific to an entity whose MAC address is specified. The log files are created in the `locserver` directory under the following path:

`/opt/mse/logs/locserver`

A maximum of 5 MAC addresses can be logged at a time. The Log file format for MAC address `aa:bb:cc:dd:ee:ff` is `macaddress-debug-aa-bb-cc-dd-ee-ff.log`

You can create a maximum of two log files for a MAC Address. The two log files may consist of one main and one backup or rollover log file.

The minimum size of a MAC log file is 10 MB. The maximum size allowed is 20 MB per MAC Address. The MAC log files that are not updated for more than 24 hours are pruned.

## Downloading Mobility Services Engine Log Files

If you need to analyze mobility services engine log files, you can use NCS to download them to your system. NCS downloads a zip file containing the log files.

To download a zip file containing the log files, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine to view its status.
  - Step 3** From the left sidebar menu, choose **Logs**.
  - Step 4** Click **Download Logs**.
  - Step 5** Follow the instructions in the File Download dialog box to open the file or save the zip file to your system.
- 

## Managing User and Group Accounts for a Mobility Services Engine

This section describes how to configure and manage users and groups on the mobility services engine.

This section describes how to add, delete, and edit users for a mobility services engine and contains the following topics:

- [Adding Users for a Mobility Services Engine, page 16-29](#)
- [Deleting Users, page 16-30](#)
- [Editing User Properties, page 16-30](#)

---

**Note** See the “[Viewing Active Session Details for a Mobility Services Engine](#)” section on [page 16-24](#) for information on viewing active sessions for each user.

---

- **Managing Group Accounts**—This section describes how to add, delete, and edit user groups for a mobility services engine and contains the following topics:
  - [Adding User Groups, page 16-30](#)
  - [Deleting User Groups, page 16-31](#)
  - [Editing Group User Permissions, page 16-31](#)

## Adding Users for a Mobility Services Engine

To add a users to a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the device name of the mobility services engine that you want to edit.
  - Step 3** From the left sidebar menu, choose **Systems > Accounts > Users**.
  - Step 4** From the Select a command drop-down list, choose **Add User**.
  - Step 5** Click **Go**.
  - Step 6** Enter the username in the Username text box.

**Step 7** Enter a password in the Password text box.

**Step 8** Enter the name of the group to which the user belongs in the Group Name text box.

**Step 9** Select a permission level from the Permission drop-down list.

There are three permission levels to select from: Read Access, Write Access, and Full Access (required for NCS to access a mobility services engine).

**Caution**

Group permissions override individual user permissions. For example, if you give a user full access and add that user to a group with read access, that user will not be able to configure mobility services engine settings.

**Step 10** Click **Save** to add the new user to the mobility services engine.

## Deleting Users

To delete a user from a mobility services engine, follow these steps:

**Step 1** Choose **Services > Mobility Services**.

**Step 2** Click the device name of the mobility services engine that you want to edit.

**Step 3** From the left sidebar menu, choose **Systems > Accounts > Users**.

**Step 4** Select the check box(es) of the user(s) that you want to delete.

**Step 5** From the Select a command drop-down list, choose **Delete User**.

**Step 6** Click **Go**.

**Step 7** Click **OK** to confirm that you want to delete the selected users.

## Editing User Properties

To change user properties, follow these steps:

**Step 1** Choose **Services > Mobility Services**.

**Step 2** Click the device name of the mobility services engine that you want to edit.

**Step 3** From the left sidebar menu, choose **Systems > Accounts > Users**.

**Step 4** Click the username of the user that you want to edit.

**Step 5** Make the required changes to the Password, Group Name, and Permission text boxes.

**Step 6** Click **Save** to apply your change.

## Adding User Groups

To add a user group to a mobility services engine, follow these steps:

**Step 1** Choose **Services > Mobility Services**.

- Step 2** Click the device name of the mobility services engine that you want to edit.
- Step 3** From the left sidebar menu, choose **Systems > Accounts > Groups**.
- Step 4** From the Select a command drop-down list, choose **Add Group**.
- Step 5** Click **Go**.
- Step 6** Enter the name of the group in the Group Name text box.
- Step 7** Choose a permission level from the Permission drop-down list.
- There are three permissions levels to choose from:
- Read Access
  - Write Access
  - Full Access (required for NCS to access mobility services engines)
- Step 8** Click **Save** to add the new group to the mobility services engine.

**Caution**

---

Group permissions override individual user permissions. For example, if you give a user full access and add that user to a group with read access permission, that user will not be able to configure mobility services engine settings.

---

## Deleting User Groups

To delete user groups from a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the device name of the mobility services engine that you want to edit.
- Step 3** From the left sidebar menu, choose **Systems > Accounts > Groups**.
- Step 4** Select the check box(es) of the group(s) that you want to delete.
- Step 5** From the Select a command drop-down list, choose **Delete Group**.
- Step 6** Click **Go**.
- Step 7** Click **OK** to confirm that you want to delete the selected users.
- 

## Editing Group User Permissions

To change user group permissions, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the device name of the mobility services engine that you want to edit.
- Step 3** From the left sidebar menu, choose **Systems > Accounts > Groups**.
- Step 4** Click the group name of the group that you want to edit.
- Step 5** Choose a permission level from the Permission drop-down list.
- Step 6** Click **Save** to apply your change.

**Caution**

Group permissions override individual user permissions. For example, if you give a user permission for full access and add that user to a group with read access, that user will not be able to configure mobility services engine settings.

## Monitoring Status Information for a Mobility Services Engine

The **System > Status** page enables you to monitor server events, NCS alarms and events, and NMSP connection status for the mobility services engine.

This section provides additional information and contains the following topics:

- [Viewing Server Events for a Mobility Services Engine, page 16-32](#)
- [Viewing NCS Alarms for a Mobility Services Engine, page 16-33](#)
- [Viewing NCS Events for a Mobility Services Engine, page 16-33](#)
- [Viewing NMSP Connection Status for a Mobility Services Engine, page 16-33](#)

### Viewing Server Events for a Mobility Services Engine

To view a list of server events, follow these steps:

- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the applicable mobility services engine.
- Step 3** From the left sidebar menu, choose **System > Status > Server Events**.

The **Status > Server Events** page provides the following information:

- **Timestamp**—Time of the server event.
- **Severity**—Severity of the server event.
- **Event**—Detailed description of the event.
- **Facility**—The facility in which the event took place.

### Viewing Audit Logs from a Mobility Services Engine

You can view the audit logs for User-triggered operations using the **Audit Logs** option available in a Mobility Services Engine. To view the audit logs, follow these steps:

- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the applicable mobility services engine.
- Step 3** From the left sidebar menu, choose **System > Status > Audit Logs**.

The **Status > Audit Logs** page provides the following information:

- **Username**—The Username which has triggered the audit log.

- Operation—The operation that has been performed by the User.
  - Operation Status—The status of the operation. It could be either SUCCESSFUL or FAILED.
  - Invocation Time—The date and time at which the audit log was recorded for the specified operation.
- 

## Viewing NCS Alarms for a Mobility Services Engine

To view a list of NCS alarms, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the applicable mobility service.
  - Step 3** From the left sidebar menu, choose **System > Status > NCS Alarms**. See the [“Monitoring Alarms” section on page 5-125](#) for more information.
- 

## Viewing NCS Events for a Mobility Services Engine

To view a list of NCS events, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the applicable mobility service.
  - Step 3** From the left sidebar menu, choose **System > Status > NCS Events**. See the [“Monitoring Events” section on page 5-142](#) for more information.
- 

## Viewing NMSP Connection Status for a Mobility Services Engine

The NMSP Connection Status page allows you to verify the NMSP connection between the mobility services engine and the Cisco controller to which the mobility services engine is assigned.

### Note

Network Mobility Services Protocol (NMSP) is the protocol that manages communication between the mobility service and the controller.

---

To verify the NMSP connection between the controller and the mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the applicable mobility service.
  - Step 3** From the left sidebar menu, choose **System > Status > NMSP Connection Status**.

The NMSP Connection Status page displays the following information:

- Summary—The Summary section displays each device type, the total number of connections, and the number of inactive connections.
- NMSP Connection Status—This section displays the following:
  - IP address—Click the device IP address to view NMSP connection status details for this device. See the “[Viewing NMSP Connection Status Details](#)” section on page 16-34 for additional information.
  - Target Type—Indicates the device to which the NMSP connection is intended.
  - Version—Indicates the current software version for the device.
  - NMSP Status—Indicates whether the connection is active or inactive.
  - Echo Request Count—Indicates the number of echo requests that were sent.
  - Echo Response Count—Indicates the number of echo responses that were received.
  - Last Message Received—Indicates the date and time of the most recent message received.

**Step 4** Verify that the NMSP Status is ACTIVE.

- If active, you can view details on wired switches, controllers, and wired clients.
- If not active, resynchronize the NCS device and the mobility services engine.

---

**Note** You can launch an NMSP troubleshooting tool for an inactive connection.

---

## Viewing NMSP Connection Status Details

To view NMSP Connection Status details, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the applicable mobility service.
  - Step 3** From the left sidebar menu, choose **System > Status > NMSP Connection Status**.
  - Step 4** Click the device IP address to open the NMSP Connection Status Details page. The Details page displays the following information:
    - Summary
      - IP Address
      - Version—The current software version for the device.
      - Target Type—The device to which the NMSP connection is intended.
      - NMSP Status—Indicates whether the connection is active or inactive.
      - Echo Request Count—The number of echo requests that were sent.
      - Echo Response Count—The number of echo responses that were received.
      - Last Activity Time—The date and time of the most recent message activity between the device and the mobility services engine.
      - Last Echo Request Message Received At—The date and time the last echo request was received.
      - Last Echo Response Message Received At—The date and time the last echo response was received.

- Model—The device model.
  - MAC Address—The MAC address of the device, if applicable.
  - Capable NMSP Services—Indicates the NMSP-capable services for this device such as ATTACHMENT or LOCATION.
  - Subscribed Services—Indicates subservices for each subscribed NMSP service. For example, MOBILE\_STATION\_ATTACHMENT is a subservice of ATTACHMENT.
  - Messages
    - Message Type—Message types may include: ATTACHMENT\_NOTIFICATION, ATTACHMENT\_REQUEST, ATTACHMENT\_RESPONSE, CAPABILITY\_NOTIFICATION, ECHO\_REQUEST, ECHO\_RESPONSE, LOCATION\_NOTIFICATION, LOCATION\_REQUEST, SERVICE\_SUBSCRIBE\_REQUEST, SERVICE\_SUBSCRIBE\_RESPONSE.
    - In/Out—Indicates whether the message was an incoming or outgoing message.
    - Count—Indicates the number of incoming or outgoing messages.
    - Last Activity Time—The date and time of the most recent activity or message.
    - Bytes—Size of the message in Bytes.
- 

## Managing Maintenance for Mobility Services

This section contains the following topics:

- [Viewing or Editing Mobility Services Backup Parameters, page 16-35](#)
- [Backing Up Mobility Services Engine Historical Data, page 16-36](#)
- [Restoring Mobility Services Engine Historical Data, page 16-36](#)
- [Downloading Software to a Mobility Services Engine Using NCS, page 16-37](#)

### Viewing or Editing Mobility Services Backup Parameters

To view or edit mobility service backup parameters, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility service whose properties you want to edit.
  - Step 3** From the left sidebar menu, choose **Maintenance > Backup**.
    - Backups located at—Indicates the location of the backup file.
    - Enter a name for the Backup—Enter or edit the name of the backup file.
    - Timeout (in secs)—Indicate the length of time (in seconds) before attempts to back up files will time out.
-

## Backing Up Mobility Services Engine Historical Data

NCS includes functionality for backing up mobility services engine data.

To back up mobility services engine data, follow these steps:

- 
- Step 1** In Cisco NCS, click **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine that you want to back up.
  - Step 3** From the left sidebar menu, choose **Maintenance > Backup**.
  - Step 4** Enter the name of the backup.
  - Step 5** Enter the time in seconds after which the backup times out.
  - Step 6** Click **Submit** to back up the historical data to the hard drive of the server running NCS.

Status of the backup can be seen on the screen while the backup is in process. Three items will display on the screen during the backup process: (1) Last Status field provides messages noting the status of the backup; (2) Progress field shows what percentage of the backup is complete; and (3) Started at field shows when the backup began noting date and time.

---

**Note** You can run the backup process in the background while working on other mobility services engine operations in other NCS pages.

---

---

**Note** Backups are stored in the FTP directory that you specify during the NCS installation. However, in NCS installation, FTP directory is not specified. It might be necessary to give the full path of the FTP root.

---

## Restoring Mobility Services Engine Historical Data

To restore a file back into the mobility service, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility service whose properties you want to edit.
  - Step 3** From the left sidebar menu, choose **Maintenance > Restore**.
  - Step 4** Choose the file to restore from the drop-down list.
  - Step 5** Select the **Delete synchronized service assignments** check box if you want to permanently remove all service assignments from the mobility services engine.

This option is applicable for network designs, wired switches, controllers and event definitions. The existing location history data is retained, however you must use manual service assignments to do any future location calculations.

- Step 6** Click **Submit** to start the restoration process.
  - Step 7** Click **OK** to confirm that you want to restore the data from the NCS Server hard drive.
- When the restoration is complete, NCS displays a message to that effect.

**Note** You can run the restore process in the background while working on other mobility service engine operations in other NCS pages.

## Downloading Software to a Mobility Services Engine Using NCS

To download software to a mobility services engine using NCS, follow these steps:

- Step 1** Verify that you can ping the location appliance from NCS or an external FTP server, whichever you are going to use for the application code download.
- Step 2** Choose **Services > Mobility Services**.
- Step 3** Click the name of the mobility services engine to which you want to download software.
- Step 4** On the left sidebar menu, choose **Maintenance**.
- Step 5** Click **Download Software**.

To download software, do one of the following:

- To download software listed in the NCS directory, select the **Select from uploaded images to transfer into the Server** check box. Then, choose a binary image from the drop-down list.  
NCS downloads the binary images listed in the drop-down list into the FTP server directory you specified during the NCS installation.  
In NCS installation, FTP directory is not specified. It might be necessary to give the full path of the FTP root.
- To use downloaded software available locally or over the network, select the **Browse a new software image to transfer into the Server** check box and click **Browse**. Locate the file and click **Open**.

- Step 6** Enter the time, in seconds (between 1 and 1800), after which the software download times out.
- Step 7** Click **Download** to send the software to the /opt/installers directory on the mobility services engine.

## Managing Cisco Adaptive wIPS Service Parameters

The wIPS Service page allows you to view or manage wIPS service administrative settings.

**Note** Cisco Adaptive wIPS functionality is not supported for non-root partition users.

### Managing wIPS Service Administration Settings

To view or manage wIPS service administration settings, follow these steps:

- Step 1** Choose **Services > Mobility Services**.
- Step 2** Choose the device name of the applicable mobility services engine.

- Step 3** From the left sidebar menu, choose **wIPS Service**.
- Step 4** View or edit the following parameters:
- Log level—Choose the applicable log level from the drop-down list. Log levels include debug, error, important event, major debug, none, and warning.
  - Forensic size limit (GB)—Enter the maximum allowable size of forensic files.
  - Alarm ageout (hours)—Enter the age limit in hours for each alarm.
  - Device ageout (days)—Enter the age limit in days for the device to send alarms.
- Step 5** Click **Save** to confirm the changes or **Cancel** to close the page with no changes applied.
- 

## Managing Context-Aware Software Parameters

Context-Aware Software (CAS) allows a mobility services engine to simultaneously track thousands of mobile assets and clients by retrieving contextual information such as location, temperature and asset availability about a client or tag (Cisco CX version or later) from Cisco access points.

CAS relies on two engines for processing the contextual information it receives. The *Context-Aware Engine for Clients* processes data received from Wi-Fi clients and the *Context-Aware Engine for Tags* processes data received from Wi-Fi tags; these engines can be deployed together or separately depending on the business need.

**Note** Mobility services engines do not track or map non-Cisco CX tags.

---

**Note** CAS was previously referred to as Cisco location-based services.

---

You can modify Context-Aware Software properties as to the type and number of clients or tags that are tracked and whether or not locations are calculated for those clients or tags.

You can also modify parameters that affect the location calculation of clients and tags such as Receiver Signal Strength Indicator (RSSI) measurements.

### Viewing Contextual Information

Before you can use NCS to view contextual information, initial configuration for the mobility services engine is required using a command-line (CLI) console session. Refer to the *Cisco 3350 Mobility Services Engine Getting Started Guide* and the *Cisco 3100 Mobility Services Engine Getting Started Guide* at the following URL:

[http://www.cisco.com/en/US/products/ps9742/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps9742/tsd_products_support_series_home.html).

After its installation and initial configuration are complete, the mobility services engine can communicate with multiple Cisco wireless LAN controllers to collect operator-defined contextual information. You can then use the associated NCS to communicate with each mobility services engine to transfer and display selected data.

You can configure the mobility services engine to collect data for clients, rogue access points, rogue clients, mobile stations, interferers, and active RFID asset tags.

## Licensing for Clients and Tags

You must purchase licenses from Cisco to retrieve contextual information on tags and clients from access points.

- Licenses for tags and clients are offered separately.
- The clients license also includes tracking of rogue clients and rogue access points, and interferers (if enabled).
- Licenses for tags and clients are offered in a variety of quantities, ranging from 1,000 to 12,000 units.

The AeroScout Context-Aware Engine for Tags support 100 permanent tag licenses; Context-Aware Software will consist of permanent tag licenses.

**Note** For more information on tags and client licenses, refer to the *Release Notes for Cisco 3300 Series Mobility Services Engine for Software Release 6.0* at the following URL:  
[http://www.cisco.com/en/US/products/ps9742/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps9742/tsd_products_support_series_home.html)

For additional information on Context-Aware parameters, select one of the following topics:

- [Context-Aware General Parameters, page 16-39](#)
- [Context-Aware Administration Parameters, page 16-39](#)
- [Context Aware Advanced Parameters, page 16-57](#)

## Context-Aware General Parameters

To access the Context Aware Service > General page, choose **Services > Mobility Services > General** from the left sidebar menu. This page provides the following information:

- Number of tracked clients
- Number of traced tags
- Number of tracked rogues
- Number of tracked interferers
- Number of tracked wired clients
- Limit for total elements tracked
- Limit for number of tracked tags
- Interactive graph of the mobility services engine client and tag count

## Context-Aware Administration Parameters

This section contains the following topics:

- [Modifying Tracking Parameters for Mobility Services, page 16-40](#)
- [Modifying Filtering Parameters for Mobility Services, page 16-44](#)
- [Modifying History Parameters for Mobility Services, page 16-46](#)
- [Enabling Location Presence for Mobility Services, page 16-47](#)

- [Importing Asset Information for Mobility Services, page 16-48](#)
- [Exporting Asset Information for Mobility Services, page 16-48](#)
- [Importing Civic Information for Mobility Services, page 16-49](#)

## Modifying Tracking Parameters for Mobility Services

The mobility services engine can track up to 18,000 clients or up to 18,000 tags (with the proper license purchase). Updates on the locations of elements being tracked are provided to the mobility services engine from the Cisco wireless LAN controller.

Only those elements designated for tracking by the controller are viewable in NCS maps, queries, and reports. No events and alarms are collected for non-tracked elements and none are used in calculating the 18,000 element limit for clients or tags.

You can modify the following tracking parameters using NCS:

- Enable and disable element locations (client stations, active asset tags, interferers, wired clients, rogue clients, and rogue access points) you actively track.
  - Wired client location tracking enables servers in a data center to more easily find wired clients in the network. Servers are associated with wired switch ports in the network.
- Set limits on how many of a specific element you want to track.

For example, given a client license of 12,000 trackable units, you can set a limit to track only 8,000 client stations (leaving 4,000 units available to track rogue clients and rogue access points). Once the tracking limit is met for a given element, the number of elements not being tracked is summarized in the Tracking Parameters page.

- Disable tracking and reporting of ad hoc rogue clients and access points.

To configure tracking parameters for a mobility services engine, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services** to open the Mobility Services page.
  - Step 2** Click the name of the mobility services engine whose properties you want to edit. The General Properties page opens.
  - Step 3** In the Context-Aware Software menu located on the left sidebar menu, choose **Tracking Parameters** from the Administration sub-heading to display the configuration options.
  - Step 4** Modify the following tracking parameters as appropriate (see [Table 16-4](#)).

Table 16-4 Tracking Parameters

| Parameter           | Configuration Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Rogue Access Points   | <ol style="list-style-type: none"> <li>1. Select the <b>Enable</b> check box to enable tracking of rogue clients and asset points by the mobility services engine.</li> <li>2. Select the <b>Enable Limiting</b> check box to set a limit on the number of rogue clients and asset tags stations to track.</li> <li>3. Enter a Limit Value, if limiting is enabled. The limit entered can be any positive value up to 18,000 which is the maximum number of rogue clients and access points that can be tracked by a mobility services engine.</li> </ol> <p><b>Note</b> The actual number of tracked rogues (clients and access points) is driven by the client license purchased. The user must consider the number of clients that are being tracked in determining the available quantity to allocate to track rogue clients and access points because clients and rogue clients and access points are addressed by the same license.</p> <p><b>Note</b> Active Value (Display only): Indicates the number of rogue clients and access points currently being tracked.</p> <p><b>Note</b> Not Tracked (Display only): Indicates the number of rogue clients and access points beyond the limit.</p> |
| Exclude Ad-Hoc Rogues | <p>Select the check box to turn off the tracking and reporting of ad hoc rogues in the network. As a result, ad hoc rogues are not displayed on NCS maps or its events and alarms reported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Rogue Clients         | <ol style="list-style-type: none"> <li>1. Select the <b>Enable</b> check box to enable tracking of rogue clients by the mobility services engine.</li> <li>2. Select the <b>Enable Limiting</b> check box to set a limit on the number of rogue clients to track.</li> <li>3. Enter a Limit Value, if limiting is enabled. The limit entered can be any positive value up to 18,000 which is the maximum number of rogue clients that can be tracked by a mobility services engine.</li> </ol> <p><b>Note</b> The actual number of tracked rogues (clients and access points) is driven by the client license purchased. The user must consider the number of clients that are being tracked in determining the available quantity to allocate to track rogue clients and access points because clients and rogue clients and access points are addressed by the same license.</p> <p><b>Note</b> Active Value (Display only): Indicates the number of rogue clients being tracked.</p> <p><b>Note</b> Not Tracked (Display only): Indicates the number of rogue clients beyond the limit.</p>                                                                                                          |

**Table 16-4 Tracking Parameters (continued)**

| Parameter                                                                                | Configuration Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interferers                                                                              | <p>1. Select the <b>Enable</b> check box to enable tracking of the interferers by the mobility services engine.</p> <p>In 7.0, the client license encompasses all network location service elements and is shared among wireless clients, wired clients, rogue clients, access points, and interferers.</p> <p><b>Note</b> Active Value (Display only): Indicates the number of interferers currently being tracked.</p> <p><b>Note</b> Not Tracked (Display only): Indicates the number of interferers beyond the limit.</p> |
| <b>Asset Tracking Elements</b>                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Active RFID Tags                                                                         | <p>1. Select the <b>Enable</b> check box to enable tracking of active RFID tags by the mobility services engine.</p> <p><b>Note</b> The actual number of tracked active RFID tags is determined by the license purchased.</p> <p><b>Note</b> Active Value (Display only): Indicates the number of active RFID tags currently being tracked. It also depends on the tag engine chosen.</p> <p><b>Note</b> Not Tracked (Display only): Indicates the number of active RFID tags beyond the limit.</p>                           |
| <b>SNMP Parameters</b> Not applicable to mobility services engines later than 7.0.105.0. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SNMP Retry Count                                                                         | Enter the number of times to retry a polling cycle, the default value is 3. Allowed values are from 1 to 99999. (Configurable in controller release 4.1 and earlier only.)                                                                                                                                                                                                                                                                                                                                                    |
| SNMP Timeout                                                                             | Enter the number of seconds before a polling cycle times out, the default value is 5. Allowed values are from 1 to 99999. (Configurable in controller release 4.1 and earlier only.)                                                                                                                                                                                                                                                                                                                                          |
| <b>SNMP Polling Interval</b>                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Client Stations                                                                          | Select the <b>Enable</b> check box to enable client station polling and enter the polling interval in seconds. Default value is 300. Allowed values are from 1 to 99999. (Configurable in controller release 4.1 and earlier only.)                                                                                                                                                                                                                                                                                           |
| Active RFID Tags                                                                         | <p>Select the <b>Enable</b> check box to enable active RFID tag polling and enter the polling interval in seconds. Allowed values are from 1 to 99999.</p> <p> <b>Note</b> Before the mobility service can collect asset tag data from controllers, you must enable the detection of active RFID tags using the CLI command <b>config rfid status enable</b> on the controllers.</p>                                                       |
| Rogue Clients and Access Points                                                          | Select the <b>Enable</b> check box to enable rogue access point polling and enter the polling interval in seconds. Default value is 600. Allowed values are from 1 to 99999.(Configurable in controller release 4.1 and earlier only.)                                                                                                                                                                                                                                                                                        |
| Statistics                                                                               | Select the <b>Enable</b> check box to enable statistics polling for the mobility service, and enter the polling interval in seconds. Default value is 900. Allowed values are from 1 to 99999.(Configurable in controller release 4.1 and earlier only.)                                                                                                                                                                                                                                                                      |

**Step 5** Click **Save** to store the new settings in the mobility services engine database.

## Modifying Filtering Parameters for Mobility Services

In NCS, you can limit the number of asset tags, wired clients, rogue clients, interferers and access points whose location is tracked by filtering on the following:

- MAC addresses

Specific MAC addresses can be entered and labeled as allowed or disallowed from location tracking. You can import a file with the MAC addresses that are to be allowed or disallowed, or you can enter them individually in the NCS GUI page.

The format for entering MAC addresses is xx:xx:xx:xx:xx:xx. If a file of MAC addresses is imported, the file must follow a specific format as follows:

- Each MAC address should be listed on a single line.
- Allowed MAC addresses must be listed first and preceded by an “[Allowed]” line item. Disallowed MAC addresses must be preceded by “[Disallowed].”
- Wildcard listings can be used to represent a range of MAC addresses. For example, the first entry “00:11:22:33:\*” in the Allowed listing that follows is a wildcard.

**Note** Allowed MAC address formats are viewable in the Filtering Parameters configuration page. See [Table 16-5](#) for details.

EXAMPLE file listing:

```
[Allowed]
00:11:22:33:*
22:cd:34:ae:56:45
02:23:23:34:*
[Disallowed]
00:10:*
ae:bc:de:ea:45:23
```

- Probing clients

Probing clients are clients that are associated to another controller but whose probing activity causes them to be seen by another controller and be counted as an element by the “probed” controller as well as its primary controller.

To configure filtering parameters for a mobility services engine, follow these steps:

- Step 1** Choose **Services > Mobility Services**. The Mobility Services page appears.
- Step 2** Click the name of the mobility services engine whose properties you want to edit. The General Properties page appears.
- Step 3** From the Context-Aware Software menu, choose **Filtering Parameters** from the Administration sub-heading to display the configuration options.
- Step 4** Modify the following filtering parameters as appropriate (see [Table 16-5](#)).

**Table 16-5** Filtering Parameters

| Parameter                     | Configuration Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclude Probing Clients       | Select the check box to prevent location calculation of probing clients.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Location MAC Filtering | <ol style="list-style-type: none"> <li>1. Select the check box to enable MAC filtering of specific elements by their MAC address.</li> <li>2. To import a file of MAC addresses (Upload a file for Location MAC Filtering field), browse for the file name and click <b>Save</b> to load the file. The imported list of MAC addresses auto-populates the Allowed List and Disallowed List based on their designation in the file.</li> </ol> <p><b>Note</b> To view allowed MAC address formats, click the red question mark next to the Upload a file for Location MAC Filtering field.</p> <ol style="list-style-type: none"> <li>3. To add an individual MAC address, enter the MAC addresses (format is xx:xx:xx:xx:xx:xx) and click either <b>Allow</b> or <b>Disallow</b>. The address appears in the appropriate column.</li> </ol> <p><b>Note</b> To move an address between the Allow and Disallow columns, highlight the MAC address entry and click the button under the appropriate column.</p> <p><b>Note</b> To move multiple addresses, click the first MAC address and press <b>Ctrl</b> to highlight additional MAC addresses. Click <b>Allow</b> or <b>Disallow</b> based on its desired destination.</p> <p><b>Note</b> If a MAC address is not listed in the Allow or Disallow column, by default, it appears in the Blocked MACs column. If you click the <b>Unblock</b> button, the MAC address automatically moves to the Allow column. You can move it to the Disallow column by selecting the Disallow button under the Allow column.</p> |

**Step 5** Click **Save** to store the new settings in the mobility services engine database.

## Modifying History Parameters for Mobility Services

You can use NCS to specify how long to store (archive) histories on client stations, rogue clients, and asset tags. These histories are received from those controllers that are associated with the mobility service.

You can also program the mobility service to periodically remove (prune) duplicate data from its historical files to reduce the amount of data stored on its hard drive.

To configure mobility service history settings, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility service whose properties you want to edit.
  - Step 3** From the left sidebar menu, choose **Context Aware Service > History Parameters**.
  - Step 4** Modify the following history parameters as appropriate (see [Table 16-6](#)).

**Table 16-6** History Parameters

| Parameter                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Archive for</b>                                                                              | Enter the number of days for the location appliance to retain a history of each enabled category. Default value is 30. Allowed values are from 1 to 99999.                                                                                                                                                                                                          |
| <b>Prune data starting at</b>                                                                   | Enter the number of hours and minutes at which the location appliance starts data pruning (between 0 and 23 hours, and between 1 and 59 minutes).<br><br>Enter the interval in minutes after which data pruning starts again (between 0, which means never, and 99900000). Default start time is 23 hours and 50 minutes, and the default interval is 1440 minutes. |
| <b>Enable History Logging of Location Transitions for</b>                                       | Choose one or more of the following options to enable history logging of Location transitions: <ul style="list-style-type: none"> <li>• Client Stations</li> <li>• Wired Stations</li> <li>• Asset Tags</li> <li>• Rogue Clients</li> <li>• Rogue Access Points</li> <li>• Interferers</li> </ul>                                                                   |
|  <b>Note</b> | Before the mobility service can collect asset tag data from controllers, you must enable the detection of RFID tags using the CLI command <b>config rfid status enable</b> .                                                                                                                                                                                        |

- Step 5** Click **Save** to store your selections in the location appliance database.
-

## Enabling Location Presence for Mobility Services

You can enable location presence on the mobility services engine to provide expanded Civic (city, state, postal code, country) and GEO (longitude, latitude) location information beyond the Cisco default setting (campus, building, floor, and X, Y coordinates). This information can then be requested by wireless and wired clients on a demand basis for use by location-based services and applications.

You can also import advanced location information such as the MAC address of a wired client and the wired switch slot and port to which the wired client is attached.

Location Presence can be configured when a new Campus, Building, Floor or Outdoor Area is being added or configured at a later date.

Once enabled, the mobility services engine is capable of providing any requesting Cisco CX v5 client its location.

### Note

Before enabling this feature, synchronize the mobility services engine.

To enable and configure location presence on a mobility services engine, follow these steps:

- Step 1** Choose **Services > Mobility Services > Device Name**. Select the mobility services engine to which the campus or building or floor is assigned.
- Step 2** From the left sidebar menu, choose **Context Aware Services > Administration > Presence Parameters**.
- Step 3** Select the Service Type **On Demand** check box to enable location presence for Cisco CX clients v5.
- Step 4** Select one of the following Location Resolution options:
  - a. When **Building** is selected, the mobility services engine can provide any requesting client, its location by building.
    - For example, if a client requests its location and the client is located in Building A, the mobility services engine returns the client address as Building A.
  - b. When **AP** is selected, the mobility services engine can provide any requesting client, its location by its associated access point. The MAC address of the access point appears.
    - For example, if a client requests its location and the client is associated with an access point with a MAC address of 3034:00hh:0adg, the mobility services engine returns the client address of 3034:00hh:0adg.
  - c. When **X,Y** is selected, the mobility services engine can provide any requesting client, its location by its X and Y coordinates.
    - For example, if a client requests its location and the client is located at (50, 200) the mobility services engine returns the client address of 50, 200.
- Step 5** Select any or all of the location formats:
  - a. Select the **Cisco** check box to provide location by campus, building and floor and X and Y coordinates. Default setting.
  - b. Select the **Civic** check box to provide the name and address (street, city, state, postal code, country) of a campus, building, floor, or outdoor area.

### Note

To import a file with multiple Civic listings, see the [“Importing Civic Information for Mobility Services”](#) section on page 16-49.

- c. Select the **GEO** check box to provide the longitude and latitude coordinates.
  - Step 6** By default, the Text check box for Location Response Encoding is selected. It indicates the format of the information when received by the client. There is no need to change this setting.
  - Step 7** Select the **Retransmission Rule Enable** check box to allow the receiving client to retransmit the received information to another party.
  - Step 8** Enter a Retention Expiration value in minutes. This determines how long the received information is stored by the client before it is overwritten. Default value is 24 hours (1440 minutes).
  - Step 9** Click **Save**.
- 

## Importing Asset Information for Mobility Services

To import asset, chokepoint, and TDOA receiver information for the mobility services engine using NCS, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine for which you want to import information.
  - Step 3** Choose **Context Aware Service > Administration > Import Asset Information**.
  - Step 4** Enter the name of the text file or browse for the filename.  
Specify information in the imported file in the following formats:
    - tag format: #tag, 00:00:00:00:00:00, categoryname, groupname, assetname
    - station format: #station, 00:00:00:00:00:00, categoryname, groupname, assetname
  - Step 5** When the import file name is located in the Browse text box, click **Import**.
- 

## Exporting Asset Information for Mobility Services

To export asset, chokepoint, and TDOA receiver information from the mobility services engine to a file using NCS, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine from which you want the export information.
  - Step 3** Choose **Context Aware Service > Administration > Export Asset Information**.  
Information in the exported file is in the the following formats:
    - tag format: #tag, 00:00:00:00:00:00, categoryname, groupname, assetname
    - station format: #station, 00:00:00:00:00:00, categoryname, groupname, assetname
  - Step 4** Click **Export**.  
Click **Open** (display to screen), **Save** (to external PC or server), or **Cancel** (to cancel the request).

**Note** If you select **Save**, you are asked to select the asset file destination and name. The file is named `assets.out` by default. Click **Close** in the dialog box when download is complete.

## Importing Civic Information for Mobility Services

To import civic information for the mobility services engine using NCS, follow these steps:

- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the mobility services engine for which you want to import asset information.
- Step 3** From the left sidebar menu, choose **Context Aware Software**.
- Step 4** From the Administration left sidebar menu, choose **Import Civic Information**.
- Step 5** Enter the name of the text file or browse for the file name.

Information in the imported file should be one of the following formats:

Switch IP Address, Slot Number, Port Number, Extended Parent Civic Address, X, Y, Floor ID, Building ID, Network Design ID, ELIN:"ELIN", PIDs-Lo-Tag:"Civic Address Element Value"

**Note** Each entry must appear on a separate line.

- Step 6** Click **Import**.

## Context Aware Wired Parameters

This section describes the Context Aware Service > Wired drop-down list parameters and contains the following topics:

- [Monitoring Wired Switches, page 16-49](#)
- [Wired Switch Details, page 16-50](#)
- [Monitoring Wired Clients, page 16-51](#)
- [Wired Client Details, page 16-51](#)

### Monitoring Wired Switches

You can review details on the wired switch (IP address, MAC address, serial number, software version, and ELIN), its port, its wired clients (count and status), and its civic information.

Wired switch data is downloaded to the mobility services engine through NCS when the Ethernet switch and the mobility services engine are synchronized (Services > Synchronize Services > Switches). Communication between a location-capable switch and the mobility services engine is over NMSP. NCS and the mobility services engine communicate over XML.

To view details on wired switches, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** In the Mobility Services page, click the device name link of the appropriate wired location switch.
- Step 3** Choose **Context Aware Service > Wired > Wired Switches**. A summary of wired switches that are synchronized with the mobility services engine appears.
- Step 4** To see more details on the switch, its port, its wired clients (count and status), and its civic information click the IP address link. See the [“Wired Switch Details” section on page 16-50](#) for information on wired switch details.
- 

## Wired Switch Details

To view wired switch details, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
- Step 2** At the Mobility Services page, click the device name link of the appropriate mobility services engine.
- Step 3** Choose **Context Aware Service > Wired > Wired Switches**. A summary of wired switches that are synchronized with the mobility services engine appears.
- Step 4** Click the IP address link for the applicable wired switch. The Wired Switch Details page opens.
- The Wired Switch Details page has four tabs: Switch Information, Switch Ports, Civic, and Advanced.

**Note** You can export civic information from the switch by choosing that option from the Select a command drop-down list. This option is available in all four dashlets of the Wired Switches page.

---

The Wired Switch Details tabs display the following information:

- Switch Information—Displays a total count summary of wired clients connected to the switch along with the state of the client (connected, disconnected, and unknown).
  - Connected clients—Clients that are connected to the wired switch.
  - Disconnected clients—Clients that are disconnected from the wired switch.
  - Unknown clients—Clients are marked as unknown when the NMSP connection to the wired switch is lost.

**Note** You can view detailed wired client information by clicking in one of the client count links (total clients, connected, disconnected, and unknown). See the [“Monitoring Wired Clients” section on page 16-51](#) section for more information.

---

- Switch Ports—Displays a detailed list of the ports on the switch.

**Note** You can change the listing order (ascending, descending) of port IP addresses, slot numbers, module number, port type, and port number by clicking in the respective column heading.

---

- Civic—Displays a detailed list of the civic information for the wired switch.

- **Advanced**—Displays a detailed list of the additional civic information for the wired switch.
- 

## Monitoring Wired Clients

You can view details on a wired client (MAC address, IP address, username, serial number, UDI, model no., software version, VLAN ID, and VLAN ID), port association, and its civic information.

Wired client data is downloaded to the mobility services engine through NCS when the switch and the mobility services engine are synchronized (Services > Synchronize Services > Switches).

NCS and the mobility services engine communicate over XML.

You can view the details of the wired client on either the wired switches page (Context Aware Service > Wired > Wired Switches) or wired clients page (Context Aware Service > Wired > Wired Clients).

- If you know the IP address, MAC address, VLAN ID, serial number, or username, you can use the search field on the wired clients page.
- If you want to examine wired clients as they relates to a specific switch, you can view that information on the wired switches page. See the [“Monitoring Wired Switches” section on page 16-49](#) section for more information.

To view details on a wired client, follow these steps:

---

**Step 1** Choose **Services > Mobility Services**. The Mobility Services page opens.

**Step 2** Click the device name link of the appropriate wired location switch.

**Step 3** Choose **Context Aware Service > Wired > Wired Clients**.

At the Wired Clients summary page, clients are grouped by their switch.

A client status is noted as connected, disconnected, or unknown:

- **Connected clients**—Clients that are active and connected to a wired switch.
- **Disconnected clients**—Clients that are disconnected from the wired switch.
- **Unknown clients**—Clients that are marked as unknown when the NMSP connection to the wired switch is lost. See the [“Viewing NMSP Connection Status for a Mobility Services Engine” section on page 16-33](#) for more information about NMSP connections.

If you know the MAC address of the wired client, you can click that link to reach the detail page of the client or use the search field. See the [“Wired Client Details” section on page 16-51](#) for more information on wired client details.

- You can also search for a wired client by its IP address, username, or VLAN ID.

If you click the IP address of the switch, you are forwarded to the detail page of the switch. See the [“Monitoring Wired Switches” section on page 16-49](#) section for more information.

**Step 4** Click the MAC Address for the applicable client to view wired client details. See the [“Wired Client Details” section on page 16-51](#) for more information on wired client details.

---

## Wired Client Details

To view wired client details, follow these steps:

---

**Step 1** Choose **Services > Mobility Services**.

- Step 2** At the Mobility Services page, click the device name link of the appropriate mobility services engine.
- Step 3** Choose **Context Aware Service > Wired > Wired Clients**. A summary of wired clients that are synchronized with the mobility services engine appears.
- Step 4** Click the MAC address link for the applicable wired client. The Wired Client Details page opens. The Wired Client Details page has four tabs: Device Information, Port Association, Civic Address, and Advanced.

The Wired Switch Details tabs display the following information:

- Device Information—Display MAC and IP address, username, serial and model number, UDI, software version, VLAN ID, and VLAN name.
- Port Association—Displays the physical location of the switch port/slot/module on which the wired client terminates, the client status (connected, disconnected, unknown), and the switch IP address.
- Civic Address—Displays any civic address information.
- Advanced—Displays extended physical address details for the wired clients, if applicable.

**Note** A client takes on the civic address and advanced location information that is configured for the port on which the client terminates. If no civic and advanced information is defined for the its port (port/slot/module) then no location data is displayed.

## Monitoring Interferers

The Monitor > Interferers page allows you to monitor interference devices detected by the CleanAir enabled access points.

This section provides information on the interferers detected by the CleanAir enabled access points. By default, the [Monitor > Interferers > AP Detected Interferers](#), page 16-52 page is displayed.

This section contains the following topics:

- [Monitor > Interferers > AP Detected Interferers](#), page 16-52
- [Monitor > Interferers > AP Detected Interferers > Interferer Details](#), page 16-53
- [Monitor > Interferers > Edit View](#), page 16-55
- [Monitor > Interferers > Edit View > Edit Search](#), page 16-56

### Monitor > Interferers > AP Detected Interferers

Choose **Monitor > Interferers** to view all the interfering devices detected by the CleanAir enabled access points on your wireless network. This page enables you to view a summary of the interfering devices including the following default information:

- Interferer ID—A unique identifier for the interferer. Click this link to know more about the interferer.
- Type—Indicates the category of the interferer. Click to read more about the type of device. The dialog box appears displaying more details. The categories include the following:
  - Bluetooth link—A Bluetooth link (802.11b/g/n only)
  - Microwave Oven—A microwave oven (802.11b/g/n only)

- 802.11 FH—An 802.11 frequency-hopping device (802.11b/g/n only)
- Bluetooth Discovery—A Bluetooth discovery (802.11b/g/n only)
- TDD Transmitter—A time division duplex (TDD) transmitter
- Jammer—A jamming device
- Continuous Transmitter—A continuous transmitter
- DECT-like Phone—A digital enhanced cordless communication (DECT)-compatible phone
- Video—A video camera
- 802.15.4—An 802.15.4 device (802.11b/g/n only)
- WiFi Inverted—A device using spectrally inverted Wi-Fi signals
- WiFi Invalid—A device using non-standard Wi-Fi channels
- SuperAG—An 802.11 SuperAG device
- Canopy—A Motorola Canopy device
- Radar—A radar device (802.11a/n only)
- Xbox—A Microsoft Xbox (802.11b/g/n only)
- WiMAX Mobile—A WiMAX mobile device (802.11a/n only)
- WiMAX Fixed—A WiMAX fixed device (802.11a/n only)
- Status—Indicates the status of the interfering device.
  - Active—Indicates that the interferer is currently being detected by the CleanAir enabled access point.
  - Inactive—Indicates that the interferer is no longer being detected by the CleanAir enabled access point or the CleanAir enabled access point saw the interferer no longer reachable by NCS.
- Severity—Displays the severity ranking of the interfering device.
- Affected Band—Displays the band in which this device is interfering.
- Affected Channels—Displays the affected channels.
- Duty Cycle (%)—The duty cycle of interfering device in percentage.
- Discovered—Displays the time at which it was discovered.
- Last Updated—The last time the interference was detected.
- Floor—The location where the interfering device is present.

**Note**

These devices appear only if the option to track Interferers is enabled in the Tracking Parameters page. This option is disabled by default. For more information on tracking parameters, see the [“Modifying Tracking Parameters for Mobility Services”](#) section on page 16-40.

### Monitor > Interferers > AP Detected Interferers > Interferer Details

Choose **Monitor > Interferers > Interferer ID** to view this page. This page enables you to view the details of the interfering devices detected by the access points. This page provides the following details about the interfering device.

- Interferer Properties

- Type—Displays the type of the interfering device detected by the AP.
- Status—The status of the interfering device. Indicates the status of the interfering device.
  - Active—Indicates that the interferer is currently being detected by the CleanAir enabled access point.
  - Inactive—Indicates that the interferer is no longer being detected by the CleanAir enabled access point or the CleanAir enabled access point saw the interferer no longer reachable by NCS.
  - Severity—Displays the severity ranking of the interfering device.
  - Duty Cycle (%)—The duty cycle of interfering device in percentage.
  - Affected Band—Displays the band in which this device is interfering.
  - Affected Channels—Displays the affected channels.
  - Discovered—Displays the time at which it was discovered.
  - Last Updated—The last time the interference was detected.
- Location
  - Floor—The location where this interfering device was detected.
  - Last Located At—The last time where the interfering device was located.
  - On MSE—The Mobility Server Engine on which this interference device was located.
- Clustering Information
  - Clustered By—Displays the following:
    - IP address of the controller if clustered by a controller.
    - IP address of the mobility services engine if clustered by a mobility services engine.
  - Detecting APs—Displays the details of the access point that has detected the interfering device. The details include: Access Point Name (Mac), Severity, and Duty Cycle(%).

**Note**

---

The detecting access point information is available only for active devices. And even for some active devices, this information may not be available. This is because, those interferers are in the process of being marked inactive and in the next refresh of Monitor > Interferers page, those will appear inactive.

---

- Details—Displays a short description about the interfering type.

Select a command

The Select a command drop-down list provides access to the location history of the interfering device detected by the access point. See the “[Monitor > Interferers > AP Detected Interferer Details > Interference Device ID > Location History](#)” section on page 16-54.

### Monitor > Interferers > AP Detected Interferer Details > Interference Device ID > Location History

Choose **Monitor > Interferers > Interference Device ID**, choose **Location History** from the Select a command drop-down list, and click **Go** to view this page.

- Interferer Information—Displays the basic information about the interfering device.
  - Data Collected At—The time stamp at which the data was collected.
  - Type—The type of the interfering device.

- Severity—The severity index of the interfering device.
- Duty Cycle—The duty cycle (in percentage) of the interfering device.
- Affected Channels—A comma separated list of the channels affected.
- Interferer Location History—Displays the location history of the interfering devices.
  - Time Stamp
  - Floor
- Clustering Information
  - Clustered By
- Detecting APs
  - AP Name—The access point that detected the interfering device.
  - Severity—The severity index of the interfering device.
  - Duty Cycle(%)—The duty cycle (in percentage) of the interfering device.
- Location
  - Location Calculated At—Displays the time stamp at which this information was generated.
  - Floor—Displays location information of the interfering device.
  - A graphical view of the location of the interfering device is displayed in a map. Click the Enlarge link to view an enlarged image.

### Monitor > Interferers > Edit View

The Edit View page allows you to add, remove, or reorder columns in the AP Detected Interferers Summary page. It also allows you to search for Interferers. By default only those interferers that are in Active state and with severity greater than or equal to 5 are displayed in the AP Detected Interferers page. For more information on editing search criteria, see the [“Monitor > Interferers > Edit View > Edit Search” section on page 16-56](#).

To edit the columns in the AP Detected Interferers page, follow these steps:

- 
- Step 1** Choose **Monitor > Interferers**. The AP Detected Interferers page appears showing details of the interferers detected by the CleanAir enabled access points.
  - Step 2** Click the **Edit View** link in the AP Detected Interferers page.
  - Step 3** To add an additional column to the access points table, click to highlight the column heading in the left column. Click **Show** to move the heading to the right column. All items in the right column are displayed in the table.
  - Step 4** To remove a column from the access points table, click to highlight the column heading in the right column. Click **Hide** to move the heading to the left column. All items in the left column are not displayed in the table.
  - Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired column heading and click **Up** or **Down** to move it higher or lower in the current list.
  - Step 6** Click **Reset** to restore the default view.
  - Step 7** Click **Submit** to confirm the changes.
-

**Monitor > Interferers > Edit View > Edit Search**

You can search for interferers based on certain criteria. By default only those interferers that are in Active state and with severity greater than or equal to 5 are displayed in the AP Detected Interferers page. Use the Edit Search option to customize the interferer search.

To edit the search criteria, follow these steps:

- 
- Step 1** Choose **Monitor > Interferers**. The AP Detected Interferers page appears.
  - Step 2** Click **Edit Search** and select the appropriate criteria. This option allows you to specify the following search criteria:
    - Search Category—For interferer search, the search category is Interferers.
    - Detected By—From the drop-down list, select Access Points or Spectrum Experts.
    - Search By—From the list box, select any one of the following options:
      - All Interferers
      - Interferer ID
      - Interferer Type
      - Severity
      - Duty Cycle
      - Location
    - Severity greater than—Enter the severity level in the text box.
    - Detected within the last—From the list box, select any one of the following options:
      - 5 Minutes
      - 15 Minutes
      - 30 Minutes
      - 1 Hour
      - 3 Hours
      - 6 Hours
      - 12 Hours
      - 24 Hours
      - All History
    - Interferer status—From the list box, choose any of the following options:
      - Active
      - Inactive
      - All
    - Restrict By Radio Band/Channels—Select this check box if you want to restrict certain radio frequencies or channels from the search. By default, this check box is unselected. On selected this check box, a list box appears with 2.4 GHz, 5 GHz and Individual Channel options. If you select Individual Channel, an Affected Channels text box appears. Specify the channel and select either the **Match All** or **Match Any** radio button.
  - Step 3** Select the number of items per page that you want to view in the search results.
  - Step 4** Select the **Save Search** check box if you want to save the search.

**Step 5** After specifying the search criteria. Click **Go** to view the search results.

## Context Aware Advanced Parameters

This section contains the following topics:

- [Modifying Location Parameters for Mobility Services, page 16-57](#)
- [Modifying Notification Parameters for Mobility Services, page 16-59](#)

## Modifying Location Parameters for Mobility Services

You can use NCS to specify whether the mobility service retains its calculation times and how soon the mobility service deletes its collected Receiver Signal Strength Indicator (RSSI) measurement times. You can also apply varying smoothing rates to manage location movement of an element.

To configure location parameters, follow these steps:

- Step 1** Choose **Services > Mobility Services**.
- Step 2** Click the name of the mobility service whose properties you want to edit.
- Step 3** From the left sidebar menu, choose **Context Aware Service > Location Parameters**.
- Step 4** Modify the location parameters as appropriate (see [Table 16-7](#)).

**Table 16-7** Location Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>             |                                                                                                                                                                                                                                                                                                                                 |
| Enable Calculation Time    | Select the check box to enable the calculation of the time required to compute location.<br><br><br><b>Caution</b> Enable only under Cisco TAC personnel guidance because enabling this parameter slows down overall location calculations. |
| Enable OW Location         | Select the check box to enable Outer Wall (OW) calculation as part of location calculation.<br><br><br><b>Note</b> The OW Location parameter is ignored by the location server.                                                             |
| Relative discard RSSI time | Enter the number of minutes since the most recent RSSI sample after which RSSI measurement should be considered stale and discarded. Default value is 3. Allowed values range from 0 to 99999. A value of less than 3 is not recommended.                                                                                       |

**Table 16-7 Location Parameters (continued)**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Absolute discard RSSI time               | Enter the number of minutes after which RSSI measurement should be considered stale and discarded, regardless of the most recent sample. Default value is 60. Allowed values range from 0 to 99999. A value of less than 60 is not recommended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RSSI Cutoff                              | <p>Enter the RSSI cutoff value, in decibels (dBs) with respect to one (1) mW (dBm), above which the mobility service will always use the access point measurement. Default value is -75.</p> <p> <b>Note</b> When 3 or more measurements are available above the RSSI cutoff value, the mobility service will discard any weaker values and use the 3 (or more) strongest measurements for calculation; however, when only weak measurements below the RSSI cutoff value are available, those values are used for calculation.</p> <p> <b>Caution</b> Modify only under Cisco TAC personnel guidance. Modifying this value can reduce the accuracy of location calculation.</p> |
| Enable Location Filtering                | <p>If enabled, the location filter is applied only for client location calculation.</p> <p>Enabling location filter allows previous location estimates to be used in estimating current location. This reduces location jitter for stationary clients and improve tracking for mobile clients.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Chokepoint Usage                         | Select the check box to enable the usage of chokepoint proximity to determine location. Applies to Cisco compatible Tags capable of reporting chokepoint proximity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Use Chokepoints for Interfloor conflicts | <p>Allows the use of chokepoints to determine the correct floor during Interfloor conflicts.</p> <p>Select Never, Always, or Floor Ambiguity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Chokepoint Out of Range Timeout          | After a Cisco compatible Tag leaves a chokepoint proximity range, this is the timeout (in seconds) after which RSSI information will be used again to determine location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Absent Data Cleanup Interval             | Enter the interval period (in minutes) for removing inactive elements from the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 16-7 Location Parameters (continued)**

| Parameter                                   | Description                                                                                                                                                                                         |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Default Heatmaps for Non Cisco Antennas | Select this check box to enable the usage of default heatmaps for non-Cisco antennas during the Location Calculation. This option is disabled by default.                                           |
| <b>Movement Detection</b>                   |                                                                                                                                                                                                     |
| Individual RSSI change threshold            | This parameter specifies the Individual RSSI movement recalculation trigger threshold.<br>Enter a threshold value between 0-127 dBm<br>It should not be modified without Customer Support guidance. |
| Aggregated RSSI change threshold            | This parameter specifies the Aggregated RSSI movement recalculation trigger threshold.<br>Enter a threshold value between 0-127 dBm<br>It should not be modified without Customer Support guidance. |
| Many new RSSI change percentage threshold   | This parameter specifies Many new RSSI movement recalculation trigger threshold in percentage.<br>It should not be modified without Customer Support guidance.                                      |
| Many missing RSSI percentage threshold      | This parameter specifies Many missing RSSI movement recalculation trigger threshold in percentage.<br>It should not be modified without Customer Support guidance.                                  |

**Step 5** Click **Save** to store your selections in the NCS and mobility service databases.

## Modifying Notification Parameters for Mobility Services

You can use NCS to configure mobility services engine event notification parameters that define such items as how often the notifications are generated or resent by the mobility services engine.

**Note**

Modify notification parameters only if you expect the mobility services engine to send a large number of notifications or if notifications are not being received.

You can also enable forwarding of northbound notifications for tags to be sent to third-party applications.

The format of northbound notifications sent by the mobility services engine is available on the Cisco developers support portal at the following URL:

[http://www.cisco.com/en/US/products/svcs/ps3034/ps5408/ps5418/serv\\_home.html](http://www.cisco.com/en/US/products/svcs/ps3034/ps5408/ps5418/serv_home.html)

To configure notification parameters, follow these steps:

- 
- Step 1** Choose **Services > Mobility Services**.
  - Step 2** Click the name of the mobility services engine you want to configure.
  - Step 3** From the Context Aware Software left sidebar menu, choose **Notification Parameters** from the Advanced sub-heading to display the configuration options.
  - Step 4** Select the **Enable Northbound Notifications** check box to enable the function.
  - Step 5** Select the **Notification Contents** check box to send notifications to third-party applications (northbound).
  - Step 6** Select one or more of the following Notification content options:
    - Chokepoints
    - Telemetry
    - Emergency
    - Battery Level
    - Vendor Data
    - Location
  - Step 7** Select the **Notification Triggers** check box.
  - Step 8** Select one or more of the following Notification trigger options:
    - Chokepoints
    - Telemetry
    - Emergency
    - Battery Level
    - Vendor Data
    - Location Recalculation
  - Step 9** Enter the IP address and port for the system that is to receive the northbound notifications.
  - Step 10** Choose the transport type from the drop-down list.
  - Step 11** Select **HTTPS** if you want to use HTTPS protocol for secure access to the destination system.
  - Step 12** To modify the notification parameter settings, enter the new value in the appropriate text box in the Advanced tab of the page. [Table 16-8](#) describes each parameter.

**Table 16-8** User-Configurable Conditional and Northbound Notifications Parameters

| Parameter                                        | Configuration Options                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rate Limit                                       | Enter the rate in milliseconds at which the mobility services engine generates notifications. A value of 0 (default) means that the mobility services engine generates notifications as fast as possible (Northbound notifications only).                                                                                                                                                             |
| Queue Limit                                      | Enter the event queue limit for sending notifications. The mobility services engine drops any event above this limit. Default values: Cisco 3350 (30000), Cisco 3310 (5,000), and Cisco 2710 (10,000).                                                                                                                                                                                                |
| Retry Count                                      | Enter the number of times to generate an event notification before the refresh time expires. This parameter can be used for asynchronous transport types which do not acknowledge the receipt of the notification and there is a possibility that the notification may be lost in transit. Default value is 1.<br><br><b>Note</b> The mobility services engine does not store events in its database. |
| Refresh Time                                     | Enter the wait time in minutes that must pass before a notification is resent. For example if a device is configured for In Coverage Area notification and it is constantly being detected within the Coverage Area. The notification will be sent once every refresh time.                                                                                                                           |
| Drop Oldest Entry on Queue Overflow              | (Read only). The number of event notifications dropped from the queue since startup.                                                                                                                                                                                                                                                                                                                  |
| Serialize Events per Mac address per Destination | Select this option if you want the successive events for the same MAC address to be sent to a single destination in a serial manner.                                                                                                                                                                                                                                                                  |

**Step 13** Click **Save**.

## Viewing Tag Engine Status

To access the Tag Engine Status page, choose **Services > Mobility Services > MSE Name > Context Aware Service > Tag Engine > Status**.

**Note** This option appears only if Partner Tag engine was chosen as the engine.

If tag licenses are available, then Aeroscout Tag Engine is enabled. Else, Cisco Tag Engine is enabled by default.

If only evaluation license is available then Cisco Tag Engine is enabled by default. The Tag Engine status page shows status based on whether it is Aeroscout Tag Engine or Cisco Tag Engine.

**Note** Aeroscout engine fails to start on MSE if WCS map names have special characters such as '&'.

Table 16-9 lists and describes the fields in the Tag Engine Status page for Aeroscout Tag Engine.

**Table 16-9** Fields in the Tag Engine Status page for Aeroscout Tag Engine

| Field                    | Description                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------|
| Tag Location Engine Name | The Partner engine name, which is <b>aeroscout</b> .                                                            |
| Version                  | Version of the Aeroscout Tag Engine.                                                                            |
| Description              | Description for the Tag Engine.                                                                                 |
| Registered               | Displays as True when the Aeroscout Tag Engine has established communication with the mobility services engine. |
| Active                   | Displays as True when the Aeroscout Tag Engine is up and running.                                               |
| License Information      | The maximum tags that are available with the Aeroscout Tag Engine.                                              |

If you have selected Cisco Tag Engine for Context Aware Service, the Tag Engine Status page displays the following information.

[Table 16-10](#) describes the fields in the Tag Engine Status page for Cisco Tag Engine.

**Table 16-10** Fields in the Tag Engine Status page for Cisco Tag Engine

| Field                    | Description                                                    |
|--------------------------|----------------------------------------------------------------|
| Tag Location Engine Name | The Tag location engine name, which is <b>Cisco</b> .          |
| Version                  | Version of the Cisco Tag Engine.                               |
| Description              | Description for the Tag Engine.                                |
| Active                   | Displays as True when the Cisco Tag Engine is up and running.  |
| License Information      | The maximum tags that are available with the Cisco Tag Engine. |

## Viewing Notification Information for Mobility Services

The **Services > Context Aware Notifications** page provides the ability to define events. This section contains the following topics:

- [Viewing the Notifications Summary for Mobility Services, page 16-62](#)
- [Viewing and Managing Notifications Settings for Mobility Services, page 16-64](#)
- [Viewing Notification Statistics, page 16-64](#)

## Viewing the Notifications Summary for Mobility Services

To view the Notification Summary, choose **Services > Context Aware Notifications > Summary**.

The mobility service sends event notifications and does not store them (fire and forget). However, if NCS is a destination of notification events, it stores the notifications it receives and groups them into the following seven categories:

- **Absence (Missing)**—Generated when the mobility service cannot see the asset in the WLAN for the specified time.
- **Location Changes**—Generated when client stations, asset tags, rogue clients, and rogue access points move from their previous location.
- **Chokepoint Notifications**—Generated when a tag is seen (stimulated) by a chokepoint. This information is only reported and displayed for CCX v.1 compliant tags.
- **In/Out Area**—Generated when an asset is moved inside or outside a designated area.

---

**Note** You define a containment area (campus, building, or floor) in the Maps section of NCS (Monitor > Maps). You can define a coverage area using the Map Editor.

---

- **Battery Level**—Generated when a tracked asset tag hits the designated battery level.
- **Movement from Marker**—Generated when an asset is moved beyond a specified distance from a designated marker you define on a map.
- **Emergency**—Generated for a CCX v.1 compliant asset tag when the panic button of the tag is triggered or the tag becomes detached, tampered with, goes inactive or reports an unknown state. This information is only reported and displayed for CCX v.1 compliant tags.

The summary details include the following:

- All Notifications
- Client Stations
- Asset Tags
- Rogue Clients
- Rogue Access Points

**Note**

---

To view details for each of the notifications, click the number under the Last Hour, Last 24 Hours, or Total Active column to open the details page for the applicable notification.

---

## Notifications Cleared

A mobility service sends event notifications when it clears an event condition in one of the following scenarios:

- **Missing (Absence)**—Elements reappear.
- **In/Out Area (Containment)**—Elements move back in or out of the containment area.
- **Distance**—Elements move back within the specified distance from a marker.
- **Location Changes**—Clear state is not applicable to this condition.
- **Battery Level**—Tags are detected again operating with Normal battery level.
- **Emergency**
- **Chokepoint**

**Note** In NCS, the Notifications Summary page reflects whether notifications for cleared event conditions have been received.

## Viewing and Managing Notifications Settings for Mobility Services

**Note** An Event Group must be created which contains the rules that trigger a notification.

To view the Notifications Settings, follow these steps:

**Step 1** Choose **Services > Context Aware Notifications**.

**Step 2** From the left sidebar menu, choose **Settings**.

## Viewing Notification Statistics

You can view the notification statistics for a specific mobility services engine. To view the Notification Statistics for a specific mobility services engine, choose **Services > Mobility Services > MSE-name > Context Aware Service > Notification Statistics**.

where *MSE-name* is the name of a mobility services engine.

[Table 16-2](#) lists and describes the fields in the Notification statistics page.

**Table 16-11 Notification Statistics fields**

| Field                                  | Description                                                                                    |
|----------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Summary</b>                         |                                                                                                |
| Destinations                           |                                                                                                |
| Total                                  | Total count of the destinations.                                                               |
| Unreachable                            | Count of unreachable destinations.                                                             |
| <b>Notification Statistics Summary</b> |                                                                                                |
| Track Definition Status                | Status of the track definition. Track notification status could be either Enabled or Disabled. |
| Track Definition                       | Track definition can be either Nothbound or CAS event notification.                            |
| Destination IP Address                 | The destination IP address to which the notifications are sent.                                |
| Destination Port                       | The destination port to which the notifications are sent.                                      |
| Destination Type                       | The type of the destination. Example: SOAP_XML                                                 |
| Destination Status                     | Status of the destination device. The status is either Up or Down.                             |

**Table 16-11 Notification Statistics fields**

| Field          | Description                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary</b> |                                                                                                                                                       |
| Last Sent      | The date and time at which the last notification was sent to the destination device.                                                                  |
| Last Failed    | The date and time at which the notification had failed.                                                                                               |
| Total Count    | The total count of notifications sent to the destination. Click the count link to view the notification statistics details of the destination device. |

## About Event Groups

To manage events more efficiently, you can use NCS to create event groups. Event groups help you organize your event definitions.

This section contains the following topics:

- [Adding Event Groups, page 16-65](#)
- [Deleting Event Groups, page 16-65](#)
- [Working with Event Definitions, page 16-66](#)
- [Deleting an Event Definition, page 16-72](#)

## Adding Event Groups

To add an event group, follow these steps:

- 
- Step 1** Choose **Services > Context Aware Notifications**.
  - Step 2** Click **Notification Definitions** from the left sidebar menu.
  - Step 3** From the Select a command drop-down list, choose **Add Event Group**.
  - Step 4** Click **Go**.
  - Step 5** Enter the name of the group in the Group Name text box.
  - Step 6** Click **Save**.

The new event group appears in the Event Settings page.

---

## Deleting Event Groups

To delete an event group, follow these steps:

- 
- Step 1** Choose **Services > Context Aware Notifications**.
  - Step 2** Choose **Notification Definitions** from the left sidebar menu.

- Step 3** Select the check box of the event group you want to delete.
  - Step 4** From the Select a command drop-down list, choose **Delete Event Group(s)**.
  - Step 5** Click **Go**.
  - Step 6** Click **OK** to confirm the deletion.
  - Step 7** Click **Save**.
- 

## Working with Event Definitions

An event definition contains information about the condition that caused the event, the assets to which the event applies, and the event notification destinations. This section describes how to add, delete, and test event definitions.

**Note** NCS enables you to add definitions on a per-group basis. Any new event definition must belong to a particular group.

---

To add an event definition, follow these steps:

- Step 1** Choose **Services > Context Aware Notifications**.
- Step 2** From the left sidebar menu, choose **Notification Definitions**.
- Step 3** Click the name of the group to which you want to add the event. An event definition summary page appears for the selected event group.
- Step 4** From the Select a command drop-down list, choose **Add Event Definition**.
- Step 5** Click **Go**.
- Step 6** Enter the name of the event definition in the Event Definition Name text box.

**Note** The event definition name must be unique within the event group.

---

- Step 7** Click **Save**.
- Step 8** On the General tab, manage the following parameters:
  - Admin Status—Enable event generation by selecting the **Enabled** check box (disabled by default).
  - Priority—Set the event priority by choosing a number from the drop-down list. Zero is highest.

**Note** An event definition with higher priority is serviced before event definitions with lower priority.

---

- Activate—To continuously report events, select the **All the Time** option. To indicate specific days and times for activation, unselect the **All the Time** option and choose the applicable days and From/Until times. Click **Save**.
- Step 9** On the Conditions tab, add one or more conditions. For each condition, specify the rules for triggering events notifications. To add a condition, follow these steps:
  - a. Click **Add** to open the Add/Edit Condition page.

- b. Choose a condition type from the Condition Type drop-down list and configure its associated Trigger If parameters (Table 16-12).

**Table 16-12** Condition Type/Trigger If Parameters

| Condition Type  | Trigger If                                                                                                                                                                                                                                                                                                  |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Missing         | Missing for Time (mins)—Enter the number of minutes after which a missing asset event is generated.<br><br>For example, if you enter 10 in this text box, the mobility services engine generates a missing asset event if the mobility services engine has not located the asset for more than 10 minutes.  |
| In/Out          | Inside of or Outside of—Click <b>Select Area</b> and choose the area parameters from the Select page. Click <b>Select</b> . The area to monitor could be an entire campus, building within a campus, a floor in a building, or a coverage area (you can define a coverage area using the map editor).       |
| Distance        | At the distance of $x$ (feet) from Marker—Enter the the distance in feet that will trigger an event notification if the monitored asset moves beyond the specified distance from a designated marker. Click <b>Select Marker</b> and choose the marker parameters in the Select page. Click <b>Select</b> . |
| Battery Level   | Battery Level Is—Low, Medium, Normal. Select the appropriate battery level that will trigger an event.                                                                                                                                                                                                      |
| Location Change | An event is triggered if the location of the asset changes.                                                                                                                                                                                                                                                 |
| Emergency       | Select <b>Any, Panic Button, Tampered, or Detached</b>                                                                                                                                                                                                                                                      |
| Chokepoint      | In the range of Chokepoints—Click <b>Select Chokepoint</b> and choose the chokepoint parameters in the Select page. Click <b>Select</b> .                                                                                                                                                                   |

- c. In the Apply To drop-down list, choose the type of asset (Any, Clients, Tags, Rogue APs, Rogue Clients or Interferers) for which an event is generated if the trigger condition is met.

**Note** Emergency and chokepoint events are only applicable to tags (CCXv.1 compliant).

- d. From the Match By drop-down list, choose the matching criteria (MAC Address, Asset Name, Asset Group, or Asset Category), the operator (Equals or Like), and enter the relevant text for the selected Match By element.
- e. Click **Add**.

**Step 10** In the Destination and Transport tab, follow these steps to add one or more destinations to receive event notifications and configure the transport settings:

- a. Click **Add** to open the Add/Edit Destination and Transport page.
- b. To add one or more new destinations, click **Add New**, enter the applicable IP address, and click **OK**.

---

**Note** The recipient system must have an event listener running to process notifications. By default, when you create an event definition, NCS adds its IP address as the destination.

---

- c. To select a destination to receive notifications, click to highlight one or more IP addresses in the box on the right and click **Select** to add the IP address(es) to the box on the left.
- d. In the Message Format field, select **XML** or **Plain Text**.

---

**Note** If you select NCS as the destination, you must select XML format.

---

- e. Choose one of the following transport types from the Transport Type drop-down list:
  - SOAP—Simple Object Access Protocol. Use SOAP to send notifications over HTTP/HTTPS and to be processed by web services on the destination.  
Specify whether to send notifications over HTTPS by selecting its corresponding check box. Enter the destination port number in the Port Number text box.
  - Mail—Use this option to send notifications via email.  
Choose the protocol for sending the mail from the Mail Type drop-down list. Enter the following: username and password (if Authentication is enabled), name of the sender, prefix to add to the subject line, email address of recipient, and a port number if necessary.
  - SNMP—Simple Network Management Protocol. Use this option to send notifications to SNMP-capable devices.  
If you have selected SNMP version v2c then you would be prompted to enter the SNMP community string in the SNMP Community text box and the applicable port number in the Port Number text box.  
If you have selected SNMP version v3 then you would be prompted to enter the username, security name, choose the authentication type from the drop-down list, enter the authentication password, choose the privacy type from the drop-down list and enter the privacy password.
  - SysLog—Specifies the system log on the destination system as the recipient of event notifications.
  - Enter the notification priority in the Priority text box, the name of the facility, and the port number on the destination system.
- f. Click **Add**.

**Step 11** Verify that the new event definition is listed for the event group (Context Aware Service > Notifications > Event > Settings > Event Group Name).

---

## Adding Event Definitions

An event definition contains information about the condition that caused the event, the assets to which the event applies, and the event notification destination.

Cisco NCS enables you to add definitions for each group. An event definition must belong to a group. See the *Cisco Content-Aware Software Configuration Guide* for information on deleting or testing event definitions.

To add an event definition, follow these steps:

- 
- Step 1** Choose **Services > Context Aware Notifications**.
  - Step 2** Choose **Notification Definitions** from the left sidebar menu.
  - Step 3** Click the name of the group to which you want to add to the event. An event definition summary page appears for the selected event group.
  - Step 4** From the Select a command drop-down list, choose **Add Event Definition**, and click **Go**.
  - Step 5** At the Conditions tab, add one or more conditions. For each condition you add, specify the rules for triggering event notifications.

**Tip**

For example, to keep track of heart monitors in a hospital, you could add rules to generate event notifications when a heart monitor is missing for one hour, a heart monitor moves off its assigned floor, or a heart monitor enters a specific coverage area within a floor.

---

To add a condition, follow these steps:

- a. Click **Add** to add a condition that triggers this event.
- b. In the Add/Edit Condition dialog box, follow these steps:
  1. Choose a condition type from the Condition Type drop-down list.

If you chose Missing from the Condition Type drop-down list, enter the number of minutes after which a missing asset event is generated. For example, if you enter 10 in this text box, the mobility service engine generates a missing asset event if the mobility service engine has not found the asset for more than 10 minutes. Proceed to Step c.

If you chose In/Out from the Condition Type drop-down list, choose **Inside of** or **Outside of**, then select **Select Area** to select the area to monitor for assets going into it or out of it. In the Select dialog box, choose the area to monitor, then click **Select**. The area to monitor could be an entire campus, building within a campus, a floor in a building, or a coverage area (you can define a coverage area using the map editor). For example, to monitor part of a floor in a building, choose a campus from the Campus drop-down list, choose a building from the Building drop-down list, and choose the area to monitor from the Floor Area drop-down list. Then click **Select**. Proceed to Step c.

If you chose Distance from the Condition Type drop-down list, enter the distance in feet that will trigger an event notification if the monitored asset moves beyond the specified distance from a designated marker, then click **Select Marker**. In the Select dialog box, choose the campus, building, floor, and marker from the corresponding drop-down list, and click **Select**. For example, if you add a marker to a floor plan and set the distance in the Trigger If text box to 60 feet, an event notification will be generated if the monitored asset moves more than 60 feet away from the marker. Proceed to Step c.

**Note**

You can create markers and coverage areas using the Map Editor. When you create marker names, make sure they are unique across the entire system.

---

If you chose Battery Level from the Condition Type drop-down list, select the check box next to the battery level (low, medium, normal) that will trigger an event. Proceed to Step c.

If you chose Location Change from the Condition Type drop-down list, proceed to Step c.

If you chose Emergency from the Condition Type drop-down list, click the button next to the emergency (any, panic button, tampered, detached) that will trigger an event. Proceed to Step c.

If you chose Chokepoint from the Condition Type drop-down list, proceed to Step c. There is only one trigger condition, and it is displayed by default. No configuration is required.

- c. From the Apply To drop-down list, choose the type of asset (Any, Clients, Tags, Rogue APs, Rogue Clients, or Interferers) for which an event will be generated if the trigger condition is met.

**Note** If you choose the any option from the Apply to drop-down list, the battery condition is applied to all tags, clients, and rogue access points and rogue clients.

**Note** Emergency and chokepoint events apply only to Cisco-compatible extension tags version 1 (or later).

- d. From the Match By drop-down list, choose the matching criteria (MAC Address, Asset Name, Asset Group, or Asset Category), the operator (Equals or Like) from the drop-down list, and enter the relevant text for the selected Match By element.

Some examples of asset matching criteria that you can specify:

- If you choose **MAC Address** from the Match By drop-down list, choose **Equals** from the Operator drop-down list, and enter a MAC address (for example 12:12:12:12:12:12), the event condition applies to the element whose MAC address is 12:12:12:12:12:12 (exact match).
- If you choose **MAC Address** from the Match By drop-down, choose **Like** from the Operator drop-down list, and enter **12:12**, the event condition applies to elements whose MAC address starts with 12:12.

- e. Click **Add** to add the condition you have just defined.

**Note** If you are defining a chokepoint, you must select the chokepoint after you add the condition.

To select a chokepoint, do the following:

1. Click **Select Chokepoint**. An entry page appears.
2. Choose **Campus**, **Building**, and **Floor** from the appropriate drop-down lists.
3. Choose a Chokepoint from the menu that appears.

You are returned to the Add/Edit Condition page, and the location path (Campus > Building > Floor) for the chokepoint auto-populates the text area next to the Select Checkpoint button.

- Step 6** At the Destination and Transport tab, follow these steps to add one or more destinations to receive event notifications and to configure the transport settings:

- a. To add a new destination, click **Add**. The Add/Edit Destination configuration page appears.
- b. Click **Add New**.
- c. Enter the IP address of the system that will receive event notifications, and click **OK**.

The recipient system must have an event listener running to process notifications. By default, when you create an event definition, Cisco NCS adds its IP address as the destination.

- d. To select a destination to send event notifications to, highlight one or more IP addresses in the box on the right, and click **Select** to add the IP addresses to the box on the left.
- e. Choose **XML** or **Plain Text** to specify the message format.
- f. Choose one of the following transport types from the Transport Type drop-down list:
  - SOAP—Specifies Simple Object Access Protocol, a simple XML protocol, as the transport type for sending event notifications. Use SOAP to send notifications over HTTP/HTTPS that are processed by web services on the destination.  
If you choose SOAP, specify whether to send notifications over HTTPS by selecting its corresponding check box. If you do not, HTTP is used. Also, enter the destination port number in the Port Number text box.
  - Mail—Use this option to send notifications via e-mail.  
If you choose Mail, you need to choose the protocol for sending the mail from the Mail Type drop-down list. You also need to enter the following information: username and password (if Authentication is enabled), name of the sender, prefix to add to the subject line, e-mail address of recipient, and a port number if necessary.
  - SNMP—Use Simple Network Management Protocol, a very common technology for network monitoring used to send notifications to SNMP-capable devices.  
If you choose SNMP, enter the SNMP community string in the SNMP Community text box and the port number to send notifications to in the Port Number text box.
  - SysLog—Specifies the system log on the destination system as the recipient of event notifications.  
If you choose SysLog, enter the notification priority in the Priority text box, the name of the facility in the Facility text box, and the port number of the destination system in the Port Number text box.
- g. To enable HTTPS, select the **Enable** check box next to it.  
Port Number auto-populates.
- h. Click **Save**.

**Step 7** At the General tab, follow these steps:

- a. Select the **Enabled** check box for Admin Status to enable event generation (disabled by default).
- b. Set the event priority by choosing a number from the Priority drop-down list. Zero is the highest priority.

**Note** An event notification with high priority is serviced before event definitions with lower priority.

- c. To select how often the event notifications are sent:
  1. Select the **All the Time** check box to continuously report events. Proceed to Step g.
  2. Unselect the **All the Time** check box to select the day and time of the week that you want event notifications sent. Days of the week and time fields appear for the selection. Proceed to Step d.
- d. Select the check box next to each day you want the event notifications sent.
- e. Select the time for starting the event notification by selecting the appropriate hour, minute, and AM/PM options from the Apply From heading.
- f. Select the time for ending the event notification by selecting the appropriate hour, minute, and AM/PM options from the Apply Until heading.

g. Click **Save**.

**Step 8** Verify that the new event notification is listed for the event group (Mobility > Notifications > Settings > Event Group Name).

---

## Deleting an Event Definition

To delete one or more event definitions from NCS, follow these steps:

---

**Step 1** Choose **Services > Context Aware Notifications**.

**Step 2** From the left sidebar menu, choose **Settings**.

**Step 3** Click the name of the group from which you want to delete the event definitions.

**Step 4** Select the event definition that you want to delete by selecting its corresponding check box.

**Step 5** From the Select a command drop-down list, choose **Delete Event Definition(s)**.

**Step 6** Click **Go**.

**Step 7** Click **OK** to confirm that you want to delete the selected event definitions.

---

## Upgrading from 5.x to 6.0 or 7.0

**Caution**

The number of supported clients, tags, and access points (wIPS) is reset to 100 clients, 100 tags, and 20 access points when you upgrade to release 6.0 or above. All tracking beyond these limits is lost. These limits correspond to the 60 day evaluation licenses that are standard.

---

**Caution**

When upgrading mobility services engine from 6.0 to 7.0, if any limits have been set on wireless clients or rogues, they will get reset because of the wired client limit change in 7.0.

---

**Caution**

You must backup the mobility services engine database **before** upgrading from release 5.x1 or 6.0 to 7.0 to preserve client, tag, and access point configurations. You can restore the database after the software upgrade.

---

**Note**

Release 5.1 did not support licenses. You must order, register, and install licenses to track client and tag locations (CA) or access points (wIPS) beyond the limits of the 60-day evaluation licenses.

---

To upgrade to release 7.0, follow these steps:

---

**Step 1** Register the Product Authorization Key (PAK).

**Note** You receive a PAK when you order a license. If you have lost your PAK, you can use your sales order or the UDI number of the mobility services engine to register.

- Client and wIPS licenses are registered at:  
[www.cisco.com/go/license](http://www.cisco.com/go/license)
- Tag licenses are registered at:  
<http://www.aeroscout.com/content/support>

**Step 2** Backup the mobility services engine database:

- a. Choose **Services > Mobility Services**.
- b. Click the name of the mobility services engine on which you want to backup the database.
- c. Choose **Maintenance > Backup** from under the System menu (left).
- d. Enter a name for the backup file. Click **Submit**.

**Step 3** Download release 7.0:

- a. Choose **Services > Mobility Services**.
- b. Click the name of the mobility services engine on which you want to upgrade the software.
- c. Choose **Maintenance > Download Software** from under the System menu.
- d. Select either an uploaded image or browse and upload an image. Click **Download**.

**Step 4** Install release 7.0 using the MSE CLI:

- a. To overwrite existing software, enter:  

```
/etc/init.d/msed stop
cd opt/installers
./<mse software file name>
```
- b. To do a fresh install, enter:  

```
/etc/init.d/msed stop
cd /opt/mes/uninstall
./uninstall (enter this once in directory)
(Enter no when prompted to keep old database)
cd /opt/installers
./<mse software file name>
```

**Step 5** Restore mobility services engine database (For Step 4 b.):

- a. Choose **Services > Mobility Services**.
- b. Click the name of the mobility services engine on which you upgraded the software.
- c. Choose **Maintenance > Restore** from under the System menu.
- d. Select file name to restore from the drop-down list. Click **Submit**.

**Step 6** Install licenses:

Refer to Chapter 2 of the *ContextAware Services Configuration Guide Release 7.0* at

[http://www.cisco.com/en/US/products/ps9806/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps9806/products_installation_and_configuration_guides_list.html)

## Viewing the MSE Alarm Details

In the Monitor > Alarms page, click an MSE item under Failure Source to access the alarms details for a particular MSE.

Alternatively, you can access **Services > Mobility Services > MSE Name > System > Status > NCS Alarms** page and click a particular MSE item under Failure Source to access the alarms details for a particular MSE.

Figure 16-2 shows a NCS Alarm for MSE.

**Figure 16-2 MSE Alarm**

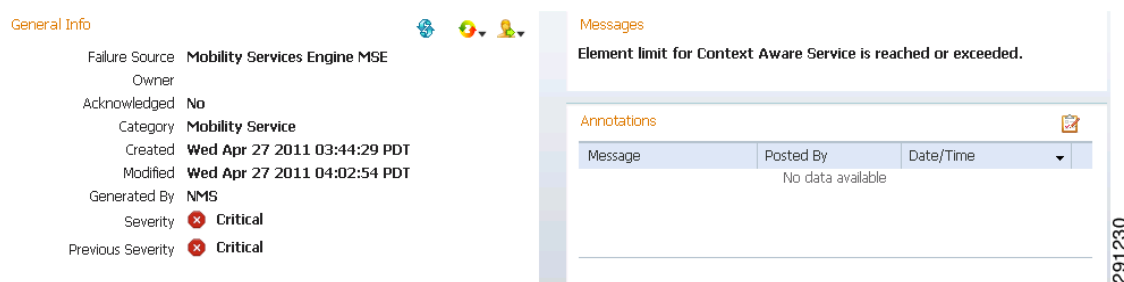

Table 16-13 describes the various fields in the Alarm Detail page for an MSE.

**Table 16-13 General Parameters**

| Parameter         | Description                                                                   |
|-------------------|-------------------------------------------------------------------------------|
| Failure Source    | The MSE that generated the alarm.                                             |
| Owner             | Name of person to which this alarm is assigned, or blank.                     |
| Acknowledged      | Displays whether or not the alarm is acknowledged by the user.                |
| Category          | The category of the alarm. The Alarm category is Mobility Services for MSEs.  |
| Created           | Month, day, year, hour, minute, second, AM or PM alarm created.               |
| Modified          | Month, day, year, hour, minute, second, AM or PM alarm last modified.         |
| Generated By      | This field will display MSE.                                                  |
| Severity          | Level of security: Critical, Major, Minor, Warning, Clear, Info, Color coded. |
| Previous Severity | Critical, Major, Minor, Warning, Clear, Info. Color coded.                    |

**Note**

The General information may vary depending on the type of alarm. For example, some alarm details may include location and switch port tracing information.

- Annotations—Enter any new notes in this text box and click **Add** to update the alarm. Notes appear in the “Annotations” display area.
- Messages—Displays information about the alarm.
- Audit Report—Click to view config audit alarm details. This report is only available for Config Audit alarms.

Configuration audit alarms are generated when audit discrepancies are enforced on config groups.

**Note**

If enforcement fails, a critical alarm is generated on the config group. If enforcement succeeds, a minor alarm is generated on the config group.

The alarms have links to the audit report where you can view a list of discrepancies for each controller.

- Event History—Opens you to the MSE Alarm Events page to view events for this alarm. When there are multiple alarm pages, the page numbers appear at the top of the page with a scroll arrow on each side. Use these scroll arrows to view additional alarms.

## Select a command

The Select a command drop-down list provides access to the following functions:

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Clear—Clear the selected alarm(s). Indicates that the alarm is no longer detected by any access point.

**Note**

Once the severity is Clear, the alarm is deleted from NCS after 30 days.

- Acknowledge—You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality. See the “[Acknowledging Alarms](#)” section on page 5-134 for more information.
- Unacknowledge—You can choose to unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the All **Alarms** > **Email Notification** page to view and configure email notifications. See the “[Monitoring RFID Tags](#)” section on page 5-113 for more information.
- Event History—Takes you to the **Monitor** > **Events** page to view events for this alarm. See the “[Monitoring Events](#)” section on page 5-142 for more information.

For more information on Alarms, see the “[Monitoring Alarms](#)” section on page 5-125.

## MSE License Overview

The MSE packages together multiple product features related to network topology, design such as NMSP, Network Repository along with related Service Engines and application processes, such as the following:

- Context Aware Service
- Wireless Intrusion Prevention Service (WIPS)

To enable smooth management of MSE and its services, various licenses are offered.

### Note

You must have a Cisco NCS license to use MSE and its associated services.

This section contains the following topics:

- [MSE License Structure Matrix, page 16-76](#)
- [Sample MSE License File, page 16-76](#)
- [Revoking and Reusing an MSE License, page 16-77](#)

## MSE License Structure Matrix

Table 16-14 lists the breakup of the licenses between the High end, Low end and Evaluation licenses for MSE, Location services, SCM, wIPS and MIR.

**Table 16-14** MSE License Structure Matrix

|                              | High End                                                                                             | Low End                                                                                     | Evaluation                                   |
|------------------------------|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>MSE Platform</b>          | High-end appliance and Infrastructure platform such as Cisco 3350 and 3355 mobility services engine. | Low-end appliance and Infra-structure platform such as Cisco 3310 mobility services engine. |                                              |
| <b>Context Aware Service</b> | 18,000 Tags                                                                                          | 2000 Tags                                                                                   | Validity 60 days, 100 Tags and 100 Elements. |
|                              | 18,000 Elements                                                                                      | 2000 Elements                                                                               |                                              |
| <b>wIPS</b>                  | 3000 access points                                                                                   | 2000 access points                                                                          | Validity 60 days, 20 access points.          |

## Sample MSE License File

The following is a sample MSE license file:

```
FEATURE MSE cisco 1.0 permanent uncounted \
 VENDOR_STRING=UDI=udi,COUNT=1 \
 HOST ID=ANY \
 NOTICE="<LicFileID>MSELicense</LicFileID><LicLineID>0</LicLineID> \
 <PAK>dummyPak</PAK>" \
 SIGN="0C04 1EBA BE34 F208 404F 98ED 43EC \
 45D7 F881 08F6 7FA5 4DED 43BC AF5C C359 0444 36B2 45CF 6EA6 \
 1DB1 899F 413F F543 F426 B055 4C7A D95D 2139 191F 04DE"
```

This sample file has 5 license entries. The first word of the first line of any license entry tells you what type of license it is. It could either be a Feature or Increment. A feature license is a static lone item to license. There can be multiple Service Engines running in MSE. An Increment license is an additive license. In MSE, the individual Service Engines are treated as increment licenses.

The second word of the first line defines the specific component to be licensed. Example: MSE, LOCATION\_TAG. The third word depicts the vendor of the license, example: Cisco. The fourth word denotes the version of the license, example 1.0. The fifth word denotes the expiration date, this could be permanent for licenses that never expire or a date in the format dd-mmm-yyyy. The last word defines whether this license is counted.

For more information on the license types, see the [“Mobility Services Engine \(MSE\) License Information”](#) section on page 15-12.

## Revoking and Reusing an MSE License

You can revoke an MSE appliance license from one system and reuse it on another system. When you revoke a license, the license file is deleted from the system. If you want to reuse the license on another system, then the license needs to be rehosted.

If you want to reuse a license with an upgrade SKU on another system, then you need to have the corresponding base license SKU installed in the system to which you want to reuse the upgrade SKU. You cannot reuse the upgrade license SKU in a system if the corresponding base license SKU is deleted from it.

When you revoke a license, MSE restarts the individual service engines to reflect the changes to the licenses. Then the service engines receives the updated capacity from MSE during startup.

For more information on Licensing, see the following:

- [NCS License Information, page 15-8](#)
- [Mobility Services Engine \(MSE\) License Information, page 15-12](#)
- [Mobility Services Engine \(MSE\) License Summary, page 15-13](#)

## Location Assisted Client Troubleshooting from the ContextAware Dashboard

You can use the ContextAware tab in the NCS Home Page to troubleshoot a client.

You can specify a MAC address or Username or IP address as the search criteria, and click **Troubleshoot**.

### Note

Username, IP address and partial MAC address-based troubleshooting is supported only on MSEs with version 7.0.200.0 and later.

The Troubleshoot Client page appears.

You can view the Context Aware History report in the Context Aware History tab.

You can filter this report based on MSE Name. You can further filter the report based on Timezone, State or All. The states can be either associated or dissociated.

If you select timezone then you could select any of the following:

- Date and Time

Or

- Any one of these values from the drop-down list:
  - Last 1 Hour
  - Last 6 Hours
  - Last 1 Day
  - Last 2 Days
  - Last 3 Days
  - Last 4 Days
  - Last 5 Days
  - Last 6 Days
  - Last 7 Days
  - Last 2 Weeks
  - Last 4 Weeks

Alternately, you can use the Generate Report link to generate a Client Location History report. You could also opt to export to CSV or PDF format or email the report using the icons available in the report page.

For more information on the ContextAware tab of the NCS Home Page, see the [“Context Aware Dashboard” section on page 2-21](#).

## MSE Reports

You can generate many ContextAware reports using the Report Launch Pad. For more information on ContextAware reports, see the [“ContextAware Reports” section on page 14-77](#).

## Planning for and Configuring Context-Aware Software

Context-Aware Software (CAS) resides on the mobility services engine. For more information on the CAS service, refer to the [Cisco Context-Aware Software Configuration Guide](#).

### Note

If you have a location server, you can track or map non-Cisco CCX tags.

### Note

Context-Aware Software was previously referred to as *Cisco location-based services*.

Chapter 4 of the [Cisco Context-Aware Software Configuration Guide](#) contains the following information on configuring and viewing system properties on the mobility services engine:

- Configuring general properties
- Modifying NMSP parameters
- Viewing active sessions on a system
- Adding and deleting trap destinations
- Viewing and configuring advanced parameters

Chapter 5 of the [Cisco Context-Aware Software Configuration Guide](#) contains information on configuring and managing users and groups on the mobility services engine.

Chapter 6 of the *Cisco Context-Aware Software Configuration Guide* contains the following information on event notifications:

- Adding and deleting event groups
- Adding, deleting, and testing event definitions
- Viewing event notification summary
- Notifications cleared
- Notification message formats

Chapter 7 of the *Cisco Context-Aware Software Configuration Guide* contains the following information on the tools and configurations that can be used to enhance the location accuracy of elements (clients, tags, rogue clients, interferers and rogue access points):

- Planning for data, voice, and location deployment
- Creating and applying calibration models
- Inspecting location readiness and quality
- Inspecting location quality using calibration data
- Verifying location accuracy
- Using chokepoints to enhance tag location reporting
- Using Wi-Fi TDOA receiver to enhance tag location reporting
- Using tracking optimized monitor mode to enhance tag location reporting
- Defining inclusion and exclusion regions on a floor
- Defining a rail line on a floor
- Modifying context aware software parameters
- Enabling Location Services on Wired Switches and Wired Clients.
- Assigning a Catalyst Switch to Mobility Services Engine and Synchronizing

Chapter 8 of the *Cisco Context-Aware Software Configuration Guide* contains the following information on how to monitor the mobility services engine by configuring and viewing alarms, events, and logs and how to generate reports on system utilization and element counts:

- Working with alarms
- Working with events
- Working with logs
- Generating reports
- Monitoring wireless clients
- Monitoring tagged assets
- Monitoring chokepoints
- Monitoring Wi-Fi TDOA receivers
- Monitoring Wired Switches
- Monitoring Wired Clients
- Monitoring Interferers

Chapter 9 of the *Cisco Context-Aware Software Configuration Guide* contains the following information on backing up and restoring mobility services engine data and updating the mobility services engine software:

- Recovering a lost password
- Recovering a lost root password
- Backing up and restoring mobility services engine data
- Downloading software to mobility services engines
- Configuring the NTP server
- Defragmenting the mobility services engine database
- Rebooting the mobility services engine hardware
- Shutting down the mobility services engine hardware
- Clearing mobility services engine configurations

## wIPS Planning and Configuring

With a fully integrated solution, Cisco can continually monitor wireless traffic on both the wired and wireless networks and can use that network intelligence to analyze attacks from many different sources of information to more accurately pinpoint and proactively prevent attacks versus waiting until damage or exposure has occurred. See *Cisco Adaptive Wireless IPS* documentation for the following information:

- NCS and wIPS integration overview
- Mobility services engines
- wIPS profiles
- Configuring SSID group list
- Viewing wIPS alarms
- Viewing wIPS events
- Configuring access points and access point templates
- policy alarm encyclopedia
- NCS security vulnerability assessment
- Rogue management
- Radio resource management

## Identity Services

Cisco Identity Services Engine (ISE) is a next-generation identity and policy-based network access platform that enables enterprises to enforce compliance, enhance infrastructure security, and streamline their service operations.

NCS manages the wired and the wireless clients in the network. When Cisco ISE is used as a RADIUS server to authenticate clients, NCS collects additional information about these clients from Cisco ISE and provides all client relevant information to NCS to be visible in a single console.

**Note** NCS communicates with ISE using REST API. For details see [http://www.cisco.com/en/US/docs/security/ise/1.0/api\\_ref\\_guide/ise10\\_api\\_ref\\_guide\\_ch1.html](http://www.cisco.com/en/US/docs/security/ise/1.0/api_ref_guide/ise10_api_ref_guide_ch1.html).

**Note**

Accounting data for wired clients are collected from ISE every 15 minutes. There is a background task ISE Status task which polls all ISEs added to NCS for every 15 minutes for the status of ISEs and updates the status. For more information, see “[Viewing Identity Services Engine Status](#)” section on page 15-30.

The ISE integration in NCS provides the following features:

- Periodic polling to ISE for collecting client statistics and other attributes requires for client list, dashboard charts, and reports.
- On demand query to ISE for getting additional client details such as Authorization Profile, Posture and Endpoint Type (profiler) etc.
- Cross launch ISE user interface with automatic single sign on. For details see, “[Identity Services Engine Reports](#)” section on page 14-123.

For more information about the ISE integration in NCS, see “[Cisco Identity Service Engine Solution](#)” section on page 1-12.

For more information about ISE, see *Cisco Identity Services Engine User Guide, Release 1.0* : [http://www.cisco.com/en/US/products/ps11640/products\\_user\\_guide\\_list.html](http://www.cisco.com/en/US/products/ps11640/products_user_guide_list.html)

This section contains the following topics:

- [Viewing Identify Services, page 16-81](#)
- [Adding an Identity Services Engine, page 16-81](#)
- [Removing an Identity Services Engine, page 16-82](#)

## Viewing Identify Services

To see the Identity Services Engines that are added in NCS, choose **Services > Identity Services**. The following parameters appear:

- Server Address—IP Address of ISE.
- Port—HTTPS port number for the server.
- Retries—Indicates the number of retry attempts.
- Version—Indicates the version of the ISE.
- Status—Indicates the reachability status, that is, Reachable or Unreachable.
- Role—Indicates if a node is a primary, standalone or, standby node.

## Adding an Identity Services Engine

**Note**

A maximum of two ISEs can be added in NCS. If you add two ISEs, one should be primary and the other should be standby. When you are adding a standalone node, you can add only one standalone node and can not add any second node.

To add an Identity Services Engine, follow these steps:

- 
- Step 1** Choose **Services > Identity Services**.
- Step 2** From the Select a command drop-down list, choose **Add Identity Services Engine**.
- Step 3** In the **Server Address** text box, type the IP address of the server.
- Step 4** In the **Port** text box, enter the port number of the server. The default is 443.
- Step 5** In the **Username** text box, enter the username.
- Step 6** In the **Password** text box, enter the password.
- Step 7** Re-enter the password in the **Confirm Password** text box.

---

**Note** The credentials should be superuser credentials. Otherwise, ISE integration will not work. You can not add an ISE also.

---

- Step 8** In the HTTP Connection Timeout text box, enter the amount of time (in seconds) allowed before the process time outs. The default is 30 seconds.
- Step 9** Click **Save**.
- 

## Removing an Identity Services Engine

To remove an Identity Services Engine, follow these steps:

- 
- Step 1** Choose **Services > Identity Services**.
- Step 2** Select the check box(es) of the identity services engines that you want to delete.
- Step 3** From the Select a command drop-down list, choose **Delete Identity Services Engine(s)**.
- Step 4** Click **OK** to confirm the deletion.
- 

•

# CHAPTER 17

## Tools

---

The Tools menu provides access to the Voice Audit, Location Accuracy Tool, Configuration Audit Summary, and Migration Analysis features of Cisco NCS. This chapter contains the following sections:

- [Information About Tools, page 17-1](#)
- [Running Voice Audits, page 17-2](#)
- [Configuring Location Accuracy Tool, page 17-7](#)
- [Configuring Audit Summary, page 17-11](#)
- [Configuring Migration Analysis, page 17-12](#)
- [Configuring TAC Case Attachments, page 17-15](#)

## Information About Tools

The Tools menu provides access to the Voice Audit, Location Accuracy Tool, Configuration Audit Summary, and Migration Analysis features of NCS.

## Voice Audit

NCS provides an auditing mechanism to check the controller configuration and to ensure that any deviations from the deployment guidelines are highlighted as an Audit Violation.

To access the Voice Audit feature, choose **Tools > Voice Audit**.

The NCS Voice Audit has three tabs: Controllers, Rules, Reports.

- The Controllers tab allows you to choose the controller(s) on which to run the voice audit.
- The Rules tab allows you to indicate the applicable VoWLAN SSID and the applicable rules for this voice audit.
- The Voice Audit Report provides a summary of the voice audit details and report results.
  - [Voice Audit Report Details, page 17-6](#)
  - [Voice Audit Report Results, page 17-6](#)

## Location Accuracy Tool

By verifying for location accuracy, you are ensuring that the existing access point deployment can estimate the true location of an element within 10 meters at least 90% of the time.

You can analyze the location accuracy of non-rogue and rogue clients, interferers, and asset tags by using the Accuracy Tool.

There are two methods of conducting location accuracy testing:

- **Scheduled Accuracy Testing**—Employed when clients, tags, and interferers are already deployed and associated to the wireless LAN infrastructure. Scheduled tests can be configured and saved when clients, tags, and interferers are already pre-positioned so that the test can be run on a regularly scheduled basis.
- **On demand Accuracy Testing**—Employed when elements are associated but not pre-positioned. On demand testing allows you to test the location accuracy of clients, tags, and interferers at a number of different locations. It is generally used to test the location accuracy for a small number of clients, tags, and interferers.

The Accuracy Tool enables you to run either a scheduled or on-demand location accuracy test. Both tests are configured and executed through a single page.

## Running Voice Audits

To access the Voice Audit feature, choose **Tools > Voice Audit**.

This section provides the following information:

- [Running Voice Audits on Controllers, page 17-2](#)
- [Choosing Voice Audit Rules, page 17-3](#)

## Running Voice Audits on Controllers

The Controllers tab allows you to choose the controller(s) on which to run the voice audit.

**Note**

---

You can run the voice audit on a maximum of 50 controllers in a single operation.

---

To select the controller(s) for the voice audit, follow these steps:

---

- Step 1** Choose **Tools > Voice Audit**.
- Step 2** Click the **Controllers** tab.
- Step 3** From the **Run audit on** drop-down list, select from **All Controllers**, a **Floor Area**, or a **Single Controller**.
  - All Controllers—No additional Controller information necessary.
  - A Floor Area—From the drop-down lists, select the applicable Campus, Building, Floor, and Controller.
  - A Single Controller—Select the applicable controller from the drop-down list.

- Step 4** Click the **Rules** tab to determine the rules for this voice audit. See the “[Choosing Voice Audit Rules](#)” section on page 17-3 for more information.

## Choosing Voice Audit Rules

The Rules tab allows you to indicate the applicable VoWLAN SSID and the applicable rules for this voice audit.

To indicate the rules for the voice audit, follow these steps:

- Step 1** In the **Tools > Voice Audit** page, click the **Rules** tab.
- Step 2** Type the applicable VoWLAN SSID in the **VoWLAN SSID** text box.
- Step 3** From the **Rules List**, select the check boxes of the applicable rules for this voice audit (see [Table 17-1](#)).

**Note** The red circle indicates an invalid rule (due to insufficient data). The green circle indicates a valid rule.

**Table 17-1** Rules List for Voice Audit

| Rule              | Rule Details                                                                                                                                 |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| VoWLAN SSID       | Description—Checks whether or not the VoWLAN SSID exists.<br>Rule validity—User defined VoWLAN SSID.                                         |
| CAC: 7920         | Description—Checks whether or not 7920 AP CAC is enabled for VoWLAN.<br>Rule validity—User defined VoWLAN SSID.                              |
| CAC: 7920 Clients | Description—Checks whether or not the 7920 Client CAC is disabled for VoWLAN.<br>Rule validity—User defined VoWLAN SSID.                     |
| DHCP Assignment   | Description—Checks whether or not DHCP assignment is disabled for VoWLAN.<br>Rule validity—User defined VoWLAN SSID.                         |
| MFP Client        | Description—Checks whether or not MFP Client protection is not set to <b>Required</b> for VoWLAN.<br>Rule validity—User defined VoWLAN SSID. |
| Platinum QoS      | Description—Checks whether or not QoS is set to Platinum (Voice) for VoWLAN.<br>Rule validity—User defined VoWLAN SSID.                      |
| Non Platinum QoS  | Description—Checks that QoS is not set to Platinum for non-VoWLAN.<br>Rule validity—User defined VoWLAN SSID.                                |

Table 17-1 Rules List for Voice Audit (continued)

| Rule                            | Rule Details                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WMM                             | <p>Description—Checks whether or not WMM is enabled for VoWLAN.</p> <p>Rule data—Select <b>Allowed</b> or <b>Required</b> from the drop-down list.</p> <p>Rule validity—User defined VoWLAN SSID.</p>                                                                                                                                      |
| CCKM                            | <p>Description—Checks whether or not CCKM is enabled for VoWLAN.</p> <p>Rule validity—User defined VoWLAN SSID.</p>                                                                                                                                                                                                                        |
| ACM                             | <p>Description—Checks whether or not Admission Control is enabled.</p> <p>Rule data—Select the check box for 802.11a/n ACM, 802.11b/g/n ACM, or both.</p> <p>Rule validity—At least one band must be selected.</p>                                                                                                                         |
| DTPC                            | <p>Description—Checks whether or not Dynamic Transmit Power Control is enabled.</p> <p>Rule data—Select the check box for 802.11a/n DTPC, 802.11b/g/n DTPC, or both.</p> <p>Rule validity—At least one band must be selected.</p>                                                                                                          |
| Expedited Bandwidth             | <p>Description—Checks whether or not Expedited Bandwidth is enabled.</p> <p>Rule data—Select the check box for 802.11a/n Expedited Bandwidth, 802.11b/g/n Expedited Bandwidth, or both.</p> <p>Rule validity—At least one band must be selected.</p>                                                                                       |
| Load Based CAC                  | <p>Description—Checks whether or not Load Based Admission Control (CAC) is enabled.</p> <p>Rule data—Select the check box for 802.11a/n Load Based CAC, 802.11b/g/n Load Based CAC, or both.</p> <p>Rule validity—At least one band must be selected.</p>                                                                                  |
| CAC: Max Bandwidth              | <p>Description—Checks whether or not Maximum RF Bandwidth for Call Admission Control is configured properly.</p> <p>Rule data—Enter percentages in the text boxes for Maximum Allowed Bandwidth for 802.11a/n and 802.11b/g/n.</p> <p>Rule validity—Data for at least one band must be provided. Valid range is 0—100%.</p>                |
| CAC: Reserved Roaming Bandwidth | <p>Description—Checks whether or not Reserved Roaming Bandwidth for Call Admission Control is configured properly.</p> <p>Rule data—Enter percentages in the text boxes for Maximum Reserved Roaming Bandwidth for 802.11a/n and 802.11b/g/n.</p> <p>Rule validity—Data for at least one band must be provided. Valid range is 0—100%.</p> |

**Table 17-1** Rules List for Voice Audit (continued)

| Rule                      | Rule Details                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pico Cell mode            | <p>Description—Checks whether or not Pico Cell mode is disabled.</p> <p>Rule data—Select the check boxes for 802.11a/n Pico Cell mode, 802.11b/g/n Pico Cell mode, or both.</p> <p>Rule validity—At least one band must be selected.</p>                                                                                                                               |
| Beacon Period             | <p>Description—Checks whether or not Beacon Period is configured properly.</p> <p>Rule data—Enter the time (ms) in the text boxes for Beacon Period for 11a/n and 11b/g/n.</p> <p>Rule validity—Data for at least one band must be provided. Valid range is 20—1000. Enter 0 or keep it empty if a band should not be checked.</p>                                     |
| Short Preamble            | <p>Description—Checks whether or not Short Preamble is enabled for 11b/g.</p>                                                                                                                                                                                                                                                                                          |
| Fragmentation Threshold   | <p>Description—Checks whether or not Fragmentation Threshold is configured properly.</p> <p>Rule data—Enter the threshold amount (bytes) in the text boxes for Fragmentation Threshold for 11a/n and 11b/g/n.</p> <p>Rule validity—Data for at least one band must be provided. Valid range is 256—2346. Enter 0 or keep it empty if a band should not be checked.</p> |
| Data Rate                 | <p>Description—Checks whether or not Data Rates are configured properly.</p> <p>Data Rate configuration for 11b/g—Select <b>Disabled</b>, <b>Supported</b>, or <b>Mandatory</b> for each Mbps category.</p> <p>Data Rate configuration for 11a—Select <b>Disabled</b>, <b>Supported</b>, or <b>Mandatory</b> for each Mbps category.</p>                               |
| Aggressive Load Balancing | <p>Description—Checks whether or not Aggressive Load Balancing is disable.</p>                                                                                                                                                                                                                                                                                         |
| QoS Profile               | <p>Description—Checks that QoS Profiles are not altered from default values.</p>                                                                                                                                                                                                                                                                                       |
| EAP Request Timeout       | <p>Description—Checks whether or not EAP Request Timeout is configured properly.</p> <p>Rule data—Enter the time limit (sec) for the EAP Request Timeout</p> <p>Rule validity—Data cannot be left blank or as zero. Valid range is 1—120.</p>                                                                                                                          |
| ARP Unicast               | <p>Description—Checks whether or not ARP Unicast is disabled.</p>                                                                                                                                                                                                                                                                                                      |

**Note**

Use the **Reset** button to reset the rules to the default configuration.

- Step 4** When the rules are configured for this voice audit, click **Save** to save the current configuration or **Save and Run** to save the configuration and run the report.
- Step 5** Click the **Report** tab to view the Report results. See the [“Voice Audit Report Details” section on page 17-6](#) for more information.
- 

## Voice Audit Report Details

The Voice Audit details provides the following information:

- Audit Status—Indicates whether or not the audit is complete.
- Start Time and End Times—Indicates the time at which the voice audit began and ended.
- # Total Devices—Indicates the number of devices involved in the voice audit.
- # Completed Devices—Indicates the number of devices the tool attempted to audit.

---

**Note** If a controller is unreachable, the audit skips it. The Voice Audit will not complete any rule checks for that controllers.

---

- # Rules—Indicates the number of rules selected for the voice audit.

## Voice Audit Report Results

The Voice Audit Report results include the following information:

- IP Address—Indicates the IP Address for the controller involved in the voice audit.
- Rule—Indicates the rule that was applied for this controller.
- Result—Indicates the result (Skipped, Violation, Unreachable) of the applied rule.

---

**Note** If there is no mismatch between the current configuration and a rule value, no results are displayed for that rule.

---

- Details—Defines an explanation for the rule results.

---

**Note** If the applied rule results in a Violation, the Details link provides additional information including Name, the Device Value, and the Rule Value. Hold your mouse cursor over the link to view the additional details.

---

- Time—Provides a timestamp for the voice audit.

# Configuring Location Accuracy Tool

You can analyze the location accuracy of non-rogue and rogue clients, asset tags, and interferers by using the Accuracy Tool.

There are two ways to test location accuracy:

- **Scheduled Accuracy Testing**—Employed when clients, tags, and interferers are already deployed and associated to the wireless LAN infrastructure. Scheduled tests can be configured and saved when clients, tags, and interferers are already pre-positioned so that the test can be run on a regularly scheduled basis.
- **On-Demand Accuracy Testing**—Employed when elements are associated but not pre-positioned. On demand testing allows you to test the location accuracy of clients, tags, and interferers at a number of different locations. It is generally used to test the location accuracy for a small number of clients, tags, and interferers.

Both are configured and executed through a single page.

This section includes the following topics:

- [Enabling the Location Accuracy Tool, page 17-7](#)
- [Viewing Currently Scheduled Accuracy Tests, page 17-8](#)
- [Viewing Accuracy Test Details, page 17-8](#)
- [Using Scheduled Accuracy Testing to Verify Accuracy of Current Location, page 17-8](#)
- [Using On-demand Accuracy Testing to Test Location Accuracy, page 17-10](#)

## Enabling the Location Accuracy Tool

**Note**

You must enable the **Advanced Debug** option in Cisco NCS to use the Scheduled and On-demand location accuracy testing features. The Location Accuracy Tool does not appear as an option under the Tools menu when the Advanced Debug option is not enabled.

To enable the advanced debug option in NCS, follow these steps:

- Step 1** In NCS, choose **Monitor > Maps**.
- Step 2** Choose **Properties** from the Select a command drop-down list, and click **Go**.
- Step 3** In the page that appears, select **Enabled** for the Advanced Debug Mode option. Click **OK**.

**Note**

If Advanced Debug is already enabled, you do not need to do anything further. Click **Cancel**.

You can now run location accuracy tests on the mobility services engine using the Location Accuracy Tool.

Proceed to either the [“Using Scheduled Accuracy Testing to Verify Accuracy of Current Location” section on page 17-8](#) or [“Using On-demand Accuracy Testing to Test Location Accuracy” section on page 17-10](#) section.

## Viewing Currently Scheduled Accuracy Tests

To view currently scheduled accuracy tests, follow these steps:

- 
- Step 1** Select **Tools > Location Accuracy Tool**.
- Step 2** The Accuracy Tests page displays all currently scheduled accuracy tests. The page displays the following information:
- Test Name—Click the Name to view details regarding this accuracy test.
  - Test Type
  - Floor or Outdoor Area—Displays the location of this test.
  - Status
  - Accuracy %
- 

Use the Select a command drop-down list to create a new scheduled or on-demand accuracy test, to download logs for last run, to download all logs, or to delete a current accuracy test.

**Note**

You can download logs for accuracy tests from the Accuracy Tests summary page. To do so, check the listed test check box and select either Download Logs or Download Logs for Last Run from the Select a command drop-down list. Click **Go**.

- The Download Logs option downloads the logs for all accuracy tests for the selected test(s).
- The Download Logs for Last Run option downloads logs for only the most recent test run for the selected test(s).

## Viewing Accuracy Test Details

To view details regarding a current accuracy test, follow these steps:

- 
- Step 1** Select **Tools > Location Accuracy Tool**.
- Step 2** Click the name of the accuracy test for which you want to access details.  
From the Accuracy Test Details page, you can position test points or delete the accuracy test.
- Step 3** Click **Cancel** to return to the Accuracy Test overview page.
- 

## Using Scheduled Accuracy Testing to Verify Accuracy of Current Location

To configure a scheduled accuracy test, follow these steps:

- 
- Step 1** Click **Tools > Location Accuracy Tool**.
- Step 2** Select New Scheduled Accuracy Test from the Select a command drop-down list.
- Step 3** Enter a Test Name.

- Step 4** Select the Area Type from the drop-down list.
- Step 5** Campus is configured as Root Area, by default. There is no need to change this setting.
- Step 6** Select the Building from the drop-down list.
- Step 7** Select the Floor from the drop-down list.
- Step 8** Select the begin and end time of the test by entering the days, hours and minutes. Hours are entered using a 24-hour clock.

---

**Note** When entering the test start time, be sure to allow enough time prior to the test start to position testpoints on the map.

---

- Step 9** Test results are viewed at the Accuracy Tests > Results page. Reports are in PDF format.

---

**Note** If you select the email option, a SMTP Mail Server must first be defined for the target email address. Click **Administrator > Settings > Mail Server** to enter the appropriate information.

---

- Step 10** Click Position Testpoints. The floor map appears with a list of all clients, tags, and interferers on that floor with their MAC addresses.
- Step 11** Click the check box next to each client, tag and interferer for which you want to check the location accuracy.
- When you check a MAC address check box, two icons appear on the map. One icon represents the actual location and the other represents the reported location.

---

**Note** To enter a MAC address for a client or tag or interferer that is not listed, check the Add New MAC check box, enter the MAC address, and click **Go**. An icon for the element appears on the map. If the newly added element is on the location server but on a different floor, the icon is displayed in the left-most corner (0,0 position).

---

- Step 12** If the actual location for an element is not the same as the reported location, drag the actual location icon for that element to the correct position on the map. Only the actual location icon can be dragged.
- Step 13** Click **Save** when all elements are positioned. A pane appears confirming successful accuracy testing.
- Step 14** Click **OK** to close the confirmation pane. You are returned to the Accuracy Tests summary page.

---

**Note** The accuracy test status displays as Scheduled when the test is about to execute. A status of Running displays when the test is in process and Idle when the test is complete. A Failure status appears when the test is not successful.

---

- Step 15** To view the results of the location accuracy test, click the test name and then select the Results tab on the page that displays.
- Step 16** At the Results pane, click the Download link under the Saved Report heading to view the report. The Scheduled Location Accuracy Report includes the following information:
- A summary location accuracy report that details the percentage of elements that fell within various error ranges.
  - An error distance histogram.

- A cumulative error distribution graph.
  - An error distance over time graph.
  - A summary by each MAC address whose location accuracy was tested noting its actual location, error distance and a map showing its spatial accuracy (actual vs. calculated location) and error distance over time for each MAC.
- 

## Using On-demand Accuracy Testing to Test Location Accuracy

An On demand Accuracy Test is run when elements are associated but not pre-positioned. On demand testing allows you to test the location accuracy of clients, tags, and interferers at a number of different locations. It is generally used to test the location accuracy for a small number of clients, tags, and interferers.

To run an On-demand Accuracy Test, follow these steps:

- 
- Step 1** Click **Tools > Location Accuracy Tool**.
  - Step 2** From the Select a command drop-down list, choose **New On demand Accuracy Test**.
  - Step 3** Enter a Test Name.
  - Step 4** Select the Area Type from the drop-down list.
  - Step 5** Campus is configured as Root Area, by default. There is no need to change this setting.
  - Step 6** Select the Building from the drop-down list.
  - Step 7** Select the Floor from the drop-down list.
  - Step 8** Select the Destination point for the test results. Test results are viewed at the Accuracy Tests > Results page. Reports are in a PDF.
  - Step 9** Click **Position Testpoints**. The floor map appears with a red crosshair at the (0,0) coordinate.
  - Step 10** To test the location accuracy and RSSI of a particular location, select either client or tag or interferer from the drop-down list on the left. A list of all MAC addresses for the selected option (client or tag or interferer) displays in a drop-down list to its right.
  - Step 11** Select a MAC address from the drop-down list and move the red cross hair to a map location and click the mouse to place it.
  - Step 12** From the **Zoom** percentage drop-down list, choose the zoom percentage for the map.  
The X and Y text boxes are populated with the coordinates based on the position of the red cross hair in the map.
  - Step 13** Click **Start** to begin collection of accuracy data.
  - Step 14** Click **Stop** to finish collection. You should allow the test to run for at least two minutes before clicking Stop.
  - Step 15** Repeat [Step 11](#) to [Step 14](#) for each testpoint that you want to plot on the map.
  - Step 16** Click **Analyze Results** when you are finished mapping the testpoints.
  - Step 17** Click the **Results** tab on the pane that appears.

The On-demand Accuracy Report includes the following information:

- A summary location accuracy report that details the percentage of elements that fell within various error ranges.
- An error distance histogram
- A cumulative error distribution graph

## Configuring Audit Summary

Choose **Tools > Config Audit** to launch the Configuration Audit Summary page (see [Figure 17-1](#)).

**Figure 17-1** *Tools > Config Audit Summary Page*

### Tools > Config Audit Summary Page

| Summary                      | Count             |
|------------------------------|-------------------|
| Total Enforced Config Groups | 0                 |
| Total Mismatched Controllers | <a href="#">5</a> |
| Total Config Audit Alarms    | 7                 |

### Most recent 5 Audit Alarms [\(View All\)](#)

| Object                                                   | Event Type   | Date/Time               |
|----------------------------------------------------------|--------------|-------------------------|
| <a href="#">Controller_Talwar-TME/172.20.225.154</a>     | Config Audit | Apr 10, 2009 1:00:07 AM |
| <a href="#">Controller_SJC_14_LWAPP2/209.165.200.225</a> | Config Audit | Apr 10, 2009 1:00:07 AM |
| <a href="#">Controller_wlc-b-hsrp/172.20.228.197</a>     | Config Audit | Apr 10, 2009 1:00:07 AM |
| <a href="#">Controller_SJC_14_LWAPP1/209.165.200.225</a> | Config Audit | Apr 10, 2009 1:00:05 AM |
| <a href="#">Controller_wism-12/172.20.229.90</a>         | Config Audit | Apr 10, 2009 1:00:03 AM |

This page provides a summary of the following:

- **Total Enforced Config Groups**—Identifies the count of config group templates which are configured for Background Audit and enforcement enabled.

Click the link to launch the Config Group page to view config groups with **Enforce Configuration** enabled.

- **Total Mismatched Controllers**—Identifies the number of mismatched controllers. Mismatched controllers indicate that there were configuration differences found between the NCS and the controller during the last audit.

Click the link to launch the controller list sorted on the mismatched audit status column. Click an item in the Audit Status column to view the audit report for this controller.

- **Total Config Audit Alarms**—Identifies the number of alarms generated when audit discrepancies are enforced on config groups.

Click the link to view all config audit alarm details.

---

**Note** If enforcement fails, a critical alarm is generated on the config group. If enforcement succeeds, a minor alarm is generated on the config group. The alarms have links to the audit report where you can view list of discrepancies for each controller.

---

- **Most recent 5 audit alarms**—Lists the most recent configuration audit alarms including the object name, event type, and date and time for the audit alarm.

Click **<View All>** to view the applicable Alarm page which includes all configuration audit alarms.

## Configuring Migration Analysis

Choose **Tools > Migration Analysis** to launch the Configuration Migration Analysis Summary page.

**Note**

---

You can also access the migration analysis summary by choosing **Configure > Migration Templates** and selecting **View Migration Analysis Summary** from the Select a command drop-down list.

---

The autonomous access points are eligible for migration only if all the criteria has a pass status. A red X designates ineligibility, and a green check mark designates eligibility. These columns represent the following:

- **Privilege 15 Criteria**—The Telnet credential provided as part of the autonomous access point discovery must be privilege 15.
- **Software Version**—Conversion is supported only from 12.3(7)JA releases excluding 12.3(11)JA, 12.3(11)JA1, 12.3(11)JA2, and 12.3(11)JA3.
- **Role Criteria**—A wired connection between the access point and controller is required to send the association request; therefore, the following autonomous access point roles are required:
  - root
  - root access point
  - root fallback repeater
  - root fallback shutdown
  - root access point only

Radio Criteria—In dual-radio access points, the conversion can happen even if only one radio is of the supported type.

## Upgrading Autonomous Access Points

You can choose to upgrade the autonomous access points manually or automatically. From the Migration Analysis page, you can select the access point with the software version listed as failed and choose **Upgrade Firmware (Manual or Automatic)** from the Select a command drop-down list. This process upgrades the autonomous firmware image of the Cisco IOS access point to a supported version.

NCS uses a Telnet-based connection to upgrade the access point firmware. If you choose the automatic option, the internal TFTP server is used with the default images present in NCS. The default images as per device type are as follows:

- ap801-k9w7-tar.124-10b.JA3.tar
- ap802-k9w7-tar
- c1100-k9w7-tar.123-7.JA5.tar
- c1130-k9w7-tar.123-7.JA5.tar
- c1200-k9w7-tar.123-7.JA5.tar
- c1240-k9w7-tar.12307.JA5.tar
- c1250-k9w7-tar.124-10b.JA3.tar
- c1310-k9w7-tar.123-7.JA5.tar

If you choose the manual option, an additional screen with TFTP server IP, file path, and file path name appears. The final page is the report page.

## Changing Station Role to Root Mode

Because a wired connection between the access point and controller is required in order to send the association request, the autonomous access point must be assigned the appropriate role. If the role shows as ineligible, you can choose **Change Station Role to Root Mode** from the Select a command drop-down list.

## Running Migration Analysis

You can choose **Run Migration Analysis** from the Select a command drop-down list of the Migration Analysis Summary page. The resulting migration analysis summary shows the current status of different criteria. Initially, migration analysis is run automatically when the access point is discovered.

## Generating the Migration Analysis Report

You can choose **View Migration Analysis Report** from the Select a command drop-down list of the Migration Analysis Summary page to generate a report. The report includes the following:

- Access point address
- Status
- Timestamp
- Access point logs

## Viewing a Firmware Upgrade Report

Choose **View Firmware Upgrade Report** from the Select a command drop-down list to view a current report of the upgrade status for the selected access point.

The following information displays:

- AP Address—IP address of the access point.
- Status—Current status of the firmware upgrade.
- TimeStamp—Indicates the date and time of the upgrade.
- AP Logs

Click **OK** to return to the Migration Analysis Summary page.

See the [“Upgrading Autonomous Access Points”](#) section on page 17-13 for more information.

## Changing Station Role to Root Mode

Because a wired connection between the access point and controller is required to send the association request, the autonomous access point must be assigned the appropriate role. If the role shows as ineligible, you can choose **Change Station Role to Root Mode** from the Select a command drop-down list.

## Viewing a Role Change Report

Because a wired connection between the access point and controller is required to send the association request, the autonomous access point must be assigned the appropriate role.

To view a report of these role changes, choose **View Role Change Report** from the Select a command drop-down list. The following information displays:

- AP Address—IP address of the access point.
- Status—Current status of the role change.
- TimeStamp—Indicates the date and time of the upgrade.
- AP Logs

Click **OK** to return to the Migration Analysis Summary page.

## Running Migration Analysis

You can choose **Run Migration Analysis** from the Select a command drop-down list of the Migration Analysis Summary page. The resulting migration analysis summary shows the current status of different criteria. Initially, migration analysis is run automatically when the access point is discovered.

## Viewing a Migration Analysis Report

You can choose **View Migration Analysis Report** from the Select a command drop-down list of the Migration Analysis Summary page to generate a report. The report includes the following:

- Access point address

- Status
- Timestamp
- Access point logs

## Configuring TAC Case Attachments

---

**Note** You must configure a valid mail server before configuring TAC case attachments.

---

TAC Case Attachment tool helps you easily attach all the relevant controller TAC cases information in one shot. This tool provides two options:

- **Send**— Sends an email to [attach@cisco.com](mailto:attach@cisco.com).
- **Download**— Downloads the information to a local computer. You have to manually email the data to [attach@cisco.com](mailto:attach@cisco.com). This option will be handy if there are no email connectivity between NCS server and Cisco system or if the information is too big to be attached through email.

This tool sends the following information:

- **Network Information**—Sends device inventory details and the client types.
- **Controller Information**—Sends running configuration details, tech-support, message logs, trap logs, controller crash files.
- **Access Point Information**—Sends crash files and radio core-dumps.

To **Send** or **Download** information, you have to enter the following details:

- Enter a Valid TAC Case Number.
- Select a controller if you want to send the controller or AP information.

---

**Note** You can also send additional information using the additional comments text box. After sending the information you can verify whether the data has reached Cisco by looking at the attachment section in Case tool.

---

---

**Note** This tool requires read-write access on the controller to collect and upload Controller or Access Point information

---

# CHAPTER 18

## Configuring Virtual Domains

---

This chapter describes how to perform basic operations like uploading or downloading a file on a controller, scheduling administrative tasks through Cisco NCS, and creating user accounts and groups.

This chapter includes the following sections:

- [Information About Virtual Domains, page 18-1](#)
- [Configuring a Virtual Domain, page 18-2](#)
- [Understanding Virtual Domain Hierarchy, page 18-3](#)
- [Managing a Virtual Domain, page 18-7](#)
- [Virtual Domain RADIUS and TACACS+ Attributes, page 18-9](#)

## Information About Virtual Domains

A NCS Virtual Domain consists of a set of NCS devices and/or maps and restricts a user view to information relevant to these managed objects.

Through a virtual domain, an administrator can ensure that users are only able to view the devices and maps for which they are responsible. In addition, because of the virtual domain filters, users are able to configure, view alarms, generate reports for *only* their assigned part of the network.

### Note

---

The following elements can be partitioned in a virtual domain: maps, controllers, access points, templates, and config groups.

The following cannot be partitioned in a virtual domain (and are only available from the root partition: Google Earth Maps, Auto Provisioning, and Mobility Services).

---

The administrator specifies for each user a set of allowed virtual domains. Only one of these can be active for that user at login. The user can change the current virtual domain by selecting a different allowed virtual domain from the Virtual Domain drop-down list at the top of the page. All reports, alarms, and other functionality are now filtered by that virtual domain.

From NCS 1.0 release and later, you are required to add a virtual domain in ACS when exporting the task list to ACS. This may be the default ROOT-DOMAIN virtual domain. If you do not add a virtual domain to ACS then you will not be allowed to log in. This is applicable irrespective of whether you have a single or multiple domains.

# Configuring a Virtual Domain

Use the Administration > Virtual Domain page to create, edit, or delete virtual domains. Each virtual domain may contain a subset of the elements included with its parent virtual domain. You can assign additional maps, controllers, and access points to the new virtual domain. See the “[Managing a Virtual Domain](#)” section on page 18-7 for more information on managing virtual domains.

- **New**—Click to create a new virtual domain. See the “[Creating a New Virtual Domain](#)” section on page 18-2 for more information.
- **Delete**—Click to delete the selected virtual domain from the hierarchy.
- **Export**—Click to configure custom attributes for the selected virtual domain. See the “[Virtual Domain RADIUS and TACACS+ Attributes](#)” section on page 18-9 for more information.

## Creating a New Virtual Domain

**Note**

---

See the “[Managing a Virtual Domain](#)” section on page 18-7 for more information.

---

To create a new virtual domain, follow these steps:

---

- Step 1** Choose **Administration > Virtual Domains**.
- Step 2** From the left Virtual Domain Hierarchy sidebar menu, select to highlight the virtual domain to which you want to add a sub (child) virtual domain.

**Note**

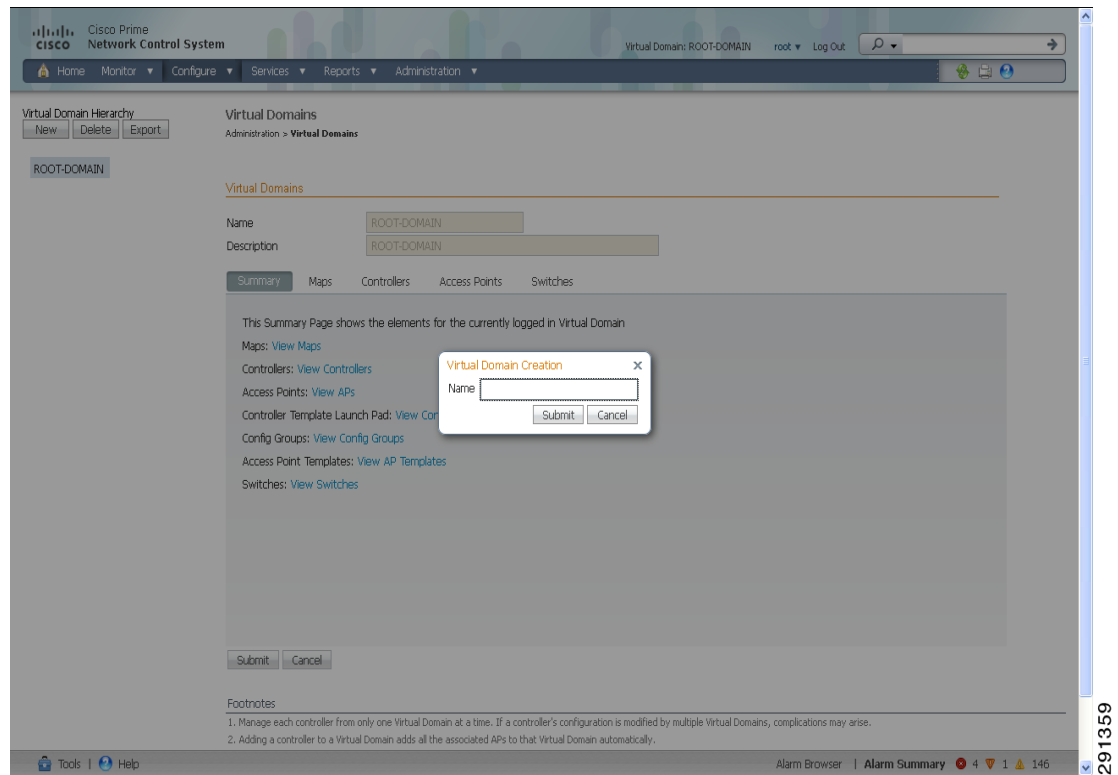

---

The selected virtual domain becomes the parent virtual domain of the newly-created sub-virtual domain.

---

- Step 3** Click **New** (see [Figure 18-1](#)).

Figure 18-1 Virtual Domains

**Step 4** Enter the virtual domain name in the text box.

**Step 5** Click **Submit** to create the virtual domain or **Cancel** to close the page with no changes.

**Note**

Each virtual domain may contain a subset of the elements included with its parent virtual domain. When a user is assigned a virtual domain, that user may view the same maps, controllers, and access points that are assigned to its parent virtual domain.

**Note**

To modify or update a current virtual domain name or description, choose **Administration > Virtual Domains**. From the left Virtual Domain Hierarchy sidebar menu, click the virtual domain you want to edit.

## Understanding Virtual Domain Hierarchy

Virtual domains are organized hierarchically. Sub-sets of an existing virtual domain contain the network elements that are contained in the parent virtual domain.

**Note**

---

The default or "ROOT-DOMAIN" domain includes all virtual domains.

---

Because network elements are managed hierarchically, some features and components such as report generation, searches, templates, config groups, and alarms are affected.

**Note**

---

If you create a virtual domain with only access points and no controllers assigned, you lose some ability to choose controller-based features. For example, some options require you to drill down from controller to access points. Because controllers are not in the virtual domain, you are not able to generate associated reports. If you create a partition with only a few controllers and then go to Configure > Access Points and click an individual link in the AP Name column, the complete list of NCS-assigned controllers is displayed for primary, secondary and tertiary controllers rather than the limited number specified in the partition.

---

**Note**

---

If a controller's configuration is modified by multiple Virtual Domains, complications may arise. To avoid this, manage each controller from only one Virtual Domain at a time.

---

This section helps you to better understand the effects of partitioning and includes the following topics.

- [Reports, page 18-4](#)
- [Search, page 18-5](#)
- [Alarms, page 18-5](#)
- [Templates, page 18-5](#)
- [Config Groups, page 18-5](#)
- [Maps, page 18-6](#)
- [Access Points, page 18-6](#)
- [Controllers, page 18-7](#)
- [Email Notification, page 18-7](#)

## Reports

Reports only include components assigned to the current virtual domain. For example, if you create a virtual domain with only access points and no controllers assigned, all controllers do not display when you generate a controller inventory report.

If you create a virtual domain with only access points and no controllers assigned, you lose some ability to choose controller-based features. For example, some options require you to drill down from controller to access points. Because controllers are not in the virtual domain, you are not able to generate associated reports.

**Note**

---

Reports are only visible in the current virtual domain. The parent virtual domain cannot view the reports from its sub-virtual domain.

---

Client reports such as Client Count only include clients that belong to the current virtual domain.

---

**Note** If new clients are assigned to this partition by the administrator, the previous reports do not reflect these additions. Only new reports will reflect the new clients.

---

## Search

Search results only include components that are assigned to the virtual domain in which the search is performed. Search results do not display floor areas when the campus is not assigned to the virtual domain.

---

**Note** The saved searches are only visible in the current virtual domain. The parent virtual domain cannot view these search results.

---

---

**Note** NCS does not partition network lists. If you search a controller by network list, all controllers will be returned.

---

---

**Note** Search results do not display floor areas when the campus is not assigned to the virtual domain.

---

## Alarms

When a component is added to a virtual domain, no previous alarms for that component are visible to that virtual domain. Only newly-generated alarms are visible. For example, when a new controller is added to a virtual domain, any alarms generated for that controller prior to its addition do not appear in the current virtual domain.

Alarms are not deleted from a virtual domain when the associated controllers or access points are deleted from the same virtual domain.

---

**Note** Alarm Email Notifications—Only the ROOT-DOMAIN virtual domain can enable Location Notifications, Location Servers, and NCS email notifications.

---

## Templates

When you create or discover a template in a virtual domain, it is only available in that virtual domain unless it is applied to a controller. If it is applied to a controller and that controller is assigned to a sub-virtual domain, the template stays with the controller in the new virtual domain.

---

**Note** If you create a sub virtual domain and then apply a template to both network elements in the virtual domain, NCS may incorrectly reflect the number of partitions to which the template was applied.

---

## Config Groups

Config groups in a virtual domain can also be viewed by the parent virtual domain. A parent virtual domain can modify config groups for a sub (child) virtual domain. For example, the parent virtual domain can add or delete controllers from a sub virtual domain.

## Maps

You can only view the maps that your administrator assigned to your current virtual domain.

- When a campus is assigned to a virtual domain, all buildings in that campus are automatically assigned to the same virtual domain.
- When a building is assigned to a virtual domain, it automatically includes all of the floors associated with that building.
- When a floor is assigned, it automatically includes all of the access points associated with that floor.

**Note**

If only floors are assigned to a virtual domain, you lose some ability to choose map-based features. For example, some reports and searches require you to drill down from campus to building to floor. Because campus and buildings are not in the virtual domain, you are not able to generate these kinds of reports or searches.

**Note**

Coverage areas shown in NCS are only applied to campus and buildings. In a floor-only virtual domain, NCS does not display coverage areas.

**Note**

If a floor is directly assigned to a virtual domain, it cannot be deleted from the virtual domain which has the building to which the floor belongs.

**Note**

Search results do not display floor areas when the campus is not assigned to the virtual domain.

## Access Points

When a controller or map is assigned to a virtual domain, the access points associated with the controller or map are automatically assigned as well. Access points can also be assigned manually (separate from the controller or map) to a virtual domain.

**Note**

If the controller is removed from the virtual domain, all of its associated access points are also removed. If an access point is manually assigned, it remains assigned even if its associated controller is removed from the current virtual domain.

**Note**

If you create a virtual domain with only access points and no controllers assigned, you lose some ability to choose controller-based features. For example, some options require you to drill down from controller to access points. Because controllers are not in the virtual domain, you are not able to generate associated reports.

**Note**

If a manually-added access point is removed from a virtual domain but is still associated with a controller or map that is assigned to the same virtual domain, the access point remains visible in the virtual domain. Any alarms associated with this access point are not deleted with the deletion of the access point.

**Note**

When maps are removed from a virtual domain, the access points on the maps can be removed from the virtual domain.

**Note**

If you later move an access point to another partition, some events (such as generated alarms) may reside in the original partition location.

**Note**

Rogue access point partitions are associated with one of the detecting access points (the one with the latest or strongest RSSI value). If there is detecting access point information, NCS uses the detecting controller.

If the rogue access point is detected by two controllers which are in different partitions, the rogue access point partition may be changed at any time.

## Controllers

Because network elements are managed hierarchically, controllers may be affected by partitioning. If you create a virtual domain with only access points and no controllers assigned, you lose some ability to choose controller-based features. For example, some options require you to drill down from controller to access points. Because controllers are not in the virtual domain, you are not able to generate associated reports.

If you create a partition with only a few controllers and then choose **Configure > Access Points** and click an individual link in the AP Name column, the complete list of NCS-assigned controllers is displayed for primary, secondary and tertiary controllers rather than the limited number specified in the partition.

**Note**

If a controller configuration is modified by multiple Virtual Domains, complications may arise. To avoid this, manage each controller from only one Virtual Domain at a time.

## Email Notification

Email notification can be configured per virtual domain. An email is sent only when alarms occur in that virtual domain.

# Managing a Virtual Domain

Select a Virtual Domain from the Virtual Domain Hierarchy on the left side to view or edit its assigned maps, controllers, and access points. The Summary page displays with links to view the current logged in virtual domain available maps, controllers, and access points.

**Note**

Because all maps, controllers, and access points are included in the partition tree, you should expect this page to take several seconds to load.

The **Maps**, **Controllers**, and **Access Points** tabs are used to add or remove components assigned to this virtual domain.

To assign a map, controller, or access point to this domain, follow these steps:

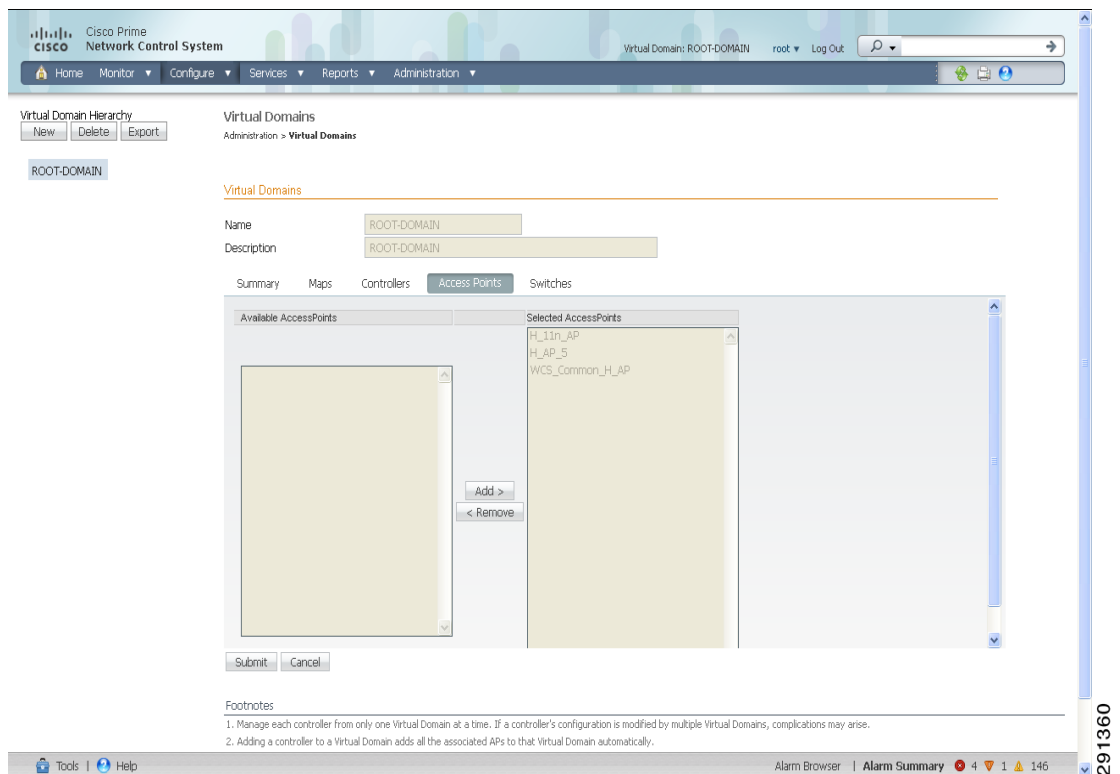

- Step 1** Choose **Administration > Virtual Domains**.
- Step 2** Choose Virtual Domain Hierarchy from the left sidebar menu.

**Note** Because all maps, controllers, and access points are included in the partition tree, you should expect it to take several minutes to load. This increases if you have a system with a significant number of controllers and access points.

- Step 3** Click the applicable **Maps**, **Controller**, or **Access Points** tab.
- Step 4** In the Available (**Maps**, **Controllers**, or **Access Points**) column, click to highlight the new component(s) you want to assign to the virtual domain.
- Step 5** Click **Add** to move the component(s) to the Selected (**Maps**, **Controllers**, or **Access Points**) column (see [Figure 18-2](#)).

**Figure 18-2** Virtual Domains Access Points Tab

**Note** To remove a component from the virtual domain, click to highlight the component in the Selected (Maps, Controllers, or Access Points) column and click **< Remove**. The component returns to the Available column.

- Step 6** Click **Submit** to confirm the changes.

**Note**

After assigning elements to a virtual domain and submitting the changes, NCS may take a long time to process depending on how many elements are added.

## Virtual Domain RADIUS and TACACS+ Attributes

The Virtual Domain Custom Attributes page allows you to indicate the appropriate protocol-specific data for each virtual domain. The Export button on the Virtual Domain Hierarchy sidebar menu pre-formats the virtual domain RADIUS and TACACS+ attributes. You can copy and paste these attributes into the ACS server. This allows you to copy only the applicable virtual domains into the ACS server page and ensures that the users only have access to these virtual domains.

To apply the pre-formatted RADIUS and TACACS+ attributes to the ACS server, follow these steps:

- Step 1** Choose Administration > Virtual Domains.
- Step 2** From the left Virtual Domain Hierarchy sidebar menu, select to highlight the virtual domain for which you want to apply the RADIUS and TACACS+ attributes.
- Step 3** Click **Export**.
- Step 4** Highlight the text inside of the RADIUS or TACACS+ Custom Attributes (depending on which one you are currently configuring), go to your browser's menu, and choose **Edit > Copy**.
- Step 5** Log in to ACS.
- Step 6** Go to User or Group Setup.

**Note**

If you want to specify virtual domains on a per user basis, then you need to make sure you add ALL the custom attributes (for example, tasks, roles, virtual domains) information into the User custom attribute page.

- Step 7** For the applicable user or group, click **Edit Settings**.
- Step 8** Use your browser **Edit > Paste** feature to place the RADIUS or TACACS+ custom attributes into the applicable field.
- Step 9** Select the check boxes to enable these attributes.
- Step 10** Click **Submit + Restart**.

**Note**

For more information on adding RADIUS and TACACS+ attributes to the ACS server, see [“Adding NCS User Groups into ACS for TACACS+”](#) section on page 15-54 or [“Adding NCS User Groups into ACS for RADIUS”](#) section on page 15-57.

## Understanding Virtual Domains as a User

When you log in, you can access any of the virtual domains that the administrator assigned to you.

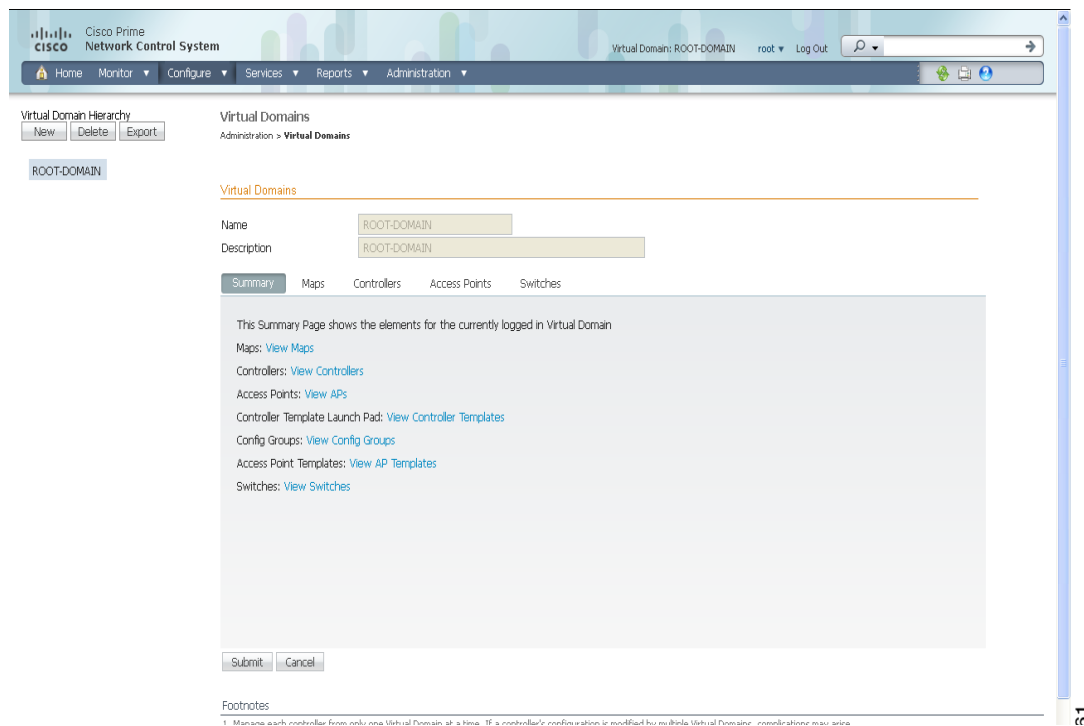

Only one virtual domain can be active at login. You can change the current virtual domain by using the Virtual Domain drop-down list at the top of the page. Only virtual domains that have been assigned to you are available in the drop-down list.

When you select a different virtual domain from the drop-down list, all reports, alarms, and other functionality are filtered by the conditions of the new virtual domain.

## Viewing Assigned Virtual Domain Components

To view all components (including maps, controllers, and access points) assigned to the current virtual domain, choose **Administration > Virtual Domains** (see [Figure 18-3](#)). Click a link on the Summary tab to view the assigned components for your virtual domain.

**Figure 18-3** Virtual Domains Summary Tab

## Limited Menu Access

Non-ROOT-DOMAIN virtual domain users do not have access to the following NCS menus:

- Monitor > RRM
- Configure > Auto Provisioning
- Configure > ACS View Servers
- Mobility > Mobility Services
- Mobility > Synchronize Servers
- Administration > Background Tasks
- Administration > Settings

- Administration > User Preferences
- Tools > Voice Audit
- Tools > Config Audit
-

# CHAPTER 19

## wIPS Policy Alarm Encyclopedia

---

### Security IDS/IPS Overview

The addition of WLANs in the corporate environment introduces a new class of threats for network security. RF signals that penetrate walls and extend beyond intended boundaries can expose the network to unauthorized users. Rogue access points installed by employees for their personal use usually do not adhere to the corporate security policy. A rogue access point can put the entire corporate network at risk for outside penetration and attack. Not to understate the threat of the rogue access point, there are many other wireless security risks and intrusions such as mis-configured and unconfigured access points and DoS (denial of service) attacks.

The Cisco Adaptive Wireless IPS is designed to help manage against security threats by validating proper security configurations and detecting possible intrusions. With the comprehensive suite of security monitoring technologies, the Cisco Adaptive Wireless IPS alerts the user on more than 100 different threat conditions in the following categories:

- User authentication and traffic encryption
- Rogue and ad-hoc mode devices
- Configuration vulnerabilities
- Intrusion detection on security penetration
- Intrusion detection on DoS attacks

To maximize the power of the Cisco Adaptive Wireless IPS, security alarms can be customized to best match your security deployment policy. For example, if your WLAN deployment includes access points made by a specific vendor, the product can be customized to generate the rogue access point alarm when an access point made by another vendor is detected by the access point or sensor.

#### Note

---

The wIPS Local Mode or H-REAP Mode Access points does not support all security alarms. The magnifying glass icon  indicates that this alarm is not supported by the wIPS Local Mode or H-REAP Mode Access points.

---

### Pre-configured profiles for various WLAN environments

During installation, the user can select an appropriate profile based on the WLAN network implemented.

The Cisco Adaptive Wireless IPS provides separate profiles for:

- Enterprise best practice
- Enterprise rogue detection only

- Financial (Gramm-Leach-Bliley Act compliant)
- HealthCare (Health Insurance Portability and Accountability Act compliant)
- Hotspot implementing 802.1x security
- Hotspot implementing NO security
- Tradeshow environment
- Warehouse/manufacturing environment
- Government/Military (8100.2 directive compliant)
- Retail environment

When the administrator selects the appropriate profile, the Cisco Adaptive Wireless IPS will enable or disable alarms from the policy profile that are appropriate for that WLAN environment. For example, health care institutions can select the Healthcare profile and all alarms that are necessary to be HIPAA compliant will be enabled. The administrator still has the option after installation to enable or disable any alarm or change the threshold values as per individual preferences.

The Cisco Adaptive Wireless IPS system not only is an IDS (Intrusion Detection System), but also is an IPS (Intrusion Prevention System).

Tip

To learn more about Cisco Adaptive wIPS features and functionality, go to [Cisco.com](http://Cisco.com) to watch a multimedia presentation. Here you will also find the learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

Cisco Adaptive Wireless IPS policies are included in two security subcategories: wIPS—Denial of Service (DoS) Attacks and wIPS—Security Penetration.

- [Intrusion Detection—Denial of Service Attack, page 19-2](#)
- [Intrusion Detection—Security Penetration, page 19-24](#)

## Intrusion Detection—Denial of Service Attack

Wireless DoS (denial of service) attacks aim to disrupt wireless services by taking advantage of various vulnerabilities of WLANs at layer one and two. DoS attacks may target the physical RF environment, access points, client stations, or the back-end authentication RADIUS servers. For example, RF jamming attacks with a high-power directional antenna from a distance can be carried out from the outside of your office building. Attack tools used by intruders leverage hacking techniques such as spoofed 802.11 management frames, spoofed 802.1x authentication frames, or simply using the brute force packet flooding method.

The nature and protocol standards for wireless are subject to some of these attacks. Cisco has developed Management Frame Protection, the basis of 802.11i, to proactively prevent many of these attacks. (For more information on MFP, refer to the Cisco NCS online help.) The Cisco Adaptive Wireless IPS contributes to this solution by an early detection system where the attack signatures are matched. The Cisco Adaptive Wireless IPS DoS detection focuses on WLAN layer one (physical layer) and two (data link layer, 802.11, 802.1x). When strong WLAN authentication and encryption mechanisms are used, higher layer (IP layer and above) DoS attacks are difficult to execute. The wIPS server tightens your WLAN defense by validating strong authentication and encryption policies. In addition, the Cisco Adaptive Wireless IPS Intrusion Detection on denial of service attacks and security penetration provides 24 X 7 air tight monitoring on potential wireless attacks.

Denial of service attacks include the following three subcategories:

- [Denial of Service Attack Against Access Points, page 19-3](#)
- [Denial of Service Attack Against Infrastructure, page 19-8](#)
- [Denial of Service Attack Against Client Station, page 19-13](#)

## Denial of Service Attack Against Access Points

DoS attacks against access points are typically carried out on the basis of the following assumptions:

- Access points have limited resources. For example, the per-client association state table.
- WLAN management frames and authentication protocols 802.11 and 802.1x have no encryption mechanisms.

Wireless intruders can exhaust access point resources, most importantly the client association table, by emulating large number of wireless clients with spoofed MAC addresses. Each one of these emulated clients attempts association and authentication with the target access point but leaves the protocol transaction mid-way. When the access point resources and the client association table is filled up with these emulated clients and their incomplete authentication states, legitimate clients can no longer be serviced by the attacked access point. This creates a denial of service attack.

The Cisco Adaptive Wireless IPS tracks the client authentication process and identifies DoS attack signatures against the access point. Incomplete authentication and association transactions trigger the attack detection and statistical signature matching process. Detected DoS attacks result in setting off WIPS alarms which include the usual alarm detail description and target device information.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against frame and device spoofing.

DoS attacks against access points include:

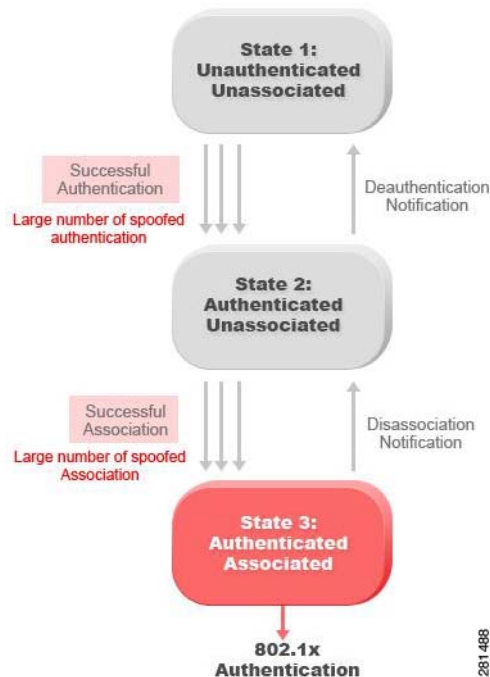

- [Denial of Service Attack: Association Flood](#)
- [Denial of Service Attack: Association Table Overflow](#)
- [Denial of Service Attack: Authentication Flood](#)
- [Denial of Service Attack: EAPOL-Start Attack](#)
- [Denial of Service Attack: PS Poll Flood](#)
- [Denial of Service Attack: Unauthenticated Association](#)

### Denial of Service Attack: Association Flood

#### Alarm Description and Possible Causes

This DoS attack exhausts the access point resources, particularly the client association table, by flooding the access point with a large number of spoofed client associations. At the 802.11 layer, shared-key authentication is flawed and rarely used. The other alternative is open authentication (null authentication) that relies on higher level authentication such as 802.1x or VPN. Open authentication allows any client to authenticate and then associate. An attacker using such a vulnerability can emulate a large number of clients to flood a target access point client association table by creating many clients reaching State 3. When the client association table overflows, legitimate clients cannot get associated; therefore, a DoS attack is committed. (See [Figure 19-1](#))

Figure 19-1 DoS Attack: Association Flood

## wIPS Solution

The Cisco Adaptive Wireless IPS detects spoofed MAC addresses and tracks the 802.1x actions and data communication after a successful client association to detect this form of DoS attack. After this attack is reported by the Cisco Adaptive Wireless IPS, you may log onto this access point to inspect its association table for the number of client associations.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against frame and device spoofing.

## Denial of Service Attack: Association Table Overflow

### Alarm Description and Possible Causes

Wireless intruders can exhaust access point resources, most importantly the client association table, by imitating a large number of wireless clients with spoofed MAC addresses. Each one of these imitated clients attempts association and authentication with the target access point. The 802.11 authentication typically completes because most deployments use 802.11 open system authentication, which is a null authentication process. Association with these imitated clients follows the authentication process. These imitated clients do not, however, follow up with higher level authentication such as 802.1x or VPN, which leaves the protocol transaction half-finished. At this point, the attacked access point maintains a state in the client association table for each imitated client. When the access point resources and client association table is filled with these imitated clients and their state information, legitimate clients can no longer be serviced by the attacked access point. This creates a DoS attack.

## wIPS Solution

The Cisco Adaptive Wireless IPS tracks the client authentication process and identifies a DoS attack signature against an access point. Incomplete authentication and association transactions trigger the Cisco Adaptive Wireless IPS attack detection and statistical signature matching process.

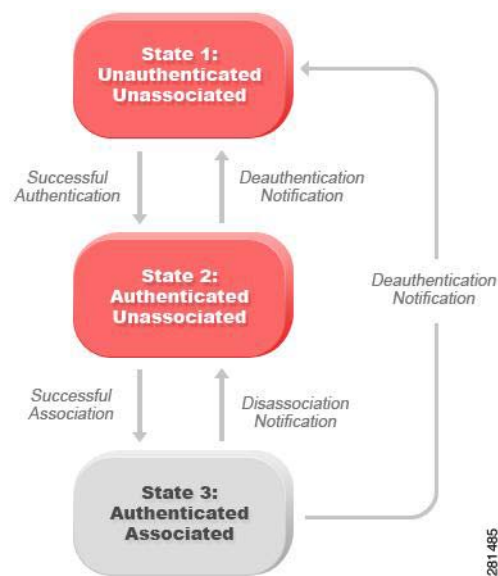

## Denial of Service Attack: Authentication Flood

Attack tool: Void11

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking station authentication and association status. Wireless clients and access points implement such a state machine according to the IEEE standard (see Figure 19-2). On the access point, each client has a state recorded in the access point client table (association table). This recorded state has a size limit that can either be a hard-coded number or a number based on the physical memory constraint.

**Figure 19-2 Client State Machine**

A form of DoS attack floods the access point client state table (association table) by imitating many client stations (MAC address spoofing) sending authentication requests to the access point. Upon receipt of each individual authentication request, the target access point creates a client entry in State 1 of the association table. If open system authentication is used for the access point, the access point returns an *authentication success* frame and moves the client to State 2. If shared-key authentication is used for the access point, the access point sends an *authentication challenge* to the attacker imitated client, which does not respond. In this case, the access point keeps the client in State 1. In either case, the access point contains multiple clients hanging in either State 1 or State 2 which fills up the access point association table. When the table reaches its limit, legitimate clients cannot authenticate and associate with this access point. This results in a DoS attack.

## wIPS Solution

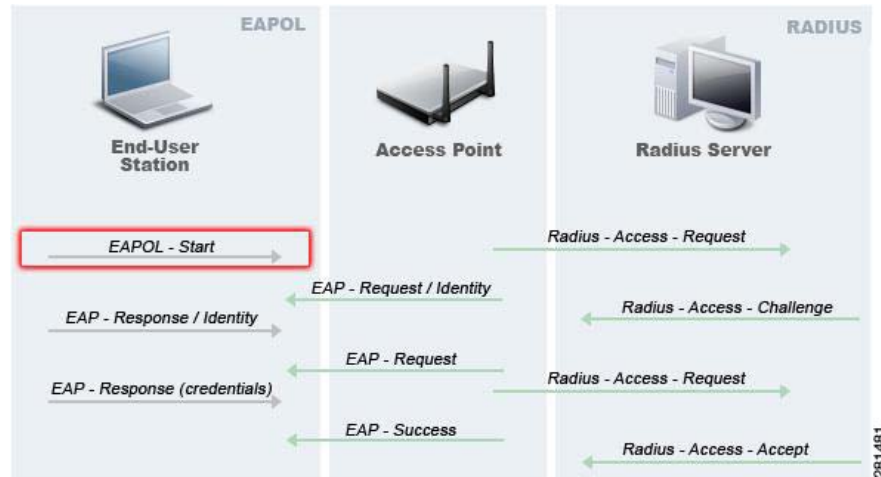

The Cisco Adaptive Wireless IPS detects this form of DoS attack by tracking client authentication and association states. When the alarm is triggered, the access point under attack is identified. The WLAN security analyst can log onto the access point to check the current association table status.

## Denial of Service Attack: EAPOL-Start Attack

### Alarm Description and Possible Causes

The IEEE 802.1x standard defines the authentication protocol using EAP over LANs (EAPOL). The 802.1x protocol starts with an EAPOL-Start frame sent by the client station to begin the authentication transaction. The access point responds to an EAPOL-start frame with a EAP-identity-request and some internal resource allocation.

**Figure 19-3** EAPOL-Start Protocol and EAPOL-Start Attack

An attacker attempts to disrupt an access point by flooding it with EAPOL-start frames to exhaust the access point internal resources.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by tracking the 802.1x authentication state transition and particular attack signature.

## Denial of Service Attack: PS Poll Flood

### Alarm Description and Possible Causes

Power management is probably one of the most critical features of wireless LAN devices. Power management helps to conserve power by enabling stations to remain in power saving state mode for longer periods of time and to receive data from the access point only at specified intervals.

The wireless client device must inform the access point of the length of time that it will be in the sleep mode (power save mode). At the end of the time period, the client wakes up and checks for waiting data frames. After it completes a handshake with the access point, it receives the data frames. The beacons from the access point also include the Delivery Traffic Indication Map (DTIM) to inform the client when it needs to wake up to accept multicast traffic.

The access point continues to buffer data frames for the sleeping wireless clients. Using the Traffic Indication Map (TIM), the access point notifies the wireless client that it has buffered data buffered. Multicast frames are sent after the beacon that announces the DTIM.

The client requests the delivery of the buffered frames using PS-Poll frames to the access point. For every PS-Poll frame, the access point responds with a data frame. If there are more frames buffered for the wireless client, the access point sets the data bit in the frame response. The client then sends another PS-Poll frame to get the next data frame. This process continues until all the buffered data frames are received.

A potential hacker could spoof the MAC address of the wireless client and send out a flood of PS-Poll frames. The access point then sends out the buffered data frames to the wireless client. In reality, the client could be in the power safe mode and would miss the data frames.

### wIPS Solution

The Cisco Adaptive Wireless IPS can detect this DoS attack that can cause the wireless client to lose legitimate data. Locate and remove the device from the wireless environment.

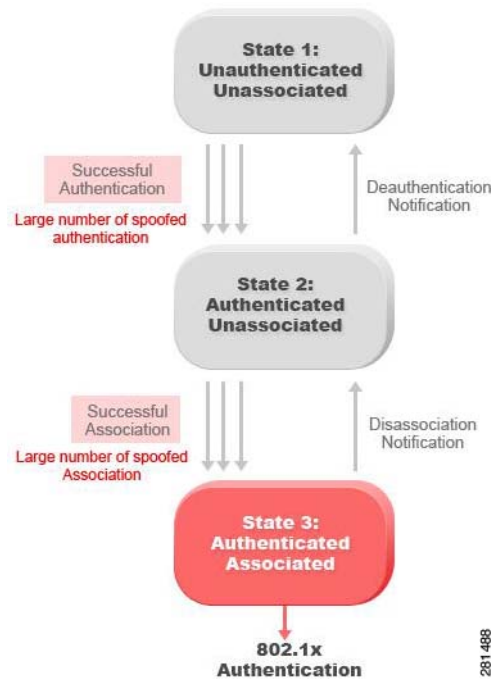

Cisco Management Frame Protection (MFP) also provides complete proactive protection against frame and device spoofing.

## Denial of Service Attack: Unauthenticated Association

### Alarm Description and Possible Causes

A form of DoS attack is to exhaust the access point resources, particularly the client association table, by flooding the access point with a large number of spoofed client associations. At the 802.11 layer, shared-key authentication is flawed and rarely used. The other alternative is open authentication (null authentication) which relies on higher level authentication such as 802.1x or VPN. Open authentication allows any client to authenticate and then associate. An attacker using such a vulnerability can imitate a large number of clients to flood a target access point client association table by creating many clients reaching State 3. When the client association table overflows, legitimate clients cannot get associated causing a DoS attack.

Figure 19-4 DoS Attack: Unauthenticated Association

## wIPS Solution

The Cisco Adaptive Wireless IPS detects spoofed MAC addresses and tracks 802.1x actions and data communication after a successful client association to detect this form of DoS attack. After this attack is reported by the Cisco Adaptive Wireless IPS, you may log onto this access point to inspect its association table for the number of client associations.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against frame and device spoofing.

## Denial of Service Attack Against Infrastructure

In addition to attacking access points or client stations, the wireless intruder may target the RF spectrum or the back-end authentication RADIUS server for DoS attacks. The RF spectrum can be easily disrupted by injecting RF noise generated by a high power antenna from a distance. Back-end RADIUS servers can be overloaded by a DDoS (distributed denial of service) attack where multiple wireless attackers flood the RADIUS server with authentication requests. This attack does not require a successful authentication to perform the attack.

DoS attacks against infrastructure include:

- Denial of Service Attack: CTS Flood
- Denial of Service Attack: Queensland University of Technology Exploit
- Denial of Service attack: RF Jamming
- Denial of Service: RTS Flood
- Denial of Service Attack: Virtual Carrier Attack

## Denial of Service Attack: CTS Flood

Attack tool: CTS Jack

### Alarm Description and Possible Causes

As an optional feature, the IEEE 802.11 standard includes the RTS/CTS (request-to-send/clear-to-send) functionality to control the station access to the RF medium. The wireless device ready for transmission sends a RTS frame to acquire the right to the RF medium for a specified time duration. The receiver grants the right to the RF medium to the transmitter by sending a CTS frame of the same time duration. All wireless devices observing the CTS frame should yield the media to the transmitter for transmission without contention.

**Figure 19-5** Standard RTS/CTS Functionality Compared to the CTS DoS Attack

A wireless DoS attacker may take advantage of the privilege granted to the CTS frame to reserve the RF medium for transmission. By transmitting back-to-back CTS frames, an attacker can force other wireless devices sharing the RF medium to hold back their transmission until the attacker stops transmitting the CTS frames.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects the abuse of CTS frames for a DoS attack.

## Denial of Service Attack: Queensland University of Technology Exploit

Denial of Service Vulnerability in IEEE 802.11 Wireless Devices: US-CERT VU#106678 & Aus-CERT AA-2004.02.

## Alarm Description and Possible Causes

802.11 WLAN devices use Carrier Sense Multiple Access with Collision Avoidance (CSMA/CA) as the basic access mechanism in which the WLAN device listens to the medium before starting any transmission and backs-off when it detects any existing transmission taking place. Collision avoidance combines the physical sensing mechanism and the virtual sense mechanism that includes the Network Allocation Vector (NAV), the time before which the medium is available for transmission. Clear Channel Assessment (CCA) in the DSSS protocol determines whether a WLAN channel is clear so an 802.11b device can transmit on it.

Mark Looi, Christian Wullems, Kevin Tham and Jason Smith from the Information Security Research Centre, Queensland University of Technology, Brisbane, Australia, have recently discovered a flaw in the 802.11b protocol standard that could potentially make it vulnerable to DoS radio frequency jamming attacks.

This attack specifically attacks the CCA functionality. According to the AusCERT bulletin, "an attack against this vulnerability exploits the CCA function at the physical layer and causes all WLAN nodes within range, both clients and access points, to defer transmission of data for the duration of the attack. When under attack, the device behaves as if the channel is always busy, preventing the transmission of any data over the wireless network."

This DoS attack affects DSSS WLAN devices including IEEE 802.11, 802.11b, and low-speed (below 20 Mbps) 802.11g wireless devices. IEEE 802.11a (using OFDM), high-speed (above 20 Mbps using OFDM) 802.11g wireless devices are not affected by this attack. Devices that use FHSS are also not affected.

Any attacker using a PDA or a laptop equipped with a WLAN card can launch this attack on SOHO and enterprise WLANs. Switching to the 802.11a protocol is the only solution or known protection against this DoS attack.

For more information on this DoS attack, refer to:

- [www.isrc.qut.edu.au](http://www.isrc.qut.edu.au)
- [www.isrc.qut.edu.au/wireless](http://www.isrc.qut.edu.au/wireless)
- <http://www.auscert.org.au/render.html?it=4091>
- <http://www.kb.cert.org/vuls/id/106678>

## wIPS Solution

The Cisco Adaptive Wireless IPS detects this DoS attack and sets off the alarm. Locate and remove the responsible device from the wireless environment.

## Denial of Service attack: RF Jamming

### Alarm Description and Possible Causes

WLAN reliability and efficiency depend on the quality of the radio frequency (RF) media. Each RF is susceptible to RF noise impact. An attacker using this WLAN vulnerability can perform two types of DoS attacks:

- Disrupt WLAN service—At the 2.4 GHz unlicensed spectrum, the attack may be unintentional. A cordless phone, Bluetooth devices, microwave, wireless surveillance video camera, or baby monitor can all emit RF energy to disrupt WLAN service. Malicious attacks can manipulate the RF power at 2.4 GHz or 5 GHz spectrum with a high-gain directional antenna to amplify the attack impact from a distance.

With free-space and indoor attenuation, a 1-kW jammer 300 feet away from a building can jam 50 to 100 feet into the office area. The same 1-kW jammer located inside a building can jam 180 feet into the office area. During the attack, WLAN devices in the target area are out of wireless service.

- Physically damage AP hardware—An attacker using a high-output transmitter with directional high gain antenna 30 yards away from an access point can pulse enough RF power to damage electronics in the access point putting it being permanently out of service. Such High Energy RF (HERF) guns are effective and are inexpensive to build.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects continuous RF noise over a certain threshold for a potential RF jamming attack.

Cisco Spectrum Intelligence also provides specific detection of non-802.11 jamming devices. For more information on Cisco Spectrum Intelligence, refer to the *Cisco Wireless Control System Configuration Guide*.

## Denial of Service: RTS Flood

### Alarm Description and Possible Causes

As an optional feature, the IEEE 802.11 standard includes the RTS/CTS (Request-To-Send/Clear-To-Send) functionality to control access to the RF medium by stations. The wireless device ready for transmission sends an RTS frame to acquire the right to the RF medium for a specified duration. The receiver grants the right to the RF medium to the transmitter by sending a CTS frame of the same duration. All wireless devices observing the CTS frame should yield the RF medium to the transmitter for transmission without contention. See [Figure 19-6](#).

**Figure 19-6** Standard RTS/CTS mechanism vs. intruder-injected RTS DoS attack

A wireless denial of service attacker may take advantage of the privilege granted to the CTS frame to reserve the RF medium for transmission. By transmitting back-to-back RTS frames with a large transmission duration field, an attacker reserves the wireless medium and force other wireless devices sharing the RF medium to hold back their transmissions.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects the abuse of RTS frames for denial of service attacks.

## Denial of Service Attack: Virtual Carrier Attack

### Alarm Description and Possible Causes

The virtual carrier-sense attack is implemented by modifying the 802.11 MAC layer implementation to allow random duration values to be sent periodically. This attack can be carried out on the ACK, data, RTS, and CTS frame types by using large duration values. By doing this the attacker can prevent channel access to legitimate users.

Under normal circumstances, the only time a ACK frame carries a large duration value is when the ACK is part of a fragmented packet sequence. A data frame legitimately carries a large duration value only when it is a subframe in a fragmented packet exchange.

One approach to deal with this attack is to place a limit on the duration values accepted by nodes. Any packet containing a larger duration value is truncated to the maximum allowed value. Low cap and high cap values can be used. The low cap has a value equal to the amount of time required to send an ACK frame, plus media access backoffs for that frame. The low cap is used when the only packet that can follow the observed packet is an ACK or CTS. This includes RTS and all management (association, and so on) frames. The high cap is used when it is valid for a data packet to follow the observed frame. The

limit in this case needs to include the time required to send the largest data frame, plus the media access backoffs for that frame. The high cap must be used in two places: when observing an ACK (because the ACK may be part of a MAC level fragmented packet) and when observing a CTS.

A station that receives an RTS frame also receives the data frame. The IEEE 802.11 standard specifies the exact times for the subsequent CTS and data frames. The duration value of RTS is respected until the following data frame is received or not received. Either the observed CTS is unsolicited or the observing node is a hidden terminal. If this CTS is addressed to a valid in-range station, the valid station can nullify this by sending a zero duration null function frame. If this CTS is addressed to an out-of-range station, one method of defense is to introduce authenticated CTS frames containing cryptographically signed copies of the preceding RTS. With this method, there is a possibility of overhead and feasibility issues.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this DoS attack. Locate the device and take appropriate steps to remove it from the wireless environment.

## Denial of Service Attack Against Client Station

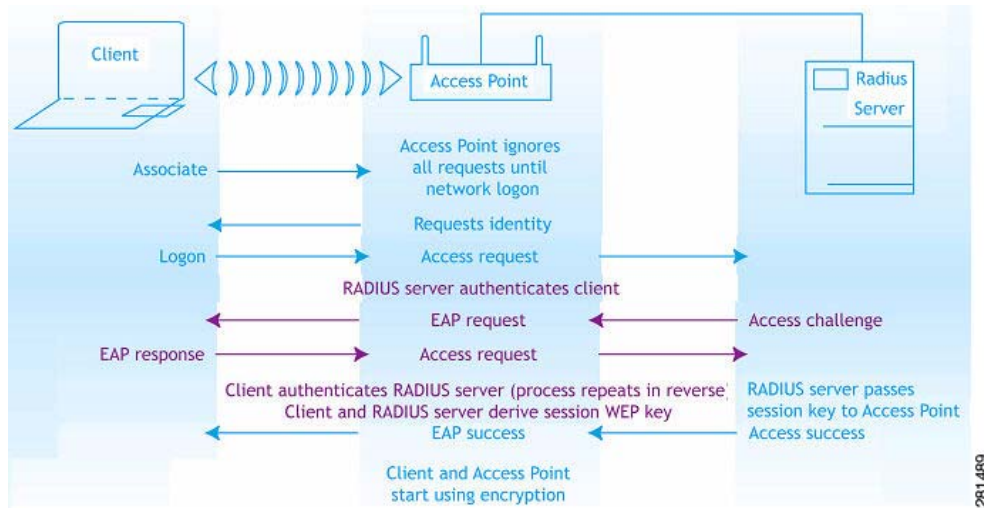

DoS (denial of service) attacks against wireless client station are typically carried out based upon the fact that 802.11 management frames and 802.1x authentication protocols have no encryption mechanism and thus can be spoofed. For example, wireless intruders can disrupt the service to a client station by continuously spoofing a 802.11 dis-association or deauthentication frame from the access point to the client station. The 802.11 association state machine as specified by the IEEE standard is illustrated in [Figure 19-7](#) to show how an associated station can be tricked out of the authenticated and associated state by various types of spoofed frames.

**Figure 19-7** 802.11 Association and Authentication State Machine

Besides the 802.11 authentication and association state attack, there are similar attack scenarios for 802.1x authentication. For example, 802.1x EAP-Failure or EAP-logoff messages are not encrypted and can be spoofed to disrupt the 802.1x authenticated state to disrupt wireless service. See [Figure 19-8](#) for 802.1x authentication and key exchange state change.

Figure 19-8 802.1x User Authentication Process

The Cisco Adaptive Wireless IPS tracks the client authentication process and identifies DoS attack signatures. Incomplete authentication and association transactions trigger the attack detection and statistical signature matching process. Detected DoS attack results in setting off wIPS alarms that include the usual alarm detail description and target device information.

This section describes the DoS attacks against client station and includes the following topics:

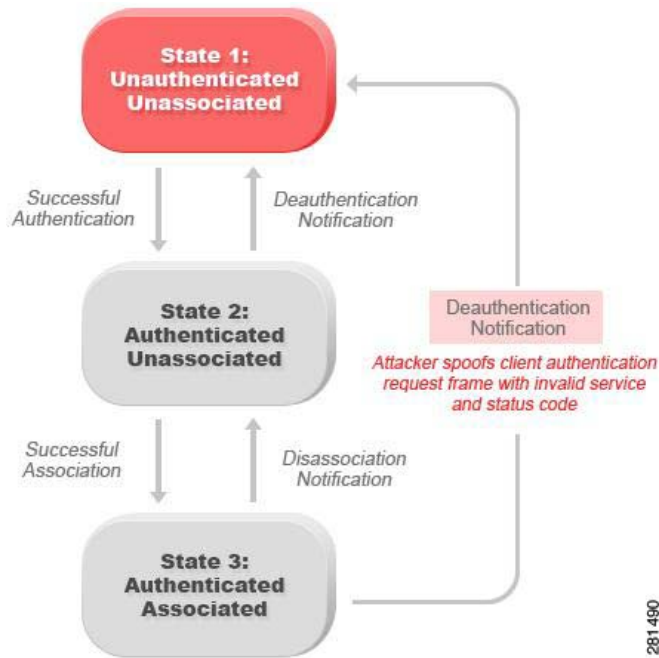

- [Denial of Service Attack: Authentication-Failure Attack, page 19-14](#)
- [Denial of Service Attack: Block ACK, page 19-15](#)
- [Denial of Service Attack: Deauthentication Broadcast Flood, page 19-16](#)
- [Denial of Service Attack: Deauthentication Flood, page 19-17](#)
- [Denial of Service Attack: Disassociation Broadcast Flood, page 19-19](#)
- [Denial of Service Attack: Disassociation Flood, page 19-20](#)
- [Denial of Service Attack: EAPOL-Logoff Attack, page 19-21](#)
- [Denial of Service Attack: FATA-Jack Tool, page 19-21](#)
- [Denial of Service Attack: Premature EAP-Failure, page 19-23](#)
- [Denial of Service Attack: Premature EAP-Success, page 19-23](#)

## Denial of Service Attack: Authentication-Failure Attack

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking station authentication and association status. Wireless clients and access points implement this client state machine based on the IEEE standard (see [Figure 19-9](#)). A successfully associated client remains in State 3 to continue wireless communication. A client in State 1 and in State 2 cannot participate in the WLAN data communication process until it is authenticated and associated to State 3. IEEE 802.11 defines two authentication services: open system authentication and shared key authentication. Wireless clients go through one of these authentication processes to associate with an access point.

Figure 19-9 Client State Machine

A denial of service (DoS) attack spoofs invalid authentication request frames (with bad authentication service and status codes) being sent from an associated client in State 3 to an access point. Upon receipt of the invalid authentication requests, the access point updates the client to State 1, which disconnects client wireless service.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of a DoS attack by monitoring for spoofed MAC addresses and authentication failures. This alarm may also indicate an intrusion attempt. When a wireless client fails too many times in authenticating with an access point, the server raises this alarm to indicate a potential intruder attempt to breach security.

#### Note

This alarm focuses on IEEE 802.11 authentication methods, such as open system and shared key. EAP and 802.1x based authentications are monitored by other alarms.

## Denial of Service Attack: Block ACK

### Alarm Description & Possible Causes

A form of denial of service attack allows an attacker to prevent an 802.11n AP from receiving frames from a specific valid corporate client. With the introduction of the 802.11n standard, a transaction mechanism was introduced which allows a client to transmit a large block of frames at once, rather than dividing them up into segments. To initiate this exchange, the client will send an Add Block Acknowledgement (ADDBA) to the AP, which contains sequence numbers to inform the AP of the size of the block being transmitted. The AP will then accept all frames that fall within the specified sequence (consequently dropping any frames that fall outside of the range) and transmit a BlockACK message back to the client when the transaction has been completed.

To exploit this process, an attacker can transmit an invalid ADDBA frame while spoofing the valid client MAC address. This process will cause the AP to ignore any valid traffic transmitted from the client until the invalid frame range has been reached.

### wIPS Solution

The wIPS server monitors ADDBA transactions for signs of spoofed client information. When an attacker is detected attempting to initiate a Block ACK attack, an alarm is triggered. We recommend that users locate the offending device and eliminate it from the wireless environment as soon as possible.

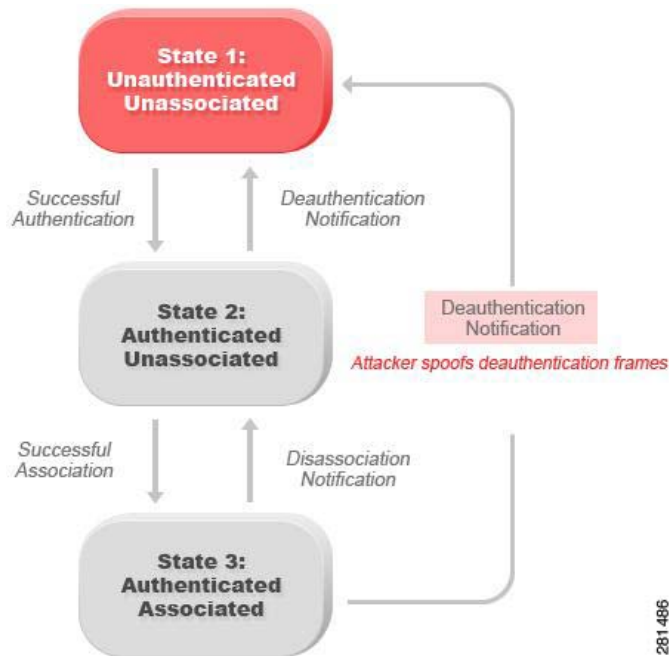

## Denial of Service Attack: Deauthentication Broadcast Flood

Attack tool: WLAN Jack, Void11, Hunter Killer

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking the station authentication and association status. Wireless clients and access points implement this state machine according to the IEEE standard. A successfully associated client remains in State 3 to continue wireless communication. A client in State 1 and State 2 cannot participate in WLAN data communication until it is authenticated and associated to State 3.

Figure 19-10 Client State Machine and Deauthentication Broadcast Attack

A form of DoS attack sends all clients of an access point to the unassociated or unauthenticated State 1 by spoofing deauthentication frames from the access point to the broadcast address. With current client adapter implementation, this form of attack is very effective and immediate in disrupting wireless services against multiple clients. Typically, client stations reassociate and reauthenticate to regain service until the attacker sends another deauthentication frame.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by detecting spoofed deauthentication frames and tracking client authentication and association states. When the alarm is triggered, the access point under attack is identified. The WLAN security analyst can log onto the access point to verify the current association table status.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against MAC spoofing. For more information on MFP, refer to the *Cisco Wireless Control System Configuration Guide*.

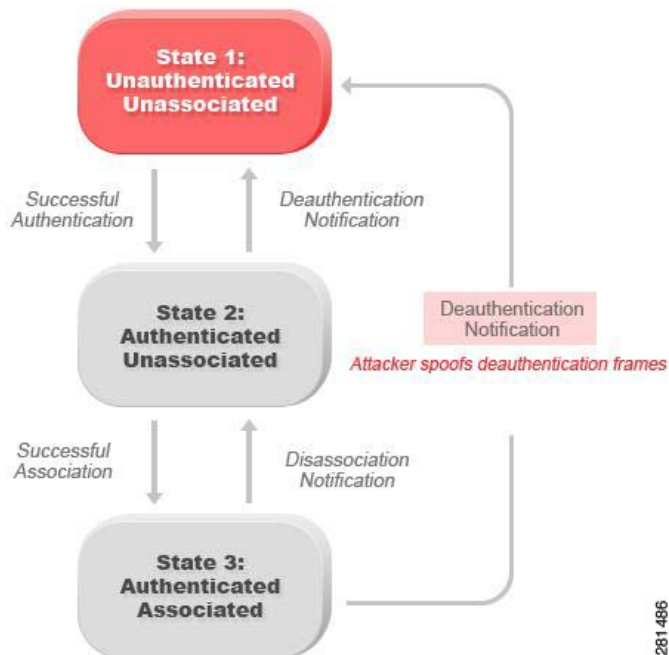

## Denial of Service Attack: Deauthentication Flood

Attack tool: WLAN Jack, Void11

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking station authentication and association status. Wireless clients and access points implement this state machine according to the IEEE standard. A successfully associated client stays in State 3 to continue wireless communication. A client in State 1 and State 2 cannot participate in WLAN data communication until it is authenticated and associated to State 3.

**Figure 19-11 Client State Machine and Deauthentication Flood Attack**

A form of DoS attack aims to send an access point client to the unassociated or unauthenticated State 1 by spoofing deauthentication frames from the access point to the client unicast address. With current client adapter implementations, this form of attack is very effective and immediate for disrupting wireless services against the client. Typically, client stations reassociate and reauthenticate to regain service until the attacker sends another deauthentication frame. An attacker repeatedly spoofs the deauthentication frames to keep all clients out of service.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by detecting spoofed deauthentication frames and tracking client authentication and association states. When the alarm is triggered, the access point and client under attack are identified. The WLAN security officer can log onto the access point to check the current association table status.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against MAC spoofing. For more information on MFP, refer to the *Cisco Wireless Control System Configuration Guide*.

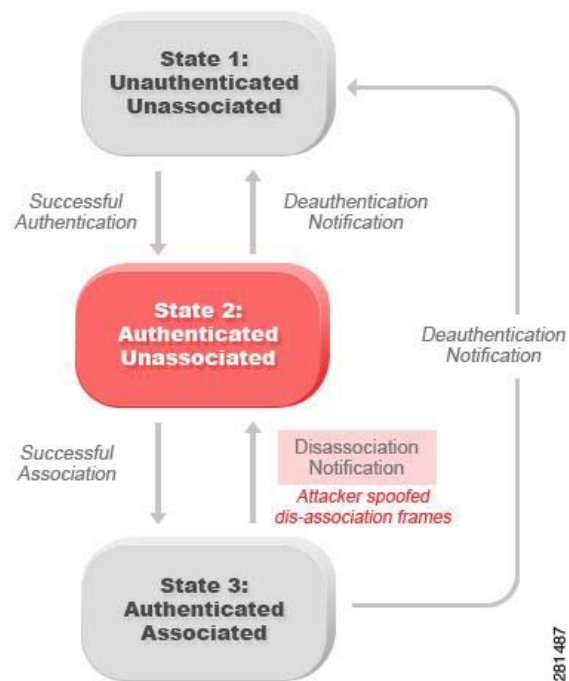

## Denial of Service Attack: Disassociation Broadcast Flood

Attack tool: ESSID Jack

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking the station authentication and association status. Wireless clients and access points implement this state machine according to the IEEE standard. A successfully associated client station stays in State 3 to continue wireless communication. A client station in State 1 and State 2 can not participate in WLAN data communication until it is authenticated and associated to State 3.

**Figure 19-12 Client State Machine and Disassociation Broadcast Attack**

A form of DoS attack aims to send an access point client to the unassociated or unauthenticated State 2 by spoofing disassociation frames from the access point to the broadcast address (all clients). With current client adapter implementations, this form of attack is effective and immediate for disrupting wireless services against multiple clients. Typically, client stations reassociate to regain service until the attacker sends another disassociation frame. An attacker repeatedly spoofs the disassociation frames to keep all clients out of service.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by detecting spoofed disassociation frames and tracking client authentication and association states. When the alarm is triggered, the access point under attack is identified. The WLAN security officer can log onto the access point to check the current association table status.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against MAC spoofing. For more information on MFP, refer to the *Cisco Wireless Control System Configuration Guide*.

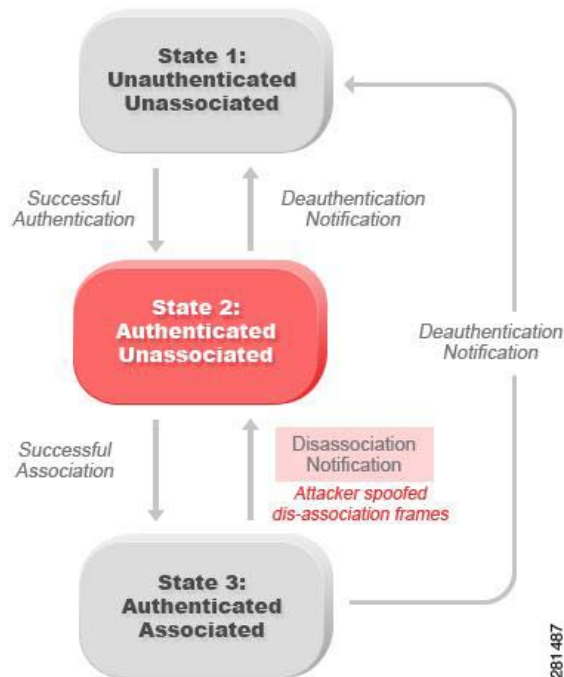

## Denial of Service Attack: Disassociation Flood

Attack tool: ESSID Jack

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking the station authentication and association status. Wireless clients and access points implement this state machine according to the IEEE standard. A successfully associated client stays in State 3 to continue wireless communication. A client in State 1 and State 2 cannot participate in WLAN data communication until it is authenticated and associated to State 3.

**Figure 19-13 Client State Machine and Disassociation Flood Attack**

A form of DoS attack aims to send an access point to the unassociated or unauthenticated State 2 by spoofing disassociation frames from the access point to a client. With client adapter implementations, this form of attack is effective and immediate for disrupting wireless services against this client. Typically, client stations reassociate to regain service until the attacker sends another disassociation frame. An attacker repeatedly spoofs the disassociation frames to keep the client out of service.

### wIPS Solution

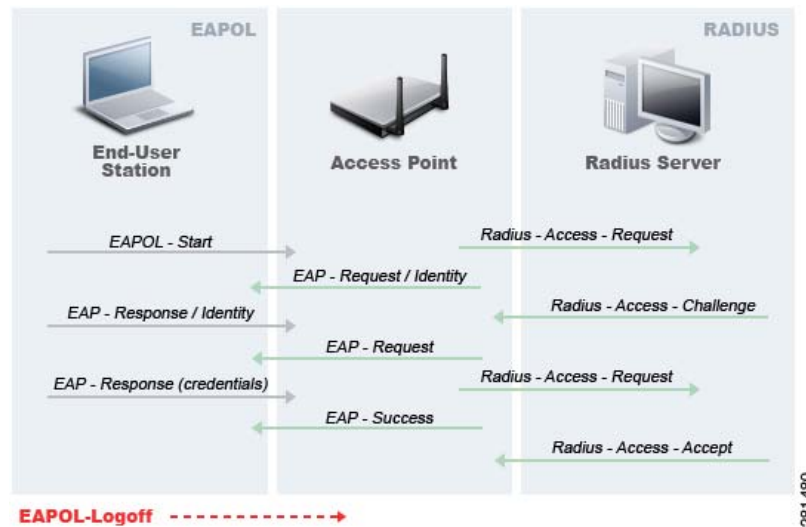

The Cisco Adaptive Wireless IPS detects this form of DoS attack by detecting spoofed disassociation frames and tracking client authentication and association states. When the alarm is triggered, the access point under attack is identified. The WLAN security officer can log onto the access point to check the current association table status.

## Denial of Service Attack: EAPOL-Logoff Attack

### Alarm Description and Possible Causes

The IEEE 802.1x standard defines the authentication protocol using Extensible Authentication Protocol (EAP) over LANs or EAPOL. The 802.1x protocol starts with a EAPOL-start frame to begin the authentication transaction. At the end of an authenticated session when a client station logs off, the client station sends an 802.1x EAPOL-logoff frame to terminate the session with the access point.

**Figure 19-14** EAPOL-Logoff Protocol and EAPOL-Logoff Attack

Because the EAPOL-logoff frame is not authenticated, an attacker can potentially spoof this frame and log the user off from the access point, thus committing a DoS attack. The fact that the client is logged off from the access point is not obvious until it attempts communication through the WLAN. Typically, the disruption is discovered and the client re-associates and authenticates automatically to regain the wireless connection. The attacker can continuously transmit the spoofed EAPOL-logoff frames to be effective on this attack.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by tracking 802.1x authentication states. When the alarm is triggered, the client and access point under attack are identified. The WLAN security officer logs onto the access point to check the current association table status.

## Denial of Service Attack: FATA-Jack Tool

### Alarm Description and Possible Causes

IEEE 802.11 defines a client state machine for tracking station authentication and association status. Wireless clients and access points implement this state machine based on the IEEE standard. A successfully associated client station stays in State 3 to continue wireless communication. A client station in State 1 and in State 2 cannot participate in the WLAN data communication process until it is

authenticated and associated to State 3. IEEE 802.11 defines two authentication services: open system and shared key. Wireless clients go through one of these authentication processes to associate with an access point.

**Figure 19-15** Client State Machine and DoS Attack

A form of DoS attack spoofs invalid authentication request frames (with bad authentication service and status codes) from an associated client in State 3 to an access point. Upon reception of the invalid authentication requests, the access point updates the client to State 1, which disconnects its wireless service.

FATA-jack is one of the commonly used tools to run a similar attack. It is a modified version of WLAN-jack and it sends authentication-failed packets along with the reason code of the previous authentication failure to the wireless station. This occurs after it spoofs the MAC address of the access point. FATA-jack closes most active connections and at times forces the user to reboot the station to continue normal activities.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects the use of FATA-jack by monitoring on spoofed MAC addresses and authentication failures. This alarm may also indicate an intrusion attempt. When a wireless client fails too many times in authenticating with an access point, the Cisco Adaptive Wireless IPS raises this alarm to indicate a potential intruder's attempt to breach security.

### Note

This alarm focuses on 802.11 authentication methods (open system, shared key, and so on). EAP and 802.1x based authentications are monitored by other alarms.

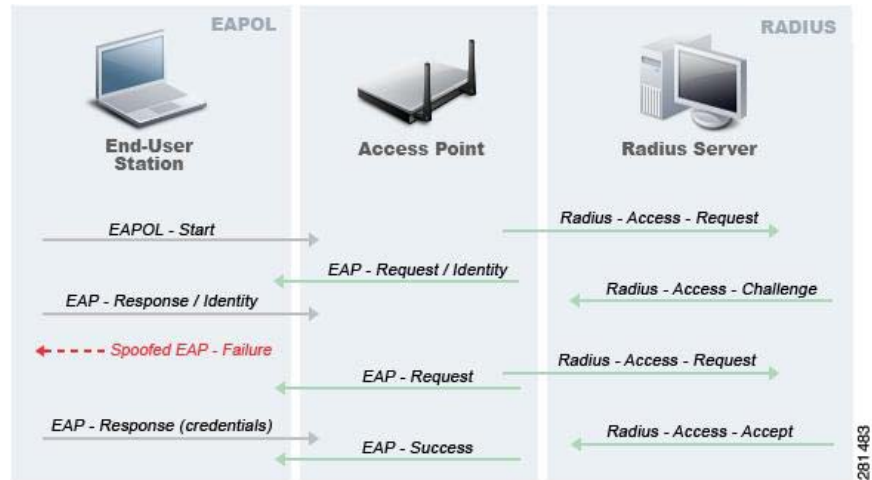

Cisco Management Frame Protection also provides complete proactive protection against frame and device spoofing.

## Denial of Service Attack: Premature EAP-Failure

### Alarm Description and Possible Causes

The IEEE 802.1x standard defines the authentication protocol using Extensible Authentication Protocol over LANs or EAPOL. The 802.1x protocol starts with an EAPOL-Start frame to begin the authentication transaction. When the 802.1x authentication packet exchange is complete with the back-end RADIUS server, the access point sends an EAP-success or EAP-failure frame to the client to indicate authentication success or failure.

**Figure 19-16 EAP-Failure Protocol and Premature EAP-Failure Attack**

The IEEE 802.1X specification prohibits a client from displaying its interface when the required mutual authentication is not complete. This enables a well-implemented 802.1x client station to avoid being fooled by a fake access point sending premature EAP-success packets.

An attacker keeps the client interface from appearing by continuously spoofing pre-mature EAP-failure frames from the access point to the client to disrupt the authentication state on the client.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by tracking the spoofed premature EAP-failure frames and the 802.1x authentication states for each client station and access point. Find the device and remove it from the wireless environment.

## Denial of Service Attack: Premature EAP-Success

### Alarm Description and Possible Causes

The IEEE 802.1x standard defines the authentication protocol using Extensible Authentication Protocol over LANs or EAPOL. The 802.1x protocol starts with an EAPOL-start frame to begin the authentication transaction. When the 802.1x authentication packet exchange is completed with the back-end RADIUS server, the access point sends an EAP-success frame to the client to indicate a successful authentication.

Figure 19-17 EAP-Success Protocol and EAP-Success Attack

The IEEE 802.1X specification prohibits a client from displaying its interface when the required mutual authentication has not been completed. This enables a well-implemented 802.1x client station to avoid being fooled by a fake access point sending premature EAP-success packets to bypass the mutual authentication process.

An attacker keeps the client interface from appearing by continuously spoofing premature EAP-success frames from the access point to the client to disrupt the authentication state.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects this form of DoS attack by tracking spoofed premature EAP-success frames and the 802.1x authentication states for each client station and access point. Find the device and remove it from the wireless environment.

## Intrusion Detection—Security Penetration

A form of wireless intrusion is to breach the WLAN authentication mechanism to gain access to the wired network or the wireless devices. Dictionary attacks on the authentication method is a common attack against an access point. The intruder can also attack the wireless client station during its association process with an access point. For example, a faked access point attack on a unsuspecting wireless client may fool the client into associating with faked access point. This attack allows the intruder to gain network access to the wireless station and potentially hack into its file system. The intruder can then use the station to access the wired enterprise network.

These security threats can be prevented if mutual authentication and strong encryption techniques are used. The Cisco Adaptive Wireless IPS looks for weak security deployment practices as well as any penetration attack attempts. The Cisco Adaptive Wireless IPS ensures a strong wireless security umbrella by validating the best security policy implementation as well as detecting intrusion attempts. If such vulnerabilities or attack attempts are detected, the Cisco Adaptive Wireless IPS generates alarms to bring these intrusion attempts to the administrator notice.

## Airsnarf Attack

### Alarm Description and Possible Causes

A hotspot is any location where Wi-Fi network access is made available for the general public. Hotspots are found in airports, hotels, coffee shops, and other places where business people tend to congregate. They are important network access services for business travelers.

Customers are able to connect to the legitimate access point and receive service using a wireless-enabled laptop or handheld. Most hotspots do not require the user to have any advanced authentication mechanism to connect to the access point other than popping up a web page for the user to log in. The criterion for entry is dependent only on whether or not the subscriber has paid the subscription fees. In a wireless hotspot environment, no one should be trusted. Due to current security concerns, some WLAN hotspot vendors are using 802.1x or higher authentication mechanisms to validate the identity of the user.

**Figure 19-18 Basic Components of a WLAN Hotspot Network**

The 4 components of a basic hotspot network include:

- Hotspot Subscribers—Valid users with a wireless-enabled laptop or handheld and valid login for accessing the hotspot network.
- WLAN Access Points—Can be SOHO gateways or enterprise level access points depending upon the hotspot implementation.
- Hotspot Controllers—Deals with user authentication, gathering billing information, tracking usage time, filtering functions, and so on. This can be an independent machine or incorporated in the access point itself.
- Authentication Server—Contains the login credentials for the subscribers. Most hotspot controllers verify subscribers credentials with the authentication server.

Airsnarf is a wireless access point setup utility that shows how a hacker can steal username and password credentials from public wireless hotspots.

Airsnarf, a shell script-based tool, creates a hotspot complete with a captive portal where the users enter their login information. Important values such as local network information, gateway IP address, and SSID can be configured within the airsnarf configuration file. This tool initially broadcasts a very strong signal that disassociates the hotspot wireless clients from the authorized access point connected to the Internet. The wireless clients assume that they are temporarily disconnected from the Internet due to some unknown issue and they try to log in again. Wireless clients that associate to the Airsnarf access point receive the IP address, DNS address, and gateway IP address from the rogue Airsnarf access point instead of the legitimate access point installed by the hotspot operator. A web page requests a username and password and the DNS queries are resolved by the rogue Airsnarf access point. The username and password entered are collected by the hacker.

The username and password can be used in any other hotspot location of the same provider anywhere in the nation without the user realizing the misuse. The only case where it could have lesser impact is if the hotspot user is connected using a pay-per-minute usage scheme.

The Airsnarf tool can also penetrate the laptop clients that are unknowingly connected to the Airsnarf access point. The AirSnarf tool can be downloaded by hackers from:

<http://airsnarf.shmoo.com/>

## wIPS Solution

The Cisco Adaptive Wireless IPS detects the wireless device running the AirSnarf tool. Appropriate action must be taken by the administrator to remove the AirSnarf tool from the WLAN environment.

## Chopchop Attack

### Alarm Description and Possible Causes

It is well publicized that a WLAN device using a static WEP key for encryption is vulnerable to various WEP cracking attacks. Refer to *Weaknesses in the Key Scheduling Algorithm of RC4 - I* by Scott Fluhrer, Itsik Mantin, and Adi Shamir for more information.

**Figure 19-19** WEP Encipher Process Block Diagram

A cracked WEP secret key offers no encryption protection for data to be transmitted, leading to compromised data privacy. The WEP key, which is in most cases 64-bit or 128-bit (some vendors also offer 152-bit encryption), is a secret key specified by the user, linked with the 24-bit IV (Initialization Vector). The chopchop tool was written for the Linux operating system by Korek to exploit a weakness in WEP and decrypt the WEP data packet. However, the chopchop tool only reveals the plaintext. The attacker uses the packet capture file of a previously injected packet during the initial phase and decrypts the packet by retransmitting modified packets to the attacked network. When the attack is completed, the chopchop tool produces an unencrypted packet capture file and another file with PRGA (Pseudo Random Generation Algorithm) information determined during the decryption process. The PRGA is then XORed with the cyphertext to obtain the plaintext.

**Figure 19-20** *Commands for Initiating a Chopchop Attack*

```
aireplay-ng -4 -h XX:XX:XX:XX:XX:XX -b YY:YY:YY:YY:YY:YY ath0
```

Where:

- 4 means the chopchop attack
- h XX:XX:XX:XX:XX:XX is the MAC address of an associated client or your card's MAC if you did fake authentication
- b YY:YY:YY:YY:YY:YY is the access point MAC address•ath0 is the wireless interface name

281478

Access points that drop data packets shorter than 60 bytes may not be vulnerable to this kind of attack. If an access point drops packets shorter than 42 bytes, aireplay will try to guess the rest of the missing data, as far as the headers are predictable. If an IP packet is captured, it additionally checks if the checksum of the header is correct after guessing the missing parts of it. This attack requires at least one WEP data packet. A chopchop attack also works against dynamic WEP configurations. The Cisco Adaptive Wireless IPS is able to detect potential attacks using the chopchop tool.

### wIPS Solution

The Cisco Adaptive Wireless IPS activates an alert when a potential chopchop attack is in progress. WEP should not be used in the corporate environment and appropriate measures should be taken to avoid any security holes in the network and upgrade the wireless network infrastructure and devices to use the more secure IEEE 802.11i standard.

## rDay-0 Attack by WLAN Performance Anomaly

### Alarm Description and Possible Causes

WLAN performance efficiency is constantly challenged by the dynamics of the RF environment and the mobility of client devices. A closely monitored and well tuned WLAN system can achieve a higher throughput than a poorly managed one. Radio Resource Management (RRM) built into the Cisco Unified Wireless Network monitors and dynamically corrects performance issues found in the RF environment. Further performance anomaly monitoring may be done via the Wireless IPS system. For more information on RRM, refer to the Cisco NCS online help.

The Cisco Adaptive Wireless IPS ensures WLAN performance and efficiency by monitoring the WLAN on a continued basis and alerting the wireless administrator on early warning signs for trouble. Performance alarms are generated and classified in the following categories in the event of any performance degradation:

- RF Management—The Cisco Adaptive Wireless IPS monitors the physical RF environment that is dynamic and very often the source of WLAN performance problems. While monitoring on the RF environment, the server characterizes the following WLAN fundamentals and reports problems accordingly:
  - Channel interference and channel allocation problems
  - Channel noise and non-802.11 signals
  - WLAN RF service under-coverage area
  - Classic RF hidden-node syndrome

- Problematic traffic pattern—Many WLAN performance problems including the RF multipath problem manifest themselves in the MAC layer protocol transactions and statistics. By tracking and analyzing the wireless traffic, the Cisco Adaptive Wireless IPS is able to spot performance inefficiencies and degradations early on. In many cases, the Cisco Adaptive Wireless IPS can determine the cause of the detected performance problem and suggest counter measures. The Cisco Adaptive Wireless IPS tracks MAC layer protocol characteristics including the following:
  - Frame CRC error
  - Frame re-transmission
  - Frame speed (1, 2, 5.5, 11, ... Mbps) usage and distribution
  - Layer 2 frame fragmentation
  - Access point and station association/re-association/dis-association relationship
  - Roaming hand-off
- Channel or device overloaded—The Cisco Adaptive Wireless IPS monitors and tracks the load to ensure smooth operation with both channel bandwidth limitation or the WLAN device resource capacity. In the event of unsatisfactory performance by the WLAN due to under-provisioning or over-growth, the Cisco Adaptive Wireless IPS raises alarms and offers specific details. RF has no boundaries that could lead to your WLAN channel utilization to increase significantly even when your neighbor installs new WLAN devices in an adjoining channel. The Cisco Adaptive Wireless IPS monitors your WLAN to ensure proper bandwidth and resource provisioning.
- Deployment and operation error—The Cisco Adaptive Wireless IPS scans the airwaves for configuration and operation errors. The following specific areas are continuously monitored:
  - Inconsistent configuration among access points servicing the same SSID
  - Configuration against the principles of best practice
  - Connection problems caused by client/access point mismatch configuration
  - WLAN infrastructure device down or reset
  - Flaws in WLAN device implementation
- IEEE 802.11e and VoWLAN issues—The IEEE 802.11e standard adds QoS (quality of service) features and multimedia support to the existing 802.11 a/b/g wireless standard. This is done while maintaining full backward compatibility with these standards. The QoS feature is critical to voice and video applications. Wireless LAN has limited bandwidth and high overheads as compared to the traditional wired Ethernet. The throughput is reduced for a variety of reasons including the RTS/CTS mechanism, packet fragmentation, packet retransmission, acknowledgements, and collisions.

## wIPS Solution

The Cisco Adaptive Wireless IPS has detected a single Performance Intrusion policy violation on a large number of devices in the wireless network. Either the number of devices violating the specific policy in the time period specified are observed or there is a sudden percentage increase in the number of devices as specified in the threshold settings for the alarm. Depending on the Performance Intrusion violation, it is suggested that the devices be monitored and located to carry out further analysis.

For example:

- If the *AP overloaded by stations alarm* is generated by a large number of devices, it may indicate that a hacker has generated thousands of stations and forcing them to associate to the corporate access point. If this occurs, legitimate corporate clients cannot connect to the access point.
- *Excessive frame retries* on the wireless devices may indicate such things as noise, interference, packet collisions, multipath, and hidden node syndrome.

## Day-0 Attack by WLAN Security Anomaly

### Alarm Description and Possible Causes

The addition of WLANs in the corporate environment introduces a whole new class of threats for network security. RF signals that penetrate walls and extend beyond intended boundaries can expose the network to unauthorized users. Rogue access points installed by employees for their personal use usually do not adhere to the corporate security policy. A rogue access point can put the entire corporate network at risk of outside penetration and attack. Besides rogue access points, there are many other wireless security vulnerabilities which compromise the wireless network such as misconfigured and unconfigured access points. There can also be DoS (denial of service) attacks from various sources against the corporate network.

NCS provides automated security vulnerability assessment within the wireless infrastructure that proactively reports any security vulnerabilities or mis-configurations. Further assessment may be done over-the-air via the Wireless IPS system. With the comprehensive suite of security monitoring technologies, the Cisco Adaptive Wireless IPS alerts the user on more than 100 different threat conditions in the following categories:

- User authentication and traffic encryption (Static WEP encryption, VPN, Fortress, Cranite, 802.11i and 802.1x)—Common security violations in this category (authentication and encryption) include mis-configurations, out-of-date software or firmware, and suboptimal choice of corporate security policy.
- Rogue, monitored, and ad-hoc mode devices—Rogue devices must be detected and removed immediately to protect the integrity of the wireless and wired enterprise network.
- Configuration vulnerabilities—Implementing a strong deployment policy is fundamental to a secure WLAN. However, enforcing the policy requires constant monitoring to catch violations caused by mis-configuration or equipment vendor implementation errors. With the increased trend on laptops with built-in Wi-Fi capabilities, the complexity of WLAN configuration extends beyond access points to the user laptops. WLAN device configuration management products can make the configuration process easier, but the need for validation persists especially in laptops with built-in but unused and unconfigured Wi-Fi.
- Intrusion detection on security penetration—A form of wireless intrusion includes breaching the WLAN authentication mechanism to gain access to the wired network or the wireless devices. A Dictionary attack on the authentication method is a very common attack against an access point. The intruder can also attack the wireless client station during its association process with an access point. For example, a faked AP attack on an unsuspecting wireless client may fool the client into associating with a fake access point. This attack allows the intruder to gain network access to the wireless station and potentially hack into its file system. The intruder can then use the station to access the wired enterprise network.
- Intrusion detection on denial of service attacks—Wireless DoS (denial of service) attacks aim to disrupt wireless services by taking advantage of various vulnerabilities of WLAN at layer one and two. DoS attacks may target the physical RF environment, access points, client stations, or the back-end authentication RADIUS servers. For example, RF jamming attack with high power directional antenna from a distance can be carried out from the outside of your office building. Attack tools used by intruders leverage hacking techniques such as spoofed 802.11 management frames, spoofed 802.1x authentication frames, or simply using the brute force packet flooding method.

### wIPS Solution

The Cisco Adaptive Wireless IPS has detected a single Security IDS/IPS policy violation on a large number of devices in the wireless network. Either the number of devices violating the specific policy in the time period specified are observed or there is a sudden percentage increase in the number of devices as specified in the threshold settings for the alarm. Depending on the Security IDS/IPS violation, it is

suggested that the devices are monitored and located to carry out further analysis to check if they are compromising the Enterprise wireless network in any way (attack or vulnerability). If this is an increase in the number of rogue devices, it may indicate an attack against the network. The WLAN administrator may use the integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find it.

If there is a sudden increase in the number of client devices with encryption disabled, it may be necessary to revisit the Corporate Security Policy and enforce users to use the highest level of encryption and authentication according to the policy rules.

## Day-0 Attack by Device Performance Anomaly

### Alarm Description and Possible Causes

WLAN performance efficiency is constantly challenged by the dynamics of the RF environment and the mobility of client devices. A closely monitored and well-tuned WLAN system can achieve a higher throughput than a poorly managed one. Radio Resource Management built into the Cisco Unified Wireless Network monitors and dynamically corrects performance issues found in the RF environment. Further performance anomaly monitoring may be done via the Wireless IPS system. For more information on RRM, refer to the Cisco NCS online help.

The Cisco Adaptive Wireless IPS ensures WLAN performance and efficiency by monitoring the WLAN on a continued basis and alerting the wireless administrator on early warning signs for trouble. Performance alarms are generated and classified in the following categories in the event of any performance degradation:

- RF Management—The Cisco Adaptive Wireless IPS monitors the physical RF environment that is dynamic and very often the source of WLAN performance problems. While monitoring on the RF environment, the server characterizes the following WLAN fundamentals and reports problems accordingly:
  - Channel interference and channel allocation problems
  - Channel noise and non-802.11 signals
  - WLAN RF service under-coverage area
  - Classic RF hidden-node syndrome
- Problematic traffic pattern—Many WLAN performance problems including the RF multipath problem manifest themselves in the MAC layer protocol transactions and statistics. By tracking and analyzing the wireless traffic, the Cisco Adaptive Wireless IPS is able to spot performance inefficiencies and degradations early on. In many cases, the Cisco Adaptive Wireless IPS can determine the cause of the detected performance problem and suggest counter measures. The Cisco Adaptive Wireless IPS tracks MAC layer protocol characteristics including the following:
  - Frame CRC error
  - Frame re-transmission
  - Frame speed (1, 2, 5.5, 11, ... Mbps) usage and distribution
  - Layer 2 frame fragmentation
  - Access point and station association/re-association/dis-association relationship
  - Roaming hand-off
- Channel or device overloaded—The Cisco Adaptive Wireless IPS monitors and tracks the load to ensure smooth operation with both channel bandwidth limitation or the WLAN device resource capacity. In the event of unsatisfactory performance by the WLAN due to under-provisioning or over-growth, the Cisco

Adaptive Wireless IPS raises alarms and offers specific details. RF has no boundaries that could lead to your WLAN channel utilization to increase significantly even when your neighbor installs new WLAN devices in an adjoining channel. The Cisco Adaptive Wireless IPS monitors your WLAN to ensure proper bandwidth and resource provisioning.

- Deployment and operation error—The Cisco Adaptive Wireless IPS scans the airwaves for configuration and operation errors. The following specific areas are continuously monitored:
  - Inconsistent configuration among access points servicing the same SSID
  - Configuration against the principles of best practice
  - Connection problems caused by client/access point mismatch configuration
  - WLAN infrastructure device down or reset
  - Flaws in WLAN device implementation
- IEEE 802.11e and VoWLAN issues—The IEEE 802.11e standard adds QoS (quality of service) features and multimedia support to the existing 802.11 a/b/g wireless standard. This is done while maintaining full backward compatibility with these standards. The QoS feature is critical to voice and video applications. Wireless LAN has limited bandwidth and high overheads as compared to the traditional wired Ethernet. The throughput is reduced for a variety of reasons including the RTS/CTS mechanism, packet fragmentation, packet retransmission, acknowledgements, and collisions.

To maximize the power of the Cisco Adaptive Wireless IPS, performance alarms can be customized to best match your WLAN deployment specification. For example, if your WLAN is designed for all users to use 5.5 and 11 mbps speed only, customize the threshold for performance alarm 'Low speed tx rate exceeded' to reflect such an expectation.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects a device violating a large number of performance intrusion policies. This device has either generated a large number of performance intrusion violations in the time period specified or there is a sudden percentage increase as specified in the threshold settings for the various alarms. It is suggested that the device is monitored and located to carry out further analysis to check if this device is causing any issues in the overall performance of the network.

For example, if there is a device which has caused an increase in the number of "access points overloaded by stations" and "access points overloaded by utilization" alarms, this could indicate that the access point cannot handle the stations. The administrator may need to reconsider re-deployment of the access points.

## Day-0 Attack by Device Security Anomaly

### Alarm Description and Possible Causes

The addition of WLANs in the corporate environment introduces a new class of threats for network security. RF signals that penetrate walls and extend beyond intended boundaries can expose the network to unauthorized users. Rogue access points installed by employees for their personal use usually do not adhere to the corporate security policy. Rogue access points can put the entire corporate network at risk for outside penetration and attack. Besides rogue access points, there are many other wireless security vulnerabilities which compromise the wireless network such as misconfigured and unconfigured access points. There can also be DoS attacks from various sources against the corporate network.

NCS provides automated security vulnerability assessment within the wireless infrastructure that proactively reports any security vulnerabilities or mis-configurations. Further assessment may be done over-the-air via the Wireless IPS system. With the comprehensive suite of security monitoring technologies, the Cisco Adaptive Wireless IPS alerts the user on more than 100 different threat conditions in the following categories:

- User authentication and traffic encryption (Static WEP encryption, VPN, Fortress, Cranite, 802.11i and 802.1x)—Common security violations in this category (authentication and encryption) include mis-configurations, out-of-date software or firmware, and suboptimal choice of corporate security policy.
- Rogue, monitored, and ad-hoc mode devices—Rogue devices must be detected and removed immediately to protect the integrity of the wireless and wired enterprise network.
- Configuration vulnerabilities—Implementing a strong deployment policy is fundamental to a secure WLAN. However, enforcing the policy requires constant monitoring to catch violations caused by mis-configuration or equipment vendor implementation errors. With the increased trend on laptops with built-in Wi-Fi capabilities, the complexity of WLAN configuration extends beyond access points to the user laptops. WLAN device configuration management products can make the configuration process easier, but the need for validation persists especially in laptops with built-in but unused and unconfigured Wi-Fi.
- Intrusion detection on security penetration—A form of wireless intrusion includes breaching the WLAN authentication mechanism to gain access to the wired network or the wireless devices. A Dictionary attack on the authentication method is a very common attack against an access point. The intruder can also attack the wireless client station during its association process with an access point. For example, a faked AP attack on a unsuspecting wireless client may fool the client into associating with a fake access point. This attack allows the intruder to gain network access to the wireless station and potentially hack into its file system. The intruder can then use the station to access the wired enterprise network.
- Intrusion detection on DoS attacks—Wireless DoS (denial of service) attacks aim to disrupt wireless services by taking advantage of various vulnerabilities of WLAN at layer one and two. DoS attacks may target the physical RF environment, access points, client stations, or the back-end authentication RADIUS servers. For example, RF jamming attack with high power directional antenna from a distance can be carried out from the outside of your office building. Attack tools used by intruders leverage hacking techniques such as spoofed 802.11 management frames, spoofed 802.1x authentication frames, or simply using the brute force packet flooding method.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects a device violating a large number of Security IDS/IPS policies. This device has either generated a number of Security IDS/IPS violations in the time period specified or there is a sudden percentage increase as specified in the threshold settings for the various alarms. The device should be monitored and located to carry out further analysis to check if this device is compromising the Enterprise Wireless Network in any way (attack or vulnerability). If this is a rogue device, the WLAN administrator may use the integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find it.

## Device Probing for APs

Some commonly used scan tools include: NetStumbler (newer versions), MiniStumbler (newer versions), MACStumbler, WaveStumbler, PrismStumbler, dStumbler, iStumbler, Aerosol, Boingo Scans, WiNc, AP Hopper, NetChaser, Microsoft Windows XP scans.

## Alarm Description and Possible Causes

The Cisco Adaptive Wireless IPS detects wireless devices probing the WLAN and attempting association (such as association request for an access point with any SSID).

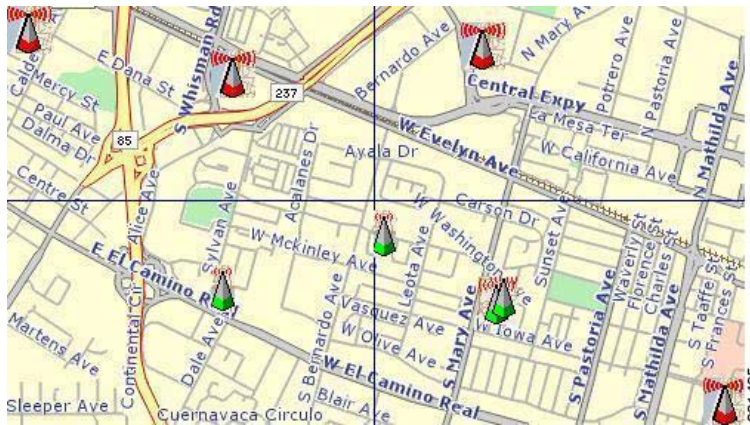

Such devices could pose potential security threats in one of the following ways:

- War-driving, WiLDing (Wireless LAN Discovery), war-chalking, war-walking, war cycling, war-lightrailing, war-busing, and war-flying.
- Legitimate wireless client attempting risky promiscuous association.

War-driving, war-chalking, war-walking, and war-flying activities include:

- War-driving—A wireless hacker uses war-driving tools to discover access points and publishes information such as MAC address, SSID, and security implemented on the Internet with the access points geographical location information.

**Figure 19-21 802.11 Access Point Locations Posted on the Internet**

- War-chalking—War-chalkers discover WLAN access points and mark the WLAN configuration at public locations with universal symbols (Figure 19-22).

**Figure 19-22 War-Chalker Universal Symbols**

| let's warchalk.!               |                                          |
|--------------------------------|------------------------------------------|
| KEY                            | SYMBOL                                   |
| OPEN NODE                      | ssid<br>X<br>bandwidth                   |
| CLOSED NODE                    | ssid<br>O                                |
| WEP NODE                       | ssid    access contact<br>W<br>bandwidth |
| blackbeltjones.com/warchalking |                                          |

- War-walking—War-walking is similar to war-driving, but the hacker is on foot instead of a car.

## wIPS Solution

To prevent your access points from being discovered by these hacking tools, configure the access points to not broadcast SSIDs. Use the Cisco Adaptive Wireless IPS to determine which access points are broadcasting (announcing) their SSID in the beacons.

## Dictionary Attack on EAP Methods

### Alarm Description and Possible Causes

IEEE 802.1x provides an EAP framework for wired or wireless LAN authentication. An EAP framework allows flexible authentication protocol implementation. Some implementations of 802.1x or WPA use authentication protocols such as LEAP, MD5, OTP (one-time-password), TLS, and TTLS. Some of these authentication protocols are based upon the username and password mechanism in which the username is transmitted without encryption and the password is used to answer authentication challenges.

Most password-based authentication algorithms are susceptible to dictionary attacks. During a dictionary attack, an attacker gains the username from the unencrypted 802.1x identifier protocol exchange. The attacker then tries to guess a user password to gain network access by using every word in a dictionary of common passwords or possible combinations of passwords. A dictionary attack relies on a password being a common word, name, or combination of both with a minor modification such as a trailing digit or two.

A dictionary attack can take place actively online, where an attacker repeatedly tries all the possible password combinations. Online dictionary attacks can be prevented using lock-out mechanisms available on the authentication server (RADIUS servers) to lock out the user after a certain number of invalid login attempts. A dictionary attack can also take place offline, where an attacker captures a successful authentication challenge protocol exchange and then tries to match the challenge response with all possible password combinations. Unlike online attacks, offline attacks are not easily detected. Using a strong password policy and periodically expiring user passwords significantly reduces an offline attack tool's success.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects online dictionary attacks by tracking 802.1x authentication protocol exchange and the user identifier usages. When a dictionary attack is detected, the alarm message identifies the username and attacking station MAC address.

The Cisco Adaptive Wireless IPS advises switching username and password based authentication methods to encrypted tunnel based authentication methods such as PEAP and EAP-FAST, which are supported by many vendors including Cisco.

## EAP Attack Against 802.1x Authentication

### Alarm Description and Possible Causes

IEEE 802.1x provides an Extensible Authentication Protocol (EAP) framework for wired or wireless LAN authentication. An EAP framework allows flexible authentication protocol implementation. Some implementations of 802.1x or WPA use authentication protocols such as LEAP, MD5, OTP (one-time-password), TLS, TTLS, and EAP-FAST. Some of these authentication protocols are based upon the username and password mechanism, where the username is transmitted clear without encryption and the password is used to answer authentication challenges.

Most password-based authentication algorithms are susceptible to dictionary attacks. During a dictionary attack, an attacker gains the username from the unencrypted 802.1x identifier protocol exchange. The attacker attempts to guess a user password and gain network access by using every "word" in a dictionary of common passwords or possible combinations of passwords. A dictionary attack relies on the fact that a password is often a common word, name, or combination of words or names with a minor modification such as a trailing digit or two.

Intruders with the legitimate 802.1x user identity and password combination (or valid certificate) can penetrate the 802.1x authentication process without the proper knowledge of the exact EAP-type. The intruder tries different EAP-types such as TLS, TTLS, LEAP, EAP-FAST, or PEAP to successfully log onto the network. This is a trial and error effort because there are only a handful of EAP-types for the intruder to try and manage to get authenticated to the network.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects an attempt by an intruder to gain access to the network using different 802.1x authentication types. Take appropriate steps to locate the device and remove it from the wireless environment.

## Fake Access Points Detected

### Alarm Description and Possible Causes

The Fake AP tool is meant to protect your WLAN acting as a decoy to confuse war-drivers using NetStumbler, Wellenreiter, MiniStumbler, Kismet, and so on. The tool generates beacon frames imitating thousands of counterfeit 802.11b access points. War-drivers encountering a large number of access points cannot identify the real access points deployed by the user. This tool, although very effective in fending off war-drivers, poses other disadvantages such as bandwidth consumption, misleading legitimate client stations, and interference with the WLAN management tools. Running the Fake AP tool in your WLAN is not recommended.

### wIPS Solution

The administrator should locate the device running the Fake AP tool and remove it from the wireless environment.

## Fake DHCP Server Detected

### Alarm Description and Possible Causes

Dynamic Host Configuration Protocol (DHCP) is used for assigning dynamic IP addresses to devices on a network.

DHCP address assignment takes place as follows:

- 
- Step 1** The client NIC sends out a DHCP discover packet, indicating that it requires a IP address from a DHCP server.
  - Step 2** The server sends a DHCP offer packet with the IP address.
  - Step 3** The client NIC sends a DHCP request, informing the DHCP server that it wants to be assigned the IP address sent by the servers offer.
  - Step 4** The server returns a DHCP ACK, acknowledging that the NIC has sent a request for a specific IP address.

**Step 5** The client interface assigns or binds the initially offered IP address from the DHCP server.

The DHCP server should be a dedicated machine and part of the enterprise wired network or it could be a wireless/wired gateway. Other wireless devices can have the DHCP service running innocently or maliciously so as to disrupt the WLAN IP service. Wireless clients that are requesting an IP address from the DHCP server may then connect to these fake DHCP servers to get their IP address because the clients do not have any means to authenticate the server. These fake DHCP servers may give the clients non-functional network configurations or divert all the client's traffic through them. The hackers can then eavesdrop on every packet sent by the client. With the aid of rogue DNS servers, the hacker could also send the users to fake web page logins to get username and password credentials. It could also give out non-functional and non-routable IP addresses to achieve a DoS attack. This sort of attack is generally against a WLAN without encryption such as hotspots or trade show networks.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects such wireless STAs running the DHCP service and providing IP addresses to unaware users.

When the client is identified and reported, the WLAN administrator may use the integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find the device.

## Fast WEP Crack Tool Detected

### Alarm Description and Possible Causes

It is well publicized that WLAN devices using static WEP key for encryption are vulnerable to WEP key cracking attack (Refer to *Weaknesses in the Key Scheduling Algorithm of RC4 - I* by Scott Fluhrer, Itsik Mantin, and Adi Shamir).

**Figure 19-24 WEP Encipherment Block Diagram**

The WEP secret key that has been cracked by any intruder results in no encryption protection, thus leading to compromised data privacy. The WEP key that is in most cases 64-bit or 128-bit (few vendors also offer 152-bit encryption) consists of the secret key specified by the user linked with the 24-bit IV (Initialization Vector). The IV that is determined by the transmitting station can be reused frequently or in consecutive frames, thus increasing the possibility of the secret key to be recovered by wireless intruders.

The most important factor in any attack against the WEP key is the key size. For 64-bit WEP keys, around 150 K unique IVs and for 128-bit WEP keys around 500 k to a million unique IVs should be enough. With insufficient traffic, hackers have created a unique way of generating sufficient traffic to

perform such an attack. This is called the replay attack based on arp-request packets. Such packets have a fixed length and can be spotted easily. By capturing one legitimate arp-request packet and resending them repeatedly, the other host responds with encrypted replies, providing new and possibly weak IVs.

## wIPS Solution

The Cisco Adaptive Wireless IPS alerts on weak WEP implementations and recommends a device firmware upgrade if available from the device vendor to correct the IV usage problem. Ideally, enterprise WLAN networks can protect against WEP vulnerability by using the TKIP (Temporal Key Integrity Protocol) encryption mechanism, which is now supported by most enterprise level wireless equipment. TKIP enabled devices are not subject to any such WEP key attacks.

NCS also provides automated security vulnerability scanning that proactively reports any access points configured to utilize weak encryption or authentication. For more information on automated security vulnerability scanning, refer to the Cisco NCS online help.

## Fragmentation Attack

### Alarm Description and Possible Causes

It is well publicized that a WLAN device using a static WEP key for encryption is vulnerable to various WEP cracking attacks. Refer to *Weaknesses in the Key Scheduling Algorithm of RC4 - I* by Scott Fluhrer, Itsik Mantin, and Adi Shamir for more information.

**Figure 19-25** WEP Encipher Process Block Diagram

A cracked WEP secret key offers no encryption protection for data to be transmitted which lead to compromised data privacy. The WEP key, which is in most cases 64-bit or 128-bit (few vendors also offer 152-bit encryption), is the secret key specified by the user and linked with the 24-bit IV (Initialization Vector).

According to <http://www.aircrack-ng.org/doku.php?id=fragmentation&s=fragmentation>, the aircrack program obtains a small amount of keying material from the packet and then attempts to send ARP and/or LLC packets with known information to an access point. If the packet gets successfully echoed back by the access point, then a larger amount of keying information can be obtained from the returned packet. This cycle is repeated several times until 1500 bytes (less in some cases) of PRGA are obtained.

This attack does not recover the WEP key itself, but merely obtains the PRGA. The PRGA can then be used to generate packets with “packetforge-ng” which can be used for various injection attacks.

**Figure 19-26** *Commands to Run the Fragmentation Attack*

```
aireplay-ng -5 -h XX:XX:XX:XX:XX:XX -b YY:YY:YY:YY:YY:YY ath0
```

**Where:**

- 5 means the fragmentation attack
- h XX:XX:XX:XX:XX:XX is the MAC address of an associated client or your card's MAC if you did fake authentication
- b YY:YY:YY:YY:YY:YY is the access point MAC address•ath0 is the wireless interface name

281479

The Cisco Adaptive Wireless IPS detects potential fragmentation attacks in progress against the Wi-Fi network.

### wIPS Solution

The Cisco Adaptive Wireless IPS alerts on detecting a potential fragmentation attack in progress, and recommends that WEP not be used in the corporate environment and that appropriate measures be taken to avoid any security holes in the network and upgrade the wireless network infrastructure and devices to use the more secure IEEE 802.11i standard.

## Hot-Spotter Tool Detected

### Alarm Description and Possible Causes

A hotspot is any location where Wi-Fi network access is available for the general public. Hotspots are often found in airports, hotels, coffee shops, and other places where business people tend to congregate. It is currently one of the most important network access services for business travelers. The customer requires a wireless-enabled laptop or handheld to connect to the legitimate access point and to receive service. Most hotspots do not require the user to have an advanced authentication mechanism to connect to the access point, other than using a web page to log in. The criterion for entry is only dependent on whether or not the subscriber has paid subscription fees. In a wireless hotspot environment, no one should trust anyone else. Due to current security concerns, some WLAN hotspot vendors are using 802.1x or higher authentication mechanisms to validate the identity of the user.

**Figure 19-27 Basic Components of a WLAN Hotspot Network**

The four components of a basic hotspot network are:

- Hotspot Subscribers—Valid users with a wireless enabled laptop or handheld and valid login for accessing the hotspot network.
- WLAN Access Points—SOHO gateways or enterprise level access points depending upon the hotspot implementation.
- Hotspot Controllers—Deals with user authentication, gathering billing information, tracking usage time, filtering functions, and so on. This can be an independent machine or can be incorporated in the access point itself.
- Authentication Server—Contains the login credentials for the subscribers. In most cases, hotspot controllers verify subscriber credentials with the authentication server.

"Hotspotter" automates a method of penetration against wireless clients, independent of the encryption mechanism used. Using the Hotspotter tool, the intruder can passively monitor the wireless network for probe request frames to identify the SSIDs of the networks of the Windows XP clients.

After it acquires the preferred network information, the intruder compares the network name (SSID) to a supplied list of commonly used hotspot network names. When a match is found, the Hotspotter client acts as an access point. The clients then authenticate and associate unknowingly to this fake access point.

When the client gets associated, the Hotspotter tool can be configured to run a command such as a script to kick off a DHCP daemon and other scanning against the new victim.

Clients are also susceptible to this kind of attack when they are operating in different environments (home and office) while they are still configured to include the hotspot SSID in the Windows XP wireless connection settings. The clients send out probe requests using that SSID and make themselves vulnerable to the tool.

## wIPS Solution

When the rogue access point is identified and reported by the Cisco Adaptive Wireless IPS, the WLAN administrator may use the integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find the rogue device.

## Malformed 802.11 Packets Detected

### Alarm Description and Possible Causes

Hackers using illegal packets (malformed non-standard 802.11 frames) can force wireless devices to behave in an unusual manner. Illegal packets can cause the firmware of a few vendor wireless NICs to crash.

Examples of such vulnerability includes NULL probe response frame (null SSID in the probe response frame) and oversized information elements in the management frames. These ill-formed frames can be broadcasted to cause multiple wireless clients to crash.

## wIPS Solution

The Cisco Adaptive Wireless IPS can detect these illegal packets that may cause some NICs to lock up and crash. Also, wireless clients experiencing blue screen or lock-up problem during the attack period should consider upgrading the WLAN NIC driver or the firmware.

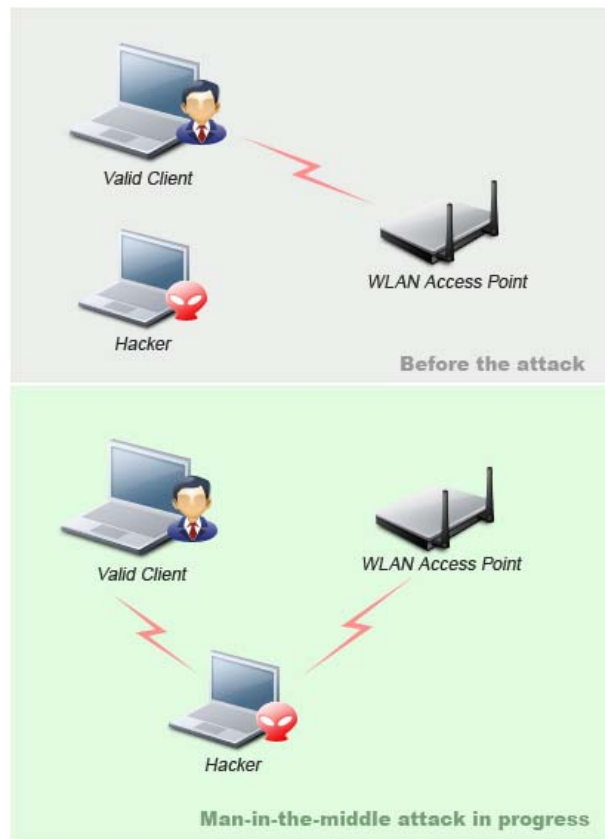

When the client is identified and reported by the Cisco Adaptive Wireless IPS, the WLAN administrator may use the device locator to locate it.

## Man-in-the-Middle Attack

### Alarm Description and Possible Causes

A Man-in-the-middle (MITM) attack is one of the most common 802.11 attacks that can lead to confidential corporate and private information being leaked to hackers. In a MITM attack, the hacker can use a 802.11 wireless analyzer and monitor 802.11 frames sent over the WLAN. By capturing the wireless frames during the association phase, the hacker gets IP and MAC address information about the wireless client card and access point, association ID for the client, and the SSID of the wireless network.

**Figure 19-28** *Man-in-the-Middle Attack*

A common MITM attack involves the hacker sending spoofed disassociation or deauthentication frames. The hacker station then spoofs the MAC address of the client to continue an association with the access point. At the same time, the hacker sets up a spoofed access point in another channel to keep the client associated. All traffic between the valid client and access point then passes through the hacker station.

One of the most commonly used MITM attack tools is Monkey-Jack.

### wIPS Solution

The Cisco Adaptive Wireless IPS recommends the use of strong encryption and authentication mechanisms to thwart any MITM attacks by hackers. One way to avoid such an attack is to prevent MAC address spoofing by using MAC address exclusion lists and monitoring the RF channel environment.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against MITM attacks.

## Monitored Device Detected

### Alarm Description and Possible Causes

There are some cases in which the access points and STAs activity must be continuously monitored:

- Malicious intruders attempting to hack into the enterprise wired network must be monitored. It is important to keep track of these access points and STAs to help avoid repeated rogue-related and intrusion attempt problems.

- Lost enterprise wireless equipment must be located.
- Vulnerable devices with previous security violations must be monitored.
- Devices used by ex-employees who may have not returned all their wireless equipment must be monitored.

These nodes may be added to the monitor list to alert the wireless administrator the next time the access point or STA shows up in the RF environment.

## wIPS Solution

The wireless administrator can add the access point or STA to the monitor list by identifying it as a monitored device on the Cisco Adaptive Wireless IPS.

## NetStumbler Detected

### Alarm Description and Possible Causes

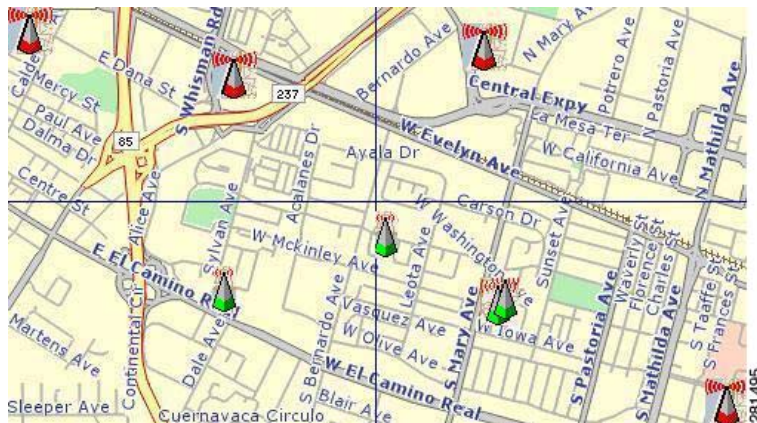

The Cisco Adaptive Wireless IPS detects a wireless client station probing the WLAN for an anonymous association (such as an association request for an access point with any SSID) using the NetStumbler tool. The *Device probing for Access Point* alarm is generated when hackers use recent versions of the NetStumbler tool. For older versions, the Cisco Adaptive Wireless IPS generates the *NetStumbler detected* alarm.

**Figure 19-29** War-Chalker Universal Symbols

| let's warchalk..! |                                       |
|-------------------|---------------------------------------|
| KEY               | SYMBOL                                |
| OPEN NODE         | ssid<br>X<br>bandwidth                |
| CLOSED NODE       | ssid<br>O                             |
| WEP NODE          | ssid access contact<br>W<br>bandwidth |

blackbeltjones.com/warchalking 281492

NetStumbler is the most widely used tool for war-driving and war-chalking. A wireless hacker uses war-driving tools to discover access points and to publish their information (MAC address, SSID, security implemented, and so on.) on the Internet with the access points' geographical location information. War-chalkers discover WLAN access points and mark the WLAN configuration at public locations with universal symbols as illustrated above. War-walking is similar to war-driving, but the hacker is on foot instead of a car. The NetStumbler website (<http://www.netstumbler.com/>) offers MiniStumbler software for use on Pocket PC hardware, saving war-walkers from carrying heavy laptops. It can run on a machine running Windows 2000, Windows XP, or later versions. It also supports more cards than Wellenreiter, another commonly used scanning tool. War-walkers like to use MiniStumbler and similar products to sniff shopping malls and big-box retail stores. War-flying is sniffing for wireless networks from the air. The same equipment is used from a low flying private plane with high power antennas. It has been reported that a Perth, Australia-based war-flier picked up email and Internet Relay Chat sessions from an altitude of 1,500 feet on a war-flying trip.

**Figure 19-30 Posted 802.11 Access Point Locations****wIPS Solution**

To prevent your access points from being discovered by these hacking tools, configure your access points to not broadcast its SSID. You can use the Cisco Adaptive Wireless IPS to see which of your access points is broadcasting an SSID in the beacons.

NCS also provides automated security vulnerability scanning that reports any access points configured to broadcast their SSIDs. For more information on automated security vulnerability scanning, refer to the Cisco NCS online help.

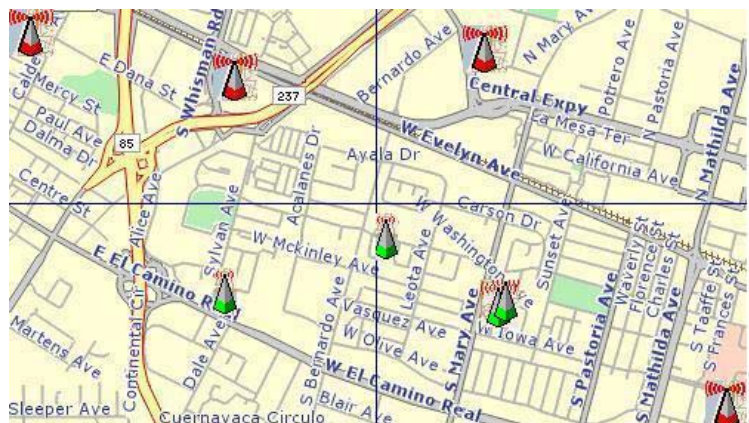

**NetStumbler Victim Detected****Alarm Description and Possible Causes**

The Cisco Adaptive Wireless IPS detects a wireless client station probing the WLAN for an anonymous association (such as association request for an access point with any SSID) using the NetStumbler tool. The Device probing for access point alarm is generated when hackers more recent versions of the NetStumbler tool. For older versions, the Cisco Adaptive Wireless IPS generates the NetStumbler detected alarm.

NetStumbler is the most widely used tool for war-driving, war-walking, and war-chalking. A wireless hacker uses war-driving tools to discover access points and publish their information (MAC address, SSID, security implemented, and so on.) on the Internet with the access point geographical location information. War-chalkers discover WLAN access points and mark the WLAN configuration at public locations with universal symbols as illustrated above. War-walking is similar to war-driving, but the hacker conducts the illegal operation on foot instead of by car. The NetStumbler website (<http://www.netstumbler.com/>) offers MiniStumbler software for use on Pocket PC hardware, saving war-walkers from carrying heavy laptops. It can run on a machine running Windows 2000, Windows XP, or later. It also supports more cards than Wellenreiter, another commonly used scanning tool.

War-walkers typically use MiniStumbler and similar products to sniff shopping malls and big-box retail stores. War-flying is sniffing for wireless networks from the air. The same equipment is used, but from a low-flying private plane with high-power antennas. It has been reported that a Perth, Australia-based war-flier picked up e-mail and Internet Relay Chat sessions from an altitude of 1,500 feet on a war-flying trip.

Figure 19-31 Posted 802.11 Access Point Locations

The Cisco Adaptive Wireless IPS alerts the user when it observes that a station running Netstumbler is associated to a corporate access point.

**wIPS Solution**

To prevent your access points from being discovered by these hacking tools, configure your access points to not broadcast its SSID. You can use the Cisco Adaptive Wireless IPS to see which access point is broadcasting its SSID in the beacons.

**Publicly Secure Packet Forwarding (PSPF) Violation Detected**

**Alarm Description and Possible Causes**

PSPF is a feature implemented on WLAN access points to block wireless clients from communicating with other wireless clients. With PSPF enabled, client devices cannot communicate with other client devices on the wireless network.

Figure 19-32 PSPF

For most WLAN environments, wireless clients communicate only with devices such as web servers on the wired network. By enabling PSPF it protects wireless clients from being hacked by a wireless intruder. PSPF is effective in protecting wireless clients especially at wireless public networks (hotspots) such as airports, hotels, coffee shops, and college campuses where authentication is null and anyone can associate with the access points. The PSPF feature prevents client devices from inadvertently sharing files with other client devices on the wireless network.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects PSPF violations. If a wireless client attempts to communicate with another wireless client, the Cisco Adaptive Wireless IPS raises an alarm for a potential intrusion attack. This alarm does not apply if your WLAN deploys wireless printers or VoWLAN applications because these applications rely on wireless client-to-client communication.

## ASLEAP Tool Detected

### Alarm Description and Possible Causes

WLAN devices using static WEP key for encryption are vulnerable to the WEP key cracking attack (See *Weaknesses in the Key Scheduling Algorithm of RC4-1* by Scott Fluhrer, Itsik Mantin, and Adi Shamir for more information).

Cisco Systems introduced LEAP (Lightweight Extensible Authentication Protocol) to leverage the existing 802.1x framework to avoid such WEP key attacks. The Cisco LEAP solution provides mutual authentication, dynamic per session and per user keys, and configurable WEP session key time out. The LEAP solution was considered a stable security solution and is easy to configure.

There are hacking tools that compromise wireless LAN networks running LEAP by using off-line dictionary attacks to break LEAP passwords. After detecting WLAN networks that use LEAP, this tool de-authenticates users which forces them to reconnect and provide their username and password credentials. The hacker captures packets of legitimate users trying to re-access the network. The attacker can then analyze the traffic off-line and guess the password by testing values from a dictionary.

The main features of the ASLEAP tool include:

- Reading live from any wireless interface in RFMON mode with libpcap.
- Monitoring a single channel or performing channel hopping to look for target networks running LEAP.
- Actively deauthenticating users on LEAP networks, forcing them to reauthenticate. This allows quick LEAP password captures.
- Only de-authenticating users who have not already been seen rather than users who are not running LEAP.
- Reading from stored libpcap files.
- Using a dynamic database table and index to allow quick lookups on large files. This reduces the worst-case search time to .0015% as opposed to lookups in a flat file.
- Writing only the LEAP exchange information to a libpcap file.

This could be used to capture LEAP credentials with a device short on disk space (like an iPaq); the LEAP credentials are then stored in the libpcap file on a system with more storage resources to mount the dictionary attack.

The source and Win32 binary distribution for the tool are available at <http://asleap.sourceforge.net>.

Cisco Systems has developed the Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST) protocol which stops these dictionary attacks. EAP-FAST helps prevent man-in-the-middle attacks, dictionary attacks, and packet and authentication forgery attacks. In EAP-FAST, a tunnel is created between the client and the server using a PAC (Protected Access Credential) to authenticate each other. After the tunnel establishment process, the client is then authenticated using the user-name and password credentials.

Some advantages of EAP-FAST include:

- It is not proprietary.
- It is compliant with the IEEE 802.11i standard.
- It supports TKIP and WPA.
- It does not use certificates and avoids complex PKI infrastructures.
- It supports multiple Operating Systems on PCs and Pocket PCs.

## wIPS Solution

The Cisco Adaptive Wireless IPS detects the deauthentication signature of the ASLEAP tool. When detected, the server alerts the wireless administrator. The user of the attacked station should reset the password. The best solution to counter the ASLEAP tool is to replace LEAP with EAP-FAST in the corporate WLAN environment.

NCS also provides automated security vulnerability scanning that proactively reports any access points configured to utilize weak encryption or authentication. For more information on automated security vulnerability scanning, refer to Cisco NCS online help.

## Honey Pot AP Detected

### Alarm Description and Possible Causes

The addition of WLANs in the corporate environment introduces a whole new class of threats for network security. RF signals that penetrate walls and extend beyond intended boundaries can expose the network to unauthorized users. A rogue access point can put the entire corporate network at risk for

outside penetration and attack. Not to understate the threat of the rogue access point, there are many other wireless security risks and intrusions such as mis-configured access points, unconfigured access points, and DoS (denial of service) attacks.

One of the most effective attacks facing enterprise networks implementing wireless is the use of a "honey pot" access point. An intruder uses tools such as NetStumbler, Wellenreiter, and MiniStumbler to discover the SSID of the corporate access point. Then the intruder sets up an access point outside the building premises or, if possible, within the premises and broadcasts the discovered corporate SSID. An unsuspecting client then connects to this "honey pot" access point with a higher signal strength. When associated, the intruder performs attacks against the client station because traffic is diverted through the "honey pot" access point.

### wIPS Solution

When a "honey pot" access point is identified and reported by the Cisco Adaptive Wireless IPS, the WLAN administrator may use the integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find the rogue device.

## Soft AP or Host AP Detected

Host AP tools: Cqure AP

### Alarm Description and Possible Causes

A host-based access point (desktop or a laptop computer serving as a wireless access point) represents two potential threats to enterprise security. First, host based access points are not typically part of the enterprise wireless infrastructure and are likely to be rogue devices which do not conform to the corporate security policy. Second, host-based access points are used by wireless attackers as a convenient platform to implement various known intrusions such as man-in-the-middle, honey-pot access point, access point impersonation, and DoS (denial of service) attacks. Since software tools for turning a desktop or laptop into an access point can be easily downloaded from the Internet, host-based access points are more than just a theoretical threat.

Some laptops are shipped with the HostAP software pre-loaded and activated. When the laptops connect to the enterprise wireless network, they expose the wireless network to the hackers.

### wIPS Solution

The Cisco Adaptive Wireless IPS detected soft access point should be treated as a rogue access point as well as a potential intrusion attempt. When the soft access point is identified and reported by the Cisco Adaptive Wireless IPS, the WLAN administrator may use integrated over-the-air physical location capabilities, or trace device on the wired network using rogue location discovery protocol (RLDP) or switchport tracing to find the rogue device.

## Spoofed MAC Address Detected

Spoofing tools may include the following: SMAC, macchanger, and SirMACsAlot.

## Alarm Description and Possible Causes

A wireless intruder can disrupt a wireless network using a wide range of available attack tools, many of which are available as free downloads from the Internet. Most of these tools rely on a spoofed MAC address which masquerades as an authorized wireless access point or as an authorized client. By using these tools, an attacker can launch various denial of service (DoS) attacks, bypass access control mechanisms, or falsely advertise services to wireless clients.

### wIPS Solution

The Cisco Adaptive Wireless IPS detects a spoofed MAC address by following the IEEE authorized OUI (vendor ID) and 802.11 frame sequence number signature.

Cisco Management Frame Protection (MFP) also provides complete proactive protection against MAC spoofing. For more information on MFP, refer to the *Cisco Wireless Control System Configuration Guide*.

## Suspicious After-Hours Traffic Detected

### Alarm Description and Possible Causes

One way to detect a wireless security penetration attempt is to match wireless usage against the time when there is not supposed to be any wireless traffic. The wIPS server monitors traffic patterns against the office-hours configured for this alarm to generate alerts when an abnormality is found. Specific suspicious wireless usage sought after by the wIPS server during after-office hours includes the following:

- Client station initiating authentication or association requests to the office WLAN that may indicate security breach attempts.
- Wireless data traffic that may indicate suspicious download or upload over the wireless network.

### wIPS Solution

For global wIPS deployment, the configurable office-hour range is defined in local time. The access point or sensor can be configured with a time zone to facilitate management. For the office and manufacturing floor mixed WLAN, one can define one set of office hours for the office WLAN SSID and another set for the manufacturing floor WLAN SSID. If this alarm is triggered, the administrator should look for the devices responsible for the suspicious traffic and remove them from the wireless environment.

## Unauthorized Association by Vendor List

### Alarm Description and Possible Causes

The Cisco Adaptive Wireless IPS enables network administrators to include vendor information in a policy profile to allow the system to effectively detect stations on the WLAN that are not made by approved vendors. When such a policy profile is created, the system generates an alarm whenever an access point is associating with a station by an unapproved vendor. See [Figure 19-33](#).

**Figure 19-33** Unauthorized Access Point-station Associations Filtered by Station Vendors

As the diagram shows, the access points in ACL-1 should only associate with stations made by Cisco and the access points in ACL-2 can only associate with stations manufactured by Intel. This information is entered in the WIPS system policy profile. Any association between the access points and non-Cisco or non-Intel stations is unauthorized and triggers an alarm.

In the enterprise WLAN environment, rogue stations cause security concerns and undermine network performance. They take up air space and compete for network bandwidth. Since an access point can only accommodate a limited number of stations, it rejects association requests from stations when its capacity is reached. An access point laden with rogue stations denies legitimate stations the access to the network. Common problems caused by rogue stations include connectivity problems and degraded performance.

### WIPS Solution

The Cisco Adaptive Wireless IPS automatically alerts network administrators to any unauthorized access point-station association involving non-conforming stations using this alarm. When the alarm has been triggered, the unauthorized station must be identified and actions must be taken to resolve the issue. One way is to block it using the rogue containment.

## Unauthorized Association Detected

### Alarm Description and Possible Causes

In an enterprise network environment, rogue access points installed by employees do not usually follow the network standard deployment practice and therefore compromise the integrity of the network. They are loopholes in network security and make it easy for intruders to hack into the enterprise wired

network. One of the major concerns that most wireless network administrators face is unauthorized associations between stations in an ACL and a rogue access point. Since data to and from the stations flows through the rogue access point, it leaves the door open for hackers to obtain sensitive information.

Rogue stations cause security concerns and undermine network performance. They take up air space and compete for bandwidths on the network. Since an access point can only serve a certain number of stations, it rejects association requests from stations once its capacity is reached. An access point laden with rogue stations denies legitimate stations access to the network. Common problems caused by rogue stations include disrupted connections and degraded performance.

## wIPS Solution

The Cisco Adaptive Wireless IPS can automatically alert network administrators to any unauthorized access point-station association it has detected on the network through this alarm. When the alarm is triggered, the rogue or unauthorized device must be identified and actions must be taken to resolve the reported issue.

## Wellenreiter Detected

### Alarm Description and Possible Causes

The Cisco Adaptive Wireless IPS detects a wireless client station probing the WLAN for an anonymous association (such as association request for an access point with any SSID) using the Wellenreiter tool.

**Figure 19-34** War-Chalker Universal Symbols

| let's warchalk..! |                                       |
|-------------------|---------------------------------------|
| KEY               | SYMBOL                                |
| OPEN NODE         | ssid<br>X<br>bandwidth                |
| CLOSED NODE       | ssid<br>O                             |
| WEP NODE          | ssid access contact<br>W<br>bandwidth |

blackbeltjones.com/warchalking 281492

Wellenreiter is a commonly used tool for war-driving and war-chalking. A wireless hacker uses war-driving tools to discover access points and to publish their information (MAC address, SSID, security implemented, and so on.) on the Internet with the access point geographical location information. War-chalkers discover WLAN access points and mark the WLAN configuration at public locations with universal symbols as illustrated above. War-walking is similar to war-driving, but the hacker is on foot instead of a car. War-walkers like to use Wellenreiter and similar products to sniff shopping malls and big-box retail stores. War-flying is sniffing for wireless networks from the air. The same equipment is used, but from a low flying private plane with high power antennas. It has been reported that a Perth, Australia-based war-flier picked up email and Internet Relay Chat sessions from an altitude of 1,500 feet on a war-flying trip.

# APPENDIX **A**

## Troubleshooting and Best Practices

---

This appendix identifies and explains any additional troubleshooting or best practices you may find necessary as you implement a particular function.

This appendix includes the following sections:

- [Troubleshooting Cisco Compatible Extensions Version 5 Client Devices, page A-1](#)
- [Web Auth Security on WLANs, page A-3](#)

## Troubleshooting Cisco Compatible Extensions Version 5 Client Devices

Two features are designed to troubleshoot communication problems with Cisco Compatible Extension clients: diagnostic channel and client reporting.

**Note**

---

These features are supported only on Cisco Compatible Extensions Version 5 Client Devices. They are not support for use with non-Cisco Compatible Extensions Version 5 Client Devices or with clients running an earlier version.

---

### Diagnostic Channel

The diagnostic channel feature enables you to troubleshoot problems regarding client communication with a WLAN. When initiated by a client having difficulties, the diagnostic channel is a WLAN configured to provide the most robust communication methods with the fewest obstacles to communication placed in the path of the client. The client and access points can be put through a defined set of tests in an attempt to identify the cause of communication difficulties experienced by the client.

**Note**

---

Only one WLAN per controller can have the diagnostic channel enabled, and all of the security on this WLAN is disabled.

---

# Configuring the Diagnostic Channel

Follow these steps to configure the diagnostic channel:

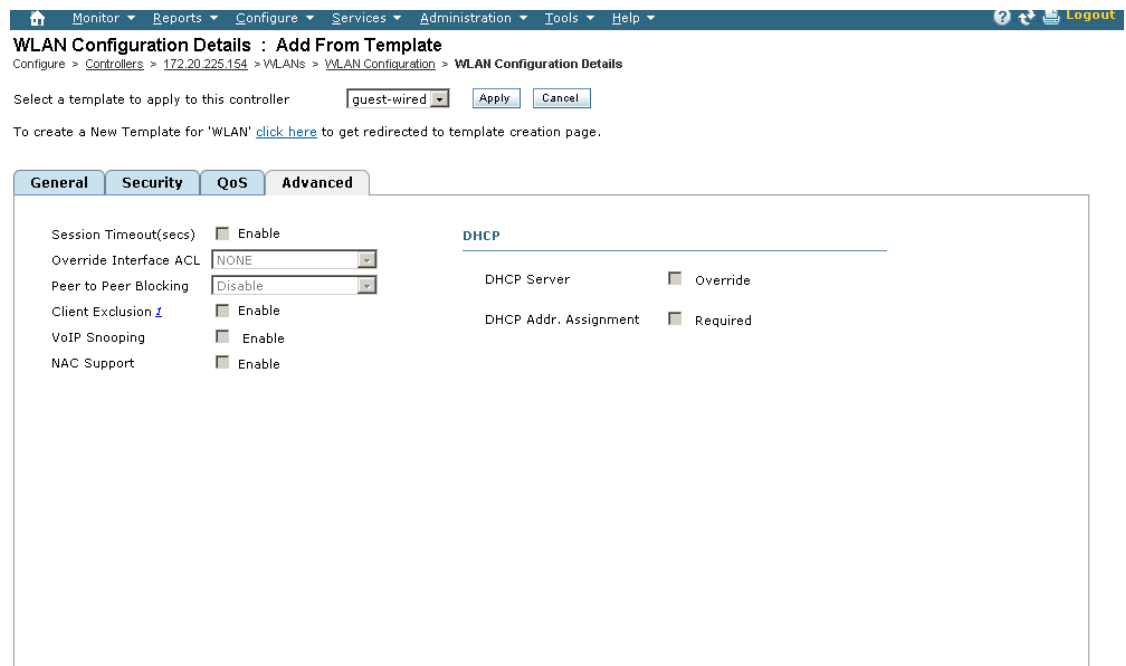

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an IP address to choose a specific controller.
- Step 3** Choose **WLANs> WLAN Configuration** from the left sidebar menu.
- Step 4** Choose **Add a WLAN** from the Select a command drop-down list to create a new or click the profile name of an existing.

**Note** We recommend that you create a new WLAN on which to run the diagnostic tests.

- Step 5** When the WLANs page appears, click the **Advanced** tab (see [Figure A-1](#)).

**Figure A-1** WLANs Advanced Tab

**Footnotes:**

1. When enabled, a excluded timeout value of zero means infinity (will require administrative override to reset excluded clients.)
2. Layer 3 and/or Layer 2 security must be set to 'none' if IPv6 and Global WebAuth configuration are enabled at same time.
3. Web Authentication cannot be used in combination with IPsec and L2TP.
4. CKIP is not supported on 10xx APs.
5. H-REAP Local Switching is not supported with IPSEC, L2TP, PPTP, CRANITE and FORTRESS authentications. It is not applicable to WLAN IDs 9-16.
6. Client MFP is not active unless WPA2 is configured.
7. Select valid EAP profile name when local EAP authentication is enabled.
8. Select an Ingress interface which has not already been assigned to any Guest LAN.
9. DTIM configuration is supported only from 6.0.X.X version of controllers.
10. Admin Status needs to be enabled for associating with a WLAN.

251762

- Step 6** If you want to enable diagnostic channel troubleshooting on this WLAN, select the **Diagnostic Channel** check box. Otherwise, leave this check box unselected, which is the default value.

**Step 7** Click **Save** to commit your changes.

---

## Web Auth Security on WLANs

This section describes the troubleshooting and best practices procedures that are useful when implementing web auth security on WLANs.

Web-auth is a Layer 3 security feature which allows web-based authentication to users on a WLAN. It is used mainly in guest networking scenarios, although not restricted to that usage.

When a WLAN is configured with web-auth security, you are redirected to the login page after passing Layer 2 authentications (static WEP, WPA+PSK, MAC filtering, and so on). The login page is stored on the local device or an external web server, and the page can be modified to allow a customized logo, title, and so on.

After the WLAN is configured with a web-auth WLAN, the HTTP *get* request is sent by the wireless client to the requested website. The controller firewall allows the DNS resolution of the specified URL. After the resolution, the controller interrupts the HTTP packets from the wireless client and redirects to the login page. When the credentials are entered on the login page and submitted, they are authenticated against the local database. If the user is not found in the local database, the configured RADIUS servers are contacted.

---

**Note** PAP and CHAP authentication are used between the client and authentication agent. Make sure your RADIUS server supports both of these protocols so web-auth login is allowed.

---

Upon successful authentication, you are allowed to pass traffic. After three unsuccessful authentication attempts, the client is excluded. This excluded client cannot associate until the exclusion timeout limit is surpassed. The exclusion timeout limit is configured with aggressive load balancing, which actively balances the load between the mobile clients and their associated access points.

Web-auth WLAN is also configured with a pre-authentication access control list (ACL). This ACL is configured the same as a normal ACL but permits access to resources that the client needs prior to authentication. An administrator must use the interface section to apply an ACL to the client after authentication.

A web-auth WLAN can be configured with a session timeout value. This value defines the time the client needs to re-authenticate with the device. If the value is set to zero, which means infinity, the client never re-authenticates unless the logged out option is used. You can access the logout URL at `http://<VirtualIP>/logout.html`.

---

**Note** Disable all pop-up blockers on the client to see the logout page.

---

Web-auth can be configured in different modes under Layer 3 security. The most commonly used modes of web-auth are as follows:

- Internal Web—Redirection to an internal page using `http://<virtual IP /DNS name >/login.html`. Customization is available.
- External Web—Redirection to an external URL.

## Debug Commands

The following debug commands are allowed:

```
debug client <client-mac-address>
```

```
debug pm ssh-tcp enable
```

```
debug pm ssh-appgw enable
```

```
debug pm rules enable
```

```
debug pm config enable
```

```
show client detail <client-mac-address>
```

```
debug pem event enable
```

## Debug Strategy

Use the following strategy for web-auth configured on a WLAN without guest tunneling:

- 
- Step 1** Identify a mobile client to work with and write down its wireless MAC address. Use the command **prompt > ipconfig /all** for all MS Windows-based systems.
- Step 2** Disable the mobile client's radio.
- Step 3** Enter the following debug commands via a serial console set for high speed (115200) or SSH session to the controller's management port:
- ```
debug client <client-mac-address>
debug pm ssh-tcp enable
debug pm ssh-appgw enable
debug pm rules enable
debug pm config enable

show client detail <client-mac-address>

debug pem event enable
debug pem state enable
```
- Step 4** Enable the radio and let the client associate. After the client is associated, enter the **show client detail client-mac-address** command.

```
$Router1> show client detail 00:0b:85:09:96:10
Client Username ..... N/A
AP MAC Address..... 00:0b:85:09:96:10

```

- Step 6** If you do not see the HTTP GET message, the HTTP packet has not reached the controller. After the client completes the redirection, enter your login and submit it.
- Step 7** Look at the client's entry in NPUdevshell hapiMmcDebugScbInfoShow ('client mac address'). If the PEM state is not moved from WEBAUTH_REQD to RUN, a credential problem exists. Check the credentials in the local or RADIUS database (where ever they were configured).
- Step 8** When the RUN state appears on the client, perform a check from the client to the gateway and see if traffic is being passed.

RF Heatmap Analysis

Scenario: In some scenarios, you will see some wierd heatmaps, where the heatmaps is not consistent all through the AP. One part of the APs shows strong heatmaps and the otherside showing weak heatmaps.

Figure A-2 RF Heatmap Analysis

Analysis: This scenario could be because you could get the neighbour APs RSSI values for one side and not for the other side. Using just one side of the RSSI value predicting the heatmap is not suggested, as there can be a thick wall or wired housing which may lead to incorrect heatmaps.

Scenario: If you are not able to view the dynamic heat map correctly.

Analysis: In case if you are not able to view the Dynamic Heatmap correctly, check the following:

- Neighbour AP RSSI values if they are same from both controller and NCS.
- Wait for 20 minutes for the heatmaps to refresh with most latest dynamic heatmap data.
- Check AP Positions.

Best Practices

If the client is not redirected to the login page and you want to avoid DNS resolution in the network, enter **http://controller-mgmt-ip**. If a redirection occur, the issue is not network related.

Enter **config network web-auth-port Port** to define the ports on the controller other than the standard HTTP port (80). The controller does not interrupt secure HTTP or HTTPS (443) even if the port is configured for interrupt.

APPENDIX **B**

NCS and End-User Licenses

This appendix provides the end-user license and warranty information that apply to the Cisco NCS. It contains these sections:

- [NCS Licenses, page B-1](#)
- [Notices and Disclaimers, page B-5](#)
- [End-User License Agreement, page B-7](#)

NCS Licenses

Before you purchase a Cisco Network Control System (NCS) license, decide on the license type and how many access points will need to be supported and licensed.

The four types of licenses for Cisco NCS support different feature levels:

- **Cisco NCS Evaluation License**
- **Cisco NCS Device Count License**
- **Cisco NCS Upgrade License**
- **Cisco NCS Migration License**

See the [“Managing Licenses”](#) section on [page 15-123](#) for information on managing NCS licenses on the GUI.

Types of Licenses

Cisco NCS is deployed through physical or virtual appliances, you will use the standard License Center Graphical User Interface to add new licenses, which will be locked by the standard Cisco Unique Device Identifier (UDI) or Virtual Unique Device Identifier (VUDI) if you are using a virtual appliance.

The licensing information for existing Cisco WCS deployments are being upgraded to support Cisco NCS 1.0. (While previous Cisco WCS SKUs will be available until September 2011, We recommend that you purchase the new Cisco NCS SKUs outlined in the NCS Ordering Guide (http://www.cisco.com/en/US/prod/collateral/wireless/ps5755/ps11682/ps11686/guide_c07-653879.html) for a more seamless migration to licensing. This chapter includes information on new Cisco NCS licenses, migrating from Cisco WCS to Cisco NCS, and deploying the free Cisco NCS demonstration license. The types of Cisco Network Control System (NCS) licenses are as follows:

- L-NCS-DEMO-X— Cisco NCS Evaluation License, provides an evaluation license for X number of devices, and for a duration of 30 days. If you need a custom device count or duration, please contact your Cisco representative. For customers wishing to download the new full featured, Cisco NCS with Spectrum Integration demonstration license that supports ten access points for up to 30 days. Demo licenses are available at <http://www.cisco.com/go/license>.

Note The free 30-day trial license is NOT supported by the Cisco Technical Assistance Center (TAC).

- L-NCS-1.0-X—Cisco NCS Enterprise License with Mobility Services Enablement, High availability, and Support for multiple Cisco NCS servers. If you choose the option of ordering the physical appliances, you will be shipped with PRIME-NCS-APL-K9 along with a PAK for the license quantity you ordered (L-NCS-1.0-X). If you choose the virtual appliance option, download the virtual NCS image and get the L-NCS-1.0-X PAK emailed to you once it has been ordered.
- L-NCS-1.0-X-ADD —For customer buying new or expansion Cisco NCS licenses running Cisco Unified Wireless Network Software. It is available as L-NCS-1.0-X-ADD option in increments of 50, 100, or 500 lightweight access points. The larger license quantities, specifically 1K, 2.5K, 5K, and 10K are actually shipped in smaller increments to allow the licenses to be split across different NCS instances.

Note When the number of managed devices exceeds the limit of those licensed, NCS generates an alarm. Also, when the user logs into NCS, they are alerted if the licensed access point count has been exceeded.

Note For ADD ON License, you must have one and only one device count license (L-NCS-1.0-X) before stacking “ADD-ON” licenses.

Note Cisco WLSE Express (Model 1030) and CiscoWorks WLSE (Model 1105 or 1133) are NOT supported with this SKU. DO NOT install the CiscoWorks WLSE CDs on the CiscoWorks WLSE Express (Model 1030) appliance or CiscoWorks WLSE (Model 1105 or 1133) because this conversion does not work and is not supported by Cisco Systems.

- NCS-2.0-UPGRADE-X-LIC—For customers upgrading from their existing Cisco NCS licenses to new Cisco NCS licenses. It is available as Cisco NCS UPGRADE in increments of 50, 100, or 500 lightweight access points.
- WCS to NCS Migration—The Cisco NCS uses a single-tier license model. When Cisco WCS BASE or WCS PLUS licenses are being migrated, licenses will be mapped to the new Cisco Prime NCS single-tier model. This is a two stage process, Obtaining the XML file from existing WCS deployment and uploading the XML into Cisco Migration Portal. The migration licenses that are generated from the Cisco migration portal. These licenses will be mapped to NCS 1.0 licenses of equivalent counts. So an WCS 7.0 Base 500 with Spectrum Expert licenses will be converted to an NCS 1.0 500 device license.

Note For more information about WCS to NCS Migration, see “[NCS Migration License](#)” section on page 1-5.

Licensing Enforcement

Cisco Unified Wireless Network Releases enforces software based licensing. Customers are prompted to enter license files by all new Cisco NCS SKU families. Existing customers migrating to a later release are also impacted by licensing and should contact their Cisco Sales Representative or TAC to obtain Product Authorization Key (PAK) certificate if they have not already received PAK certificate from Cisco. For more information, refer to the NCS Ordering Guide.

All Cisco NCS licenses can be purchased or acquired directly from Cisco.com via the normal Cisco ordering processes. Cisco Unified Wireless Network Software Releases can be downloaded from Cisco.com or, for a nominal charge, a DVD can be purchased from the NCS-1.0-X or NCS-1.0-X-LIC SKU families. The NCS DVD contains software image of Cisco NCS version 1.0. Customers can select the appropriate Cisco NCS release mode to designate whether they would like to get a Physical Appliance software image(ISO) or a Virtual appliance(OVA) version. The Cisco NCS features and access point quantity are activated after installation by inserting the license file that is tied to the original purchased Cisco NCS SKU. This DVD is shipped via U.S. mail to the purchaser's address.

The Cisco NCS free demonstration license, NCS-DEMO-X is only available as a software download from Cisco.com. Within the 30 day trial period, this free license can be upgraded to one of the non-expiring Cisco NCS SKUs by applying license files generated through the purchase of one of the non-expiring Cisco NCS SKU families.

Product Authorization Key Certificate

All Cisco NCS SKUs require a PAK certificate to register the Cisco NCS license. The PAK is a paper certificate sent via U.S. mail from Cisco Systems upon purchase of the Cisco NCS license. The PAK certificate allows customers to receive a Cisco NCS license. It is used to register the Cisco NCS and generate license files. All customers must go to the PAK registration site listed on their PAK certificate to complete their Cisco NCS registration. The PAK certificate provides clear instructions on how to complete the Cisco NCS licensing process.

**Note**

All customers that purchase Cisco NCS from Cisco.com via download or DVD must activate their Cisco NCS license by registering at the PAK site. Customers receive the PAK via U.S. mail. Cisco NCS will not be activated until the PAK registration process is completed.

Determining Which License To Use

You should select the correct license based on your deployment situation, the number of access points to be supported, and Cisco NCS options. Only one type of license can be used on the NCS at one time. For example, if your NCS has a NCS-1.0-X license, you cannot add a NCS-1.0-X-LIC license. You can add to the current license by purchasing a license to increase the access point count. For example, if you have a NCS-1.0-50 license with an access point count of 50 and in a year you need to add more access points, you can buy another NCS-1.0-100 license with an access point count of 100, apply it to the NCS, and have a NCS with license for 150 access points. You can add a license to increase the number of access points in increments of 50, 100, 500, 1000, 2500, 5000 or 10000.

Installing a License

You need to have the Network Control System license key file to install your license. The key file is distributed to you in an e-mail from Cisco Systems. This file activates the features that you have purchased for your Cisco Network Control System (NCS). Do not edit the contents of the .lic file in any way or you will render the file useless.

We strongly recommends that you print the e-mail, save the attachment to a removable media, and store both in a safe place for future use, if needed by either yourself or anyone in your organization.

Before you proceed, make sure that the NCS server software has been installed and configured on the server.

To install the NCS license, follow these steps:

-
- Step 1** Save the license file (.lic) to a temporary directory on your hard drive.
 - Step 2** Open a supported browser.
 - Step 3** In the Location or Address text box, enter the following URL, replacing IP address or host name of the NCS server: `https://<IP address>`.
 - Step 4** Log in to the NCS server as system administrator. User names and passwords are case-sensitive.
 - Step 5** Choose **Administration > License Center**.
 - Step 6** Choose **Files > NCS** from the left sidebar menu.
 - Step 7** Click **Add**. The Add a License File dialog box appears.
 - Step 8** In the Add a License File dialog box, click **Browse** to navigate to the location where you saved the .lic file.
 - Step 9** Click **Upload**.

The NCS server imports the license.

During the upload the following items are checked:

- Validity of the license file.
- Matching UDI on the license and NCS system.

If you encounter a problem with the license file, please contact the Cisco Licensing team at 800-553-2447 or licensing@cisco.com.

Backup and Restore License

The license files are saved as part of the backup and restore process, so upgrading NCS will not require reentering of the license files. However, the restore must be on a system with the same UDI for the restored licenses to work. If you have installed an upgraded license on your system, you must reinstall the original license, followed by the upgrade license. To backup the NCS database, see the [“Backing Up the NCS Database”](#) section on page 4-7.

Notices and Disclaimers

This chapter/appendix contains notices and disclaimers that pertain to Cisco NCS/Cisco WLAN Controller/whatever other product.

Notices

The following notices pertain to this software license.

OpenSSL/Open SSL Project

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

License Issues

The OpenSSL toolkit stays under a dual license, for example, both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

OpenSSL License:

Copyright © 1998-2007 The OpenSSL Project. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgment: “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>)”.
4. The names “OpenSSL Toolkit” and “OpenSSL Project” must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org.
5. Products derived from this software may not be called “OpenSSL” nor may “OpenSSL” appear in their names without prior written permission of the OpenSSL Project.
6. Redistributions of any form whatsoever must retain the following acknowledgment:
“This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>)”.

THIS SOFTWARE IS PROVIDED BY THE OpenSSL PROJECT “AS IS” AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OpenSSL PROJECT OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay License:

Copyright © 1995-1998 Eric Young (eay@cryptsoft.com). All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com).

The implementation was written so as to conform with Netscapes SSL.

This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young’s, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement:

“This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)”.

The word ‘cryptographic’ can be left out if the routines from the library being used are not cryptography-related.

4. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include an acknowledgement: “This product includes software written by Tim Hudson (tjh@cryptsoft.com)”.

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY

THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License].

Disclaimers

All third party trademarks are the property of their respective owners.

End-User License Agreement

IMPORTANT: PLEASE READ THIS END USER LICENSE AGREEMENT CAREFULLY. DOWNLOADING, INSTALLING OR USING CISCO OR CISCO-SUPPLIED SOFTWARE CONSTITUTES ACCEPTANCE OF THIS AGREEMENT.

CISCO IS WILLING TO LICENSE THE SOFTWARE TO YOU ONLY UPON THE CONDITION THAT YOU ACCEPT ALL OF THE TERMS CONTAINED IN THIS LICENSE AGREEMENT. BY DOWNLOADING OR INSTALLING THE SOFTWARE, OR USING THE EQUIPMENT THAT CONTAINS THIS SOFTWARE, YOU ARE BINDING YOURSELF AND THE BUSINESS ENTITY THAT YOU REPRESENT (COLLECTIVELY, "CUSTOMER") TO THIS AGREEMENT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, THEN CISCO IS UNWILLING TO LICENSE THE SOFTWARE TO YOU AND (A) DO NOT DOWNLOAD, INSTALL OR USE THE SOFTWARE, AND (B) YOU MAY RETURN THE SOFTWARE FOR A FULL REFUND, OR, IF THE SOFTWARE IS SUPPLIED AS PART OF ANOTHER PRODUCT, YOU MAY RETURN THE ENTIRE PRODUCT FOR A FULL REFUND. YOUR RIGHT TO RETURN AND REFUND EXPIRES 30 DAYS AFTER PURCHASE FROM CISCO OR AN AUTHORIZED CISCO RESELLER, AND APPLIES ONLY IF YOU ARE THE ORIGINAL END USER PURCHASER.

The following terms of this End User License Agreement ("Agreement") govern Customer's access and use of the Software, except to the extent (a) there is a separate signed agreement between Customer and Cisco governing Customer's use of the Software or (b) the Software includes a separate "click-accept" license agreement as part of the installation and/or download process. To the extent of a conflict between the provisions of the foregoing documents, the order of precedence shall be (1) the signed agreement, (2) the click-accept agreement, and (3) this End User License Agreement.

License. Conditioned upon compliance with the terms and conditions of this Agreement, Cisco Systems, Inc. or its subsidiary licensing the Software instead of Cisco Systems, Inc. ("Cisco"), grants to Customer a nonexclusive and nontransferable license to use for Customer's internal business purposes the Software and the Documentation for which Customer has paid the required license fees. "Documentation" means written information (whether contained in user or technical manuals, training materials, specifications or otherwise) specifically pertaining to the Software and made available by Cisco with the Software in any manner (including on CD-Rom, or on-line).

Customer's license to use the Software shall be limited to, and Customer shall not use the Software in excess of, a single hardware chassis or card or such number and types of agent(s), concurrent users, sessions, IP addresses, port(s), seat(s), server(s), site(s), features and feature sets as are set forth in the applicable Purchase Order which has been accepted by Cisco and for which Customer has paid to Cisco the required license fee.

Unless otherwise expressly provided in the Documentation, Customer shall use the Software solely as embedded in, for execution on, or (where the applicable documentation permits installation on non-Cisco equipment) for communication with Cisco equipment owned or leased by Customer and used for Customer's internal business purposes. NOTE: For evaluation or beta copies for which Cisco does not charge a license fee, the above requirement to pay license fees does not apply.

General Limitations. This is a license, not a transfer of title, to the Software and Documentation, and Cisco retains ownership of all copies of the Software and Documentation. Customer acknowledges that the Software and Documentation contain trade secrets of Cisco, its suppliers or licensors, including but not limited to the specific internal design and structure of individual programs and associated interface information. Accordingly, except as otherwise expressly provided under this Agreement, Customer shall have no right, and Customer specifically agrees not to:

(i) transfer, assign or sublicense its license rights to any other person or entity, or use the Software on unauthorized or secondhand Cisco equipment, and Customer acknowledges that any attempted transfer, assignment, sublicense or use shall be void;

(ii) make error corrections to or otherwise modify or adapt the Software or create derivative works based upon the Software, or permit third parties to do the same;

(iii) reverse engineer or decompile, decrypt, disassemble or otherwise reduce the Software to human-readable form, except to the extent otherwise expressly permitted under applicable law notwithstanding this restriction;

(iv) use or permit the Software to be used to perform services for third parties, whether on a service bureau or time sharing basis or otherwise, without the express written authorization of Cisco; or

(v) disclose, provide, or otherwise make available trade secrets contained within the Software and Documentation in any form to any third party without the prior written consent of Cisco. Customer shall implement reasonable security measures to protect such trade secrets.

To the extent required by law, and at Customer's written request, Cisco shall provide Customer with the interface information needed to achieve interoperability between the Software and another independently created program, on payment of Cisco's applicable fee, if any. Customer shall observe strict obligations of confidentiality with respect to such information and shall use such information in compliance with any applicable terms and conditions upon which Cisco makes such information available.

Software, Upgrades and Additional Copies. For purposes of this Agreement, "Software" shall include (and the terms and conditions of this Agreement shall apply to) computer programs, including firmware, as provided to Customer by Cisco or an authorized Cisco reseller, and any upgrades, updates, bug fixes or modified versions thereto (collectively, "Upgrades") or backup copies of the Software licensed or provided to Customer by Cisco or an authorized Cisco reseller. NOTWITHSTANDING ANY OTHER PROVISION OF THIS AGREEMENT: (1) CUSTOMER HAS NO LICENSE OR RIGHT TO USE ANY ADDITIONAL COPIES OR UPGRADES UNLESS CUSTOMER, AT THE TIME OF ACQUIRING SUCH COPY OR UPGRADE, ALREADY HOLDS A VALID LICENSE TO THE ORIGINAL SOFTWARE AND HAS PAID THE APPLICABLE FEE FOR THE UPGRADE OR ADDITIONAL COPIES; (2) USE OF UPGRADES IS LIMITED TO CISCO EQUIPMENT FOR WHICH CUSTOMER IS THE ORIGINAL END USER PURCHASER OR LESSEE OR WHO OTHERWISE HOLDS A VALID LICENSE TO USE THE SOFTWARE WHICH IS BEING UPGRADED; AND (3) THE MAKING AND USE OF ADDITIONAL COPIES IS LIMITED TO NECESSARY BACKUP PURPOSES ONLY.

Proprietary Notices. Customer agrees to maintain and reproduce all copyright and other proprietary notices on all copies, in any form, of the Software in the same form and manner that such copyright and other proprietary notices are included on the Software. Except as expressly authorized in this Agreement, Customer shall not make any copies or duplicates of any Software without the prior written permission of Cisco.

Term and Termination. This Agreement and the license granted herein shall remain effective until terminated. Customer may terminate this Agreement and the license at any time by destroying all copies of Software and any Documentation. Customer's rights under this Agreement will terminate immediately without notice from Cisco if Customer fails to comply with any provision of this Agreement. Upon termination, Customer shall destroy all copies of Software and Documentation in its possession or control. All confidentiality obligations of Customer and all limitations of liability and disclaimers and restrictions of warranty shall survive termination of this Agreement. In addition, the provisions of the sections titled "U.S. Government End User Purchasers" and "General Terms Applicable to the Limited Warranty Statement and End User License" shall survive termination of this Agreement.

Customer Records. Customer grants to Cisco and its independent accountants the right to examine Customer's books, records and accounts during Customer's normal business hours to verify compliance with this Agreement. In the event such audit discloses non-compliance with this Agreement, Customer shall promptly pay to Cisco the appropriate license fees, plus the reasonable cost of conducting the audit.

Export. Software and Documentation, including technical data, may be subject to U.S. export control laws, including the U.S. Export Administration Act and its associated regulations, and may be subject to export or import regulations in other countries. Customer agrees to comply strictly with all such regulations and acknowledges that it has the responsibility to obtain licenses to export, re-export, or import Software and Documentation.

U.S. Government End User Purchasers. The Software and Documentation qualify as "commercial items," as that term is defined at Federal Acquisition Regulation ("FAR") (48 C.F.R.) 2.101, consisting of "commercial computer software" and "commercial computer software documentation" as such terms are used in FAR 12.212. Consistent with FAR 12.212 and DoD FAR Supp. 227.7202-1 through 227.7202-4, and notwithstanding any other FAR or other contractual clause to the contrary in any agreement into which this End User License Agreement may be incorporated, Customer may provide to Government end user or, if this Agreement is direct, Government end user will acquire, the Software and Documentation with only those rights set forth in this End User License Agreement. Use of either the

Software or Documentation or both constitutes agreement by the Government that the Software and Documentation are "commercial computer software" and "commercial computer software documentation," and constitutes acceptance of the rights and restrictions herein.

Limited Warranty

Subject to the limitations and conditions set forth herein, Cisco warrants that commencing from the date of shipment to Customer (but in case of resale by an authorized Cisco reseller, commencing not more than ninety (90) days after original shipment by Cisco), and continuing for a period of the longer of (a) ninety (90) days or (b) the warranty period (if any) expressly set forth as applicable specifically to software in the warranty card accompanying the product of which the Software is a part (the "Product") (if any): (a) the media on which the Software is furnished will be free of defects in materials and workmanship under normal use; and (b) the Software substantially conforms to the Documentation. The date of shipment of a Product by Cisco is set forth on the packaging material in which the Product is shipped. Except for the foregoing, the Software is provided AS IS. This limited warranty extends only to the Customer who is the original licensee. Customer's sole and exclusive remedy and the entire liability of Cisco and its suppliers and licensors under this limited warranty will be (i) replacement of defective media and/or (ii) at Cisco's option, repair, replacement, or refund of the purchase price of the Software, in both cases subject to the condition that any error or defect constituting a breach of this limited warranty is reported to Cisco or the party supplying the Software to Customer, if different than Cisco, within the warranty period. Cisco or the party supplying the Software to Customer may, at its option, require return of the Software as a condition to the remedy. In no event does Cisco warrant that the Software is error free or that Customer will be able to operate the Software without problems or interruptions. In addition, due to the continual development of new techniques for intruding upon and attacking networks, Cisco does not warrant that the Software or any equipment, system or network on which the Software is used will be free of vulnerability to intrusion or attack.

Restrictions. This warranty does not apply if the Software, Product or any other equipment upon which the Software is authorized to be used (a) has been altered, except by Cisco or its authorized representative, (b) has not been installed, operated, repaired, or maintained in accordance with instructions supplied by Cisco, (c) has been subjected to abnormal physical or electrical stress, misuse, negligence, or accident; or (d) is licensed, for beta, evaluation, testing or demonstration purposes for which Cisco does not charge a purchase price or license fee.

DISCLAIMER OF WARRANTY. EXCEPT AS SPECIFIED IN THIS WARRANTY, ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS, AND WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, SATISFACTORY QUALITY, NON-INTERFERENCE, ACCURACY OF INFORMATIONAL CONTENT, OR ARISING FROM A COURSE OF DEALING, LAW, USAGE, OR TRADE PRACTICE, ARE HEREBY EXCLUDED TO THE EXTENT ALLOWED BY APPLICABLE LAW AND ARE EXPRESSLY DISCLAIMED BY CISCO, ITS SUPPLIERS AND LICENSORS. TO THE EXTENT AN IMPLIED WARRANTY CANNOT BE EXCLUDED, SUCH WARRANTY IS LIMITED IN DURATION TO THE EXPRESS WARRANTY PERIOD. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, THE ABOVE LIMITATION MAY NOT APPLY. THIS WARRANTY GIVES CUSTOMER SPECIFIC LEGAL RIGHTS, AND CUSTOMER MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM JURISDICTION TO JURISDICTION. This disclaimer and exclusion shall apply even if the express warranty set forth above fails of its essential purpose.

General Terms Applicable to the Limited Warranty Statement and End User License Agreement

Disclaimer of Liabilities. REGARDLESS WHETHER ANY REMEDY SET FORTH HEREIN FAILS OF ITS ESSENTIAL PURPOSE OR OTHERWISE, IN NO EVENT WILL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY LOST REVENUE, PROFIT, OR LOST OR DAMAGED DATA, BUSINESS INTERRUPTION, LOSS OF CAPITAL, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL,

INCIDENTAL, OR PUNITIVE DAMAGES HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY OR WHETHER ARISING OUT OF THE USE OF OR INABILITY TO USE SOFTWARE OR OTHERWISE AND EVEN IF CISCO OR ITS SUPPLIERS OR LICENSORS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. In no event shall Cisco's or its suppliers' or licensors' liability to Customer, whether in contract, tort (including negligence), breach of warranty, or otherwise, exceed the price paid by Customer for the Software that gave rise to the claim or if the Software is part of another Product, the price paid for such other Product. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATION OR EXCLUSION OF CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

Customer agrees that the limitations of liability and disclaimers set forth herein will apply regardless of whether Customer has accepted the Software or any other product or service delivered by Cisco. Customer acknowledges and agrees that Cisco has set its prices and entered into this Agreement in reliance upon the disclaimers of warranty and the limitations of liability set forth herein, that the same reflect an allocation of risk between the parties (including the risk that a contract remedy may fail of its essential purpose and cause consequential loss), and that the same form an essential basis of the bargain between the parties.

The validity, interpretation, and performance of this Warranty and End User License shall be controlled by and construed under the laws of the State of California, United States of America, as if performed wholly within the state and without giving effect to the principles of conflict of laws, and the State and federal courts of California shall have jurisdiction over any claim arising under this Agreement. The parties specifically disclaim the UN Convention on Contracts for the International Sale of Goods. Notwithstanding the foregoing, either party may seek interim injunctive relief in any court of appropriate jurisdiction with respect to any alleged breach of such party's intellectual property or proprietary rights. If any portion hereof is found to be void or unenforceable, the remaining provisions of the Agreement shall remain in full force and effect. Except as expressly provided herein, this Agreement constitutes the entire agreement between the parties with respect to the license of the Software and Documentation and supersedes any conflicting or additional terms contained in any purchase order or elsewhere, all of which terms are excluded. This Agreement has been written in the English language, and the parties agree that the English version will govern.

Supplemental License Agreement

Cisco Network Control System (NCS)

IMPORTANT-READ CAREFULLY

You have agreed to the Cisco System, Inc. End User License Agreement ("EULA") that governs your access and use of the Cisco Network Control System ("NCS"). This supplemental license agreement (this "supplement") contains additional terms and conditions.

Capitalized terms used and but not defined in this supplement have the meanings as defined in the EULA. To the extent of a conflict between the provisions of this supplement and the EULA, this supplement takes precedence.

By installing, downloading, accessing or otherwise using the Software, Customer agrees to be bound by the terms of this supplement. If Customer does not agree to the terms of this supplement, Customer may not install, download, or otherwise use the Software.

Restrictions on Managed Access Point and Devices

Customer may not use the Software unless:

- Customer obtains a NCS limited license by placing a Purchase Order for a NCS license for a specific number of access points, having the Purchase Order accepted by Cisco, and paying to Cisco the required license fee; or

- Customer obtains a NCS demonstration license by registering and downloading the Software for demonstration purposes in accordance with the Cisco Data Sheet for the Cisco Wireless Control System (the "NCS Data Sheet").

If Customer obtains a NCS limited license, Customer may not use the Software to manage more access points than those identified in the Software's Cisco SKU or the product description on Customer's accepted, paid Purchase Order plus those identified in the Software's Cisco SKUs or the product descriptions on Customer's prior accepted, paid Purchase Orders.

If Customer obtains a NCS demonstration license, Customer may not use the Software to manage more than the number of access points identified for the Cisco NCS demonstration license in the NCS Data Sheet.

Customer may use the Software only to manage those devices identified as managed devices in the product specifications section of NCS Data Sheet.

Server Restrictions

Customer may install and run the Software on multiple servers if the Software's Cisco SKU or product description on Customer's accepted, paid Purchase Order identifies the product as an enterprise or "ent" license. Otherwise, Customer may install and run the Software on only a single server.

Third-Party Proprietary Software

The Software includes proprietary software and technology from Cisco's suppliers. Some suppliers are intended third-party beneficiaries of the EULA and this supplement. Third-party-beneficiary suppliers include: (a) Hifn, Inc.; (b) Wind River Systems, Inc. and its suppliers; and (c) any other supplier Cisco identifies as a third-party beneficiary in the Documentation or additional supplements. These suppliers may enforce, and are express beneficiaries of, the EULA and this supplement. However, they are not in any contractual relationship with Customer.

The limited warranty in the EULA is made only by Cisco and is disclaimed by all Cisco suppliers. Cisco and any Cisco supplier may obtain injunctive relief if Customer's use of the Software is in violation of any license restrictions.

Open-Source Software

The Software includes certain open-source software. Despite anything to the contrary in the EULA or this supplement, the open-source software is governed by the terms and conditions of the applicable open-source license. The open-source software, the applicable open-source licenses and other open-source notices may be identified in the Documentation or in a README file accompanying the Software. Customer agrees to comply with all such licenses and other notices.

Other Terms and Conditions

The terms of the EULA and this supplement may be enforced by license registration and other software tools.

APPENDIX C

Cisco NCS Server Hardening

This appendix provides an instructional checklist for hardening a NCS server. Ideally, the goal of a hardened server is to leave it exposed on the Internet without any other form of protection. This describes the hardening of NCS, which requires some services and processes exposed to function properly. Think of it as NCS Best Practices. Hardening of NCS will involve disabling unnecessary services, removing and modifying registrykey entries, and applying appropriate restrictive permissions to files, services, and end points.

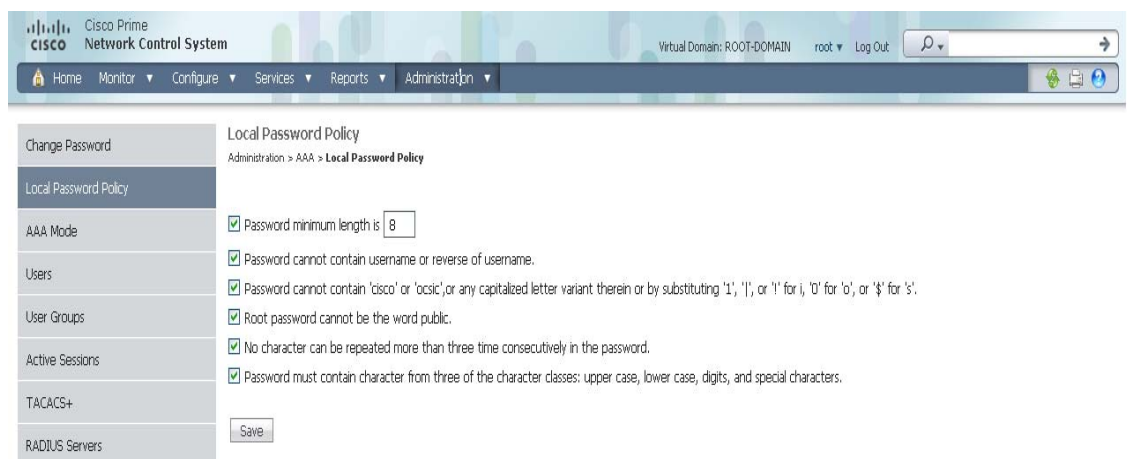

This appendix includes the following sections:

- [NCS Password Handling, page C-1](#)
- [Setting Up SSL Certification, page C-2](#)

NCS Password Handling

You can configure additional authentication by configuring the **Local Password Policy** parameters. Select the check boxes if you want the configurations to be enabled.

Figure C-1 Local Password Policy

The following configurations are added for additional authentication:

- You can configure the minimum length of the password.

291075

- You can configure if you want to allow the username or reverse of the username to be part of the password.
- You can configure if the password can contain 'cisco' or 'ocsic', or any capitalized letter variant therein or by substituting '1', 'l', or '!' for 'i', '0' for 'o', or '\$' for 's'.
- You can configure if the root password can be the word **public**.
- You can configure if a character can be repeated more than three times consecutively in the password or not.
- You can configure if the password must contain character from three of the character classes: upper case, lower case, digits, and special characters.

Setting Up SSL Certification

The Secure Socket Layer (SSL) Certification is to ensure secure transactions between a web server and the browsers. Installing the DoD Certificates will allow your Web browser to trust the identity and provide secure communications which are authenticated by Department of Defense (DoD).

These certificates are used to validate the identity of the server or web site and are used to generate the encryption key used in the SSL. This encryption protects the information being passed between the server and the client.

SSL Certification involves the following topics:

- [Setting Up SSL Client Certification, page C-2](#)
- [Setting Up SSL Server Certification, page C-3](#)

Setting Up SSL Client Certification

Follow the below steps to setup the SSL Client Certificate Authentication using DoD certificates:

Note As a prerequisite, to create the SSL Certificates, you would require “KeyTool” available in JDK. KeyTool is a command line tool to manage keystores and the certificates.

Step 1 Create SSL Client Certificate using the below command.

```
% keytool -genkey -keystore nmsclientkeystore -storetype pkcs12 -keyalg RSA -keysize 2048
-alias nmsclient -dname "CN=nmsclient, OU=WNBU, O=Cisco, L=San Jose, ST=CA, C=US"
-storepass nmskeystore
```

Note Provide the Key Algorithm as RSA and KeySize as 1024 or 2048.

Step 2 Generate the Certificate Signing Request (CSR) using the below command.

```
% keytool -certreq -keyalg RSA -keysize 2048 -alias nmsclient -keystore nmsclientkeystore
-storetype pkcs12 -file <csrfilename>
```

Note Provide the Key Algorithm as RSA and KeySize as 1024 or 2048 and provide a certificate file name.

Step 3 Send the generated CSR file to DoD. The DoD will issue the corresponding signed certificates.

Note The CSR reply is through dod.p7b file. In addition you should also receive the root CA certificates.

Note Please make sure to retrieve the PKCS7 encoded certificates; Certificate Authorities provide an option to get the PKCS7 encoded certificates.

Step 4 Import the CSR reply in the Keystore using the command:

```
% keytool -import dod.p7b -keystore nmsclientkeystore -storetype pkcs12
-storepass nmskeystore
```

Step 5 Check the formats of root CA certificates received, they must be base 64 encoded. If they are not base 64 encoded, use the OpenSSL command to convert them to base 64 encoded format.

```
% openssl x509 -in rootCA.cer -inform DER -outform PEM -outfile rootCA.crt
% openssl x509 -in DoD-sub.cer -inform DER -outform PEM -outfile rootCA.crt
```

Note Convert both root CA certificate and sub-ordinate certificates received.

In case you received both root CA certificate and the sub-ordinate certificate, you have to bundle them together using the below command:

```
% cat DoD-sub.crt > ca-bundle.crt
% cat DoD-rootCA.crt >> ca-bundle.crt
```

Step 6 To setup SSL Client Authentication using these certificates, enable SSL Client Authentication in Apache in the **ssl.conf** file located in <NCS_Home>/webnms/apache/ssl/backup/ folder.

```
SSLCAcertificationPath conf/ssl.crt
SSLCAcertificationFile conf/ssl.crt/ca-bundle.crt
SSLVerifyClient require
SSLVerifyDepth 2
```

Note SSLVerifyDepth will depend on the level of Certificate Chain. In case you have only 1 root CA certificate, this should be set to 1. In case you have a certificate chain (root CA and subordinate CA), this should be set to 2.

Step 7 Install the DoD root CA certificates in NCS.

Step 8 Import the nmsclientkeystore in your browser.

Setting Up SSL Server Certification

Follow the below steps to setup the SSL Server Certificate using DoD certificates:

Step 1 Generate the Certificate Signing Request (CSR).

```
% keyadmin -newdn genkey <csrfilename>
```

Step 2 Send the generated CSR file to DoD. The DoD will issue the corresponding signed certificates.

Note The CSR reply is through dod.p7b file. In addition you should also receive the root CA certificates.

Note Please make sure to retrieve the PKCS7 encoded certificates; Certificate Authorities provide an option to get the PKCS7 encoded certificates.

Step 3 Import the Signed Certificate using the below command in the Keytool:

```
% keyadmin -importsignedcert <dod.p7>
```

Note The certificate and the key are stored at <NCS_Home>/webnms/apache/conf/ssl.crt.
