

Cisco Prime Network Control System Configuration Guide

Software Release OL-25451-01
July 2011

Americas Headquarters
Cisco Systems, Inc.
170 West Tasman Drive
San Jose, CA 95134-1706
USA
<http://www.cisco.com>
Tel: 408 526-4000
800 553-NETS (6387)
Fax: 408 527-0883

Text Part Number: 1

THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (1005R)

CHAPTER 1

Cisco NCS Overview 1-1

The Cisco Unified Network Solution 1-1

About NCS 1-2

NCS Licenses 1-3

NCS Evaluation License 1-4

NCS Device Count License 1-4

NCS Upgrade License 1-4

NCS Migration License 1-5

Obtaining the XML file from Existing WCS Deployment 1-5

Uploading the XML file to the Cisco Migration Portal 1-5

Applying the New License to Cisco Prime NCS 1-6

Cisco Unified Network Components 1-6

Cisco Prime NCS 1-7

WLAN Controllers 1-7

Access Points 1-7

Embedded Access Points 1-8

Access Point Communication Protocols 1-9

Guidelines and Restrictions for Using CAPWAP 1-10

Cisco Wireless LAN Controller Autodiscovery 1-10

The Controller Discovery Process 1-10

NCS Services 1-11

Cisco Context Aware Service Solution 1-11

Cisco Identity Service Engine Solution 1-12

Cisco Adaptive Wireless Intrusion Prevention Service 1-13

CHAPTER 2

Getting Started 2-1

NCS Delivery Modes 2-1

Physical Appliance	2-2
Virtual Appliance	2-2
Virtual Appliance for Large Deployment	2-2
Virtual Appliance for Medium Deployment	2-3
Virtual Appliance for Small Deployment	2-3
Operating Systems Requirements	2-3
Client Requirements	2-4
Prerequisites	2-4
Reinstalling NCS on Physical Appliance	2-5
Deploying the NCS Virtual Appliance	2-5
Deploying the NCS Virtual Appliance from the VMware vSphere Client	2-6
Configuring the Basic Settings for NCS Virtual Appliance	2-8
Deploying NCS Virtual Appliance using the Command Line Client	2-9
Setting Up NCS	2-9
Starting the NCS Server	2-10
Logging into the NCS User Interface	2-11
Applying the NCS Software License	2-12
Understanding NCS Home Page	2-13
Dashboards	2-13
General Dashboard	2-15
Client Dashboard	2-16
Security Dashboard	2-17
Mesh Dashboard	2-18
CleanAir Dashboard	2-18
Context Aware Dashboard	2-21
Icons	2-22
Menu Bar	2-23
Monitor Menu	2-23
Configure Menu	2-24
Services Menu	2-25
Reports Menu	2-25
Administration Menu	2-25
Global Toolbar	2-26
Tools	2-26
Help	2-26
Alarm Summary	2-27
Command Buttons	2-27
Main Data Page	2-28
Administrative Elements	2-28

Customizing NCS Home Page	2-29
Editing NCS Home Page	2-29
Adding Dashlets	2-30
Adding a New Dashboard	2-32
Using the Search Feature	2-33
Quick Search	2-33
Advanced Search	2-34
Searching Alarms	2-36
Searching Access Points	2-37
Searching Controller Licenses	2-38
Searching Controllers	2-38
Searching Switches	2-39
Searching Clients	2-40
Searching Chokepoints	2-41
Searching Events	2-42
Searching Interferers	2-42
Searching AP-Detected Interferers	2-43
Searching Wi-Fi TDOA Receivers	2-44
Searching Maps	2-44
Searching Rogue Clients	2-44
Searching Shunned Clients	2-45
Searching Tags	2-45
Saved Searches	2-46
Configuring the Search Results Display (Edit View)	2-46

CHAPTER 3**Configuring Security Solutions 3-1**

Cisco Unified Wireless Network Solution Security	3-1
Layer 1 Solutions	3-2
Layer 2 Solutions	3-2
Layer 3 Solutions	3-2
Single Point of Configuration Policy Manager Solutions	3-2
Rogue Access Point Solutions	3-3
Rogue Access Point Challenges	3-3
Tagging and Containing Rogue Access Points	3-3
Securing Your Network Against Rogue Access Points	3-3
Interpreting the Security Dashboard	3-4
Security Index	3-5
Malicious Rogue Access Points	3-6
Adhoc Rogues	3-6

- CleanAir Security 3-7
- Unclassified Rogue Access Points 3-7
- Friendly Rogue Access Points 3-8
- Access Point Threats or Attacks 3-8
- MFP Attacks 3-9
- Attacks Detected 3-9
- Recent Rogue AP Alarms 3-9
- Recent Adhoc Rogue Alarm 3-9
- Most Recent Security Alarms 3-9
- Rogue Access Points, Ad hoc Events, and Clients 3-9
 - Classifying Rogue Access Points 3-10
 - Rogue Access Point Classification Types 3-11
 - Adhoc Rogue 3-13
- Rogue Access Point Location, Tagging, and Containment 3-13
 - Detecting Access Points on a Network 3-14
 - Viewing Rogue Access Points by Controller 3-15
- Working with Alarms 3-16
- Monitoring Rogue Alarm Events 3-17
 - Viewing Rogue AP Event Details 3-18
- Monitoring Adhoc Rogue Events 3-19
 - Viewing Adhoc Rogue Event Details 3-19
- Security Overview 3-20
 - Security Vulnerability Assessment 3-20
 - Security Index 3-21
 - Top Security Issues 3-22
- Switch Port Tracing 3-28
 - Integrated Security Solutions 3-28
- Using NCS to Convert a Cisco Unified Wireless Network Solution from Layer 3 to Layer 2 Mode 3-29
- Configuring a Firewall for NCS 3-30
- Access Point Authorization 3-30
- Management Frame Protection (MFP) 3-31
 - Guidelines for Using MFP 3-32
- Configuring Intrusion Detection Systems (IDS) 3-33
 - Viewing IDS Sensors 3-33
- Configuring IDS Signatures 3-33
 - Uploading IDS Signatures 3-36
 - Downloading IDS Signatures 3-37
 - Enabling or Disabling IDS Signatures 3-38

Enabling Web Login	3-41
Downloading Customized Web Authentication	3-42
Connecting to the Guest WLAN	3-44
Certificate Signing Request (CSR) Generation	3-44

CHAPTER 4**Performing Maintenance Operations 4-1**

Information About Maintenance Operations	4-1
Performing System Tasks	4-1
Adding a Controller to the NCS Database	4-1
Using NCS to Update System Software	4-2
Downloading Vendor Device Certificates	4-3
Downloading Vendor CA Certificates	4-4
Using NCS to Enable Long Preambles for SpectraLink NetLink Phones	4-5
Creating an RF Calibration Model	4-5
Performing NCS Operations	4-6
Verifying the Status of NCS	4-6
Stopping NCS	4-6
Backing Up the NCS Database	4-7
Scheduling Automatic Backups	4-7
Performing a Manual Backup	4-8
Restoring the NCS Database	4-8
Restoring the NCS Database	4-8
Restoring the NCS Database in a High Availability Environment	4-9
Uninstalling NCS	4-10
Upgrading WCS to NCS	4-10
Upgrading NCS in a High Availability Environment	4-12
Upgrading the Network	4-12
Reinitializing the Database	4-13
Recovering the NCS Password	4-13

CHAPTER 5**Monitoring Devices 5-1**

Information About Monitoring	5-1
Monitoring Controllers	5-1
Searching Controllers	5-2
Viewing List of Controllers	5-2
Configuring the Controller List Display	5-3
Monitoring System Parameters	5-3
Monitoring System Summary	5-4
Monitoring Spanning Tree Protocol	5-5

- Monitoring CLI Sessions 5-7
- Monitoring DHCP Statistics 5-8
- Monitoring WLANs 5-9
- Monitoring Ports 5-9
 - Monitoring General Ports 5-9
 - Monitoring CDP Interface Neighbors 5-14
- Monitoring Controller Security 5-15
 - Monitoring RADIUS Authentication 5-15
 - Monitoring RADIUS Accounting 5-17
 - Monitoring Management Frame Protection 5-19
 - Monitoring Rogue AP Rules 5-20
 - Monitoring Guest Users 5-22
- Monitoring Controllers Mobility 5-23
 - Monitoring Mobility Stats 5-23
- Monitoring Controller 802.11a/n 5-24
 - Monitoring 802.11a/n Parameters 5-25
 - Monitoring 802.11a/n RRM Groups 5-26
- Monitoring Controllers 802.11b/g/n 5-28
 - Monitoring 802.11b/g/n Parameters 5-28
 - Monitoring 802.11b/g/n RRM Groups 5-30
- Monitoring Switches 5-32
 - Searching Switches 5-32
 - Viewing List of Switches 5-33
 - Configuring the Switch List Page 5-33
 - Monitoring Switch System Parameters 5-33
 - Viewing Switch Summary Information 5-34
 - Viewing Switch Memory Information 5-35
 - Viewing Switch Environment Information 5-35
 - Viewing Switch Module Information 5-36
 - Viewing Switch VLAN Information 5-36
 - Viewing Switch VTP Information 5-36
 - Viewing Switch Physical Ports Information 5-37
 - Viewing Switch Sensor Information 5-37
 - Viewing Switch Spanning Tree Information 5-38
 - Viewing Switch Stacks Information 5-39
 - Viewing Switch NMSP and Location Information 5-39
 - Monitoring Switch Interfaces 5-39
 - Monitoring Switch Ethernet Interfaces 5-39
 - Monitoring Switch IP Interfaces 5-40
 - Monitoring Switch VLAN Interfaces 5-41

Monitoring Switch EtherChannel Interfaces	5-41
Monitoring Switch Clients	5-41
Monitoring Access Points	5-42
Searching Access Points	5-42
Viewing List of Access Points	5-43
Configuring the Access Point List Display	5-44
Configuring the List of Access Points Display	5-45
Generating a Report for Access Points	5-46
Monitoring Traffic Load	5-48
Monitoring Dynamic Power Control	5-49
Monitoring Access Points Noise	5-50
Monitoring Access Points Interference	5-50
Monitoring Access Points Coverage (RSSI)	5-51
Monitoring Access Points Coverage (SNR)	5-51
Monitoring Access Points Up/Down Statistics	5-51
Monitoring Access Points Voice Statistics	5-52
Monitoring Access Points Voice TSM Table	5-52
Monitoring Access Points Voice TSM Reports	5-54
Monitoring Access Points 802.11 Counters	5-54
Monitoring Access Points AP Profile Status	5-55
Monitoring Access Points Radio Utilization	5-55
Monitoring Access Points Traffic Stream Metrics	5-55
Monitoring Access Points Tx Power and Channel	5-55
Monitoring VoIP Calls	5-56
Monitoring Voice Statistics	5-56
Monitoring Air Quality	5-56
Monitoring Access Points Details	5-56
General Tab	5-56
Interfaces Tab	5-64
CDP Neighbors Tab	5-66
Current Associated Clients Tab	5-66
SSID Tab	5-67
Monitoring Access Point Radio Details	5-68
Monitoring On Demand Statistics	5-68
General Tab	5-70
CleanAir Tab	5-71
Monitoring Operational Parameters	5-72
Monitoring 802.11 MAC Counters	5-75
Monitoring View Alarms	5-76
Monitor View Events	5-77

- Monitoring Mesh Access Points **5-77**
 - Mesh Statistics for an Access Point **5-78**
- Retrieving the Unique Device Identifier on Controllers and Access Points **5-83**
- Monitoring Coverage Hole **5-84**
 - Monitoring Pre-Coverage Holes **5-84**
- Monitoring Rogue Access Points **5-86**
 - Detecting Rogue Devices **5-86**
 - Classifying Rogue Access Points **5-87**
 - Monitoring Rogue AP Alarms **5-90**
 - Viewing Rogue AP Alarm Details **5-94**
 - Viewing Rogue Client Details **5-98**
 - Viewing Rogue AP History Details **5-99**
 - Viewing Rogue AP Event History Details **5-100**
- Monitoring Adhoc Rogues **5-100**
 - Monitoring Adhoc Rogue Alarms **5-100**
 - Viewing Adhoc Rogue Alarm Details **5-103**
- Searching Rogue Clients Using Advanced Search **5-105**
- Monitoring Rogue Access Point Location, Tagging, and Containment **5-107**
 - Detecting Access Points **5-107**
 - Monitoring Rogue Alarm Events **5-108**
 - Viewing Rogue AP Event Details **5-109**
 - Monitoring Adhoc Rogue Events **5-110**
 - Viewing Adhoc Rogue Event Details **5-111**
- Monitoring RFID Tags **5-113**
 - Tag Summary **5-113**
 - Searching Tags **5-113**
 - Viewing RFID Tag Search Results **5-114**
 - Viewing Tag List **5-115**
- Monitoring Chokepoints **5-115**
 - Performing a Chokepoint Search **5-115**
- Monitoring Interferers **5-116**
 - Monitoring AP Detected Interferers **5-116**
 - Monitoring AP Detected Interferer Details **5-117**
 - Monitoring AP Detected Interferer Details Location History **5-118**
 - Configuring the Search Results Display **5-119**
- Monitoring Spectrum Experts **5-119**
 - Spectrum Experts Summary **5-119**
 - Interferers Summary **5-120**
 - Interferers Search **5-121**

Spectrum Experts Details	5-121
Monitoring WiFi TDOA Receivers	5-121
Monitoring Radio Resource Management (RRM)	5-122
Channel Change Notifications	5-123
Transmission Power Change Notifications	5-123
RF Grouping Notifications	5-123
Viewing the RRM Dashboard	5-123
Monitoring Clients and Users	5-125
Monitoring Alarms	5-125
Alarms and Events Overview	5-126
Viewing List of Alarms	5-126
Filtering Alarms	5-127
Viewing Alarm Details	5-128
Viewing Events Related to Alarms	5-129
Modifying Alarms	5-129
Specifying Email Notifications for Alarms	5-130
Modifying the Alarm Browser	5-130
Viewing the Alarm Summary	5-130
Modifying Alarm Settings	5-132
Modifying Alarm Count Refresh Rate	5-132
Configuring Alarm Severity Levels	5-132
Working with Alarms	5-133
Monitoring Access Point Alarms	5-134
Monitoring Air Quality Alarms	5-135
Monitoring CleanAir Security Alarms	5-137
Monitoring Email Notifications	5-138
Monitoring Severity Configurations	5-139
Monitoring Cisco Adaptive wIPS Alarms	5-139
Monitoring Cisco Adaptive wIPS Alarm Details	5-140
Monitoring Events	5-142
Searching Events	5-144
Monitoring Failure Objects	5-144
Monitoring Events for Rogue APs	5-145
Monitoring Events for Adhoc Rogues	5-146
Monitoring Cisco Adaptive wIPS Events	5-147
Monitoring CleanAir Air Quality Events	5-147
Viewing Air Quality Event Details	5-148
Monitoring Interferer Security Risk Events	5-149
Viewing Interferer Security Risk Event Details	5-150

- Monitoring Health Monitor Events 5-150
- Viewing Health Monitor Event Details 5-151
- Working with Events 5-151
- Monitoring Site Maps 5-152
- Monitoring Google Earth Maps 5-152
- 5-152

CHAPTER 6

Monitoring Maps 6-1

- Information About Maps 6-2
 - Maps 6-2
 - Campus 6-3
 - Building 6-3
 - Floor Area 6-3
 - Outdoor Area 6-4
 - Access Points 6-4
 - Chokepoints 6-4
 - Wi-Fi TDOA Receivers 6-4
 - Map Editor 6-4
- Guidelines and Limitations 6-5
 - Guidelines for Using the Map Editor 6-5
 - Guidelines for Placing Access Points 6-5
 - Guidelines for Inclusion and Exclusion areas on a Floor 6-7
- Monitoring Maps 6-8
 - Configuring Maps 6-8
 - Viewing a Map 6-8
 - Editing a Map 6-10
 - Deleting a Map 6-10
 - Copying a Map 6-11
 - Exporting a Map 6-12
 - Importing a Map 6-13
 - Editing Map Properties 6-14
 - Filtering Maps 6-15
 - Configuring Buildings 6-16
 - Adding a Building to a Campus Map 6-16
 - Viewing a Building 6-21
 - Editing a Building 6-21
 - Deleting a Building 6-22
 - Moving a Building 6-22
 - Configuring Campus 6-23

Adding a Campus Map	6-23
Viewing a Campus Map	6-24
Editing a Campus Map	6-24
Deleting a Campus Map	6-25
Configuring Outdoor Areas	6-25
Adding an Outdoor Area	6-25
Editing Outdoor Areas	6-27
Deleting Outdoor Areas	6-27
Configuring Floor Areas	6-28
Adding Floor Areas to a Campus Building	6-28
Adding Access Points to a Floor Area	6-34
Editing Floor Areas	6-39
Deleting Floor Areas	6-39
Placing Access Points	6-40
Configuring Floor Settings	6-41
Import Map and AP Location Data	6-53
Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File	6-54
Changing Access Point Positions by Importing and Exporting a File	6-55
Configuring ChokePoints	6-56
Using Chokepoints to Enhance Tag Location Reporting	6-56
Adding Chokepoints to the NCS Database	6-56
Adding a Chokepoint to a NCS Map	6-57
Positioning Chokepoints	6-58
Removing Chokepoints from the NCS Database and Map	6-59
Configuring WiFi TDOA Receivers	6-59
Adding WiFi TDOA Receivers to the NCS Database	6-60
Adding WiFi TDOA Receivers to a Map	6-60
Positioning WiFi TDOA Receivers	6-60
Removing WiFi TDOA Receivers from the Map	6-61
Removing WiFi TDOA Receivers from the NCS Database	6-61
Managing RF Calibration Models	6-62
Access Current Calibration Models	6-63
Apply Calibration Models to Maps	6-63
Calibration Model Properties	6-63
Calibration Model Details	6-63
Create New Calibration Models	6-64
Start Calibration Process	6-64
Calibrating	6-67
Apply to Maps	6-67

Delete Calibration Models	6-67
Managing Location Presence Information	6-68
Searching Maps	6-69
Using the Map Editor	6-69
Opening Map Editor	6-70
Using the Map Editor to Draw Polygon Areas	6-70
Defining an Inclusion Region on a Floor	6-73
Defining an Exclusion Region on a Floor	6-74
Defining a Rail Line on a Floor	6-75
Inspecting Location Readiness and Quality	6-76
Inspect Location Readiness	6-76
Inspecting Location Quality Using Calibration Data	6-76
Inspect VoWLAN Readiness	6-77
Troubleshooting Voice RF Coverage Issues	6-78
Monitoring Mesh Networks Using Maps	6-78
Monitoring Mesh Link Statistics Using Maps	6-78
Monitoring Mesh Access Points Using Maps	6-81
Monitoring Mesh Access Point Neighbors Using Maps	6-83
Viewing the Mesh Network Hierarchy	6-85
Using Mesh Filters to Modify Map Display of Maps and Mesh Links	6-87
Monitoring Tags Using Maps	6-89
Using Planning Mode	6-89
Accessing Planning Mode	6-89
Using Planning Mode to Calculate Access Point Requirements	6-90
Refresh Options	6-97
Creating a Network Design	6-98
Designing a Network	6-98
Importing or Exporting WLSE Map Data	6-102
Monitoring Device Details	6-103
Access Point Details	6-103
Client Details	6-105
Tag Details	6-106
Rogue Access Point Details	6-106
Rogue Adhoc Details	6-107
Rogue Client Details	6-107
Interferer Details	6-107
Floor View Navigation	6-108
Understanding RF Heatmap Calculation	6-109

Monitoring Google Earth Maps	6-111
Creating an Outdoor Location Using Google Earth	6-112
Understanding Geographical Coordinates for Google Earth	6-112
Creating and Importing Coordinates in Google Earth (KML File)	6-113
Creating and Importing Coordinates as a CSV File	6-115
Importing a File into NCS	6-116
Viewing Google Earth Maps	6-117
Viewing Google Earth Map Details	6-117
Adding Google Earth Location Launch Points to Access Point Pages	6-117
Google Earth Settings	6-118

CHAPTER 7

Managing NCS User Accounts	7-1
Managing NCS User Accounts	7-1
Adding NCS User Accounts	7-2
Deleting NCS User Accounts	7-3
Changing Passwords	7-4
Monitoring Active Sessions	7-4
Viewing or Editing User Account Information	7-5
Setting the Lobby Ambassador Defaults	7-6
Viewing or Editing Group Information	7-7
Editing the Guest User Credentials	7-8
Viewing the Audit Trail	7-8
Audit Trail Details Page	7-9
Creating Guest User Accounts	7-9
Logging in to the NCS User Interface as a Lobby Ambassador	7-10
Managing NCS Guest User Accounts	7-11
Scheduling NCS Guest User Accounts	7-11
Printing or E-mailing NCS Guest User Details	7-13
Saving Guest Accounts on a Device	7-13
Editing the Guest User Credentials	7-13
Adding a New User	7-14
Adding User Names, Passwords, and Groups	7-14
Assigning a Virtual Domain	7-15
Managing Lobby Ambassador Accounts	7-16
Creating a Lobby Ambassador Account	7-17
Editing a Lobby Ambassador Account	7-18
Logging in to the NCS User Interface as a Lobby Ambassador	7-19
Logging the Lobby Ambassador Activities	7-19

CHAPTER 8

Configuring Mobility Groups 8-1

- Information About Mobility 8-1
- Symmetric Tunneling 8-5
- Overview of Mobility Groups 8-5
 - When to Include Controllers in a Mobility Group 8-7
 - Messaging among Mobility Groups 8-7
- Configuring Mobility Groups 8-8
 - Prerequisites 8-8
 - Setting the Mobility Scalability Parameters 8-11
- Mobility Anchors 8-12
 - Configuring Mobility Anchors 8-13
- Configuring Multiple Country Codes 8-14
- Configuring Controller Config Groups 8-16
 - Adding New Group 8-17
 - Configuring Config Groups 8-18
 - Adding or Removing Controllers from a Config Group 8-18
 - Adding or Removing Templates from the Config Group 8-20
 - Applying or Scheduling Config Groups 8-20
 - Auditing Config Groups 8-21
 - Rebooting Config Groups 8-22
- Reporting Config Groups 8-22
- Downloading Software 8-23
 - Downloading IDS Signatures 8-23
 - Downloading Customized WebAuth 8-24

CHAPTER 9

Configuring Devices 9-1

- Configuring Controllers 9-1
 - Understanding the Controller Audit Report 9-3
 - Adding Controllers 9-4
 - Bulk Update of Controller Credentials 9-7
 - Removing Controllers from NCS 9-8
 - Rebooting Controllers 9-8
 - Downloading Software to Controllers 9-9
 - Download Software (FTP) 9-9
 - Download Software (TFTP) 9-11
 - Configure *IPAddr* Upload Configuration/Logs from Controller 9-13
 - Downloading IDS Signatures 9-14
 - Downloading a Customized WebAuthentication Bundle to a Controller 9-15

Downloading a Vendor Device Certificate	9-16
Downloading a Vendor CA Certificate	9-17
Saving the Configuration to Flash	9-18
Refreshing the Configuration from the Controller	9-18
Discovering Templates from the Controller	9-19
Updating Credentials in NCS	9-19
Viewing Templates Applied to a Controller	9-20
Using the Audit Now Feature	9-20
Viewing the Latest Network Audit Report	9-22
Configuring Existing Controllers	9-23
Viewing Controllers Properties	9-23
Configuring Controller System Parameters	9-25
Managing General System Properties for Controllers	9-25
Configuring Controller System Commands	9-31
Restoring Factory Defaults	9-33
Setting Controller Time and Date	9-34
Uploading Configuration/Logs from Controllers	9-34
Downloading Configurations to Controllers	9-35
Downloading Software to a Controller	9-35
Downloading a Web Admin Certificate to a Controller	9-36
Downloading IDS Signatures	9-37
Downloading a Customized Web Auth Bundle to a Controller	9-37
Configuring Controller System Interfaces	9-38
Adding an Interface	9-39
Viewing Current Interface Details	9-40
Deleting a Dynamic Interface	9-41
Configuring Controller System Interface Groups	9-41
Adding an Interface Group	9-41
Deleting an Interface Group	9-42
Viewing Interface Groups	9-43
NAC Integration	9-43
Configuring Wired Guest Access	9-46
Creating an Ingress Interface	9-48
Creating an Egress Interface	9-48
Configuring Controller Network Routes	9-49
Viewing Existing Network Routes	9-49
Configuring Controller Spanning Tree Protocol Parameters	9-50
Configuring Controller Mobility Groups	9-50
Configuring Controller Network Time Protocol	9-53
Background Scanning on 1510s in Mesh Networks	9-53

- Configuring Controller QoS Profiles 9-56
- Configuring Controller DHCP Scopes 9-56
- Configuring Controller User Roles 9-57
- Configuring a Global Access Point Password 9-59
- Configuring Global CDP 9-59
- Configuring AP 802.1X Supplicant Credentials 9-60
- Configuring Controller DHCP 9-61
- Configuring Controller Multicast Mode 9-62
- Configuring Access Point Timer Settings 9-63
- Configuring Controller WLANs 9-64
 - Viewing WLAN Details 9-65
 - General Tab 9-65
 - Security Tab 9-66
 - QoS Tab 9-70
 - Advanced Tab 9-70
 - Adding a WLAN 9-73
 - Deleting a WLAN 9-74
 - Managing WLAN Status Schedules 9-75
 - Mobility Anchors 9-76
- Configuring WLANs AP Groups 9-77
 - Adding Access Point Groups 9-77
 - Deleting Access Point Groups 9-78
 - Auditing Access Point Groups 9-79
- Configuring Hybrid REAP Parameters 9-79
 - Configuring H-REAP AP Groups 9-79
 - Auditing an H-REAP Group 9-81
- Configuring Security Parameters 9-81
 - Configuring Controller File Encryption 9-82
 - Configure Controllers > *IPaddr* > Security > AAA 9-82
 - Configuring AAA General Parameters 9-83
 - Configuring AAA RADIUS Auth Servers 9-83
 - Configuring AAA RADIUS Acct Servers 9-84
 - Configuring AAA RADIUS Fallback Parameters 9-85
 - Configuring AAA LDAP Servers 9-86
 - Configuring AAA TACACS+ Servers 9-87
 - Configuring AAA Local Net Users 9-88
 - Configuring AAA MAC Filtering 9-89
 - Configuring AAA AP/MSE Authorization 9-90
 - Configuring AAA Web Auth Configuration 9-91
 - Configuring AAA Password Policy 9-92

Configure Controllers > <i>IPaddr</i> > Security > Local EAP	9-93
Configuring Local EAP General Parameters	9-93
Configuring Local EAP Profiles	9-94
Configuring Local EAP General EAP-FAST Parameters	9-96
Configuring Local EAP General Network Users Priority	9-96
Configuring User Login Policies	9-97
Managing Manually Disabled Clients	9-97
Configuring Access Control Lists	9-98
Configure <i>IPaddr</i> > Access Control List > <i>listname</i> Rules	9-98
Configuring CPU Access Control Lists	9-99
Configuring the IDS Sensor List	9-100
Configuring CA Certificates	9-100
Configuring ID Certificates	9-101
Configure Controllers > <i>IPaddr</i> > Security > Web Auth Certificate	9-102
Configuring Wireless Protection Policies	9-102
Configuring Rogue Policies	9-103
Configuring Rogue AP Rules	9-104
Configuring Client Exclusion Policies	9-104
Configuring IDS Signatures	9-105
Configuring Controller Standard Signature Parameters	9-105
Configuring Custom Signatures	9-109
Configuring AP Authentication and MFP	9-109
Configuring Cisco Access Points	9-110
Sniffer feature	9-111
Configuring 802.11 Parameters	9-112
Configuring General Parameters for an 802.11 Controller	9-112
Configuring Aggressive Load Balancing	9-113
Configuring Band Selection	9-115
Configuring 802.11 Media Parameters	9-116
Configuring 802.11a/n Parameters	9-117
Configuring 802.11a/n General Parameters	9-117
Configuring 802.11a/n RRM Thresholds	9-119
Configuring 802.11a/n RRM Intervals	9-119
Configuring 802.11a/n RRM Transmit Power Control	9-120

INDEX

Preface

The preface provides an overview of the *Cisco Prime Network Control System Configuration Guide, Release 1.0*, references related publications, and explains how to obtain other documentation and technical assistance, if necessary. This chapter contains the following sections:

- [Audience, page lv](#)
- [Purpose, page lv](#)
- [Conventions, page lv](#)
- [Related Publications, page lvi](#)
- [Obtaining Documentation and Submitting a Service Request, page lvi](#)

Audience

This guide describes the Cisco Prime Network Control System (NCS). It is meant for networking professional, who use NCS to manage a Cisco Unified Network Solution. To use this guide, you should be familiar with the concepts and terminology associated with wired and wireless LANs.

Purpose

This guide provides the information you need to manage a Cisco Unified Network Solution using NCS.

Note

This guide pertains specifically to NCS Release 1.0. Earlier versions of NCS or WCS software may look and operate somewhat differently.

Conventions

This publication uses the following conventions to convey instructions and information:

- Commands and keywords are in **boldface** text.
- Variables are in *italicized* text.
- Examples depict screen displays and the command-line in `screen` font.
- Information you need to enter in examples is shown in **boldface screen** font.

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to material not contained in the manual.

**Caution**

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Related Publications

For more information about NCS and related products, see the following website:

<http://www.cisco.com/cisco/web/psa/default.html>

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

CHAPTER 1

Cisco NCS Overview

This chapter describes the Cisco Unified Network Solution and the Cisco NCS. It contains the following sections:

- [The Cisco Unified Network Solution, page 1-1](#)
- [About NCS, page 1-2](#)
- [NCS Licenses, page 1-3](#)
- [Cisco Unified Network Components, page 1-6](#)
- [Access Point Communication Protocols, page 1-9](#)
- [NCS Services, page 1-11](#)

The Cisco Unified Network Solution

The Cisco Unified Network Solution provides both wired and 802.11 wireless networking solutions for enterprises and service providers. It simplifies the deployment and management of large-scale wired and wireless LANs and enables you to create a unique best-in-class security infrastructure. The operating system manages all client data, communications, and system administration functions, performs radio resource management (RRM) functions, manages system-wide mobility policies using the operating system security solution, and coordinates all security functions using the operating system security framework.

The Cisco Unified Network Solution consists of Cisco Managed Switches, Cisco Unified Wireless Network Controllers (hereafter called *controllers*), and their associated lightweight access points controlled by the operating system, all concurrently managed by any or all of the following operating system user interfaces:

- An HTTPS full-featured web user interface hosted by Cisco controllers can be used to configure and monitor individual controllers.
- A full-featured command-line interface (CLI) can be used to configure and monitor individual controllers.
- NCS can be used to configure and monitor one or more controllers and associated access points. NCS has tools to facilitate large-system monitoring and control. It runs on predefined physical appliance and on specific virtual deployments.
- An industry-standard SNMP V1, V2c, and V3 interface can be used with any SNMP-compliant third-party network management system.

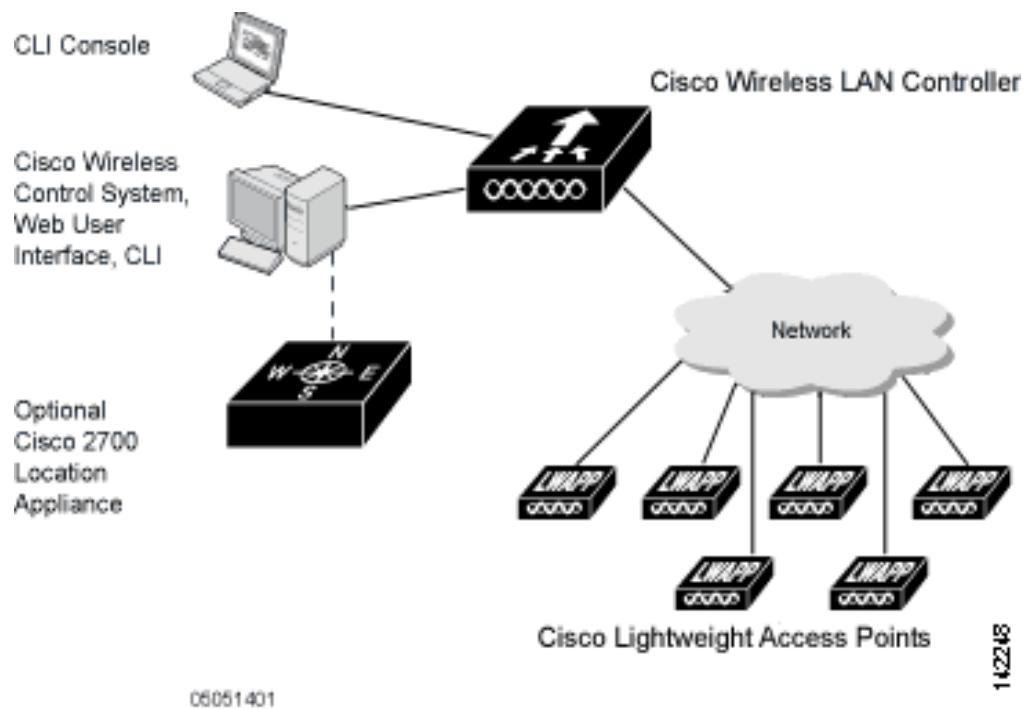

The Cisco Unified Network Solution supports client data services, client monitoring and control, and all rogue access point detection, monitoring, and containment functions. It uses lightweight access points, controllers, and the optional NCS to provide wireless services to enterprises and service providers.

**Note**

Unless specified otherwise, information pertaining to controllers applies to all Cisco Unified Wireless Network Controllers, including but not limited to Cisco 2000 and 2100 Series Unified Wireless Network Controllers, Cisco 4100 Series Unified Wireless Network Controllers, Cisco 4400 Series Unified Wireless Network Controllers, Cisco 5500 Series Wireless LAN Controllers, and controllers within the Cisco Wireless Services Module (WiSM) and Cisco 26/28/37/38xx Series Integrated Services Routers.

Figure 1-1 shows the Cisco Unified Network Solution components, which can be simultaneously deployed across multiple floors and buildings.

Figure 1-1 Cisco Unified Network Solution

About NCS

The Cisco Prime Network Control System (NCS) is a Cisco LAN Solution network management tool that adds to the capabilities of the Web User Interface and the command-line interface (CLI). NCS enables you to manage a network of controllers.

NCS enables you to configure and monitor one or more controllers, switches and associated access points. NCS includes the same configuration, performance monitoring, security, fault management, and accounting options used at the controller level and adds a graphical view of multiple controllers and managed access points.

NCS runs on Red Hat Linux Enterprise Server 5.X 64-bit installations. On Linux, NCS runs as a service, which runs continuously and resumes running after a reboot.

You must use Internet Explorer 7.0 with chrome plugins or later to control all permitted Cisco Unified Network Solution configuration, monitoring, and control functions through Internet Explorer 7.0 with the Flash plug-in, or Mozilla Firefox 3.5 or later. The administrator defines permissions from the Administration menu, which also enables the administrator to manage user accounts and schedule periodic maintenance tasks.

**Note**

We strongly recommend you do not enable third-party browser extensions. In Internet Explorer, you can disable third-party browser extensions by choosing **Tools > Internet Options** and unselecting the **Enable third-party browser extensions** check box on the Advanced tab.

NCS simplifies controller configuration and monitoring and reduces data entry errors. NCS uses the industry-standard SNMP protocol to communicate with the controllers.

NCS also includes the Floor Plan editor which allows you to do the following:

- Vectorized bitmap campus, floor plan, and outdoor area maps.
- Add and change wall types.
- Import the vector wall format maps into the database.

**Note**

The vector files allow the Cisco NCS RF Prediction Tool to make better RF predictions based on more accurate wall and window RF attenuation values.

NCS Licenses

NCS is deployed through physical or virtual appliances, you will use the standard License Center Graphical User Interface to add new licenses, which will be locked by the standard Cisco Unique Device Identifier (UDI). When NCS is deployed on a virtual appliance, the licensing is similar to physical appliance, except instead of using a UDI, you will use a Virtual Unique Device Identifier (VUDI).

**Note**

If you want to move licenses from one physical appliance to another, you will need to call the Licensing TAC and rehost the licenses to a new UDI.

NCS License is recognized by the SKU, which is usually attached to every purchase order to clearly identify which software or package is purchased by a customer. The different NCS license options are described in this section. This section contains the following topics:

- [NCS Evaluation License, page 1-4](#)
- [NCS Device Count License, page 1-4](#)
- [NCS Upgrade License, page 1-4](#)
- [NCS Migration License, page 1-5](#)

NCS Evaluation License

NCS can be used in a lab, or in an evaluation with the following license: NCS-DEMO-10. This provides an evaluation license for 10 number of devices, and for a duration of 30 days. If you need a custom device count or duration, please contact your Cisco representative.

NCS Device Count License

NCS uses a single-tier licensing structure that includes all features and functionality in a single tier. Part numbers are purchased based on number of devices to be managed. Part numbers are available to support 50, 100, 500, 1000, 2500, 5000 or 10000 devices; where both an AP and a Switch are considered a single managed device.

NCS Device Count license is of the following:

You can either choose physical appliance or virtual appliance for NCS setup. If you choose the option of ordering the physical appliances, you will be shipped with PRIME-NCS-APL-K9 along with a PAK for the license quantity you ordered. That is, if you are ordering L-NCS-1.0-1K with PRIME-NCS-APL-K9 SKU, you will get a physical NCS appliance, plus a PAK for managing 1000 devices.

If you choose the virtual appliance option, download the virtual NCS image and get the L-NCS-1.0-X PAK mailed to you once it has been ordered.

If you want to add more devices into your network, you can get the L-NCS-1.0-X-ADD SKU for X devices. The L-NCS-1.0-X-ADD are identical licenses supplied. The only difference is that these SKUs are for additional licenses and they do not come with physical or virtual activation.

The larger license quantities, specifically 1K, 2.5K, 5K, and 10K are shipped in smaller increments to allow the licenses to be split across different NCS instances.

NCS Upgrade License

The L-NCS-2.0-UPGRADE-X-ADD SKU is used to upgrade NCS 1.X to NCS 2.X. Upgrades come in the following counts: 50, 100, and 500, 1K, 2.5K, 5K and 10K devices.

Once the lower-license level count is equaled or exceeded, the system considers the license for the next level. At this point new, lower-level licenses are not allowed, but additional higher-level licenses are allowed.

Note that a higher-level system allows lower-level licenses as long as there is no higher-level license or upgrade license present. This allows you to migrate licenses; take care to migrate the licenses in order from the lowest version to the highest version.

Consider a case where you are running NCS 3.0 and you have NCS 1.0, NCS 2.0, and NCS 3.0 licenses. You need to replace the current appliance with a new one and want to move the licenses, but not as part of a backup/restore process. You must first load all NCS 1.0 licenses, an NCS 2.0 Upgrade, the NCS 2.0 licenses, an NCS 3.0 Upgrade, and then all the NCS 3.0 licenses for the licenses to be applied correctly.

NCS Migration License

The NCS uses a single-tier license model. When Cisco WCS BASE or WCS PLUS licenses are being migrated, licenses will be mapped to the new Cisco Prime NCS single-tier model. This is a two stage process.

This section contains the following topics:

- [Obtaining the XML file from Existing WCS Deployment, page 1-5](#)
- [Uploading the XML file to the Cisco Migration Portal, page 1-5](#)
- [Applying the New License to Cisco Prime NCS, page 1-6](#)

The migration licenses that are generated from the Cisco migration portal basically have two levels of plus or base with a count, additionally there could be a spectrum expert license. These licenses are mapped to NCS 1.0 licenses of equivalent counts. For example, a WCS 7.0 Base 500 with Spectrum Expert licenses can be converted to an NCS 1.0 500 device license.

Obtaining the XML file from Existing WCS Deployment

To Obtain the XML file from the existing WCS deployment, follow these steps:

-
- Step 1** Log in to the WCS server (version 7.0.164.0 or higher) and choose **Administration > License Center**.

Note Apply the L-WCS-NCS1-M-K9 License first, before adding the licenses migrated from your WCS installation.

- Step 2** From the left sidebar menu, choose **File > WCS File**.

- Step 3** Select the WCS license you want to export, and click the **Export** button and save the XML file generated to your local machine.
-

Uploading the XML file to the Cisco Migration Portal

To upload the generated XML file to the Cisco Migration Portal, follow these steps:

-
- Step 1** Go to: <http://www.cisco.com/go/license>.

- Step 2** Scroll down to the Migration section and click the **Register for Upgrade/Migrate License** link.
 - Step 3** Choose **NCS 1.0** from the drop-down list, and click **Go to Upgrade/Migration License Portal**.
 - Step 4** Enter your Product ID and Serial Number.
 - Step 5** Open the generated XML file in a text editor and copy the contents of the file to the License Text box.
 - Step 6** Accept the end-user license agreement (EULA), verify your contact information, and click **Continue**.
 - Step 7** The Cisco Migration Portal generates the new license file and will e-mail the license to you.
-

Applying the New License to Cisco Prime NCS

As mentioned in step 7 under the “[Uploading the XML file to the Cisco Migration Portal](#)” section on [page 1-5](#), the license file is distributed to you in an email from Cisco. Do not edit the contents of the .lic file in any way or you will render the file useless

To apply the New License to Cisco Prime NCS, follow these steps:

- Step 1** Log in to the Cisco NCS.
- Step 2** Choose **Administration > License Center**.
- Step 3** Choose **File > NCS Files**.
- Step 4** Click **Add**, and then choose a license file.
- Step 5** Click **OK**.

Note Prior to migrating WCS licenses on Cisco Wireless LAN Solution Engine (WLSE), the solution needs to be running Cisco Wireless Control System 7.0.164.0 or later.

Note Cisco WLSE hardware will not support Cisco Prime NCS 1.0. Customers using the WLSE hardware to run WCS are required to purchase either the physical appliance option, or deploy the virtual appliance on your own hardware.

Cisco Unified Network Components

Cisco Unified Network Solutions ensures that your business achieves the highest level of network security and versatility. Cisco Unified Network Solutions empowers your network with the ability to offer secure wireless networking, either within your office for increased mobility or bridging between your office buildings. The following are the different network components in the Cisco Unified Network Solutions:

- [Cisco Prime NCS, page 1-7](#)
- [WLAN Controllers, page 1-7](#)
- [Access Points, page 1-7](#)

Cisco Prime NCS

With NCS, network administrators have a single solution for RF prediction, policy provisioning, network optimization, troubleshooting, user tracking, security monitoring, and wired and wireless LAN systems management. Robust graphical interfaces make wired and wireless LAN deployment and operations simple and cost-effective. Detailed trending and analysis reports make NCS vital to ongoing network operations.

WLAN Controllers

The WLAN Controllers is a highly scalable and flexible platforms that enables system wide services for mission-critical wireless in medium to large-sized enterprises and campus environments. Designed for 802.11n performance and maximum scalability, the WLAN controllers offer enhanced uptime with the ability to simultaneously manage from 5000 access points to 250 access points; superior performance for reliable streaming video and toll quality voice; and improved fault recovery for a consistent mobility experience in the most demanding environments.

NCS supports the Cisco wireless controllers that help reduce the overall operational expenses of Cisco Unified Networks by simplifying network deployment, operations, and management. The following WLAN Controllers are supported in NCS:

- Cisco 2700 Series Location Appliance
- Cisco 2000 Series Wireless LAN Controllers
- Cisco 2100 Series Wireless LAN Controllers
- Cisco 2500 Series Wireless Controllers
- Cisco 4400 Series Wireless LAN Controllers
- Cisco 5500 Series Wireless Controllers
- Catalyst 3750G Wireless LAN Controller Switches
- Cisco Wireless Services Modules (WiSMs) for Cisco Catalyst 6500 Series Switches
- Cisco Wireless Services Module 2 (WiSM2) for Cisco Catalyst 6500 Series Switches
- Cisco Wireless Controller on SRE for ISR G2 Routers
- Cisco Flex 7500 Series Wireless Controllers
- Cisco WLAN Controller Network Modules for Cisco Integrated Services Routers

Access Points

NCS supports the industry-leading performance access points for highly secure and reliable wireless connections for both indoor and outdoor environments. NCS supports a broad portfolio of access points targeted to the specific needs of all industries, business types, and topologies.

The following access points are supported in NCS:

- Cisco Aironet 1000, 1040, 1100, 1130, 1140, 1200, 1230, 1240, 1250, 1260, 1310, 1500, 1524, 3500i, 3500e, and 3500p Series Lightweight Access Points.
- Cisco Aironet 801, 1040, 1100, 1130, 1141, 1142, 1200, 1240, 1250, and 1260 Autonomous Access Points.
- Cisco 600 Series OfficeExtend Access Points.

- Cisco Aironet Access Points running Lightweight Access Point Protocol (LWAPP) or Control and Provisioning of Wireless Access Points protocol (CAPWAP).
- Cisco 1550 Series Mesh Access Points.

Embedded Access Points

NCS supports the AP801, which is the integrated access point on the Cisco 800 Series Integrated Services Routers (ISRs). This access point uses a Cisco IOS software image that is separate from the router Cisco IOS software image. It can operate as an autonomous access point that is configured and managed locally, or it can operate as a centrally managed access point using CAPWAP or LWAPP protocol. The AP801 is preloaded with both an autonomous Cisco IOS release and a recovery image for the unified mode.

When you want to use the AP801 with a controller, you must enable the recovery image for the unified mode on the access point by entering the CLI command on the router in privileged EXEC mode: **service-module wlan-ap 0 bootimage unified**.

Note If the **service-module wlan-ap 0 bootimage unified** command does not work, make sure that the software license is still current.

After enabling the recovery image, enter the CLI command on the router to shut down and reboot the access point: **service-module wlan-ap 0 reload**. After the access point reboots, it discovers the controller, downloads the full CAPWAP or LWAPP software release from the controller, and acts as a lightweight access point.

Note To use the CLI commands mentioned previously, the router must be running Cisco IOS Release 12.4(20)T or later. If you experience any problems, refer to the “Troubleshooting an Upgrade or Reverting the AP to Autonomous Mode” section in the Integrated Services Router configuration guide at this URL:

http://www.cisco.com/en/US/docs/routers/access/800/860-880-890/software/configuration/guide/admin_ap.html

To support CAPWAP or LWAPP, the router must be activated with at least the Cisco Advanced IP Services IOS license-grade image. A license is required to upgrade to this Cisco IOS image on the router. See this URL for licensing information:

http://www.cisco.com/en/US/docs/routers/access/sw_activation/SA_on_ISR.html

After the AP801 boots up with the recovery image for the unified mode, it requires an IP address to communicate with the controller and to download its unified image and configuration from the controller. The router can provide DHCP server functionality, the DHCP pool to reach the controller, and setup option 43 for the controller IP address in the DHCP pool configuration. Use the following configuration to perform this task.

```
ip dhcp pool pool_name
  network ip_address subnet_mask
  dns-server ip_address
  default-router ip_address
  option 43 hex controller_ip_address_in_hex
```

Example:

```
ip dhcp pool embedded-ap-pool
  network 209.165.200.224 255.255.255.224
  dns-server 209.165.200.225
  default-router 209.165.200.226
```

```
option 43 hex f104.0a0a.0a0f /* single WLC IP address (209.165.201.0) in hex format */
```

The AP801 802.11n radio supports lower power levels than the 802.11n radio in the Cisco Aironet 1250 series access points. The AP801 stores the radio power levels and passes them to the controller when the access point joins the controller. The controller uses the supplied values to limit the user configuration.

The AP801 can be used in hybrid-REAP mode. See the “[Configuring Hybrid REAP](#)” section on [page 12-1](#) for more information on hybrid REAP.

Note For more information about AP801, refer to the documentation for the Cisco 800 Series ISRs at this URL:http://www.cisco.com/en/US/products/hw/routers/ps380/tsd_products_support_series_home.html.

Access Point Communication Protocols

In controller software release 5.2 or later, Cisco lightweight access points use the IETF standard Control and Provisioning of Wireless Access Points Protocol (CAPWAP) to communicate between the controller and other lightweight access points on the network. Controller software releases prior to 5.2 use the Lightweight Access Point Protocol (LWAPP) for these communications.

CAPWAP, which is based on LWAPP, is a standard, interoperable protocol that enables a controller to manage a collection of wireless access points. CAPWAP is being implemented in controller software release 5.2 for these reasons:

- To provide an upgrade path from Cisco products that use LWAPP to next-generation Cisco products that use CAPWAP
- To manage RFID readers and similar devices
- To enable controllers to interoperate with third-party access points in the future

LWAPP-enabled access points are compatible with CAPWAP, and conversion to a CAPWAP controller is seamless. For example, the controller discovery process and the firmware downloading process when using CAPWAP are the same as when using LWAPP. The one exception is for Layer 2 deployments, which are not supported by CAPWAP.

Deployments can combine CAPWAP and LWAPP software on the controllers. The CAPWAP-enabled software allows access points to join either a controller running CAPWAP or LWAPP. The only exception is the Cisco Aironet 1140 Series Access Point, which supports only CAPWAP and therefore joins only controllers running CAPWAP.

Note The Cisco Aironet 1140 series and 3500 series access points associate only with CAPWAP controllers that run WLC versions 7.0 or later.

This section contains the following topics:

- [Guidelines and Restrictions for Using CAPWAP, page 1-10](#)
- [Cisco Wireless LAN Controller Autodiscovery, page 1-10](#)
- [The Controller Discovery Process, page 1-10](#)

Guidelines and Restrictions for Using CAPWAP

- CAPWAP and LWAPP controllers cannot be used in the same mobility group. Therefore, client mobility between CAPWAP and LWAPP controllers is not supported.
- If your firewall is currently configured to allow traffic only from access points using LWAPP, you must change the rules of the firewall to allow traffic from access points using CAPWAP.
- Make sure that the CAPWAP ports are enabled and are not blocked by an intermediate device that could prevent an access point from joining the controller.
- Any access control lists (ACLs) in your network might need to be modified if CAPWAP uses different ports than LWAPP.

Cisco Wireless LAN Controller Autodiscovery

In a Cisco Unified Network architecture, access points (APs) are lightweight. This means they cannot act independently of a wireless LAN controller (WLC). The access points have to first discover the WLCs and register with them before the AP services the wireless clients.

After the AP has registered to the controller, CAPWAP messages are exchanged and the AP initiates a firmware download from the controller (if there is a version mismatch between the AP and controller). If the AP's onboard firmware is not the same as the controller, the AP will download the latest firmware to stay in sync with the controller. The firmware download mechanism utilizes CAPWAP. Then, the controller provisions the AP with the configurations that are specific to the WLANs so that the AP can accept client associations.

Controller Autodiscovery is limited to the Cisco WLAN Solution mobility group subnets defined by the operator.

The Cisco Wireless LAN Controller Autodiscovery:

- Allows operators to search for a single controller by IP address.
- Finds the controller on the network within the specified IP address range.
- Automatically enters the controller information into the Cisco NCS database.

**Note**

Controller Autodiscovery can take a long time in a Class C address range. Because of the large number of addresses in a Class B or Class A range, we recommend that you do not attempt Autodiscovery across Class B or Class A ranges.

As access points associate with a controller, the controller immediately transmits the access point information to Cisco NCS, which automatically adds the access point to the database.

Once the access point information is added to the Cisco NCS database, operators can add the access point to the appropriate spot on a Cisco NCS user interface map.

The Controller Discovery Process

In a CAPWAP environment, a lightweight access point discovers a controller by using CAPWAP discovery mechanisms and then sends it a CAPWAP join request. The controller sends the access point a CAPWAP join response allowing the access point to join the controller. When the access point joins the controller, the controller manages its configuration, firmware, control transactions, and data transactions.

Lightweight access points must be discovered by a controller before they can become an active part of the network. The lightweight access points support these controller discovery processes:

- Layer 3 CAPWAP or LWAPP discovery—Can occur on different subnets from the access point and uses IP addresses and UDP packets rather than the MAC addresses used by Layer 2 discovery.
- Over-the-air provisioning (OTAP)—This feature is supported by Cisco 4400 series controllers. If this feature is enabled on the controller (in the controller General page), all associated access points transmit wireless CAPWAP or LWAPP neighbor messages, and new access points receive the controller IP address from these messages. This feature is disabled by default and should remain disabled when all access points are installed.
- Locally stored controller IP address discovery—If the access point was previously associated to a controller, the IP addresses of the primary, secondary, and tertiary controllers are stored in the non-volatile memory of an access point. This process of storing controller IP addresses on access points for later deployment is called *priming the access point*.
- DHCP server discovery—This feature uses DHCP option 43 to provide controller IP addresses to the access points. Cisco switches support a DHCP server option that is typically used for this capability.
- DNS discovery—The access point can discover controllers through your domain name server (DNS). For the access point to do so, you must configure your DNS to return controller IP addresses in response to CISCO-CAPWAP-CONTROLLER.*localdomain* or CISCO-LWAPP-CONTROLLER.*localdomain*, where *localdomain* is the access point domain name. When an access point receives an IP address and DNS information from a DHCP server, it contacts the DNS to resolve CISCO-CAPWAP-CONTROLLER.*localdomain* or CISCO-LWAPP-CONTROLLER.*localdomain*. When the DNS sends a list of controller IP addresses, the access point sends discovery requests to the controllers.

NCS Services

The IT departments within organizations are tasked with meeting increased bandwidth and performance demands, managing a proliferation of new mobile devices, while guaranteeing network access, availability, and regulatory compliance.

Cisco and its partners can work with IT staff to assist with migration to the Cisco Unified Network, making it easier to manage a secure, high-performance, and integrated wired and wireless network that incorporates rich media and diverse mobile devices, including Wi-Fi-enabled phones and tablets.

NCS provides the following Services:

- [Cisco Context Aware Service Solution, page 1-11](#)
- [Cisco Identity Service Engine Solution, page 1-12](#)
- [Cisco Adaptive Wireless Intrusion Prevention Service, page 1-13](#)

Cisco Context Aware Service Solution

Context Aware Service (CAS) provides the capability for a Wi-Fi 802.11a/b/g/n network to determine the location of a person or object with an active Wi-Fi device, such as a wireless client or active RFID tag and/or associated data that can be passed by the end point through the wireless infrastructure to an upstream client.

Context Aware Service (CAS) allows a Mobility Services Engine (MSE) to simultaneously track thousands of mobile assets and clients by retrieving contextual information such as location and availability from Cisco access points.

The collected contextual information can be viewed in GUI format in the NCS User Interface, the centralized WLAN management platform. NCS is the management system that interfaces with the MSE and serves user interface (UI) for the services that the MSE provides.

After installation of MSE and initial configurations are complete, the MSE can communicate with multiple Cisco wireless LAN controllers to collect operator-defined contextual information. You can then use the associated NCS to communicate with each MSE to transfer and display selected data.

You can configure the MSE to collect data for clients, switches, rogue access points, rogue clients, mobile stations, and active RFID asset tags.

With Context-Aware Location Services, administrators can determine the location of any 802.11-based device, as well as the specific type or status of each device. Clients (associated, probing, and so on.), rogue access points, rogue clients, and active tags can all be identified and located by the system. See [Context Aware Mobility Solution Deployment Guide](#) for more information.

Note One MSE can be managed by only one NCS, that is, a single MSE cannot be managed by multiple NCS's, but a single NCS can manage multiple MSEs. When the number of devices to be managed exceeds the capacity of a single MSE, you need to deploy multiple, independent MSEs.

Cisco Identity Service Engine Solution

The Cisco Identity Services Engine (ISE) is a next-generation identity and policy-based network access platform that enables enterprises to enforce compliance, enhance infrastructure security, and streamline their service operations.

The Cisco ISE provides a single console where authentication, authorization, posture, guest, and profiling policies can be created and managed. In addition, policy elements can now be reused across all services, reducing the number of tasks and overhead and bringing consistency to the enterprise.

The Cisco ISE gathers information from devices, the infrastructure, and services to enable organizations to build richer contextual policies that can be enforced centrally across the network. The ISE tracks all clients and devices connected to the network, acting as a single source of information for connected user and device identity and location, as well as the health of the endpoint.

The ability to discover, identify, and monitor all IP-enabled endpoint devices gives IT teams complete visibility of both users and “headless” devices on the corporate network.

The Cisco ISE combines AAA, posture, profiling, and guest management capabilities in a single appliance to enforce dynamic access control. The Identity Services Engine can be deployed across the enterprise infrastructure, supporting 802.1x wired, wireless, and VPN networks.

NCS manages the wired and the wireless clients in the network. When Cisco ISE is used as a RADIUS server to authenticate clients, NCS collects additional information about these clients from Cisco ISE and provides all client relevant information to NCS to be visible in a single console.

When posture profiling is enforced in the network, NCS talks to Cisco ISE to get the posture data for the clients and displays it along with other client attributes. When Cisco ISE is used to profile the clients or an endpoint in the network, NCS collects the profiled data to determine what type of client it is, whether it is an iPhone, iPad, an Android device, or any other device.

Cisco ISE is assisting NCS to monitor and troubleshoot client information, and displays all the relevant information for a client in a single console.

Cisco Adaptive Wireless Intrusion Prevention Service

Maintain a constant awareness of your RF environment to minimize legal liability, protect your brand reputation, and assure regulatory compliance.

Cisco Adaptive Wireless Intrusion Prevention System (IPS) offers advanced network security for dedicated monitoring and detection of wireless network anomalies, unauthorized access, and RF attacks. Fully integrated with the Cisco Unified Network, this solution delivers integrated visibility and control across the network, without the need for an overlay solution.

Cisco Adaptive Wireless Intrusion Prevention Service (wIPS) performs rogue access point, rogue client, and ad-hoc connection detection and mitigation, over-the-air wireless hacking and threat detection, security vulnerability monitoring, performance monitoring and self-optimization, network hardening for proactive prevention of threats and complete wireless security management and reporting.

Cisco's wIPS is made up of the following components that work together to provide a unified security monitoring solution.

- A mobility services engine (MSE) running wIPS software-Serves as the central point of alarm aggregation for all controllers and their respective wIPS monitor mode access points. Alarm information and forensic files are stored on the mobility services engine for archival purposes.
- An wIPS monitor mode access point-Provides constant channel scanning with attack detection and forensics (packet capture) capabilities.
- Local mode access point-Provides wireless service to clients in addition to time-sliced rogue scanning.
- Wireless LAN Controller-Forwards attack information received from wIPS monitor mode access points to the mobility services engine and distributes configuration parameters to access points.
- Network Control System-Provides a centralized management platform for the administrator to configure the wIPS Service on the mobility services engine, push wIPS configurations to the controller, and configure access points in wIPS monitor mode. NCS is also used to view wIPS alarms, forensics, reporting, and to access the attack encyclopedia.

CHAPTER 2

Getting Started

This chapter describes information on system requirements, setting up and starting the NCS. The NCS is an application used to configure, manage, and monitor the wired and wireless networks. This chapter contains the following sections:

- [NCS Delivery Modes, page 2-1](#)
- [Reinstalling NCS on Physical Appliance, page 2-5](#)
- [Deploying the NCS Virtual Appliance, page 2-5](#)
- [Setting Up NCS, page 2-9](#)
- [Starting the NCS Server, page 2-10](#)
- [Logging into the NCS User Interface, page 2-11](#)
- [Applying the NCS Software License, page 2-12](#)
- [Understanding NCS Home Page, page 2-13](#)
- [Using the Search Feature, page 2-33](#)

NCS Delivery Modes

Cisco NCS comes preinstalled on a physical appliance with various performance characteristics. The NCS software runs on either a dedicated Cisco Prime Network Control System appliance or on a VMware server. The NCS software image does not support the installation of any other packages or applications on this dedicated platform. The inherent scalability of NCS allows you to add appliances to a deployment and increase performance and resiliency.

NCS is delivered in two modes, the Physical Appliance and Virtual Appliance. This section contains the following topics:

- [Physical Appliance, page 2-2](#)
- [Virtual Appliance, page 2-2](#)
- [Operating Systems Requirements, page 2-3](#)
- [Client Requirements, page 2-4](#)
- [Prerequisites, page 2-4](#)

Physical Appliance

The Physical Appliance is a dual Intel 2.40GHz Xeon E5620 quad core processor, with 16 GB RAM, and four hard drives running in a RAID level 5 configuration. The appliance will run the latest 64bit Red Hat Linux Operating System.

The Physical Appliance supports up to 15000 Cisco Aironet lightweight access points, 5000 standalone access points, 5000 switches and 1200 Cisco wireless LAN controllers.

Note To receive the expected results with NCS, you should run on High performance Physical appliance with built-in redundancy for hard disks, power supplies and internal cooling fans.

For more information on the Physical Appliance, see *Cisco Prime Network Control System Getting Started Guide, Release 1.0*.

Virtual Appliance

NCS is also offered as a Virtual Appliance, to help support lower level deployments. Cisco NCS can be run on a workstation or a server, and access points can be distributed unevenly across controllers.

The NCS Virtual Appliance software is distributed as an Open Virtualization Archive (OVA) file. There are three recommended levels of NCS distribution with different resources, and numbers of devices supported.

This section contains the following topics:

- [Virtual Appliance for Large Deployment, page 2-2](#)
- [Virtual Appliance for Medium Deployment, page 2-3](#)
- [Virtual Appliance for Small Deployment, page 2-3](#)

Note You can deploy the OVA file directly from the vSphere Client; you do not need to extract the archive before performing the deployment.

You can install NCS Virtual Appliance using any of the method for deploying an OVF supported by the VMware environment. Before starting, make sure that the NCS Virtual Appliance distribution archive is in a location that is accessible to the computer on which you are running the vSphere Client.

Note For more information about setting up your VMware environment, see the VMware vSphere 4.0 documentation.

Virtual Appliance for Large Deployment

- Supports up to 15000 Cisco Aironet lightweight access points, 5000 standalone access points, 5000 switches and 1200 Cisco wireless LAN controllers.
- 8 Processors at 2.93 GHz or better.
- 16-GB RAM.
- 400 GB minimum free disk space is needed on your hard drive.

Note The free disk space listed is a minimum requirement but may be different for your system, depending on the number of backups.

Virtual Appliance for Medium Deployment

- Supports up to 7500 Cisco Aironet lightweight access points, 2500 standalone access points, 2500 Switches and 600 Cisco wireless LAN controllers.
- 4 Processors at 2.93 GHz or better.
- 12-GB RAM.
- 300 GB minimum free disk space is needed on your hard drive.

Virtual Appliance for Small Deployment

- Supports up to 3000 Cisco Aironet lightweight access points, 1000 standalone access points, 1000 Switches and 240 Cisco wireless LAN controllers.
- 2 Processors at 2.93 GHz or better.
- 8-GB RAM.
- 200 GB minimum free disk space is needed on your hard drive.

Note For all server levels, AMD processors equivalent to the listed Intel processors are also supported.

Note The free disk space listed is a minimum requirement, but several variables (such as backups) impact the disk space.

Note If you want to use a Cisco UCS Server to deploy a virtual appliance for Cisco Prime NCS, you can use the UCS C-Series or B-Series. Make sure the server you pick matches to the Processor, RAM and Hard Disk requirements specified in [“Virtual Appliance” section on page 2-2](#) deployment.

Operating Systems Requirements

The following operating systems are supported:

- Red Hat Linux Enterprise Server 5.4 64-bit operating system installations are supported.

Note You cannot install NCS on a standalone operating system, like Red Hat Linux, as NCS is shipped as a physical or a virtual appliance that comes preinstalled with a secure and hardened Operating System.

- Red Hat Linux version support on VMware ESX version 3.0.1 and later with either local storage or SAN over fiber channel.

- The recommended deployments for virtual appliance are UCS and ESX/ESXi.

Note Individual operating systems running NCS in VMware must follow the specifications for the size of NCS that you intend to use.

Client Requirements

The Cisco NCS user interface requires Microsoft Internet Explorer 7.0 or later with the Google Chrome plugin or Mozilla Firefox 3.6 or later releases. Microsoft Internet Explorer 6.0 is not supported.

Note We strongly advise that you do not enable third-party browser extensions. In Internet Explorer, you can disable third-party browser extensions by choosing **Tools > Internet Options** and unselecting the **Enable third-party browser extensions** check box from the Advanced tab.

The client running the browser must have a minimum of 1 GB of RAM and a 2-GHz processor. The client device should not be running any CPU or memory-intensive applications.

Note The minimum screen resolution that is recommended for NCS and use it as 1024 x 768 pixels.

Prerequisites

Before installing Cisco NCS, ensure that you have completed the following:

- Meet the necessary hardware and software requirements for Cisco NCS.
- Check the Compatibility Matrix for supported Controller, IOS versions.
- Update your system with the necessary critical updates and service packs.

Note See the latest release notes for information on the service packs and patches required for correct operation of Cisco NCS.

- To receive the expected results, you should run no more than 3 concurrent NCS setups for standard server use (4 GB memory and 3 GHz CPU speed) and no more than 5 concurrent NCS setups for high-end server use (8 GB memory and 3 GHz CPU speed).
- Verify that the following ports are open during installation and startup:
 - HTTP: configurable during install (80 by default)
 - HTTPS: configurable during install (443 by default)
 - 1315
 - 1299
 - 6789
 - 8009
 - 8456
 - 8005

- 69
- 21
- 162
- 8457

**Note**

Make sure your firewall rules are not restrictive. You can check the current rules on Linux with the built-in iptables -L command.

Reinstalling NCS on Physical Appliance

You must have root privileges to install NCS on Physical Appliance.

- Step 1** Insert the NCS software Image DVD provided to you. The system boots up and the following console screen appears.

```
ISOLINUX 3.11 2005-09-02 Copyright (C) 1994-2005 H. Peter Anvin
```

```
Welcome to Cisco Prime Network Control System
```

```
To boot from hard disk, press <Enter>.
```

```
Available boot options:
```

```
[1] Network Control System Installation (Keyboard/Monitor)
[2] Network Control System Installation (Serial Console)
[3] Recover administrator password. (Keyboard/Monitor)
[4] Recover administrator password. (Serial Console)
<Enter> Boot existing OS from Hard Disk.
```

```
Enter boot option and press <return>.
```

```
boot:
```

- Step 2** Select the option 1 to reinstall the NCS software Image. The system will reboot and take you to configure appliance screen.
- Step 3** Enter the initial setup parameters and the system will reboot again. Remove the DVD and follow the steps to start the NCS server.

Deploying the NCS Virtual Appliance

This section describes how to deploy NCS Virtual Appliance both from the vSphere Client using the Deploy OVF Wizard or from the command line.(VMware vSphere Client, a Windows application for managing and configuring the vCenter Server) This section contains the following topics:

- [Deploying the NCS Virtual Appliance from the VMware vSphere Client, page 2-6](#)
- [Deploying NCS Virtual Appliance using the Command Line Client, page 2-9](#)

Deploying the NCS Virtual Appliance from the VMware vSphere Client

NCS Virtual Image is packaged as an OVA file. An OVF is a collection of items in a single archive. In the vSphere Client, you can use the Deploy OVF Wizard to create a virtual machine, running the NCS Virtual Appliance application, as described in this section.

Note While the following procedure provides a general guideline for how to deploy NCS Virtual Appliance, the exact steps that you need to perform may vary depending on the characteristics of your VMware environment and setup.

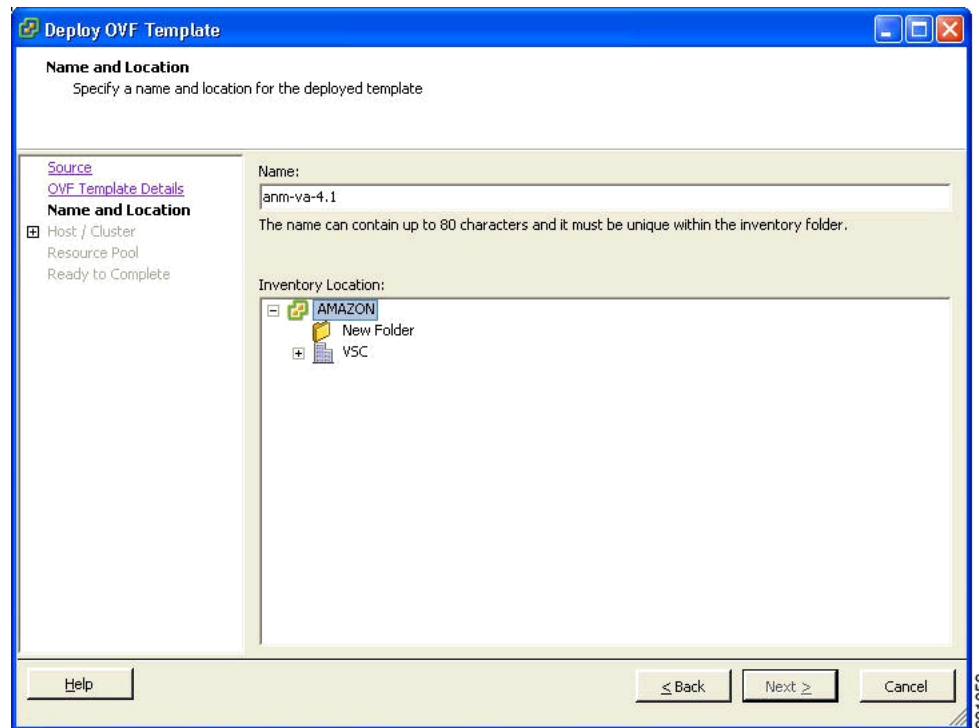

To deploy the NCS Virtual Appliance, follow these steps:

- Step 1** From the VMware vSphere Client main menu, choose **File > Deploy OVF Template**. The Deploy OVF Template Source window appears: (See [Figure 2-1](#))

Figure 2-1 Deploy OVF Template window

- Step 2** Choose **Deploy from file** and choose the OVA file that contains the NCS Virtual Appliance distribution.
- Step 3** Click **Next**. The OVF Template Details window appears. VMware ESX/ESXi reads the OVA attributes. The details include the product you are installing, the size of the OVA file (download size), and the amount of disk space that needs to be available for the virtual machine (size on disk).
- Step 4** Verify the OVF Template details and click **Next**. The Name and Location window appears (See [Figure 2-2](#)).

Figure 2-2 Name and Location window

- Step 5** Either keep the default name for the VM to be deployed in the Name text box or provide a new one and click **Next**. This name value is used to identify the new virtual machine in the VMware infrastructure so you should use any name that distinguishes this particular VM in your environment. The Host / Cluster window appears (see [Figure 2-3](#)).

Figure 2-3 Host/Cluster Window

- Step 6** Choose the destination host or HA cluster on which you want to deploy the NCS VM and click **Next**. The Resource Pool window appears.
- Step 7** If you have more than one resource pool in your target host environment, choose the resource pool to use for the deployment and click **Next**. The Ready to Complete window appears.
- Step 8** Review the settings shown for your deployment and, if needed, click the **Back** button to modify any of the settings shown.
- Step 9** Click **Finish** to complete the deployment. A message notifies you when the installation completes and you can see the NCS Appliance in your inventory.
- Step 10** Click **Close** to dismiss the Deployment Completed Successfully dialog box.

Configuring the Basic Settings for NCS Virtual Appliance

You have completed deploying (installing) NCS Virtual Appliance on a new virtual machine. A node for the virtual machine now appears in the resource tree in the VMware vSphere Client window. Deploying the OVF template creates a new virtual machine in vCenter with the NCS Virtual Appliance application and related resources already installed on it. After deployment, you need to configure basic settings for NCS Virtual Appliance. To start the NCS setup, follow these steps:

- Step 1** In the vSphere Client, click the NCS Virtual Appliance node in the resource tree. The virtual machine node should appear in the Hosts and Clusters tree below the host, cluster, or resource pool to which you deployed NCS Virtual Appliance.

- Step 2** On the Getting Started tab, click the **Power on the virtual machine** link under Basic Tasks. The Recent Tasks pane at the bottom of the vSphere Client pane indicates the status of the task associated with powering on the virtual machine. After the virtual machine successfully starts, the status column for the task displays Completed.
- Step 3** Click the **Console** tab, within the console pane to make the console prompt active for keyboard input.
-

Now you need to set up the virtual appliance, as described in [Setting Up NCS, page 2-9](#) section.

Deploying NCS Virtual Appliance using the Command Line Client

This section describes how to deploy the NCS Virtual Appliance from the command line. As an alternative to using the vSphere Client to deploy the NCS OVA distribution, you can use the VMware OVF Tool, which is a command-line client.

To deploy an OVA with the VMware OVF Tool, use the **ovftool** command, which takes the name of the OVA file to be deployed and the target location as arguments, as in the following example:

```
ovftool NCS-VA-X.X.X-large.ova vi://my.vmware-host.example.com/
```

In this case, the OVA file to be deployed is NCS-VA-X.X.X-large.ova and the target ESX host is my.vmware-host.example.com. For complete documentation on the VMware OVF Tool, see the VMware vSphere 4.0 Documentation.

Setting Up NCS

This section describes how to configure the initial settings of the NCS Virtual Appliance.

Note These steps need to be performed only once, upon first installation of NCS Virtual Appliance.

To configure the basic network and login settings for the NCS Virtual Appliance system, follow the below steps. When the steps are completed, the NCS Virtual Appliance is accessible over the network.

Note Once you put the NCS Image DVD in the physical appliance for reinstallation, you will get the same console prompt. Use the following steps to reinstall NCS for the physical appliance.

- Step 1** At the login Prompt, enter **setup**.

```
localhost.localdomain login: setup
```

The NCS configuration script starts. The script takes you through the initial configuration steps for NCS Virtual Appliance. In the first sequence of steps, you configure network settings.

- Step 2** As prompted, enter the following settings:
- Hostname for the virtual appliance.
 - IP address for the virtual appliance.
 - IP default subnet mask for the IP address entered.

- d. IP address of the default gateway for the network environment in which you are creating the virtual machine.
 - e. Default DNS domain for the target environment.
 - f. IP address or hostname of the primary IP nameserver in the network.
 - g. At the Add/Edit another nameserver prompt, you can enter y (yes) to add additional nameservers, if desired. Otherwise, press Enter to continue.
 - h. NTP server location (or accept the default by pressing Enter). At the Add/Edit secondary NTP server prompt, you can enter y (yes) to add another NTP server. Otherwise, enter n (no) to continue.
- Step 3** Enter the username for the user account used to access the Cisco NCS system running on the virtual machine. The default username is admin, but you can change this to another username by typing it here.
- Step 4** Enter the password for NCS. The password must be at least eight characters and must include both lowercase and uppercase letters and at least one number. It cannot include the username or default Cisco passwords. After you enter the password, the script verifies the network settings you configured. For instance, it attempts to reach the default gateway that you have configured.

After verifying the network settings, the script starts the NCS installation processes. This process can take several minutes, during which there is no screen feedback. When finished, the following banner appears on the screen:

```
=== Initial Setup for Application: NCS ===
```

After this banner, it starts with database scripts and reboots the server as shown in the console:

```
Running database cloning script...
logger: invalid option -- l
usage: logger [-is] [-f file] [-p pri] [-t tag] [-u socket] [ message ... ]
Running database creation script...
logger: invalid option -- l
usage: logger [-is] [-f file] [-p pri] [-t tag] [-u socket] [ message ... ]
Setting Timezone, temporary workaround for DB...
Generating configuration...
Rebooting...
```

Note If you are installing a physical appliance, remove the ISO DVD from the DVD tray.

- Step 5** Log in as admin and enter the admin password.
- Step 6** Exit the console using the **exit** command.
-

Starting the NCS Server

This section provides instructions to start NCS on either a physical appliance or virtual appliance.

Note To check the status of NCS at any time, follow the instructions in the [“Verifying the Status of NCS” section on page 4-6](#).

To start the NCS server, follow these steps:

Step 1 Once you have setup NCS, rebooted the server and login as admin.

Step 2 Enter the following command to start the NCS Server.

```
ncs start
```

Logging into the NCS User Interface

To log into the NCS user interface through a web browser, follow these steps:

Step 1 Launch Internet Explorer 7.0 or later or Mozilla Firefox 3.6 or later on a different computer than the one on which you installed and started NCS.

Note When you use Firefox 3.x to log in and access NCS for the first time, the Firefox web browser displays a warning that the site is untrustable. When Firefox displays this warning, follow the prompts to add a security exception and download the self-signed certificate from the NCS server. After you complete this procedure, Firefox accepts the NCS server as a trusted site both now and during all future login attempts.

Step 2 In the address line of browser, enter *https://ncs-ip-address*, where *ncs-ip-address* is the IP address of the server on which you installed and started NCS. The NCS user interface displays the Login page.

Step 3 Enter your username. The default username is *root*.

Step 4 Enter the root password you created during setup.

Note If any licensing problems occur, a message appears in an alert box. If you have an evaluation license, the number of days until the license expires is shown. You are also alerted to any expired licenses. You have the option to go directly to the licensing page to address these problems.

Step 5 Click **Login** to log into NCS. The NCS user interface is now active and available for use. The NCS home page appears. The NCS home page enables you to choose the information that you want to see. You can organize the information in user-defined tabs called dashboards. The default view comes with default dashboards and pre-selected dashlets for each, and you can arrange them as you like. You can predefine what appears on the home page by choosing the monitoring dashlets that are critical for your network. For example, you may want different monitoring dashlets for a mesh network so that you can create a customized mesh dashboard.

Note If the database or Apache web server does not start, check the launchout.txt file in Linux. You will see a generic “failed to start database” or “failed to start the Apache web server” message.

Note When an upgrade occurs, the user-defined tabs arranged by the previous user in the previous version are maintained. Therefore, the latest dashlets may not show. Look at the Edit dashboard link to find what new dashlets are added.

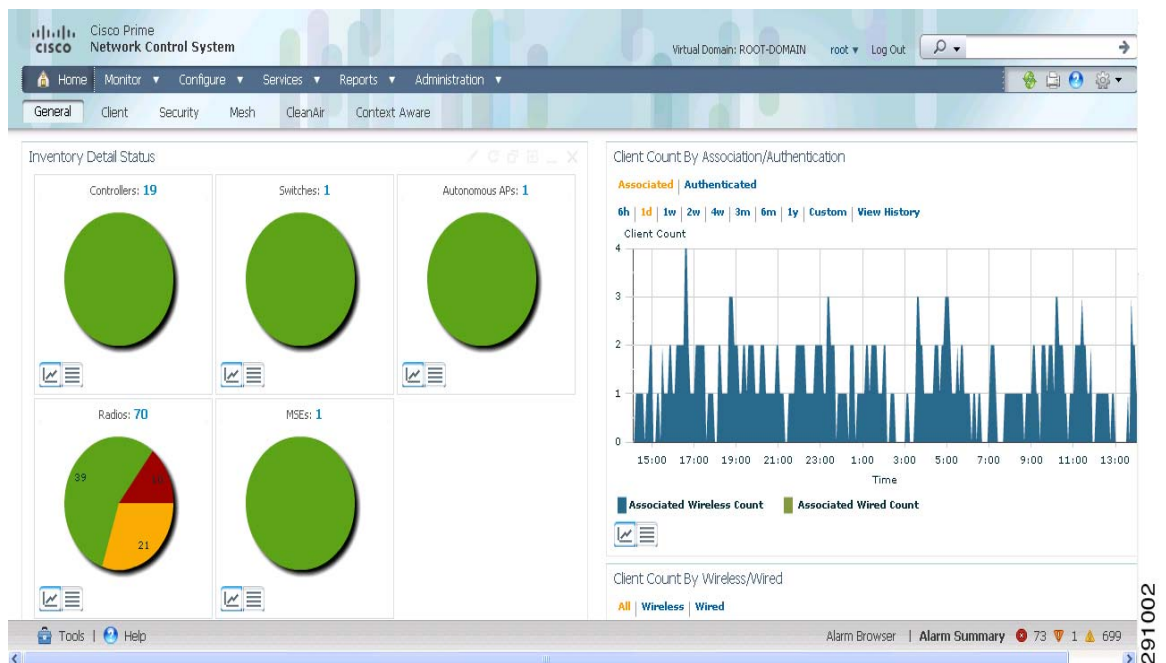

The home page provides a summary of the Cisco Unified Network Solution, including coverage areas, the most recently detected rogue access points, access point operational data, reported coverage holes, and client distribution over time. Figure 2-4 shows a typical NCS home page.

By default, you should see six dashboards on the NCS home page: General, Client, Security, Mesh, CleanAir and ContextAware dashboards.

Note When you use NCS for the first time, the network summary pages show that the Controllers, Coverage Areas, Most Recent Rogue APs, Top 5 APs, and Most Recent Coverage Holes databases are empty. It also shows that no client devices are connected to the system. After you configure the NCS database with one or more controllers, the NCS home page provides updated information.

Figure 2-4 NCS Home Page

To exit the NCS user interface, close the browser page or click **Log Out** in the upper-right corner of the page. Exiting an NCS user interface session does not shut down NCS on the server.

When a system administrator stops the NCS server during your NCS session, your session ends, and the web browser displays the message: “The page cannot be displayed.” Your session does not reassociate to NCS when the server restarts. You must restart the NCS session.

Applying the NCS Software License

This section describes how to apply a license to NCS. Before starting, make sure that you have already acquired the license from the Cisco License Center and put it in a location that is accessible by the network from NCS. To add a new NCS license file, follow these steps:

Step 1 In the Administrator menu, choose **License Center > Files > NCS Files** page, and click Add.

- Step 2** In the Add a License File dialog box, enter or browse to the applicable license file.
- Step 3** Once displayed in the License File text box, click **Upload**.
-

To add a new license, see [“Managing Licenses” section on page 15-123](#).

Understanding NCS Home Page

The NCS home page:

- enables the administrator to create and configure Cisco Unified Network Solution coverage area layouts, configure system operating parameters, monitor real-time Cisco Unified Network Solution operations, and perform troubleshooting tasks using an HTTPS web browser page.
- enables the administrator to create, modify, and delete user accounts; change passwords; assign permissions; and schedule periodic maintenance tasks. The administrator creates new usernames and passwords and assigns them to predefined permissions groups.
- allows the administrator to perform all necessary network administration tasks from one page. The NCS home page, is the landing page, displaying real-time monitoring and troubleshooting data. The navigation tabs and menus at the top of the page provide point-and-click access to all other administration features.

The NCS user interface provides an integrated network administration console from which you can manage various devices and services. These include wired and wireless devices and clients. The services may include authentication, authorization, profiler, location and mobility services as well as monitoring, troubleshooting, and reporting. All of these devices and services can be managed from a single console called the Cisco Prime NCS home page.

This section describes the NCS user interface page and contains the following topics:

- [Dashboards, page 2-13](#)
- [Icons, page 2-22](#)
- [Menu Bar, page 2-23](#)
- [Global Toolbar, page 2-26](#)
- [Alarm Summary, page 2-27](#)
- [Main Data Page, page 2-28](#)
- [Administrative Elements, page 2-28](#)

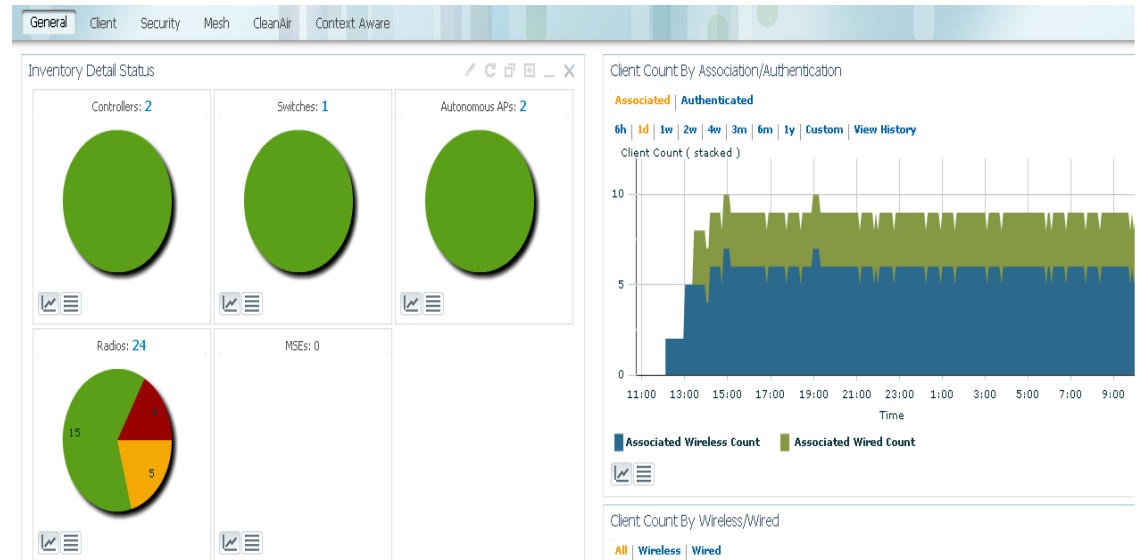

Dashboards

The NCS dashboards consist of dashlets and graphs that provide a visual overview of network health and security. The Dashboard elements visually convey complex information in a simplified format. This display allows you to quickly analyze the data and drill down for in-depth information if needed. Dashlets utilize a variety of elements to display data, including pie-charts, sparklines, stack bars, and metric meters.

The fundamental purpose of a dashboard is to provide an at-a-glance view of the most important parts of NCS. A quick scan of the dashboard should let you know if anything needs attention. Dashboard generally provides the status and alerts, monitoring and reporting information. Dashboards contain several dashlets, which are UI containers that display a variety of widgets, such as text, form elements, tables, charts, tabs, and nested content modules.

The dashboard displays the current status which reflects the status and usage of the network, like client distribution. The dashboard also displays the trend which reflects the usage and status over time which is from data collected over time, like client count.

Figure 2-5 Dashboards

Note

You must have Adobe Flash Player installed to view the dashlets on the NCS dashboard.

The six NCS dashboards are described in this section. This section contains the following topics:

- [General Dashboard, page 2-15](#)
- [Client Dashboard, page 2-16](#)
- [Security Dashboard, page 2-17](#)
- [Mesh Dashboard, page 2-18](#)
- [CleanAir Dashboard, page 2-18](#)
- [Context Aware Dashboard, page 2-21](#)

You can customize the predefined set of dashlets depending on your network management needs. You can organize the information in user-defined dashboards. The default view comes with default dashboards and pre-selected dashlets for each.

Note

- The label “**Edited**” next to the dashlet heading indicates that the dashlet has been customized. If you reset to the default settings, the Edited label is cleared. Hover your mouse cursor over the label see the edited information.
- When an upgrade occurs, the arrangement of dashlets in a previous version is maintained. Because of this, dashlets or features added in a new release are not displayed. Click the **Manage Dashboards** link to discover new dashlets.

- The horizontal and vertical scrollbars are visible if you zoom the dashlets. Reset the zoom level back to zero, or no zoom for viewing the dashlets without the scrollbars.

General Dashboard

Table 2-1 lists the factory default dashlets for the General dashboard.

Table 2-1 General Dashboard

Dashlet	Description
Inventory Detail Status	<p>Displays the following:</p> <ul style="list-style-type: none"> • Controllers—Lists the number of controllers that are managed in NCS. Graphically depicts reachable and unreachable controllers. • Switches—Lists the number of switches managed in NCS. Graphically depicts reachable and unreachable switches. • Radios—Lists the number of radios managed in NCS. Graphically depicts the number of radios in out-of-service (critical), minor, and ok conditions. This dashlet reflects ONLY the greatest radio alarm status, that is, if the radio has a minor alarm, and a critical alarm, then the radio status will show as critical. • Autonomous APs—Lists the number of Autonomous APs managed in NCS. Graphically depicts reachable and unreachable Autonomous APs. • MSEs—Lists the number of MSEs that are managed in NCS. Graphically depicts reachable and unreachable servers. Look at the installation log to verify that nothing went wrong while manually adding the servers to NCS. (The trace for MSEs must be turned on.) <p>Note Clicking on the corresponding sections of the chart will take you the item list view of the inventory.</p>
Device Uptime	Displays the devices based upon the device up time.
Coverage Area	Displays access points, radios, and client details for each coverage area.

Table 2-1 General Dashboard (continued)

Dashlet	Description
Client Count by Association/Authentication	<p>Displays the total number of clients by Association and authentication in NCS over the selected period of time.</p> <ul style="list-style-type: none"> Associated client—All clients connected regardless of whether it is authenticated or not. Authenticated client—All clients connected through an RADIUS or TACACS server. <p>Note Client count includes autonomous clients.</p>
Client Count by Wireless/Wired	<p>Displays the total number of clients by Wired and Wireless in NCS over the selected period of time.</p> <p>Note Client count includes autonomous clients.</p>
Top 5 Devices by Memory Utilization	Displays the Top 5 devices based upon memory utilization.
Recent Coverage Holes	Displays the five most recent coverage alarms.

Client Dashboard

Table 2-2 lists the factory default dashlets for the Client dashboard.

Table 2-2 Client Dashboard

Dashlet	Description
Client Troubleshooting	Allows you to troubleshoot a client by entering a client MAC address, then clicking Troubleshoot .
Client Distribution	<p>Displays the distribution of clients by protocol, EAP type, and authentication and the total current client count.</p> <ul style="list-style-type: none"> 802.3 represents wired clients 802.11 represents wireless clients <p>Note Clicking on the corresponding sections of the chart will take you the item list view of the clients and users.</p>
Client Alarms and Events Summary	Displays a summary of client alarms and events.
Client Traffic	Displays the trend of both upstream and downstream client traffic in a given time period.
Wired Client Speed Distribution	Displays the wired client speeds and the client count for each speed.
Top 5 SSIDs by Client Count	Displays the top 5 SSID client counts.

Table 2-2 *Client Dashboard (continued)*

Dashlet	Description
Top 5 Switches by Client Count	Displays the 5 switches that have the most clients as well as the number of clients associated to the switch.
Client Posture Status	Displays the client posture status and the number of clients in each of the following status: <ul style="list-style-type: none"> • Compliant • Non-compliant • Unknown • Pending • Not Applicable • Error

Security Dashboard

Table 2-3 lists the factory default dashlets for the Security dashboard.

Table 2-3 *Security Dashboard*

Dashlet	Description
Security Index	Indicates the security of the NCS managed network. The security index is calculated by assigning priority to the various security configurations and displaying them in visual form.
Malicious Rogue APs	Displays malicious rogue access points for the past hour, past 24 hours, and total active.
Unclassified Rogue APs	Displays unclassified rogue access points for the past hour, past 24 hours, and total active.
Friendly Rogue APs	Displays friendly rogue access points for the past hour, past 24 hours, and total active.
Adhoc Rogues	Displays ad hoc rogues for the past hour, past 24 hours, and total active.
CleanAir Security	Displays cleanair security events for past hour, 24 hours, and total active.
Attacks Detected	Displays wIPS and signature attacks for the past hour, past 24 hours, and total active.
Cisco Wired IPS Events	Displays Wired IPS events for the past hour, past 24 hours, and total active.
AP Threats/Attacks	Displays threats or attacks to access points for the past hour, past 24 hours, and total active.
MFP Attacks	Displays MFP attacks for the past hour, past 24 hours, and total active.
Client Security Events	Displays the client security events for the past hour, past 24 hours and total active.

Note The Rogue alarm which is set as informational, cannot be seen in the security dashboard.

Mesh Dashboard

Table 2-4 lists the factory default dashlets for the Mesh dashboard.

Table 2-4 *Mesh Dashboard*

Dashlet	Description
Most Recent Mesh Alarms	Displays the five most recent mesh alarms. Click the number in parentheses to access the Alarms page.
Mesh Worst SNR Links	Displays the worst signal-to-noise ratio (SNR) links. Data includes the Parent AP Name, the Child AP Name, and the Link SNR.
Mesh Worst Node Hop Count	Displays the worst node hop counts. Data includes the AP Name, the Hop Count, and the Parent AP Name.
Mesh Worst Packet Error Rate	Displays the worst packet error rates. Data includes the Parent AP Name, the Child AP Name, and the Packet Error Rate.

CleanAir Dashboard

Table 2-5 lists the factory default dashlets for the Mesh dashboard.

Table 2-5 *CleanAir Dashboard*

Dashlet	Description
802.11a/n Avg Air Quality	Provides a line chart representing the average air quality for the entire network over a set period of time. Displays the average air quality on the 802.11 a/n band. Data includes time and the average air quality.
802.11b/g/n Avg Air Quality	Provides a line chart representing the average air quality for the entire network over a set period of time. Displays the average air quality on the 802.11 b/g/n band. Data includes time and the average air quality.
802.11a/n Min Air Quality	Provides a line chart representing the minimum air quality for the entire network over a set period of time. Displays the minimum air quality on the 802.11 a/n band. Data includes time and the minimum air quality.

Table 2-5 *CleanAir Dashboard (continued)*

Dashlet	Description
802.11b/g/n Min Air Quality	Provides a line chart representing the minimum air quality for the entire network over a set period of time. Displays the minimum air quality on the 802.11 b/g/n band. Data includes time and minimum air quality.
Worst 802.11a/n Interferers	Provides a list of active interferers with the worst severity level for the 802.11 a/n band. The graph displays the top ten worst interferers that are currently active. Data includes InterfererID, Type, Status, Severity, Affected Channels, Duty Cycle(%), Discovered, Last Updated, and Floor.
Worst 802.11b/g/n Interferers	Provides a list of active interferers with the worst severity level for 802.11 b/g/n band. The graph displays the top ten worst interferers that are currently active. Data includes InterfererID, Type, Status, Severity, Affected Channels, Duty Cycle(%), Discovered, Last Updated, and Floor.
802.11a/n Interferer Count	<p>Provides a line chart representing the total number of interferers on all channels over the selected period of time. Displays the number of devices interfering in the 802.11 a/n band. Data includes time and interferer count.</p> <p>Note The air quality is calculated for all controllers in your network that have CleanAir-enabled access points. The report includes aggregated air quality data across your network.</p>

Table 2-5 CleanAir Dashboard (continued)

Dashlet	Description
802.11b/g/n Interferer Count	<p>Provides a line chart representing the total number of interferers on all channels over the selected period of time. Displays the number of devices interfering in the 802.11 b/g/n band. Data includes time and interferer count.</p> <p>Note The information in the worst interferer and interferer count charts is collected from Mobility Services Engines (MSE). If MSEs are not available, this chart will not show any results.</p>
Recent-Security risk Interferers	<p>Provides a list of active interferers with the worst severity level for each band. Displays the recent security risk interferers on your wireless network. Data includes Type, Severity, Affected Channels, Last Detected, Detected AP.</p> <p>Note This chart includes information for the interferers for which security alarms are enabled.</p> <p>You can also view the data presented on this dashlet in different formats.</p>

Context Aware Dashboard

Table 2-6 lists the factory default dashlets for the Context Aware dashboard.

Table 2-6 Context Aware Dashboard

Dashboard	Description
MSE Historical Element Count	<p>Displays the historical trend of tags, clients, rogue APs, rogue clients, interferers, wired clients, and guest client counts in a given period of time.</p> <p>Note The MSE Historical Count information is presented in a time-based graph. For graphs that are time-based, there is a link bar at the top of the graph page that displays 6h, 1d, 1w, 2w, 4w, 3m, 6m, 1y, and Custom. When selected, the data for that time frame is retrieved and the corresponding graph is displayed. See the “Time-Based Graphs” section on page 6-71 for more information.</p>
Rogue Elements detected by CAS	<p>Displays the indices of the Rogue APs and Rogue Clients in percentage. It also provides a count of the number of Rogue APs and Rogue Clients detected by each MSE within an hour, 24 hours as well as more than 24 hours.</p> <p>Rogue AP Index is defined as the percentage of total active tracked elements that are detected as Rogue APs across all the MSEs on NCS.</p> <p>Rogue Client Index is defined as the percentage of total active tracked elements that are detected as Rogue Clients across all the MSEs on NCS.</p>
Location Assisted Client Troubleshooting	<p>You can troubleshoot clients using this option with location assistance. You can provide either a MAC Address, Username or IP Address as the criteria for troubleshooting.</p> <p>Note Username, IP Address, and partial MAC address-based troubleshooting is supported only on MSEs with version 7.0.200.0 and later.</p> <p>For more information about Location Assisted Client Troubleshooting, see the “Location Assisted Client Troubleshooting from the Context-Aware Dashboard” section on page 12-77.</p>

Table 2-6 Context Aware Dashboard (continued)

Dashboard	Description
MSE Tracking Counts	Represents the tracked and not-tracked count of each of the element types. The element type includes tags, rogue APs, rogue clients, interferers, wired clients, wireless clients, and guest clients.
Top 5 MSEs	<p>Lists the top five MSEs based on the percentage of license utilization. It also provides count for each element type for each MSE.</p> <p>Note If you have installed NCS license but you have not added any MSE to NCS then the Context-Aware dashboard will be empty. However a message would be displayed with a link to add an MSE.</p> <p>In the dashlet, click the count link to get a detailed report.</p> <p>Use the icons in a dashlet to switch between chart and grid view.</p> <p>Use the Enlarge Chart icon to view the grid or chart in full screen.</p>

Icons

The icons on the dashlets and within the General, Client, Security, Mesh, CleanAir, and Context Aware dashboards have the following functions listed in [Table 2-7](#).

Table 2-7 Icon Representation

Icon	Description
	<p>The Dashlet Options icon enables you to customize and filter the data by using variables and search options. For example, you can search the client count trends for SSIDs, floor areas, controllers, specific autonomous APs and so on.</p> <p>Note Only some of the dashlets have these search by parameters.</p>
	The Refresh Dashlet icon enables you to automatically refresh the dashboard so that it reflects the current network status.
	The Detach Dashlet icon enables you to detach the dashlet.
	The Maximize Dashlet icon enables you to maximize the dashlet so that it is visible in full view.

Table 2-7 *Icon Representation*

Icon	Description
	The collapse Dashlet icon enables you to minimize the dashlet so that the dashlet is not visible.
	The View in Chart icon enables you to view the dashlet in chart rather than table form.
	The View in Grid icon enables you to view the dashlet in a table rather than chart form.

Menu Bar

The primary navigation is the menu from the top of the Cisco NCS page. Administrators can monitor and perform various tasks from the NCS menus. This menu is an easy-access pop-up menu that provides quick access to the sub menu that are associated with a primary menu. Hover your mouse cursor over the title of a menu to bring up the associated menu. Clicking the name links on the menu takes you directly to the feature page. The following illustration is an example of the NCS menu.

Figure 2-6 *NCS Primary Global Menu*

This section describes the menus and contains the following topics:

- [Monitor Menu, page 2-23](#)
- [Configure Menu, page 2-24](#)
- [Services Menu, page 2-25](#)
- [Reports Menu, page 2-25](#)
- [Administration Menu, page 2-25](#)

When you hover your mouse cursor over any of the five menu heading, a drop-down menu appears.

Monitor Menu

The Monitor menu provides you with a top-level description of your network devices. You can monitor your network, maps, google earth maps, network devices (controllers, switches, access points, clients, tags, chokepoints, Wi-Fi TDOA receivers), RRM, alarms, and events.

The following submenu options are available from the Monitor menu:

- Monitoring Devices
 - [Monitoring Controllers](#)

- [Monitoring Switches](#)
- [Monitoring Access Points](#)
- [Monitoring RFID Tags](#)
- [Monitoring Chokepoints](#)
- [Monitoring Interferers](#)
- [Monitoring WiFi TDOA Receivers](#)
- [Monitoring Radio Resource Management \(RRM\)](#)
- [Monitoring Clients and Users](#)
- [Monitoring Alarms and Events](#)
 - [Monitoring Alarms](#)
 - [Monitoring Events](#)
- [Monitoring Maps](#)
 - [Monitoring Maps](#)
 - [Monitoring Google Earth Maps](#)

Configure Menu

The Configure menu enables you to configure templates, controllers, access points, switches, chokepoints, Wi-Fi TDOA receivers, config groups, auto provisioning, scheduled configuration tasks, profiles, ACS view servers, and TFTP servers on your network.

The following submenu options are available from the Configure drop-down menu:

- [Configuring Devices](#)
 - [Configuring Controllers](#)
 - [Configuring Switches](#)
 - [Configuring Unknown Devices](#)
 - [Configuring Access Points](#)
 - [Configuring Chokepoints](#)
 - [Configuring Spectrum Experts](#)
 - [Configuring WiFi TDOA Receivers](#)
- [Configuring Scheduled Configuration Tasks](#)
- [Configuring Controller Auto Provisioning](#)
- [Configuring wIPS Profiles](#)
- [Configuring Templates](#)
 - [Accessing Controller Template Launch Pad](#)
 - [Configuring Lightweight Access Point Templates](#)
 - [Configuring Autonomous Access Point Templates](#)
 - [Configuring Switch Location Configuration Templates](#)
 - [Configuring Autonomous AP Migration Templates](#)
- [Configuring Controller Config Groups](#)

- [Configuring Servers](#)
 - [Configuring ACS View Servers](#)
 - [Configuring TFTP Servers](#)

Services Menu

The Services menu enables you to manage mobility services including mobility services engines and Identity Service Engines.

The following submenu options are available from the Services drop-down menu:

- [Mobility Services](#)
 - [Viewing Current Mobility Services](#)
 - [Synchronizing Services](#)
 - [Viewing Synchronization History](#)
 - [Viewing the Notifications Summary for Mobility Services](#)
- [Identity Services](#)

Reports Menu

The Reports menu provides the following submenu options:

- [Report Launch Pad](#)
- [Managing Scheduled Run Results](#)
- [Managing Saved Report Templates](#)

Administration Menu

The Administration menu enables you to schedule tasks like making a backup, checking a device status, auditing your network, synchronizing the MSE, and so on. It also contains Logging to enable various logging modules and specify restart requirements. For user administration such as changing passwords, establishing groups, setting application security settings, and so on, choose AAA. From the Administration Menu, you can also access the licensing information, set user preferences, and establish high availability (a secondary backup device running NCS).

The following submenu options are available from the Administration drop-down menu:

- [Performing Background Tasks](#)
- [Configuring Virtual Domains](#)
- [Configuring Administrative Settings](#)
- [Setting User Preferences](#)
- [Viewing Appliance Details](#)
- [Configuring AAA](#)
- [Establishing Logging Options](#)
- [Configuring High Availability](#)
- [Managing Licenses](#)

Global Toolbar

The Global Toolbar is always available at the bottom of the NCS page, providing instantaneous access to the Tools, NCS online Help system and a summary of alarm notifications. Hover your mouse cursor over the Help icon to access the available online Help.

Hover your mouse cursor over the Alarms Browser to display the summarized Alarms page, with a list of recent system alarms and the ability to filter for alarms of a specific nature. You can also drill down for detailed information on individual alarms. For more information on Alarms, see [Alarm Summary, page 2-27](#).

Figure 2-7 Global Toolbar

This section contains the following topics:

- [Tools, page 2-26](#)
- [Help, page 2-26](#)

Tools

The Tools menu provides access to the Voice Audit, Configuration Audit, and Migration Analysis features of NCS.

The following submenu options are available from the Tools drop-down menu:

- Configuring [Voice Audit](#)
- Configuring [Location Accuracy Tool](#)
- [Configuring Audit Summary](#)
- [Configuring Migration Analysis](#)
- Configuring TAC Case Attachments

Help

The Help menu allows you to access online help, learning modules, submit feedback, and to verify the current version of NCS. The Help icon is located in the bottom left corner of the Global Toolbar in the NCS page. The Help provides quick access to the comprehensive online help for NCS.

The following submenu options are available from the Help drop-down menu:

- **Online Help**—enables you to view online help. The online help is context sensitive and will open to documentation for the NCS window that you currently have open.
- **Learning Modules**—allows you to access short video clips of certain NCS features. To learn more about Cisco NCS features and functionality, go to [Cisco.com](#) to watch multimedia presentations about NCS configuration workflow, monitoring, troubleshooting, and more. Over future releases, more overview and technical presentations will be added to enhance your learning.
- **MSE Installation Guide**—provides links to the MSE installation section.
- **Submit Feedback**—allows you to access a page where you can enter feedback on the NCS.

- Help Us Improve Cisco Products—allows you to enable and provide permission to automatic collect data about how you and your organization use your Cisco wireless products, this data will be useful to improve product performance and usability. The data will be automatically collected and sent to Cisco in encrypted form. The data may contain information about your organization and it will not be shared or used outside of Cisco.

Note To get the automated feedback enabled, you have to configure your Mail Server Configuration by choosing **Administration > Settings > Mail Server Configuration**.

- About Cisco NCS—allows you to verify the version of NCS that you are running. It provides the version, host name, feature, AP limit, and type.

To verify the version of NCS, choose **About Cisco NCS**. The following information is displayed:

- Product Name
- Version Number
- Host Name
- Feature
- AP Limit
- License Type
- Copyright statement

Alarm Summary

When NCS receives an alarm message from a controller, it displays an alarm indicator at the bottom of the NCS page (see [Figure 2-8](#)). Alarms indicate the current fault or state of an element that needs attention, and they are usually generated by one or more events. The alarm can be cleared but the event remains. The Critical (red), Major (orange) and Minor (yellow) alarms appear in the alarm dashboard, left to right.

Note The Administration > Settings > Alarms page has a Hide Acknowledged Alarms check box. You must unselect it if you want acknowledged alarms to appear in the NCS and alarms lists page. By default, acknowledged alarms are not shown.

Figure 2-8 NCS Alarm Summary

Note Alarm counts are refreshed every 15 seconds.

Command Buttons

The Cisco NCS user interface uses a number of command buttons throughout its pages. The most common of these are as follows:

- Apply: Applies the selected information

- Delete: Deletes the selected information
- Cancel: Cancels new information entered on the current page and returns to the previous page
- Save: Saves the current settings
- Audit: Discovers the present status of this access point
- Place AP: Audits the configuration of the selected entity by flagging the differences between NCS database device configurations

Main Data Page

The main data page is determined by the required parameter information. Active areas on the data pages include the following:

- Text boxes into which data may be entered using the keyboard
- Drop-down lists from which one of several options may be chosen
- Check boxes in lists allow you to choose one or more items from the displayed list
- Radio buttons allow you to turn a parameter on or off
- Hyperlinks take you to other pages in the Cisco NCS user interface

Input text boxes are black text on a white background. When data is entered or selected, it is not sent to the controller, but it is saved in the text box until you click **Go**.

Administrative Elements

The following provides information regarding the current NCS user:

- User—Indicates the username for the current NCS user. Click the User link to change the user password. See the “[Changing Password](#)” section on page 15-128 for more information.
- Virtual Domain—Indicates the current virtual domain for this NCS user. See the “[Configuring Virtual Domains](#)” section on page 18-1 for more information.

Note

To switch domain names, click the blue inverted triangle to the right of the virtual domain name to open the Switch to another Virtual Domain page. Select the new virtual domain radio button and click **Save**. Your privileges are changed accordingly.

Icon	Description
	Click to access the NCS online help. Note The online help provides information applicable to your current NCS version.
	Click to update the data in the current NCS version.

Icon	Description
	Click to access a print-friendly version of the current NCS. Note Click Print to print the current NCS version or Exit Print View to return to the previous page.
	Click to edit the dashboard or to add a new dashboard in NCS.

Customizing NCS Home Page

NCS home page dashlets, contains default predefined list of dashlets which you can customize. The following customization are possible in the NCS home page:

- drag-and-drop dashlets
- add or delete dashboards
- reordering dashboards
- renaming dashlets and dashboards
- customize layout

Note You can add or delete dashlets by selecting from the predefined list.

You can customize the home page with time-based or non-time-based interactive graphs which you can display in grid or chart format (by clicking the appropriate icon). These graphs refresh automatically within a predetermined time based on the default polling cycles of dependent tasks, or you can click the Refresh dashlet icon to get the most current status. You can click the Enlarge Chart icon to enlarge the graph in a separate page.

This section contains the following topics:

- [Editing NCS Home Page, page 2-29](#)
- [Adding Dashlets, page 2-30](#)
- [Adding a New Dashboard, page 2-32](#)

Editing NCS Home Page

To customize the NCS home page dashlets, follow these steps:

-
- Step 1** On the NCS home page, click the Edit Dashboard icon. The drop-down list appears.
- Step 2** Click the Add dashlets link, which lists the available dashlets drop-down list. Add the desired dashlet by clicking the **Add** link in the right column. The dashlet is added to the appropriate dashboard.
- Step 3** Click **Apply**.
-

Adding Dashlets

Table 2-7 lists the default dashlet options you can add in your NCS home page.

Table 2-8 **Default Dashlets**

Dashlet	Description
AP Join Taken Time	Displays the access point name and the amount of time (in days, minutes, and seconds) that it took for the access point to join.
AP Threats/Attacks	Displays various types of access point threats and attacks and indicates how many of each type have occurred.
AP Uptime	Displays each access point name and amount of time it has been associated.
Ad hoc Rogues	Displays ad hoc rogues for the previous hour, previous 24 hours, and total active.
Cisco Wired IPS Events	Displays wired IPS events for the previous hour, previous 24 hours, and total active.
Client	Displays the five most recent client alarms with client association failures, client authentication failures, client WEP key decryption errors, client WPA MIC errors, and client exclusions.
Client Authentication Type	Displays the number of clients for each authentication type.
Client Count	Displays the trend of associated and authenticated client counts in a given period of time.
Client Distribution	Displays how clients are distributed by protocol, EAP type, and authentication type.
Client EAP Type Distribution	Displays count based upon the EAP type.
Client Protocol Distribution	Displays the current client count distribution by protocols.
Client Security Events	Displays client security events within the previous 24 hours including excluded client events, WEP decrypt errors, WPA MIC errors, shunned clients, and IPsec failures.
Client Traffic	Displays the trend of client traffic in a given time period.
Client Troubleshooting	Allows you to enter a MAC address of a client and retrieve information for diagnosing the client in the network.
Clients Detected by Context Aware Service	Displays the client count detected by the context aware service within the previous 15 minutes.
Controller CPU Utilization (%)	Displays the average, maximum, and minimum CPU usage.
Controller Memory Utilization	Displays the average, maximum, and minimum memory usage as a percentage for the controllers.

Table 2-8 *Default Dashlets (continued)*

Dashlet	Description
Coverage Areas	Displays the list coverage areas and details about each coverage area.
Friendly Rogue APs	Displays friendly rogue access points for the previous hour, previous 24 hours, and total active.
Guest Users Count	Displays Guest client count over a specified time.
Inventory Detail Status	Displays the Chart summarizing the status for the following device types. - Controllers - Switches - Autonomous APs - Radios - MSEs
Inventory Status	Displays the total number of client controllers and the number of unreachable controllers.
LWAPP Uptime	Displays the access point name and the amount of its uptime in days, minutes, and seconds.
Latest 5 Logged in Guest Users	Displays the most recent guest users to login.
Mesh AP by Hop Count	Displays the APs based upon hop count.
Mesh AP Queue Based on QoS	Displays the APs based upon QoS.
Mesh Parent Changing AP	Displays the worst Mesh APs based upon changing parents.
Mesh Top Over Subscribed AP	Displays the considered over subscribed APs.
Mesh Worst Node Hop Count2-28	Displays the Worst AP node hop counts from the root AP.
Mesh Worst Packet Error Rate	Displays the worst Mesh AP links based upon the packet error rates of the links.
Mesh Worst SNR Link	Displays the worst Mesh AP links based upon the SNR values of the links.
Most Recent AP Alarms	Displays the five most recent access point alarms. Click the number in parentheses to open the Alarms page which shows all alarms.
Most Recent Client Alarms	Displays the most recent client alarms.
Most Recent Mesh Alarms	Displays the most recent mesh alarms
Most Recent Security Alarms	Displays the five most recent security alarms. Click the number in parentheses to open the Alarms page.
Recent 5 Guest User Accounts	Displays the most recent guest user accounts created or modified.

Table 2-8 Default Dashlets (continued)

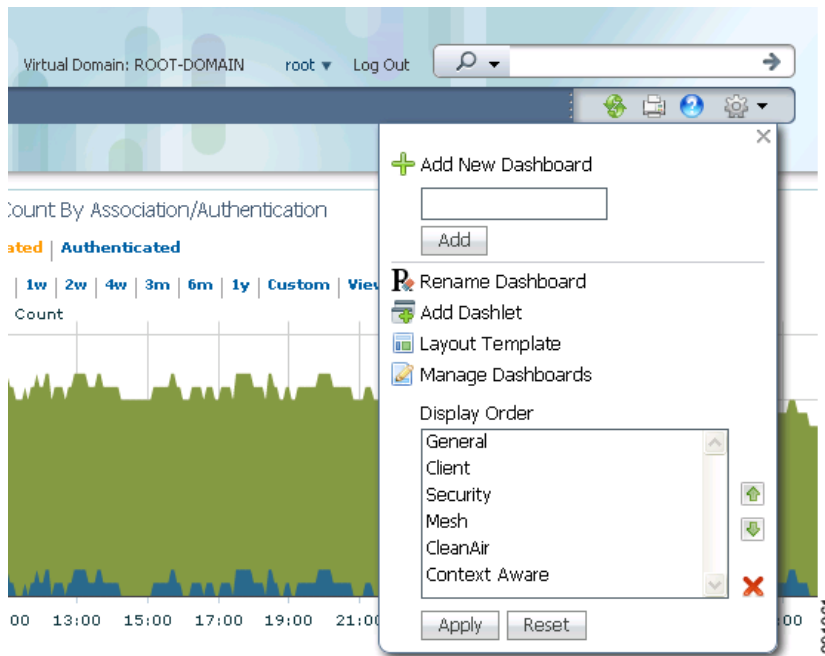

Dashlet	Description
Recent Alarms	Displays the five most recent alarms by default. Click the number in parentheses to open the Alarms page.
Recent Coverage Holes	Displays the recent coverage hole alarms listed by access point.
Recent Malicious Rogue AP Alarms	Displays the recent malicious rogue AP alarms.
Recent Rogue Alarms	Displays the five most recent rogue alarms. Click the number in parentheses to open the Alarms page which shows alarms.
Security Index	Displays the security index score for the wireless network. Security index is calculated as part of 'Configuration Sync' background task.
Top APs by Client Count	Displays the Top APs by client count are displayed.
Unclassified Rogue APs	Displays unclassified rogue access points for the previous hour, previous 24 hours, and total active.

Adding a New Dashboard

To create a new dashboard, follow these steps:

- Step 1** Click the **Edit Dashboard** icon on NCS home page. The Edit Dashboard menu appears (see [Figure 2-9](#)).

Figure 2-9 Edit Dashboard

Step 2 Enter the name of the new dashboard you are creating, and click **Add**. The dashboard name you just added appears in the Display Order list.

Note Add is the only function that does not require a Save after its operation. If you click **X**, Move Up, or Move Down, you must click **Apply** for the changes to be applied.

Step 3 You can add dashlets to the new dashboard. For more information see the “Adding Dashlets” section on page 2-30.

Note If you want to return to the restored factory defaults as shown in Figure 2-8, click **Reset** to reset to factory defaults.

Using the Search Feature

The enhanced NCS Search feature (see [Figure 2-10](#)) provides easy access to advanced search options and saved searches. You can access the search options from any page within NCS making it easy to search for a device or SSID (Service Set Identifier).

Figure 2-10 NCS Search Feature

The following searches are possible using NCS:

- [Quick Search](#), page 2-33
- [Advanced Search](#), page 2-34
- [Saved Searches](#), page 2-46

Quick Search

For a quick search, you can enter a partial or complete IP address, MAC address, name, or SSID for clients, alarms, access points, controllers, maps, tags, or rogue clients (see [Figure 2-10](#)).

Note You can also enter a username if you are searching for a client.

To quickly search for a device, follow these steps:

Step 1 Enter the complete or partial IP address, device name, SSID, or MAC address of the device in the Search text box (see [Figure 2-11](#)).

Figure 2-11 Quick Search with Partial IP Address

Step 2 Click **Search** to display all devices that match the Quick Search parameter.

The search results display the matching item type, the number of items that match your search parameter, and links to the list of matching results (see [Figure 2-12](#)). Click **View List** to view the matching devices from the Monitor or Configuration pages.

Figure 2-12 Quick Search Results Advanced Search

 A screenshot of a 'Search Results' dialog box. The title bar says 'Search Results' with a close button (X) on the right. Below the title bar, there is an information icon (i) and a message: 'Your search '9.1' matched following item(s). Please click on the 'View List' to access the matched items list under either Monitor or Configuration'. Below this message is a table with four columns: 'Item Type', 'Item Count', 'Monitor', and 'Configuration'. The table contains four rows of data. Below the table is a 'Footnotes' section with a single footnote: '1. The search was performed to match the entered text partially or fully with either IP Address or MAC Address or Name or SSID as applicable for different item types such as Clients, Alarms, Access Points, Controllers, Maps, Tags & Rogue Clients.' The number '291014' is printed vertically on the right side of the image.

Item Type	Item Count	Monitor	Configuration
Client	2	View List	
AP	37	View List	View List
Controller	17	View List	View List
Alarm	64	View List	

Advanced Search

To perform a more specific search for a device in NCS, follow these steps:

-
- Step 1** Click **Advanced Search** located in the top right corner of NCS (see [Figure 2-10](#)).
 - Step 2** In the New Search dialog, select a category from the Search Category drop-down list (see [Figure 2-13](#)).

Figure 2-13 Search Category Drop-Down List

Note Click each of the following categories for more information.

Search categories include the following:

- [Searching Alarms](#)
- [Searching Access Points](#)
- [Searching Controller Licenses](#)
- [Searching Controllers](#)
- [Searching Switches](#)
- [Searching Clients](#)
- [Searching Chokepoints](#)
- [Searching Events](#)
- [Searching Interferers](#)
- [Searching Wi-Fi TDOA Receivers](#)
- [Searching Maps](#)
- [Searching Rogue Clients](#)
- [Searching Shunned Clients](#)
- [Searching Tags](#)

Step 3 Select all applicable filters or parameters for your search (see [Figure 2-14](#)).

Note Search parameters change depending on the selected category. The following pre-defined search filters have been added in release 6.0: Associated Clients, Authenticated Clients, Excluded Clients, Probing Clients, All Clients, New Clients detected in last 24 hours, unauthenticated clients, 2.4 GHz clients, and 5 GHz clients.

Figure 2-14 New Search Parameters

- Step 4** Choose the number of items to display on the results page.
- Step 5** To save this search, select the **Save Search** check box and enter a name for the search in the text box.
- Step 6** When all filters and parameters are set, click **Go**.

Searching Alarms

You can configure the following parameters when performing an advanced search for alarms (see [Table 2-9](#)).

Table 2-9 Search Alarms Parameters

Parameter	Options
Severity	Choose All Severities, Critical, Major, Minor, Warning, or Clear.
Alarm Category	Choose All Types, Access Points, Controller, Switches, Coverage Hole, Config Audit, Mobility Service, Context Aware Notifications, Interference, Mesh Links, Rogue AP, Adhoc Rogue, Security, NCS or Performance.
Condition	Use the drop-down list to select a condition. Also, you can enter a condition by typing it in this drop-down list. Note If you have selected an alarm category, this drop-down list would contain the conditions available in that category.
Time Period	Choose a time increment from Any Time to Last 7 days. The default is Any Time.

Table 2-9 Search Alarms Parameters (continued) (continued)

Parameter	Options
Acknowledged State	Select this check box to search for alarms with an Acknowledged or Unacknowledged state. If this check box is not selected, the acknowledged state is not taken into search criteria consideration.
Assigned State	Select this check box to search for alarms with an Assigned or Unassigned state or by Owner Name. If this check box is not selected, the assigned state is not part of the search criteria. Note If you choose Assigned State > Owner Name, type the owner name in the available text box.

**Note**

You can decide what information appears on the alarm search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching Access Points

You can configure the following parameters when performing an advanced search for access points (see [Table 2-10](#)).

Table 2-10 Search Access Points Parameters

Parameter	Options
Search By	Choose All APs, Base Radio MAC, Ethernet MAC, AP Name, IP Address, Controller Name, Controller IP, All Unassociated APs, Floor Area, Outdoor Area, Unassigned APs, or Alarms. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category. For example, when you select Floor Area, you also must identify its campus and building. Or, if you select Alarms, you can search for access points based on the severity of the alarm.
AP Type	Choose All Types, LWAPP, or Autonomous.
AP Mode	Choose All Modes, Local, Monitor, H-REAP, Rogue Detector, Sniffer, Bridge, or SE-Connect.
Radio Type	Choose All Radios, 802.11a, or 802.11b/g.

Table 2-10 Search Access Points Parameters (continued) (continued)

Parameter	Options
802.11n Support	Check to search for access points with 802.11n support.
OfficeExtend AP Enabled	Check to search for OfficeExtend access points.
CleanAir Support	Check to search for access points which support CleanAir.
CleanAir Enabled	Check to search for access points which support CleanAir and which are enabled.
Items per page	Configure the number of records to be displayed in the search results page.

**Note**

You can decide what information displays on the access points search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching Controller Licenses

You can configure the following parameters when performing an advanced search for controller licenses (see [Table 2-11](#)).

Table 2-11 Search Controller Licenses Parameters

Parameter	Options
Controller Name	Type the controller name associated with the license search.
Feature Name	Choose All, Plus, or Base depending on the license tier.
Type	Choose All, Demo, Extension, Grace Period, or Permanent.
% Used or Greater	Select the percentage of the license use. The percentages range from 0 to 100.
Items per page	Configure the number of records to be displayed in the search results page.

See the [“Managing Licenses”](#) section on page 15-123 for more information on licenses and the License Center.

Searching Controllers

You can configure the following parameters when performing an advanced search for controllers (see [Table 2-12](#)).

Table 2-12 Search Controllers Parameters

Parameter	Options
Search for controller by	Choose All Controllers, IP Address, Controller Name. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.
Enter Controller IP Address	This text box appears only if you select IP Address from the Search for controller by text box.
Enter Controller Name	This text box appears only if you select Controller Name from the Search for controller by text box.
Audit Status	Choose one of the following from the drop-down list: <ul style="list-style-type: none"> • All Status • Mismatch—Config differences were found between NCS and controller during the last audit. • Identical—No config differences were found during the last audit. • Not Available—Audit status is unavailable.
Items per page	Configure the number of records to be displayed in the search results page.

**Note**

You can decide what information displays on the controllers search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching Switches

You can configure the following parameters when performing an advanced search for switches (see [Table 2-13](#)).

Table 2-13 Search Switches Parameters

Parameter	Options
Search for Switches by	Choose All Switches, IP Address, or Switch Name. You can use wildcards (*). For example, if you select IP Address and enter 172*, NCS returns all switches that begin with IP address 172.
Items per page	Configure the number of records to be displayed in the search results page.

You can decide what information displays on the client search results page. See the “[Configuring the Search Results Display \(Edit View\)](#)” section on page 2-46 for more information.

Searching Clients

You can configure the following parameters when performing an advanced search for clients (see [Table 2-14](#)).

Table 2-14 Search Clients Parameters

Parameter	Options
Media Type	Choose All, Wireless Clients, Wired Clients.
Wireless Type	Choose All, Lightweight or Autonomous Clients. If you have selected Wireless Clients in Media Type.
Search By	Choose All Clients, All Excluded Clients, All Wired Clients, All Logged in Guests, IP Address, User Name, MAC Address, Asset Name, Asset Category, Asset Group, AP Name, Controller Name, Controller IP, MSE IP, Floor Area, or Outdoor Area, Switch Name, Switch Type. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category. For example, when you select IP address, you must enter the specific IP address for this search.
Clients Detected By	Choose NCS or MSEs. Clients detected by NCS—Clients stored in NCS databases. Clients detected by MSE—Clients located by Context Aware service in the MSE directly communicating with the controllers.
Client States	Choose All States, Idle, Authenticated, Associated, Probing, or Excluded.
Posture Status	Choose All, Unknown, Passed, Failed if you want to know if the devices are clean or not.
Restrict By Radio Band	Select the check box to indicate a specific radio band. Choose 5 GHz or 2.4 GHz from the drop-down list.
Restrict By Protocol	Select the check box to indicate a specific protocol. Choose 802.11a, 802.11b, 802.11g, 802.11n, or Mobile from the drop-down list.
SSID	Select the check box and choose the applicable SSID from the drop-down list.

Table 2-14 Search Clients Parameters (continued)

Parameter	Options
Profile	Select the check box to list all of the clients associated to the selected profile. Note Once the check box is selected, choose the applicable profile from the drop-down list.
CCX Compatible	Select the check box to search for clients that are compatible with Cisco Client Extensions. Note Once the check box is selected, choose the applicable version, All Versions, or Not Supported from the drop-down list.
E2E Compatible	Select the check box to search for clients that are End to End compatible. Note Once the check box is selected, choose the applicable version, All Versions, or Not Supported from the drop-down list.
NAC State	Select the check box to search for clients identified by a certain Network Admission Control (NAC) state. Note Once the check box is selected, choose the applicable state from the drop-down list. Select from Quarantine, Access, Invalid, and Not Applicable.
Include Disassociated	Select to include clients that are no longer on the network but for which NCS has historical records.
Items per page	Configure the number of records to be displayed in the search results page.

**Note**

You can decide what information displays on the client search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching Chokepoints

You can configure the following parameters when performing an advanced search for chokepoints (see [Table 2-15](#)).

Table 2-15 Search Chokepoint Parameters

Parameter	Options
Search By	Choose MAC Address or Chokepoint Name. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category. For example, when you select MAC address, you must enter the specific MAC address for this search.

Searching Events

You can configure the following parameters when performing an advanced search for events (see [Table 2-16](#)).

Table 2-16 Search Events Parameters

Parameter	Options
Severity	Choose All Severities, Critical, Major, Minor, Warning, Clear, or Info. Color coded.
Event Category	Choose All Types, Access Points, Controller, Security, Coverage Hole, Rogue AP, Adhoc Rogue, Interference, Mesh Links, Client, Mobility Service, Location Notifications, Pre Coverage Hole, or NCS.
Condition	Use the drop-down list to select a condition. Also, you can enter a condition by typing it in this drop-down list. Note If you have selected an event category, this drop-down list would contain the conditions available in that category.
Search All Events	Configure the number of records to be displayed in the search results page.

See the “[Monitoring Rogue Alarm Events](#)” section on page 5-108 for more information on events.

Searching Interferers

You can configure the following parameters when performing an advanced search for interferers detected by access points (see [Table 2-17](#)).

Table 2-17 Search SE-Detected Interferers Parameters

Parameter	Options
Search By	Choose All Interferers, Interferer ID, Interferer Category, Interferer Type, Affected Channel, Affected AP, Severity, Power, or Duty Cycle. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.
Detected By	Choose All Spectrum Experts or a specific spectrum expert from the drop-down list.
Detected within the last	Choose the time range for the interferer detections. The times range from 5 minutes to 24 hours to All History.
Interferer Status	
Restrict by Radio Bands/Channels	Configure the search by radio bands or channels.
Items per page	Configure the number of records to be displayed in the search results page.

You can decide what information displays on the SE-detected interferers search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching AP-Detected Interferers

You can configure the following parameters when performing an advanced search for interferers detected by access points (see [Table 2-18](#)).

Table 2-18 Search AP-Detected Interferers Parameters

Parameter	Options
Search By	Choose All Interferers, Interferer ID, Interferer Type, Affected Channel, Severity, Duty Cycle, or Location. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.
Detected within the last	Choose the time range for the interferer detections. The times range from 5 minutes to 24 hours to All History.
Active Interferers Only	Select the check box to only include active interferers in your search.

Note

You can decide what information displays on the AP-detected interferers search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

Searching Wi-Fi TDOA Receivers

You can configure the following parameters when performing an advanced search for Wi-Fi TDOA receivers (see [Table 2-19](#)).

Table 2-19 Search Wi-Fi TDOA Receivers Parameters

Parameter	Options
Search By	Choose MAC Address or Wi-Fi TDOA Receivers Name. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.

Searching Maps

You can configure the following parameters when performing an advanced search for maps (see [Table 2-20](#)).

Table 2-20 Search Map Parameters

Parameter	Options
Search for	Choose All Maps, Campuses, Buildings, Floor Areas, or Outdoor Areas.
Map Name	Search by Map Name. Enter map name in the text box.
Items per page	Configure the number of records to be displayed in the search results page.

Note

You can decide what information displays on the maps search results page. See the [“Configuring the Search Results Display \(Edit View\)”](#) section on page 2-46 for more information.

See the [“Information About Maps”](#) section on page 6-2 for more information on maps.

Searching Rogue Clients

You can configure the following parameters when performing an advanced search for rogue clients (see [Table 2-21](#)).

Table 2-21 Search Rogue Client Parameters

Parameter	Options
Search for clients by	Choose All Rogue Clients, MAC Address, Controller, MSE, Floor Area, or Outdoor Area.
Search In	Choose MSEs or NCS Controllers.
Status	Select the check box and choose Alert, Contained, or Threat from the drop-down list to include status in the search criteria.

See the “[Rogue Access Points, Ad hoc Events, and Clients](#)” section on page 3-9 for more information on rogue clients.

Searching Shunned Clients

Note

When a Cisco IPS sensor on the wired network detects a suspicious or threatening client, it alerts the controller to shun this client.

You can configure the following parameters when performing an advanced search for shunned clients (see [Table 2-22](#)).

Table 2-22 Search Shunned Client Parameters

Parameter	Options
Search By	Choose All Shunned Clients, Controller, or IP Address. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.

Searching Tags

You can configure the following parameters when performing an advanced search for tags (see [Table 2-23](#)).

Table 2-23 Search Tags Parameters

Parameter	Options
Search for tags by	Choose All Tags, Asset Name, Asset Category, Asset Group, MAC Address, Controller, MSE, Floor Area, or Outdoor Area. Note Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.
Search In	Choose MSEs or NCS Controllers.
Last detected within	Choose a time increment from 5 minutes to 24 hours. The default is 15 minutes.
Tag Vendor	Select the check box and choose Aeroscout, G2, PanGo, or WhereNet.
Telemetry Tags only	Check the Telemetry Tags only to search tags accordingly.
Items per page	Configure the number of records to be displayed in the search results page.

Saved Searches

The Saved Search feature enables you to access and run any previously saved search (see [Figure 2-15](#)).

Note

When saving a search, you must assign a unique name to the search. Saved searches apply only to the current partition.

Figure 2-15 Saved Search Page

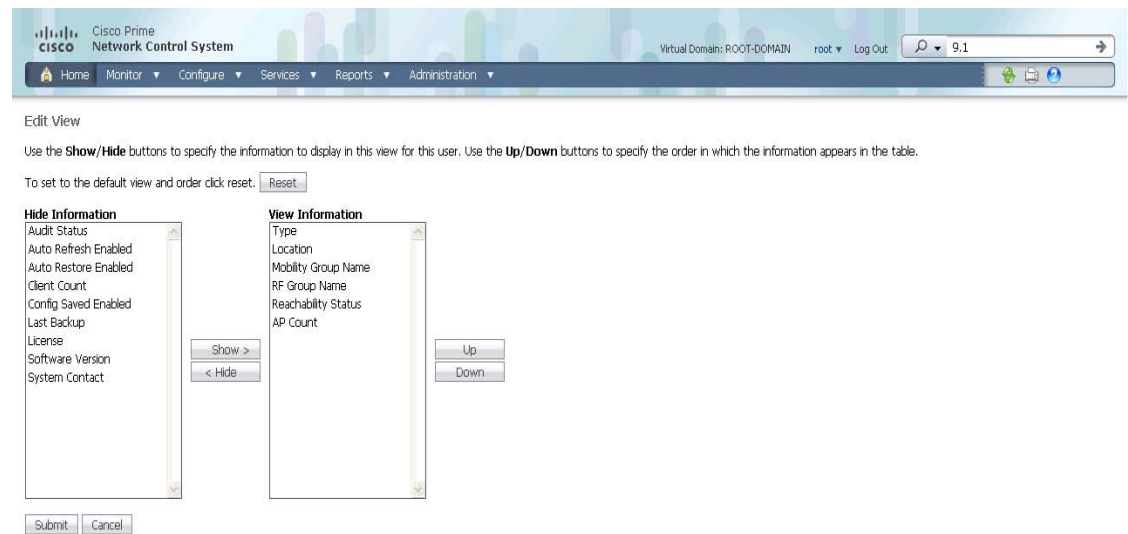

To access and run a saved search, follow these steps:

- Step 1** Click **Saved Search**.
- Step 2** Choose a category from the Search Category drop-down list.
- Step 3** Choose a saved search from the Saved Search List drop-down list.
- Step 4** If necessary, change the current parameters for the saved search.
- Step 5** Click **Go**.

Configuring the Search Results Display (Edit View)

The Edit View page (see [Figure 2-16](#)) enables you to choose which columns appear on the Search Results page.

Figure 2-16 Edit View Page

291018

Column names appear in one of the following lists:

- Hide Information—Lists columns that do not appear in the table. The Hide button points to this list.
- View Information—Lists columns that do appear in the table. The Show button points to this list.

To display a column in a table, click it in the Hide Information list, then click **Show**. To remove a column from a table, click it in the View Information list, then click **Hide**. You can select more than one column by holding down the shift or control key.

To change the position of a column in the View Information list, click it, then click **Up** or **Down**. The higher a column is in the list, the farther left it appears in the table.

Command Buttons

The following command buttons appear in the Edit View page:

- Reset—Sets the table to the default display.
- Show—Moves the highlighted columns from the Hide Information list to the View Information list.
- Hide—Moves the highlighted columns from the View Information list to the Hide Information list.
- Up—Moves the highlighted columns upward in the list (further to the left in the table).
- Down—Moves the highlighted columns downward in the list (further to the right in the table).
- Submit—Saves the changes to the table columns and returns to the previous page.
- Cancel—Undoes the changes to the table columns and returns to the previous page.

CHAPTER 3

Configuring Security Solutions

This chapter describes the security solutions for wireless LANs. It contains the following sections:

- [Cisco Unified Wireless Network Solution Security, page 3-1](#)
- [Interpreting the Security Dashboard, page 3-4](#)
- [Rogue Access Points, Ad hoc Events, and Clients, page 3-9](#)
- [Rogue Access Point Location, Tagging, and Containment, page 3-13](#)
- [Security Overview, page 3-20](#)
- [Switch Port Tracing, page 3-28](#)
- [Using NCS to Convert a Cisco Unified Wireless Network Solution from Layer 3 to Layer 2 Mode, page 3-29](#)
- [Configuring a Firewall for NCS, page 3-30](#)
- [Access Point Authorization, page 3-30](#)
- [Management Frame Protection \(MFP\), page 3-31](#)
- [Configuring Intrusion Detection Systems \(IDS\), page 3-33](#)
- [Configuring IDS Signatures, page 3-33](#)
- [Enabling Web Login, page 3-41](#)
- [Certificate Signing Request \(CSR\) Generation, page 3-44](#)

Cisco Unified Wireless Network Solution Security

The Cisco Unified Wireless Network Solution bundles potentially complicated Layer 1, Layer 2, and Layer 3 802.11 access point security components into a simple policy manager that customizes system-wide security policies on a per wireless LAN basis. It provides simple, unified, and systematic security management tools.

One of the challenges to wireless LAN deployment in the enterprise is wired equivalent privacy (WEP) encryption, which is a weak standalone encryption method. A more recent problem is the availability of low-cost access points that can be connected to the enterprise network and used to mount man-in-the-middle and denial of service attacks. Also, the complexity of add-on security solutions has prevented many IT managers from embracing the benefits of the latest advances in wireless LAN security.

This section contains the following topics:

- [Layer 1 Solutions](#)
- [Layer 2 Solutions](#)
- [Layer 3 Solutions](#)
- [Single Point of Configuration Policy Manager Solutions](#)
- [Rogue Access Point Solutions](#)

Layer 1 Solutions

The Cisco Unified Wireless Network Solution operating system security solution ensures that all clients gain access within an operator-set number of attempts. Should a client fail to gain access within that limit, it is automatically excluded (blocked from access) until the operator-set timer expires. The operating system can also disable SSID broadcasts on a per wireless LAN basis.

Layer 2 Solutions

If a higher level of security and encryption is required, the network administrator can also implement industry-standard security solutions such as 802.1X dynamic keys with Extensible Authentication Protocol (EAP) or Wi-Fi Protected Access (WPA) dynamic keys. The Cisco Unified Wireless Network Solution WPA implementation includes Advanced Encryption Standard (AES), Temporal Key Integrity Protocol + message integrity code checksum (TKIP + Michael MIC) dynamic keys, or static WEP keys. Disabling is also used to automatically block Layer 2 access after an operator-set number of failed authentication attempts.

Regardless of the wireless security solution selected, all Layer 2 wired communications between controllers and access points are secured by passing data through Lightweight Access Point Protocol (LWAPP) tunnels.

Layer 3 Solutions

The WEP problem can be further solved using industry-standard Layer 3 security solutions such as Virtual Private Networks (VPNs).

The Cisco Unified Wireless Network Solution supports local and RADIUS media access control (MAC) filtering. This filtering is best suited to smaller client groups with a known list of 802.11 access card MAC addresses. The Cisco Unified Wireless Network Solution also supports local and RADIUS user/password authentication. This authentication is best suited to small to medium client groups.

Single Point of Configuration Policy Manager Solutions

When the Cisco Unified Wireless Network Solution is equipped with Cisco NCS, you can configure system-wide security policies on a per wireless LAN basis. Small office, home office (SOHO) access points force you to individually configure security policies on each access point or use a third-party appliance to configure security policies across multiple access points. Because the Cisco Unified Wireless Network Solution security policies can be applied across the whole system from NCS, errors can be eliminated, and the overall effort is greatly reduced.

Rogue Access Point Solutions

This section describes security solutions for rogue access points and includes the following topics:

Rogue Access Point Challenges

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain text or other denial of service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as passwords and usernames. The hacker can then transmit a series of clear-to-send (CTS) frames, which mimics an access point informing a particular wireless LAN client adapter to transmit and instructing all others to wait. This scenario results in legitimate clients being unable to access the wireless LAN resources. Thus, wireless LAN service providers have a strong interest in banning rogue access points from the air space.

The operating system security solution uses the Radio Resource Management (RRM) function to continuously monitor all nearby access points, automatically discover rogue access points, and locate them as described in the [“Tagging and Containing Rogue Access Points”](#) section on page 3-3 section.

Tagging and Containing Rogue Access Points

When the Cisco Unified Wireless Network Solution is monitored using NCS, NCS generates the flags as rogue access point traps and displays the known rogue access points by MAC address. The operator can then display a map showing the location of the access points closest to each rogue access point. The next step is to mark them as Known or Acknowledged rogue access points (no further action), Alert rogue access points (watch for and notify when active), or Contained rogue access points (have between one and four access points discourage rogue access point clients by sending the clients deauthenticate and disassociate messages whenever they associate with the rogue access point).

Securing Your Network Against Rogue Access Points

You can secure your network against any rogue access points and disallow access point attacks for those access points not defined in the MAC filter list. To set up MAC filtering, follow these steps:

-
- Step 1** Choose **Configure > Controllers**.
 - Step 2** Click the IP address for which you want to enter MAC filters.
 - Step 3** Choose **Security > AAA > MAC Filtering** from the left sidebar menu. The MAC Filtering page appears (see [Figure 3-1](#)).

Figure 3-1 MAC Filtering Page

The screenshot shows the Cisco Prime Network Control System interface for MAC Filtering configuration. The breadcrumb trail is: Configure > Controllers > 9.1.121.11 > Security > AAA > MAC Filtering. The configuration shows RADIUS Compatibility Mode set to Cisco ACS and MAC Delimiter set to No Delimiter. A table lists the MAC filtering entries:

MAC Address	Profile Name	Interface	Description
<input type="checkbox"/> 00:11:22:33:44:55	Any Profile	management	mac

291019

The RADIUS compatibility mode, MAC delimiter, MAC address, profile name, interface, and description appears.

- Step 4** If you want to set the same configuration across multiple devices, you can choose **Add MAC Filter** from the Select a command drop-down list, and click **Go**. If a template exists, you can apply it. If you need to create a template, you can click the URL to get redirected to the template creation page.

Note The ability to join a controller without specification within a MAC filter list is only supported on mesh access points.

- Step 5** To make changes to the profile name, interface, or description, click a specific MAC address in the MAC Address column.

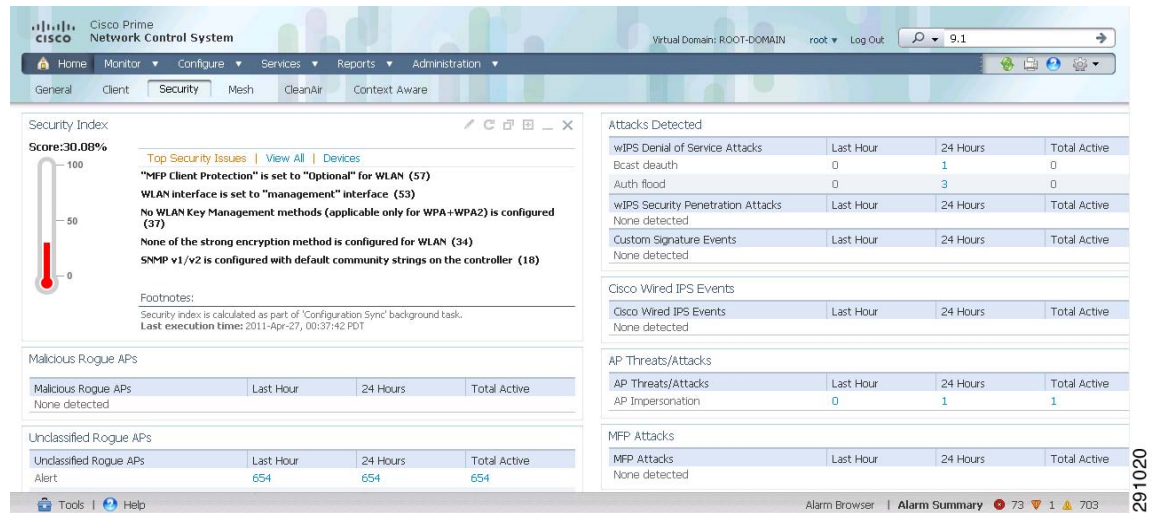

Interpreting the Security Dashboard

Because unauthorized rogue access points are inexpensive and readily available, employees sometimes plug them into existing LANs and build ad hoc wireless networks without IT department knowledge or consent. These rogue access points can be a serious breach of network security because they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. Even more alarming, wireless users frequently publish insecure access point locations, increasing the odds of having the enterprise security breached.

Rather than having a person with a scanner manually detect rogue access points, the Cisco Unified Wireless Network Solution automatically collects information on rogue access points detected by its managed access points (by MAC and IP address) and allows the system operator to locate, tag, and contain them. It can also be used to discourage rogue access point clients by sending them deauthenticate and disassociate messages from one to four access points.

For a summary of existing events and the security state of the network, click the **Security** dashboard from the NCS home page. [Figure 3-2](#) shows the security dashboard and different dashlets.

Figure 3-2 Security Dashboard

This section describes the Security dashboard, dashlets and contains the following topics:

- [Security Index, page 3-5](#)
- [Malicious Rogue Access Points, page 3-6](#)
- [Adhoc Rogues, page 3-6](#)
- [CleanAir Security, page 3-7](#)
- [Unclassified Rogue Access Points, page 3-7](#)
- [Friendly Rogue Access Points, page 3-8](#)
- [Access Point Threats or Attacks, page 3-8](#)
- [MFP Attacks, page 3-9](#)
- [Attacks Detected, page 3-9](#)

You can customize the order of information you want in the Security dashboard to display. You can move the dashlets to change the order. Use the Edit Dashlet option to customize the information displayed in the dashlet. You can change the dashlet title, enable refresh, and set the refresh time interval using the Edit Dashlet options.

Security Index

The Security Index dashlet indicates the security of the NCS managed network, and it is calculated as part of daily background tasks. It is calculated by assigning weight to the various security configurations and displaying it in visual form. The combined weighting can vary from 0 to 100 where 0 signifies the least secured and 100 is the maximum secured. The weighting comes from the lowest scoring controller and the lowest scoring Location Server/Mobility Service Engine related security configurations that are maintained within NCS itself. The Security Index of the NCS managed network is equal to the lowest scoring controller plus the lowest scoring Location Service/Mobility Service Engine.

The security thermometer color range is represented as follows:

- Above or equal to 80 - Green
- Below 80 but greater than or equal to 60 - Yellow
- Below 60 - Red

Note Guest WLANs are excluded from the WLANs. A WLAN that has web authentication or web passthrough enabled is identified as a guest WLAN.

The security index of the latest release is the benchmark for the required security configurations. For example, if AES encryption was not present in an earlier version of code, the index is reduced by the number associated with the AES encryption security configuration. Likewise, if new security configurations are introduced, the weighting would be altered.

Note The configurations stored in NCS may not be the latest with the ones in the controllers unless the Refresh from Controller command is run from NCS. You can run Security Index calculations from the Configuration Sync task to get the latest configuration data from all the controllers. See the [“Performing a Configuration Sync”](#) section on page 15-22 for steps on enabling the security index.

Malicious Rogue Access Points

This dashlet provides information on rogue access points that are classified as *Malicious*. [Table 3-1](#) describes the various parameters. For each of these parameters, a value is provided for last hour, last 24 hours, and total active. If you click an underlined number in any of the time period categories, a page with further information appears.

Note Malicious access points are detected but untrusted or unknown access points with a malicious intent within the system. They also refer to access points that fit the user-defined malicious rules or have been manually moved from the friendly access point classification.

Table 3-1 *Malicious Rogue AP Details*

Parameter	Description
Alert	Indicates the number of rogues in an alert state. Note An access point is moved to Alert if it is not on the neighbor list or part of the user-configured Friendly AP list.
Contained	Indicates the number of contained rogues.
Threat	Indicates the number of threat rogues.
Contained Pending	Indicates the number of contained rogues pending. Note Contained Pending indicates that the containment action is delayed due to unavailable resources.

Adhoc Rogues

The Adhoc Rogues dashlet displays the rogues that have occurred in the last hour, last 24 hours, and the total active. [Table 3-2](#) describes the various parameters. If you click the number in any of these columns, a page with further information appears.

Note The Adhoc Rogue state displays as *Alert* when first scanned by the controller or as *Pending* when operating system identification is underway.

Table 3-2 *Ad hoc Rogues*

Parameter	Description
Alert	Indicates the number of ad hoc rogues in an alert state. Note An access point is moved to Alert if it is not on the neighbor list or part of the user-configured Friendly AP list.
Contained	Indicates the number of contained rogues.
Threat	Indicates the number of threat rogues.
Contained Pending	Indicates the number of contained rogues pending. Note Contained pending indicates that the containment action is delayed due to unavailable resources.

CleanAir Security

This dashlet provides information on CleanAir security and provides information about the security-risk devices active during the last hour, 24 hours, and Total Active security-risk devices on the wireless network.

The following information is displayed:

- Severity
- Failure Source
- Owner
- Date/Time
- Message
- Acknowledged

To learn more about the security-risk interferers, see the [“Monitoring CleanAir Security Alarms”](#) section on page 5-137.

Unclassified Rogue Access Points

[Table 3-3](#) describes the unclassified rogue access point parameters. For each of these parameters, a value is provided for last hour, last 24 hours, and total active. If you click an underlined number in any of the time period categories, a page with further information appears.

Note An unclassified rogue access point refers to a rogue access point that is not classified as either malicious or friendly. These access points can be contained and can be moved manually to the friendly rogue access point list.

Table 3-3 *Unclassified Rogue Access Points*

Parameter	Description
Alert	Number of unclassified rogues in alert state. Rogue access point radios appear as <i>Alert</i> when first scanned by the controller or as <i>Pending</i> when operating system identification is underway.
Contained	Number of contained unclassified rogues.
Contained Pending	Number of contained unclassified rogues pending.

Friendly Rogue Access Points

This dashlet provides information on rogue access points that are classified as *friendly*. [Table 3-4](#) describes the various parameters. For each of these parameters, a value is provided for last hour, last 24 hours, and total active. If you click an underlined number in any of the time period categories, a page with further information appears.

Note

Friendly rogue access points are known, acknowledged, or trusted access points. They also refer to access points that fit the user-defined friendly rogue access point rules. Friendly rogue access points cannot be contained.

Table 3-4 *Friendly Rogue AP Details*

Parameter	Description
Alert	Indicates the number of rogues in an alert state. Note An access point is moved to Alert if it is not on the neighbor list or part of the user-configured Friendly AP list.
Internal	Indicates the number of internal access points. Note Internal indicates that the detected access point is inside the network and has been manually configured as Friendly - Internal.
External	Indicates the number of external access points. Note External indicates that the detected access point is outside of the network and has been manually configured as Friendly - External.

Access Point Threats or Attacks

[Table 3-5](#) describes the AP Threats or Attacks parameters. For each of these parameters, a value is provided for last hour, last 24 hours, and total active. If you click an underlined number in any of the time period categories, a page with further information appears.

Table 3-5 AP Threats/Attacks

Parameter	Description
Fake Attacks	Number of fake attacks
AP Missing	Number of missing access points
AP Impersonation	Number of access point impersonations
AP Invalid SSID	Number of invalid access point SSIDs
AP Invalid Preamble	Number of invalid access point preambles
AP Invalid Encryption	Number of invalid access point encryption
AP Invalid Radio Policy	Number of invalid access point radio policies
Denial of Service (NAV related)	Number of Denial of Service (NAV related) request
AP Detected Duplicate IP	Number of detected duplicate access point IPs

MFP Attacks

A value is provided for Infrastructure and client MFP attacks in the last hour, last 24 hours, and total active. If you click an underlined number in any of the time period categories, a page with further information appears.

Attacks Detected

A value is provided for wIPS Denial of Service and wIPS Security Penetration attacks and custom signature attacks for the past hour, past 24 hours, and total active. If you click an underline number in any of the time period categories, a page with further information appears.

Recent Rogue AP Alarms

A value is provided for the five most recent rogue alarms. Click the number in parentheses to access the Alarms page. Then click an item under MAC address to view alarm details.

Recent Adhoc Rogue Alarm

Displays the five most recent ad hoc rogue alarms. Click the number in parentheses to access the Alarms page. Click an item under MAC address to view ad hoc details.

Most Recent Security Alarms

Displays the five most recent security alarms. Click the number in parentheses to access the Alarms page.

Rogue Access Points, Ad hoc Events, and Clients

This section describes security solutions for rogue devices. A rogue device is an unknown access point or client that is detected by managed access points in your network.

Controllers continuously monitor all nearby access points and automatically discover and collect information on rogue access points and clients. When a controller discovers a rogue access point, it uses the Rogue Location Discovery Protocol (RLDP) to determine if the rogue is attached to your network.

**Note**

NCS consolidates all of the controllers' rogue access point data.

You can configure controllers to use RLDP on all access points or only on access points configured for monitor (listen-only) mode. The latter option facilitates automated rogue access point detection in a crowded RF space, allowing monitoring without creating unnecessary interference and without affecting regular data access point functionality. If you configure a controller to use RLDP on all access points, the controller always chooses the monitor access point for RLDP operation if a monitor access point and a local (data) access point are both nearby. If RLDP determines that the rogue is on your network, you can choose to either manually or automatically contain the detected rogue.

This section contains the following topics:

- [Classifying Rogue Access Points, page 3-10](#)
- [Rogue Access Point Classification Types, page 3-11](#)
- [Adhoc Rogue, page 3-13](#)

Classifying Rogue Access Points

Classification and reporting of rogue access points occurs through the use of rogue states and user-defined classification rules that enable rogues to automatically move between states. You can create rules that enable the controller to organize and display rogue access points as Friendly, Malicious, or Unclassified.

**Note**

NCS consolidates all of the controllers' rogue access point data.

By default, none of the classification rules are enabled. Therefore, all unknown access points are categorized as Unclassified. When you create a rule, configure conditions for it, and enable the rule, the unclassified access points are reclassified. Whenever you change a rule, it is applied to all access points (friendly, malicious, and unclassified) in the Alert state only.

**Note**

Rule-based rogue classification does not apply to ad-hoc rogues and rogue clients.

**Note**

The 5500 series controllers support up to 2000 rogues (including acknowledged rogues); the 4400 series controllers, Cisco WiSM, and Catalyst 3750G Integrated Wireless LAN Controller Switch support up to 625 rogues; and the 2100 series controllers and Controller Network Module for Integrated Services Routers support up to 125 rogues. Each controller limits the number of rogue containments to three per radio (or six per radio for access points in monitor mode).

When the controller receives a rogue report from one of its managed access points, it responds as follows:

1. The controller verifies that the unknown access point is in the friendly MAC address list. If it is, the controller classifies the access point as Friendly.

2. If the unknown access point is not in the friendly MAC address list, the controller starts applying rogue classification rules.
3. If the rogue is already classified as Malicious, Alert or Friendly, Internal or External, the controller does not reclassify it automatically. If the rogue is classified differently, the controller reclassifies it automatically only if the rogue is in the Alert state.
4. The controller applies the first rule based on priority. If the rogue access point matches the criteria specified by the rule, the controller classifies the rogue according to the classification type configured for the rule.
5. If the rogue access point does not match any of the configured rules, the controller classifies the rogue as Unclassified.
6. The controller repeats the previous steps for all rogue access points.
7. If RLDP determines that the rogue access point is on the network, the controller marks the rogue state as Threat and classifies it as Malicious automatically, even if no rules are configured. You can then manually contain the rogue (unless you have configured RLDP to automatically contain the rogue), which would change the rogue state to Contained. If the rogue access point is not on the network, the controller marks the rogue state as Alert, and you can manually contain the rogue.
8. If desired, you can manually move the access point to a different classification type and rogue state.

As mentioned previously, the controller can automatically change the classification type and rogue state of an unknown access point based on user-defined rules, or you can manually move the unknown access point to a different classification type and rogue state. [Table 3-6](#) shows the allowable classification types and rogue states from and to which an unknown access point can be configured.

Table 3-6 Allowable Classification Type and Rogue State Transitions

From	To
Friendly (Internal, External, Alert)	Malicious (Alert)
Friendly (Internal, External, Alert)	Unclassified (Alert)
Friendly (Alert)	Friendly (Internal, External)
Malicious (Alert, Threat)	Friendly (Internal, External)
Malicious (Contained, Contained Pending)	Malicious (Alert)
Unclassified (Alert, Threat)	Friendly (Internal, External)
Unclassified (Contained, Contained Pending)	Unclassified (Alert)
Unclassified (Alert)	Malicious (Alert)

If the rogue state is Contained, you have to uncontain the rogue access point before you can change the classification type. If you want to move a rogue access point from Malicious to Unclassified, you must delete the access point and allow the controller to reclassify it.

Rogue Access Point Classification Types

Rogue access points classification types include:

- Malicious—Detected but untrusted or unknown access points with a malicious intent within the system. They also refer to access points that fit the user-defined malicious rules or have been manually moved from the friendly access point classification. See the [“Malicious Rogue Access Points”](#) section on page 3-6 for more information.

- **Friendly**—Known, acknowledged, or trusted access points. They also refer to access points that fit the user-defined friendly rogue access point rules. Friendly rogue access points cannot be contained. See the [“Friendly Rogue APs” section on page 3-12](#) for more information. For more information on configuring friendly access point rules, see the [“Configuring a Friendly Access Point Template” section on page 11-82](#).
- **Unclassified**—Rogue access point that are not classified as either malicious or friendly. These access points can be contained and can be moved manually to the friendly rogue access point list. See the [“Unclassified Rogue APs” section on page 3-13](#) for more information.

Malicious Rogue APs

Malicious rogue access points are detected but untrusted or unknown access points with a malicious intent within the system. They also refer to access points that fit the user-defined malicious rules or have been manually moved from the friendly access point classification.

The Security dashboard of the NCS home page displays the number of malicious rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active malicious rogue access points.

Malicious rogue access point states include:

- **Alert**—Indicates that the access point is not on the neighbor list or part of the user-configured Friendly AP list.
- **Contained**—The unknown access point is contained.
- **Threat**—The unknown access point is found to be on the network and poses a threat to WLAN security.
- **Contained Pending**—Indicates that the containment action is delayed due to unavailable resources.
- **Removed**—This unknown access point was seen earlier but is not seen now.

Click an underlined number in any of the time period categories for detailed information regarding the malicious rogue access points. See the [“Monitoring Rogue Access Points” section on page 5-86](#) for more information.

Friendly Rogue APs

Friendly rogue access points are known, acknowledged or trusted access points. They also refer to access points that fit the user-defined friendly rogue access point rules. Friendly rogue access points cannot be contained.

The Security dashboard of the NCS home page displays the number of friendly rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active friendly rogue access points.

Friendly rogue access point states include:

- **Internal**—If the unknown access point is inside the network and poses no threat to WLAN security, you would manually configure it as Friendly, Internal. For example, the access points in your lab network.
- **External**—If the unknown access point is outside the network and poses no threat to WLAN security, you would manually configure it as Friendly, External. For example, the access points belonging to a neighboring coffee shop.
- **Alert**—The unknown access point is not on the neighbor list or part of the user-configured Friendly AP list.

Click an underlined number in any of the time period categories for detailed information regarding the friendly rogue access points. See the [“Monitoring Rogue Access Points” section on page 5-86](#) for more information.

Unclassified Rogue APs

An unclassified rogue access point refers to a rogue access point that is not classified as either malicious or friendly. These access points can be contained and can be moved manually to the friendly rogue access point list.

The Security dashboard of the NCS home page displays the number of unclassified rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active unclassified rogue access points.

Unclassified rogue access point states include:

- Pending—On first detection, the unknown access point is put in the Pending state for 3 minutes. During this time, the managed access points determine if the unknown access point is a neighbor access point.
- Alert—The unknown access point is not on the neighbor list or part of the user-configured Friendly AP list.
- Contained—The unknown access point is contained.
- Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources.

Click an underlined number in any of the time period categories for further information. See the [“Monitoring Rogue Access Points” section on page 5-86](#).

Adhoc Rogue

If the MAC address of a mobile client operating in a adhoc network is not in the authorized MAC address list, then it is identified as an adhoc rogue.

Rogue Access Point Location, Tagging, and Containment

When the Cisco Unified Wireless Network Solution is monitored using NCS, NCS generates the flags as rogue access point traps and displays the known rogue access points by MAC address. The operator can then display a map showing the location of the access points closest to each rogue access point. The next step is to mark them as **Known** or **Acknowledged** rogue access points (no further action), **Alert** rogue access points (watch for and notify when active), or **Contained** rogue access points (have between one and four access points discourage rogue access point clients by sending the clients deauthenticate and disassociate messages whenever they associate with the rogue access point).

This built-in detection, tagging, monitoring, and containment capability enables system administrators to take the appropriate action:

- Locate rogue access points
- Receive new rogue access point notifications, eliminating hallway scans
- Monitor unknown rogue access points until they are eliminated or acknowledged
- Determine the closest authorized access point, making directed scans faster and more effective

- Contain rogue access points by sending their clients deauthenticate and disassociate messages from one to four access points. This containment can be done for individual rogue access points by MAC address or can be mandated for all rogue access points connected to the enterprise subnet.
- Tag rogue access points:
 - Acknowledge rogue access points when they are outside of the LAN and do not compromise the LAN or wireless LAN security
 - Accept rogue access points when they do not compromise the LAN or wireless LAN security
 - Tag rogue access points as unknown until they are eliminated or acknowledged
 - Tag rogue access points as contained and discourage clients from associating with the rogue access points by having between one and four access points transmit deauthenticate and disassociate messages to all rogue access point clients. This function applies to all active channels on the same rogue access point.

This section contains the following topics:

- [Detecting Access Points on a Network, page 3-14](#)
- [Viewing Rogue Access Points by Controller, page 3-15](#)

Detecting Access Points on a Network

Use the Detecting Access Points feature to view information about the Cisco lightweight access points that are detecting a rogue access point.

To access the Rogue AP Alarms details page, follow these steps:

-
- Step 1** To display the Rogue AP Alarms page, do one of the following:
- Perform a search for rogue APs. See the [“Using the Search Feature” section on page 2-33](#) for more information about the search feature.
 - In the NCS home page, click the **Security** dashboard. This page displays all the rogue access points detected in the past hour and the past 24 hours. Click the rogue access point number to view the rogue access point alarms.
 - Click the **Malicious AP** number link in the dashlet.
- Step 2** In the Rogue AP Alarms page, click the Rogue MAC Address for the applicable rogue access point. The Rogue AP Alarms details page displays.
- Step 3** From the Select a command drop-down list, choose **View Detecting AP on Network**.
- Step 4** Click **Go**.
- Click a list item to display data about that item:
- AP Name
 - Radio
 - Detecting AP Location
 - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
 - Channel Number—The channel on which the rogue access point is broadcasting.
 - WEP—Enabled or disabled.
 - WPA—Enabled or disabled.

- Pre-Amble—Long or short.
 - RSSI—Received signal strength indicator in dBm.
 - SNR—Signal-to-noise ratio.
 - Containment Type—Type of containment applied from this access point.
 - Containment Channels—Channels that this access point is currently containing.
-

Viewing Rogue Access Points by Controller

Use the Detecting Access Points feature to view information about the rogue access points by controller. To access the Rogue AP Alarms details page, follow these steps:

-
- Step 1** To display the Rogue AP Alarms page, do one of the following:
- Perform a search for rogue APs. See the [“Using the Search Feature”](#) section on page 2-33 for more information about the search feature.
 - In the NCS home page, click the **Security** dashboard. This page displays all the rogue access points detected in the past hour and the past 24 hours. Click the rogue access point number to view the rogue access point alarms.
 - Click the **Malicious AP** number link in the dashlet.
- Step 2** In the Rogue AP Alarms page, click the Rogue MAC Address for the applicable rogue access point. The Rogue AP Alarms details page displays.
- Step 3** From the Select a command drop-down list, choose **View AP Details by Controller**.
- Step 4** Click **Go**.
- Click a list item to display data about that item:
- Controller IP Address
 - Detecting AP Name
 - Radio
 - Detecting AP Location
 - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
 - Channel Number—The channel on which the rogue access point is broadcasting.
 - RSSI—Received signal strength indicator in dBm.
 - Classification—Indicates if the rogue AP classification.
 - State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point. See the [“Rogue Access Point Classification Types”](#) section on page 3-11 for additional information.
 - On Network—Whether it belongs to this network “Yes” or “No”.
 - Containment Level—Indicates the containment level of the rogue access point or Unassigned (not contained).

- Last Updated Time
-

Working with Alarms

You can view, assign, and clear alarms and events on access points and mobility services engine using Cisco NCS.

Details on how to have email notifications of alarms sent to you is also described. This section contains the following topics:

- [Assigning and Unassigning Alarms, page 3-16](#)
- [Deleting and Clearing Alarms, page 3-16](#)
- [Acknowledging Alarms, page 3-17](#)

Assigning and Unassigning Alarms

To assign and unassign an alarm to yourself, follow these steps:

Step 1 Perform an advanced search for access point alarms. See the [“Using the Search Feature” section on page 2-33](#) for more information.

Step 2 Select the alarms that you want to assign to yourself by selecting their corresponding check boxes.

Note To unassign an alarm assigned to you, unselect the box next to the appropriate alarm. You cannot unassign alarms assigned to others.

Step 3 From the Select a command drop-down list, choose **Assign to Me** (or **Unassign**), and click **Go**.

If you choose **Assign to Me**, your username appears in the Owner column. If you choose **Unassign**, the username column becomes empty.

Deleting and Clearing Alarms

To delete or clear an alarm from a mobility services engine, follow these steps:

Step 1 In the Monitor > Alarms page, select the alarms that you want to delete or clear by selecting their corresponding check boxes.

Note If you delete an alarm, Cisco NCS removes it from its database. If you clear an alarm, it remains in the Cisco NCS database, but in the Clear state. You clear an alarm when the condition that caused it no longer exists.

Step 2 From the Select a command drop-down list, choose **Delete** or **Clear**, and click **Go**.

**Note**

To set up cleanup of old alarms and cleared alarms, choose **Administration > Settings > Alarms**.

Acknowledging Alarms

You may want certain alarms to be removed from the Alarms List. For example, if you are continuously receiving an interference alarm from a certain access point on the 802.11g interface, you may want to stop that access point from being counted as an active alarm on the page or any alarms list. In this scenario, you can find the alarm for the 802.11g interface in the Alarms list, select the check box, and choose **Acknowledge** from the Select a command drop-down list.

Now if the access point generates a new violation on the same interface, NCS will not create a new alarm, and the page shows no new alarms. However, if the interference violation is created on another interface, such as 802.11a, a new alarm is created.

Any alarms, once acknowledged, will not show up on either the page or any alarm list page. Also, no emails are generated for these alarms after you have marked them as acknowledged. By default, acknowledged alarms are not included for any search criteria. To change this default, choose **Administration > Settings > Alarms** page and disable the Hide Acknowledged Alarms preference.

**Note**

When you acknowledge an alarm, a warning displays as a reminder that a recurrence of the problem does not generate another alarm unless this functionality is disabled. Use the Administration > User Preferences page to disable this warning message.

You can also search for all previously acknowledged alarms to reveal the alarms that were acknowledged during the last seven days. NCS automatically deletes cleared alerts that are more than seven days old so your results can only show activity for the last seven days. Until an existing alarm is deleted, a new alarm cannot be generated for any managed entity for which NCS has already generated an alarm.

Monitoring Rogue Alarm Events

The Events page enables you to review information about rogue alarm events. NCS generates an event when a rogue access point is detected or if you make manual changes to a rogue access point (such as changing its state). The Rogue AP Events list page displays all rogue access point events.

To access the Rogue AP Events list page, follow these steps:

-
- Step 1** Do one of the following:
- Perform a search for rogue access point events using the Advanced Search feature of NCS. See the [“Using the Search Feature”](#) section on page 2-33 for more information.
 - In the Rogue AP Alarms details page, choose **Event History** from the Select a command drop-down list.
- Step 2** The Rogue AP Events list page displays the following event information.
- Severity—Indicates the severity of the alarm.
 - Rogue MAC Address—Click the rogue MAC address to view the Rogue AP Event Details page. See the [“Viewing Rogue AP Event Details”](#) section on page 3-18 for more information.
 - Vendor—Rogue access point vendor name or Unknown.

- Classification Type—Malicious, Friendly, or Unclassified. See the [“Rogue Access Point Classification Types” section on page 3-11](#) for more information.
 - On Network—Indicates how the rogue detection occurred.
 - Controller—The controller detected the rogue (Yes or No).
 - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
 - Radio Type—Lists all radio types applicable to this rogue access point.
 - Date/Time—The date and time that the event was generated.
 - State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point. See the [“Rogue Access Point Classification Types” section on page 3-11](#) for additional information.
 - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
-

Viewing Rogue AP Event Details

To view rogue access point event details, follow these steps:

-
- Step 1** In the Rogue AP Events list page, click the **Rogue MAC Address** link.
- Step 2** The Rogue AP Events Details page displays the following information:
- Rogue MAC Address
 - Vendor—Rogue access point vendor name or Unknown.
 - On Network—Indicates how the rogue detection occurred.
 - Controller—The controller detected the rogue (Yes or No).
 - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
 - Classification Type—Malicious, Friendly, or Unclassified. See the [“Rogue Access Point Classification Types” section on page 3-11](#) for more information.
 - State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point. See the [“Rogue Access Point Classification Types” section on page 3-11](#) for additional information.
 - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
 - Channel Number—The channel on which the rogue access point is broadcasting.
 - Containment Level—Indicates the containment level of the rogue access point or Unassigned.
 - Radio Type—Lists all radio types applicable to this rogue access point.
 - Created—The date and time that the event was generated.
 - Generated By—The method by which the event was generated (such as Controller).
 - Device IP Address
 - Severity—Indicates the severity of the alarm.

- **Message**—Provides details of the current event.
-

Monitoring Adhoc Rogue Events

The Events page enables you to review information about adhoc rogue events. NCS generates an event when an adhoc rogue is detected or if you make manual changes to an adhoc rogue (such as changing its state). The Adhoc Rogue Events list page displays all adhoc rogue events.

To access the Rogue AP Events list page, follow these steps:

Step 1 Do one of the following:

- Perform a search for adhoc rogues events using the Advanced Search feature of NCS. See the [“Using the Search Feature” section on page 2-33](#) for more information.
- In the Adhoc Rogue Alarms details page, choose **Event History** from the Select a command drop-down list.

Step 2 The Rogue AP Events list page displays the following event information.

- **Severity**—Indicates the severity of the alarm.
 - **Rogue MAC Address**—Click the rogue MAC address to view the Rogue AP Event Details page. See the [“Viewing Adhoc Rogue Event Details” section on page 3-19](#) for more information.
 - **Vendor**—Rogue access point vendor name or Unknown.
 - **On Network**—Indicates how the rogue detection occurred.
 - **Controller**—The controller detected the rogue (Yes or No).
 - **Switch Port Trace**—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
 - **Radio Type**—Lists all radio types applicable to this rogue access point.
 - **Date/Time**—The date and time that the event was generated.
 - **State**—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
 - **SSID**—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
-

Viewing Adhoc Rogue Event Details

To view rogue access point event details, follow these steps:

Step 1 In the Rogue AP Events list page, click the **Rogue MAC Address** link.

Step 2 The Rogue AP Events Details page displays the following information:

- **Rogue MAC Address**
- **Vendor**—Rogue access point vendor name or Unknown.
- **On Network**—Indicates how the rogue detection occurred.

- Controller—The controller detected the rogue (Yes or No).
- Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Channel Number—The channel on which the rogue access point is broadcasting.
- Containment Level—Indicates the containment level of the rogue access point or Unassigned.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Created—The date and time that the event was generated.
- Generated By—The method by which the event was generated (such as Controller).
- Device IP Address
- Severity—Indicates the severity of the alarm.
- Message—Provides details of the current event.

Security Overview

NCS provides a foundation that allows IT managers to design, control, secure, and monitor enterprise wireless networks from a centralized location.

NCS provides the following tools for managing and enforcing wireless security configurations and policies within the Cisco wireless network infrastructure:

- Network security policy creation and enforcement, such as user authentication, encryption, and access control
- Wireless infrastructure security configuration
- Rogue detection, location, and containment
- Wireless intrusion prevention system (wIPS)
- Wireless IPS signature tuning and management
- Management Frame Protection (MFP)
- Collaboration with Cisco wired Network IPS for monitoring and mitigating unauthorized or malicious wireless user activity
- Comprehensive security event management and reporting

Security Vulnerability Assessment

In Cisco Unified Wireless Network Version 5.1, an automated security vulnerability assessment is available to facilitate analysis of an enterprise's overall wireless security posture, as well as to provide WLAN operators with real-time benchmarking of their security services configurations against industry best practices. The automated security vulnerability assessment provides:

- Proactive vulnerability monitoring of the entire wireless network

- Comprehensive information on security vulnerabilities that could lead to loss of data, network intrusion, or malicious attack
- Reduction in the time and expertise required to analyze and remedy weaknesses in wireless security posture

The automated wireless vulnerability assessment audits the security posture of the entire wireless network for vulnerabilities. These vulnerabilities can result in:

- Unauthorized management access or using management protocols to compromise or adversely impact the network
- Unauthorized network access, data leakage, man-in-the-middle, or replay attacks
- Compromised or adverse impacts to the network through manipulation of network protocols and services, for example through denial of service (DoS) attacks

The Cisco NCS automatically scans the entire network and compares settings against Cisco recommended and industry best practices for wireless security configurations. The automated wireless security assessment functions within NCS scan wireless LAN controllers, access points, and network management interfaces for vulnerabilities in configuration settings, encryption, user authentication, infrastructure authentication network management, and access control.

Status of the wireless network security is graphically displayed to provide wireless network administrators with an easy-to-read dashboard of security events. The NCS displays the vulnerability assessment results through a Security Index on the NCS security dashboard. The Security Index summarizes the network security posture with a composite security score and prioritized summary of vulnerabilities. See the [“Security Index” section on page 3-21](#) for more information.

Administrators can drill down to the Security Index Detailed Report if an event in the Security Summary warrants further investigation. The Security Index Detailed Report provides in-depth analysis of the vulnerabilities across the network. It also identifies optimal security settings and recommends changes that will remedy the vulnerabilities. Any changes the administrator makes are reflected in an updated Security Index score. See the [“Security Index Detailed Report” section on page 3-22](#) for more information.

Security Index

The Security Index gives an indication of the security of the NCS managed network. The security index is calculated by assigning weight to the various security configurations and displaying it in visual form. The combined weightages can vary from 0 to 100, where 0 signifies least secured and 100 maximum secured.

The weighting comes from the lowest scoring controller and the lowest scoring Location Server/Mobility Service Engine related security configurations that are maintained within NCS itself. For example, the security index of the NCS managed network is equal to the lowest scoring controller plus the lowest scoring Location Server/Mobility Service Engine.

The following color scheme applies for the security index:

- Above or equal to 80—Green
- Below 80 but above or equal to 60—Yellow
- Below 60—Red

Note

Guest WLANs are excluded from the WLANs. A WLAN which has web authentication or web passthrough enabled is identified as a guest WLAN.

The security index of the latest release is the benchmark for the required security configurations. For example, if AES encryption was not present in an earlier version of code, the index is reduced by the number associated with the AES encryption security configuration. Likewise, if new security configurations are introduced, the weighting would be altered.

The configurations stored in NCS may not be up-to-date with the ones in the controllers unless the Refresh from Controller command is run from NCS. You can run Security Index calculations from the Configuration Sync task to get the latest config data from all the controllers.

Top Security Issues

The Top Security Issues section displays the five top security issues. The View All and Devices links sort relevant columns and show a report of security issues occurring across all controllers. Click **View All** to open the Security Index Detailed Report. Click **Devices** to view the Security Index Controller Report.

- [Security Index Detailed Report, page 3-22](#)
- [Security Index Controller Report, page 3-22](#)
- [Potential Security Issues, page 3-23](#)

Security Index Detailed Report

The Security Index Detailed Report displays all security issues found across all controllers, location servers, and mobility service engines. It details problems found in a particular security configuration retrieved from the device. If a particular issue has been acknowledged (just like alarms), it is ignored when the next Configuration Sync task runs (if Security Index Calculation is enabled).

In some cases when an issue is acknowledged and it is ignored the next time the Configuration Sync task runs, the final security index score does not change. Some possible reasons for this may include:

- The acknowledged issue is on a controller which is not directly affecting the security index score (for instance, it is not the controller with the lowest score).
- The acknowledged issue is on a WLAN that is not directly affecting the security index score. Only the lowest scoring WLAN of the lowest scoring controller affects the security index score.

When SSH and Telnet are enabled on a controller and are both flagged as issues, the Telnet issue has a higher precedence than SSH. Even if SSH is acknowledged on the controller with the lowest score, no change would occur for the security index.

From the Select a command drop-down list, choose **Show All** to view all security issues (both acknowledged and unacknowledged). Choose **Show Unacknowledged** to only view unacknowledged security issues. This is the default view when View All is selected from the Security Summary page. Choose **Show Acknowledged** to only view acknowledged security issues.

Note In order for an user to Acknowledge or Unacknowledge security issues, the user has to have "Ack and Unack Security Index Issues permission enabled".

Security Index Controller Report

This page shows the security violation report as a summary for each controller. By row, each controller shows the number of security issues that occurred on that controller and provides a link to all security issues.

If you click the number in the Security Issues Count column, the Security Index Detailed Report appears.

Potential Security Issues

Table 3-7 and Table 3-8 describe the potential security issues.

Table 3-7 Potential Security Issues

Controller Security Issue	Why is this an Issue?	What is the Solution?
WLAN SSID on the controller has a weak authentication method.	Weak authentication method for a WLAN which can be broken by using tools available online if WLAN packets are sniffed.	Use the most secured authentication method and one that is WPA+WPA2.
WLAN SSID on the controller has a weak authentication method (CKIP) configured.	Weak authentication method for a WLAN.	Use the most secured authentication method and one that is WPA+WPA2.
WLAN SSID on the controller has no user authentication configured.	No authentication method is a clear security risk for a WLAN.	Configure strong authentication methods such as WPA+WPA2.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 40 bits) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 40 bits with Key Permutation) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 40 bits with MMH) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 40 bits with MMH and Key Permutation) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (WEP 104 bits) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 104 bits) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 104 bits with MMH) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (CKIP WEP 104 bits with Key Permutation) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.

Table 3-7 *Potential Security Issues (continued)*

Controller Security Issue	Why is this an Issue?	What is the Solution?
WLAN SSID on the controller has a weak encryption method (CKIP WEP 104 bits with MMH and Key Permutation) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (WEP 40 bits) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (WEP 128 bits) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (TKIP) configured.	Weak encryption method for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has no encryption configured.	No encryption method is a clear security risk for a WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has a weak encryption method (WEP 104 bits) configured.	Weak encryption method for WLAN.	Configure strong authentication and encryption methods such as WPA+WPA2 with AES.
WLAN SSID on the controller has no key management methods configured (applicable only for WPA+WPA2).	A key management method enhances the security of keys; without one, WLAN is less secure.	Configure at least one key management methods such as CCKM.
WLAN SSID on the controller has MFP Client Protection set to "Optional".	With MFP Client Protection set to optional for a WLAN, authenticated clients may not be shielded from spoofed frames.	Set MFP Client Protection to "Required" to protect against clients connecting to a rogue access point.
WLAN SSID on the controller has MFP Client Protection set to "Disabled".	With MFP Client Protection set to disabled for a WLAN, authenticated clients may not be shielded from spoofed frames.	Set MFP Client Protection to "Required" to protect against clients connecting to a rogue access point.
WLAN SSID interface is set to "management" on the controller.	As recommended from SAFE, user traffic should be separated from management traffic.	WLAN interface should not be set to "management" on the controller.
Interface set to one which is VLAN for a WLAN.	As recommended from SAFE, user traffic should be separated from VLAN traffic.	WLAN needs its interface to be set to one which is neither management nor one which has a VLAN.
WLAN SSID on the controller has "Client Exclusion" disabled.	With Client Exclusion policies disabled, an attacker is able to continuously try to access the WLAN network.	Enable "Client Exclusion" to secure against malicious WLAN client behavior.
WLAN SSID on the controller has "Broadcast SSID" enabled.		Disable "Broadcast SSID" to secure your wireless network.

Table 3-7 Potential Security Issues (continued)

Controller Security Issue	Why is this an Issue?	What is the Solution?
WLAN SSID on the controller has “MAC Filtering” disabled.		Enable “MAC Filtering” to secure your wireless network.
Protection Type is set to “AP Authentication” on the controller.	When AP Authentication is set, an access point checks beacon/probe response frames in neighboring access points to see if they contain an authenticated information element (IE) that matches that of the RF group. This provides some security but does not cover all management frames and is open to alteration by rogue access points.	Set Protection Type to “Management Frame Protection (MFP)” on the controller.
Protection Type is set to “None” of the controller.	No security for 802.11 management messages passed between access points and clients.	Set Protection Type to “Management Frame Protection (MFP)” on the controller.
Radio type is configured to detect rogues only on DCA channels.	Rogue detection, if done only on a subset of country/all channels, is less secure than one that is done on country/all channels.	Configure radio types 802.11a/n and 802.11b/g/n to detect rogues on country channels or all channels.
Radio type is configured to detect rogues on neither country channels nor DCA channels.	Rogue detection, if not configured on country nor DCA channels, is less secure than when done on country/all channels.	Configure radio types 802.11a/n and 802.11b/g/n to detect rogues on country channels or all channels.
The rogue policy to detect and report adhoc networks is disabled on the controller.	With detection and reporting of adhoc networks turned off, adhoc rogues go undetected.	Enable the rogue policy to detect and report adhoc networks
“Check for all Standard and Custom Signatures” is disabled on the controller.	If check for all Standard and Custom Signatures is disabled, various types of attacks in incoming 802.11 packets would go undetected. various types of attacks in incoming 802.11 packets would go undetected.	Check for all Standard and Custom Signatures needs to be turned on to identify various types of attacks in incoming 802.11 packets.
Some of the Standard Signatures are disabled on the controller.	If only some of the Standard Signatures are disabled,	Enable all Standard Signatures on the controller.
The “Excessive 802.11 Association Failures” Client Exclusion Policy is disabled on the controller.	Excessive failed association attempts can consume system resources and launch potential a denial of service attack to the infrastructure.	Enable the “Excessive 802.11 Association Failures” Client Exclusion Policy on the controller.

Table 3-7 Potential Security Issues (continued)

Controller Security Issue	Why is this an Issue?	What is the Solution?
The “Excessive 802.11 Authentication Failures” Client Exclusion Policy is disabled on the controller.	Excessive failed authentication attempts can consume system resources and launch potential Denial of Service attack to the infrastructure.	Enable the “Excessive 802.11 Authentication Failures” Client Exclusion Policy on the controller.
The “Excessive 802.1X Authentication Failures” Client Exclusion Policy is disabled on the controller.	Excessive 802.1X failed authentication attempts can consume system resources and launch potential denial of service attack to the infrastructure.	Excessive 802.1X Authentication Failures Client Exclusion Policy must be enabled to prevent denial of service attack to the infrastructure.
The “Excessive 802.11 Web Authentication Failures” Client Exclusion Policy is disabled on the controller.	If Excessive 802.11 Web failed web authentication attempts can consume system resources and launch potential Denial of Service attack to the infrastructure.	Enable the “Excessive 802.11 Web Authentication Failures” Client Exclusion Policy on the controller.
The “IP Theft or IP Reuse” Client Exclusion Policy is disabled on the controller.	If IP Theft or Reuse Client Exclusion Policy is disabled, then an attacker masquerading as another client would not be disallowed.	Enable the “IP Theft or IP Reuse” Client Exclusion Policy on the controller.
No CIDS Sensor configured on the controller.	If no enabled IDS Sensor is configured, then IP-level attacks would not be detected.	Configure at least one CIDS Sensor on the controller.
Controller is configured with default community strings for SNMP v1/v2.	If SNMP V1 or V2 with default Community is configured then it is open to easy attacks since default communities are well known.	Use SNMPv3 with Auth and Privacy Types.
Controller is configured with non-default community strings for SNMP v1/v2.	SNMP V1 or V2 with non-default Community is slightly more secure than default Community but still less secure than SNMP V3.	Use SNMPv3 with Auth and Privacy types.
SNMPv3 is configured with a default user on the controller.	Using a default user makes SNMP V3 connections less secure.	Use a non-default username for SNMPv3 with Auth and Privacy Types.
SNMPv3 is configured with either no Auth or Privacy Type on the controller.	SNMP V3 with either Auth or Privacy Type set to none reduces the security of SNMP V3 connection.	Use SNMPv3 with Auth and Privacy Types to secure your wireless network.
HTTP (Web Mode enabled but Secure Web Mode disabled) is enabled on the controller.	HTTP is less secure than HTTPS.	Enable HTTPS (both Web Mode and Secure Web Mode) on the controller.

Table 3-7 *Potential Security Issues (continued)*

Controller Security Issue	Why is this an Issue?	What is the Solution?
Telnet is enabled on the controller.	If telnet is enabled, then the controller is at risk of being hacked into.	Disable telnet on the controller.
SSH is disabled and timeout value is set to zero on the controller.	If SSH is enabled and timeout is zero then the controller has risk of being hacked into.	Enable SSH with non-zero timeout value on the controller.
Telnet is enabled on the AP.	If telnet is enabled, then the access point is at risk of being hacked into.	Disable Telnet on all access points.
SSH is enabled on the AP.		Disable SSH on all the access points.
At least one of the APs is configured with default username or password.	If default password is configured, then access points are more susceptible to connections from outside the network.	Configure a non-default username and strong password for all access points associated to the controller.

Table 3-8 *Potential Security Issues*

Location Server/ Mobility Server Engine Security Issue	Why is this an Issue?	What is the Solution?
HTTP is enabled on the location server.	HTTP is less secure than HTTPS.	Enable HTTPS on the location server.
A location server user has a default password configured.	If default password is configured, then Location Server/ Mobility Server Engine is more susceptible to connections from outside the network.	Configure a strong password for the location server users.
HTTP is enabled on the mobility services engine.	HTTP is less secure than HTTPS.	Enable HTTPS on the mobility services engine.
A mobility services engine user has default password configured.	If default password is configured, then Location Server/ Mobility Server Engine is more susceptible to connections from outside the network.	Configure a strong password for the users on the mobility services engine.
wIPS Service is not enabled on the mobility services engine.	Your network is vulnerable to advanced security threats.	Deploy wIPS Service to protect your network from advanced security threats.

Switch Port Tracing

Currently, NCS provides rogue access point detection by retrieving information from the controller. The rogue access point table is populated with any detected BSSID addresses from any frames that are not present in the neighbor list. At the end of a specified interval, the contents of the rogue table are sent to the controller in an CAPWAP Rogue AP Report message. With this method, NCS would simply gather the information received from the controllers; but with software release 5.1, you can incorporate switch port tracing of Wired Rogue Access Point Switch Ports. This enhancement allows you to react to found wired rogue access points and prevent future attacks. The trace information is available only in the NCS log and only for rogue access points, not rogue clients.

Note

Rogue Client connected to the Rogue Access point information is used to track the switch port to which the Rogue Access point is connected in the network.

Note

If you try to set tracing for a friendly or deleted rogue, a warning message appears.

Note

For Switch Port Tracing to successfully trace the switch ports using SNMP v3, all of the OIDs should be included in the SNMP v3 view and VLAN content should be created for each VLAN in the SNMP v3 group.

Establishing Switch Port Tracing

To establish switch port tracing, follow these steps:

- Step 1** In the NCS home page, click the **Security** dashboard.
- Step 2** In the Rogue APs and Adhoc Rogues section, click the number URL which specifies the number of rogues in the last hour, last 24 hours, or total active.
- Step 3** Choose for which rogue you are setting switch port tracking by clicking the URL in the MAC Address column. The Alarms > Rogue AP details page opens.
- Step 4** From the Select a command drop-down list, choose **Trace Switch Port**. The Trace Switch Port page opens, and NCS runs a switch port trace.

When one or more searchable MAC addresses are available, the NCS uses CDP to discover any switches connected up to two hops away from the detecting access point. The MIBs of each CDP discovered switch is examined to see if it contains any of the target MAC addresses. If any of the MAC addresses are found, the corresponding port number is returned and reported as the switch port of a rogue.

Integrated Security Solutions

The Cisco Unified Wireless Network Solution also provides these integrated security solutions:

- Cisco Unified Wireless Network Solution operating system security is built around a robust 802.1X authorization, authentication, and accounting (AAA) engine, which enables operators to rapidly configure and enforce a variety of security policies across the Cisco Unified Wireless Network Solution.
- The controllers and access points are equipped with system-wide authentication and authorization protocols across all ports and interfaces, maximizing system security.
- Operating system security policies are assigned to individual wireless LANs, and access points simultaneously broadcast all (up to 16) configured wireless LANs. These policies can eliminate the need for additional access points, which can increase interference and degrade system throughput.
- Operating system security uses the RRM function to continually monitor the air space for interference and security breaches and notify the operator when they are detected.
- Operating system security works with industry-standard AAA servers, making system integration simple and easy.
- The Cisco intrusion detection system/intrusion protection system (CIDS/IPS) instructs controllers to block certain clients from accessing the wireless network when attacks involving these clients are detected.
- The operating system security solution offers comprehensive Layer 2 and Layer 3 encryption algorithms, which typically require a large amount of processing power. Rather than assigning the encryption tasks to yet another server, the controller can be equipped with a VPN/enhanced security module that provides extra hardware required for the most demanding security configurations.

Using NCS to Convert a Cisco Unified Wireless Network Solution from Layer 3 to Layer 2 Mode

To convert a Cisco Unified Wireless Network Solution from Layer 3 to Layer 2 LWAPP transport mode using the NCS user interface, follow these steps:

**Note**

Cisco-based lightweight access points do not support Layer 2 LWAPP mode. These access points can only be run with Layer 3.

**Note**

This procedure causes your access points to go offline until the controller reboots and the associated access points reassociate to the controller.

Step 1

Make sure that all controllers and access points are on the same subnet.

**Note**

You must configure the controllers and associated access points to operate in Layer 2 mode before completing the conversion.

Step 2

Log into the NCS user interface. Then follow these steps to change the LWAPP transport mode from Layer 3 to Layer 2:

- a. Choose **Configure > Controllers** to navigate to the All Controllers page.
- b. Click the desired IP address of a controller to display the *IP Address > Controller Properties* page.

- c. From the left sidebar menu, click **System > General** to display the *IP Address > General* page.
- d. Change LWAPP transport mode to **Layer2**, and click **Save**.
- e. If NCS displays the following message, click **OK**:

```
Please reboot the system for the LWAPP Mode change to take effect.
```

Step 3 To restart your Cisco Unified Wireless Network Solution, follow these steps:

- a. Return to the *IP Address > Controller Properties* page.
- b. Click **System > Commands** to display the *IP Address > Controller Commands* page.
- c. Under Administrative Commands, choose **Save Config To Flash**, and click **Go** to save the changed configuration to the controller.
- d. Click **OK** to continue.
- e. Under Administrative Commands, choose **Reboot**, and click **Go** to reboot the controller.
- f. Click **OK** to confirm the save and reboot.

Step 4 After the controller reboots, follow these steps to verify that the LWAPP transport mode is now Layer 2:

- a. Click **Monitor > Controllers** to navigate to the *Controllers > Search Results* page.
- b. Click the desired IP address of a controller to display the *Controllers > IP Address > Summary* page.
- c. Under General, verify that the current LWAPP transport mode is Layer2.

You have completed the LWAPP transport mode conversion from Layer 3 to Layer 2. The operating system software now controls all communications between controllers and access points on the same subnet.

Configuring a Firewall for NCS

When an NCS server and an NCS user interface are on different sides of a firewall, they cannot communicate unless the following ports on the firewall are open to two-way traffic:

- 80 (for initial http)
- 69 (tftp)
- 162 (trap port)
- 443 (https)

Open these ports to configure your firewall to allow communications between a NCS server and a NCS user interface.

Access Point Authorization

You can view a list of authorized access points along with the type of certificate that an access point uses for authorization.

Step 1 Choose **Configure > Controllers**.

- Step 2** Click one of the URLs in the IP address column.
- Step 3** From the left sidebar menu, choose **Security > AP/MSE Authorization**.
- Step 4** The AP Policies portion of the page indicates whether the authorization of access points is enabled or disabled. It also indicates whether the acceptance of self-signed certificates (SSC APs) is enabled or disabled. Normally, access points can be authorized either by AAA or certificates. (SSC is only available for 4400 and 200 controllers.)
- To change these values, choose **Edit AP Policies** from the Select a command drop-down list, and click **Go**.
- Step 5** The AP Authorization List portion shows the radio MAC address of the access point, certificate type, and key hash. To add a different authorization entry, choose **Add AP/MSE Auth Entry** from the Select a command drop-down list, and click **Go**.
- Step 6** From the drop-down list, choose a template to apply to this controller, and click **Apply**. To create a new template for access point authorization, click the **click here** link to get redirected to the template creation page. See the “[Configuring an Access Point or MSE Authorization Template](#)” section on page 11-59 for steps on creating a new template.
-

Management Frame Protection (MFP)

Management Frame Protection (MFP) provides security for the otherwise unprotected and unencrypted 802.11 management messages passed between access points and clients. MFP provides both infrastructure and client support.

- **Infrastructure MFP**—Protects management frames by detecting adversaries who are invoking denial of service attacks, flooding the network with associations and probes, interjecting as rogue access points, and affecting network performance by attacking the QoS and radio measurement frames. It also provides a quick and effective means to detect and report phishing incidents.

Specifically, infrastructure MFP protects 802.11 session management functions by adding message integrity check information elements (MIC IEs) to the management frame emitted by access points (and not those emitted by clients), which are then validated by other access points in the network. Infrastructure MFP is passive. It can detect and report intrusions but has no means to stop them.

- **Client MFP**—Shields authenticated clients from spoofed frames, preventing many of the common attacks against wireless LANs from becoming effective. Most attacks, such as deauthentication attacks, revert to simply degrading performance by contending with valid clients.

Specifically, client MFP encrypts management frames sent between access points and Cisco Compatible Extension clients so that both access points and clients can take preventive action by dropping spoofed class 3 management frames (that is, management frames passed between an access point and a client that is authenticated and associated). Client MFP leverages the security mechanisms defined by IEEE 802.11i to protect the following types of class 3 unicast management frames: disassociation, deauthentication, and QoS (WMM) action. Client MFP is active. It can protect a client-access point session from the most common type of denial of service attack. It protects class 3 management frames by using the same encryption method used for the session's data frames. If a frame received by the access point or client fails decryption, it is dropped, and the event is reported to the controller.

To use client MFP, clients must support Cisco Compatible Extensions (version 5) MFP and must negotiate WPA2 using either TKIP or AES-CCMP. EAP or PSK may be used to obtain the PMK. CCKM and controller mobility management are used to distribute session keys between access points or Layer 2 and Layer 3 fast roaming.

To prevent attacks against broadcast frames, access points supporting Cisco Compatible Extensions (version 5) do not emit any broadcast class 3 management frames (such as disassociation, deauthentication, or action). Compatible extensions clients (version 5) and access points must discard broadcast class 3 management frames.

Client MFP supplements infrastructure MFP rather than replacing it because infrastructure MFP continues to detect and report invalid unicast frames sent to clients that are not client-MFP capable, as well as invalid class 1 and 2 management frames. Infrastructure MFP is applied only to management frames that are not protected by client MFP.

Infrastructure MFP consists of three main components:

- Management frame protection—The access point protects the management frames it transmits by adding a MIC IE to each frame. Any attempt to copy, alter, or replay the frame invalidates the MIC, causing any receiving access point configured to detect MFP frames to report the discrepancy.
- Management frame validation—In infrastructure MFP, the access point validates every management frame it receives from other access points in the network. It ensures that the MC IE is present (when the originator is configured to transmit MFP frames) and matches the content of the management frame. If it receives any frame that does not contain a valid MIC IE from a BSSID belonging to an access point that is configured to transmit MFP frames, it reports the discrepancy to the network management system. In order for the timestamps to operate properly, all controllers must be Network Transfer Protocol (NTP) synchronized.
- Event reporting—The access point notifies the controller when it detects an anomaly, and the controller aggregates the received anomaly events and reports the results through SNMP traps to the network management system.

Note

Client MFP uses the same event reporting mechanisms as infrastructure MFP.

Infrastructure MFP is enabled by default and can be disabled globally. When you upgrade from a previous software release, infrastructure MFP is disabled globally if access point authentication is enabled because the two features are mutually exclusive. After infrastructure MFP is enabled globally, signature generation (adding MICs to outbound frames) can be disabled for selected WLANs, and validation can be disabled for selected access points.

You set MFP in the WLAN template. See the [“Configuring WLAN Template”](#) section on page 11-22.

Guidelines for Using MFP

Follow these guidelines for using MFP:

- MFP is supported for use with Cisco Aironet lightweight access points, except for the 1500 series mesh access points.
- Lightweight access points support infrastructure MFP in local and monitor modes and in REAP and hybrid-REAP modes when the access point is connected to a controller. They support client MFP in local, hybrid-REAP, and bridge modes.
- Client MFP is supported for use only with Cisco Compatible Extensions (version 5) clients using WPA2 with TKIP or AES-CCMP.

- Non-Cisco Compatible Extensions (version 5) clients may associate to a WLAN if client MFP is disabled or optional.

Configuring Intrusion Detection Systems (IDS)

The Cisco Intrusion Detection System/Intrusion Prevention System (CIDS/IPS) instructs controllers to block certain clients from accessing the wireless network when attacks involving these clients are detected. This system offers significant network protection by helping to detect, classify, and stop threats including worms, spyware/adware, network viruses, and application abuse. Two methods are available to detect IDS attacks:

- IDS sensors (for Layer 3)
- IDS signatures (for Layer 2)

Viewing IDS Sensors

When the sensors identify an attack, they alert the controller to shun the offending client. When you add a new IDS sensor, you register the controller with that IDS sensor so that the sensor can send shunned client reports to the controller. The controller also polls the sensor periodically.

To view IDS sensors, follow these steps:

-
- Step 1** Choose **Configure > Controllers**.
 - Step 2** Choose a controller by clicking an IP address.
 - Step 3** From the left sidebar menu, choose **Security > IDS Sensor Lists**. The IDS Sensor page appears. This page lists all of the IDS sensors that have been configured for this controller.
-

Configuring IDS Signatures

You can configure *IDS signatures*, or bit-pattern matching rules used to identify various types of attacks in incoming 802.11 packets, on the controller. When the signatures are enabled, the access points joined to the controller perform signature analysis on the received 802.11 data or management frames and report any discrepancies to the controller. If an attack is detected, an appropriate mitigation action is initiated.

Cisco supports 17 standard signatures on the controller as shown on the Standard Signatures and Custom Signatures page (see [Figure 3-3](#)). To open this page, choose **Configure > Controllers**, select a controller IP address, and then choose **Security > Wireless Protection Policies > Standard Signatures** from the left sidebar menu.

Figure 3-3 Standard Signatures Page

Precedence	Name	Frame Type	Action	State	Description
1	Bcast deauth	Management	Report	Enabled	Broadcast Deauthentication Frame
2	NULL probe resp 1	Management	Report	Enabled	NULL Probe Response - Zero length SSID element
3	NULL probe resp 2	Management	Report	Enabled	NULL Probe Response - No SSID element
4	Assoc flood	Management	Report	Enabled	Association Request flood
5	Auth flood	Management	Report	Enabled	Authentication Request flood
6	Reassoc flood	Management	Report	Enabled	Reassociation Request flood
7	Broadcast Probe floo	Management	Report	Enabled	Broadcast Probe Request flood
8	Disassoc flood	Management	Report	Enabled	Disassociation flood
9	Deauth flood	Management	Report	Enabled	Deauthentication flood
10	Reserved mgmt 7	Management	Report	Enabled	Reserved management sub-type 7
11	Reserved mgmt F	Management	Report	Enabled	Reserved management sub-type F
12	EAPOL flood	Data	Report	Enabled	EAPOL Flood Attack
13	NetStumbler 3.2.0	Data	Report	Enabled	NetStumbler 3.2.0
14	NetStumbler 3.2.3	Data	Report	Enabled	NetStumbler 3.2.3
15	NetStumbler 3.3.0	Data	Report	Enabled	NetStumbler 3.3.0
16	NetStumbler generic	Data	Report	Enabled	NetStumbler
17	Wellenreiter	Management	Report	Enabled	Wellenreiter

These signatures are divided into six main groups. The first four groups contain management signatures, and the last two groups contain data signatures:

- Broadcast deauthentication frame signatures—During a broadcast deauthentication frame attack, a hacker sends an 802.11 deauthentication frame to the broadcast MAC destination address of another client. This attack causes the destination client to disassociate from the access point and lose its connection. If this action is repeated, the client experiences a denial of service. When the broadcast deauthentication frame signature (precedence 1) is used to detect such an attack, the access point listens for clients transmitting broadcast deauthentication frames that match the characteristics of the signature. If the access point detects such an attack, it alerts the controller. Depending on how your system is configured, the offending device is contained so that its signals no longer interfere with authorized clients, or the controller forwards an immediate alert to the system administrator for further action, or both.
- NULL probe response signatures—During a NULL probe response attack, a hacker sends a NULL probe response to a wireless client adapter. As a result, the client adapter locks up. When a NULL probe response signature is used to detect such an attack, the access point identifies the wireless client and alerts the controller. The NULL probe response signatures include:
 - NULL probe resp 1 (precedence 2)
 - NULL probe resp 2 (precedence 3)
- Management frame flood signatures—During a management frame flood attack, a hacker floods an access point with 802.11 management frames. The result is a denial of service to all clients associated or attempting to associate to the access point. This attack can be implemented with different types of management frames: association requests, authentication requests, reassociation requests, probe requests, disassociation requests, deauthentication requests, and reserved management subtypes.

When a management frame flood signature is used to detect such an attack, the access point identifies management frames matching the entire characteristics of the signature. If the frequency of these frames is greater than the value of the frequency set in the signature, an access point that hears these frames triggers an alarm. The controller generates a trap and forwards it to NCS.

The management frame flood signatures include:

- Assoc flood (precedence 4)
- Auth flood (precedence 5)
- Reassoc flood (precedence 6)
- Broadcast probe flood (precedence 7)
- Disassoc flood (precedence 8)
- Deauth flood (precedence 9)
- Reserved mgmt 7 (precedence 10)
- Reserved mgmt F (precedence 11)

The reserved management frame signatures 7 and F are reserved for future use.

- EAPOL flood signature—During an EAPOL flood attack, a hacker floods the air with EAPOL frames containing 802.1X authentication requests. As a result, the 802.1X authentication server cannot respond to all of the requests and fails to send successful authentication responses to valid clients. The result is a denial of service to all affected clients. When the EAPOL flood signature (precedence 12) is used to detect such an attack, the access point waits until the maximum number of allowed EAPOL packets is exceeded. It then alerts the controller and proceeds with the appropriate mitigation.
- NetStumbler signatures—NetStumbler is a wireless LAN scanning utility that reports access point broadcast information (such as operating channel, RSSI information, adapter manufacturer name, SSID, WEP status, and the latitude and longitude of the device running NetStumbler when a GPS is attached). If NetStumbler succeeds in authenticating and associating to an access point, it sends a data frame with the following strings, depending on the NetStumbler version listed in [Table 3-9](#).

Table 3-9 NetStumbler Versions

Version	String
3.2.0	“Flurble gronk bloopit, bnip Frundletrune”
3.2.3	“All your 802.11b are belong to us”
3.3.0	Sends white spaces

When a NetStumbler signature is used to detect such an attack, the access point identifies the offending device and alerts the controller. The NetStumbler signatures include:

- NetStumbler 3.2.0 (precedence 13)
- NetStumbler 3.2.3 (precedence 14)
- NetStumbler 3.3.0 (precedence 15)
- NetStumbler generic (precedence 16)
- Wellenreiter signature—Wellenreiter is a wireless LAN scanning and discovery utility that can reveal access point and client information. When the Wellenreiter signature (precedence 17) is used to detect such an attack, the access point identifies the offending device and alerts the controller.

This section provides the instructions to configure signatures and includes the following topics:

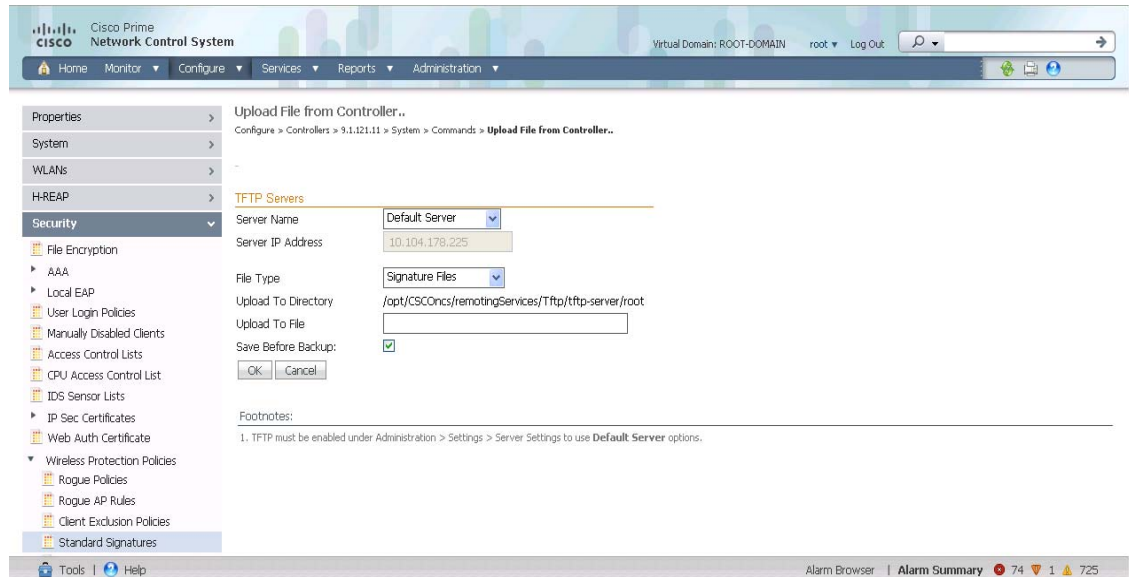

- [Uploading IDS Signatures, page 3-36](#)
- [Downloading IDS Signatures, page 3-37](#)
- [Enabling or Disabling IDS Signatures, page 3-38](#)

Uploading IDS Signatures

To upload IDS signatures from the controller, follow these steps:

-
- Step 1** Obtain a signature file from Cisco (hereafter called a *standard signature file*). You can also create your own signature file (hereafter called a *custom signature file*) by following the “[Downloading IDS Signatures](#)” section on page 3-37.
- Step 2** You can configure a TFTP server for the signature download. Keep these guidelines in mind when setting up a TFTP server:
- If you are downloading through the service port, the TFTP server must be on the same subnet as the service port because the service port is not routable. However, if you want to put the TFTP server on a different network while the management port is down, add a static route if the subnet where the service port resides has a gateway (config route add *IP address of TFTP server*).
 - If you are downloading through the distribution system network port, the TFTP server can be on the same or a different subnet because the distribution system port is routable.
 - A third-party TFTP server cannot run on the same computer as the Cisco NCS because built-in TFTP server of NCS and third-party TFTP server use the same communication port.
- Step 3** Choose **Configure > Controllers**.
- Step 4** Choose a controller by clicking on an IP address.
- Step 5** From the left sidebar menu, choose **Security** and then **Standard Signatures** or **Custom Signatures**.
- Step 6** From the Select a command drop-down list, choose **Upload Signature Files from Controller**. [Figure 3-4](#) shows the page that appears.

Figure 3-4 Uploading Signature File

- Step 7** Specify the TFTP server name being used for the transfer.
- Step 8** If the TFTP server is new, enter the TFTP IP address at the Server IP Address parameter.
- Step 9** Choose **Signature Files** from the File Type drop-down list.
- Step 10** The signature files are uploaded to the root directory which was configured for use by the TFTP server. You can change to a different directory at the Upload to File parameter (this parameter only shows if the Server Name is the default server). The controller uses this local file name as a base name and then adds *_std.sig* as a suffix for standard signature files and *_custom.sig* as a suffix for custom signature files.
- Step 11** Click **OK**.

Downloading IDS Signatures

If the standard signature file is already on the controller but you want to download customized signatures to it, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose a controller by clicking an IP address.
- Step 3** Choose **System > Commands**.
- Step 4** From the Upload/Download Commands drop-down list, choose **Download IDS Signatures**, and click **Go**.
- Step 5** Copy the signature file (*.sig) to the default directory on your TFTP server.
- Step 6** Choose **local machine** from the File is Located On parameter. If you know the filename and path relative to the server's root directory, you can also choose TFTP server.
- Step 7** Enter the maximum number of times the controller should attempt to download the signature file in the Maximum Retries parameter.

- Step 8** Enter the maximum amount of time in seconds before the controller times out while attempting to download the signature file in the Timeout parameter.
- Step 9** The signature files are uploaded to the c:\tftp directory. Specify the local file name in that directory or use the Browse button to navigate to it. A “revision” line in the signature file specifies whether the file is a Cisco-provided standard signature file or a site-tailored custom signature file (custom signature files must always have revision=custom).
- Step 10** If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name will be populated for you and retried. The local machine option initiates a two-step operation. First, the local file is copied from the administrator’s workstation to the built-in TFTP server of NCS. Then the controller retrieves that file. For later operations, the file is already in the NCS server’s TFTP directory, and the download web page now automatically populates the filename.
- Step 11** Click **OK**.
-

Enabling or Disabling IDS Signatures

To enable or disable IDS signature, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose a controller by clicking on an IP address.
- Step 3** From the left sidebar menu, choose **Security** and then **Standard Signatures** or **Custom Signatures**. [Figure 3-5](#) shows a sample of the page that appears.

Figure 3-5 Checking for Standard Signatures

The screenshot shows the Cisco Prime Network Control System interface. The left sidebar contains a navigation menu with categories like Properties, System, WLANs, H-REAP, Security, Access Points, and Management. The 'Security' category is expanded, showing various security policies and signatures. The main content area is titled 'Standard Signatures' and shows a table of 17 signatures. The table has columns for Precedence, Name, Frame Type, Action, State, and Description. The 'State' column is currently set to 'Disable'.

Precedence	Name	Frame Type	Action	State	Description
1	Bcast deauth	Management	Report	Enabled	Broadcast Deauthentication Frame
2	NULL probe resp 1	Management	Report	Enabled	NULL Probe Response - Zero length SSID element
3	NULL probe resp 2	Management	Report	Enabled	NULL Probe Response - No SSID element
4	Assoc flood	Management	Report	Enabled	Association Request flood
5	Auth flood	Management	Report	Enabled	Authentication Request flood
6	Reassoc flood	Management	Report	Enabled	Reassociation Request flood
7	Broadcast Probe flood	Management	Report	Enabled	Broadcast Probe Request flood
8	Disassoc flood	Management	Report	Enabled	Disassociation flood
9	Deauth flood	Management	Report	Enabled	Deauthentication flood
10	Reserved mgmt 7	Management	Report	Enabled	Reserved management sub-type 7
11	Reserved mgmt F	Management	Report	Enabled	Reserved management sub-type F
12	EAPOL flood	Data	Report	Enabled	EAPOL Flood Attack
13	NetStumbler 3.2.0	Data	Report	Enabled	NetStumbler 3.2.0
14	NetStumbler 3.2.3	Data	Report	Enabled	NetStumbler 3.2.3
15	NetStumbler 3.3.0	Data	Report	Enabled	NetStumbler 3.3.0
16	NetStumbler generic	Data	Report	Enabled	NetStumbler
17	Wellenreiter	Management	Report	Enabled	Wellenreiter

Step 4 To enable or disable an individual signature, click in the **Name** column for the type of attack you want to enable or disable. Figure 3-6 shows a sample of a detailed signature screen.

The Standard Signature Parameters page shows the list of Cisco-supplied signatures that are currently on the controller. The Custom Signatures page shows the list of customer-supplied signatures that are currently on the controller. The following information is displayed either on the signature page or the detailed signature page:

- **Precedence** - The order, or precedence, in which the controller performs the signature checks.
- **Name** - The type of attack the signature is trying to detect.
- **Description** - A more detailed description of the type of attack that the signature is trying to detect.
- **Frame Type** - Management or data frame type on which the signature is looking for a security attack.
- **Action** - What the controller is directed to do when the signature detects an attack. One possibility is *None*, where no action is taken, and another is *Report*, to report the detection.
- **Frequency** - The signature frequency, or the number of matching packets per interval that must be identified at the detecting access point level before an attack is detected. The range is 1 to 32,000 packets per interval, and the default value is 50 packets per interval.
- **Quiet Time** - The length of time (in seconds) after which no attacks have been detected at the individual access point level, and the alarm can stop. This time appears only if the MAC information is all or both. The range is 60 to 32,000 seconds, and the default value is 300 seconds.
- **MAC Information** - Whether the signature is to be tracked per network or per MAC address or both at the detecting access point level.
- **MAC Frequency** - The signature MAC frequency, or the number of matching packets per interval that must be identified at the controller level before an attack is detected. The range is 1 to 32,000 packets per interval, and the default value is 30 packets per interval.

- Interval - Enter the number of seconds that must elapse before the signature frequency threshold is reached within the configured interval. The range is 1 to 3600 seconds, and the default value is 1 second.
- Enable - Select this to enable this signature to detect security attacks or unselect it to disable this signature.
- Signature Patterns - The pattern that is being used to detect a security attack.

Figure 3-6 Standard Signature

The screenshot displays the configuration page for a Standard Signature in the Cisco Prime Network Control System. The breadcrumb trail is: Configure > Controllers > 9.1.121.11 > Security > Wireless Protection Policies > Standard Signatures > Standard Signatures Details. The signature name is 'EAPOL flood' and its description is 'EAPOL Flood Attack'. The configuration includes the following fields:

- Precedence: 12
- Name: EAPOL flood
- Description: EAPOL Flood Attack
- Frame Type: Data
- Action: Report
- Frequency: 500 (pps)
- Quiet Time: 300 (secs)
- MAC Information: Both
- MAC Frequency: 300 (pps)
- Interval: 10 (secs)
- Enabled: Yes

The Signature Patterns table is as follows:

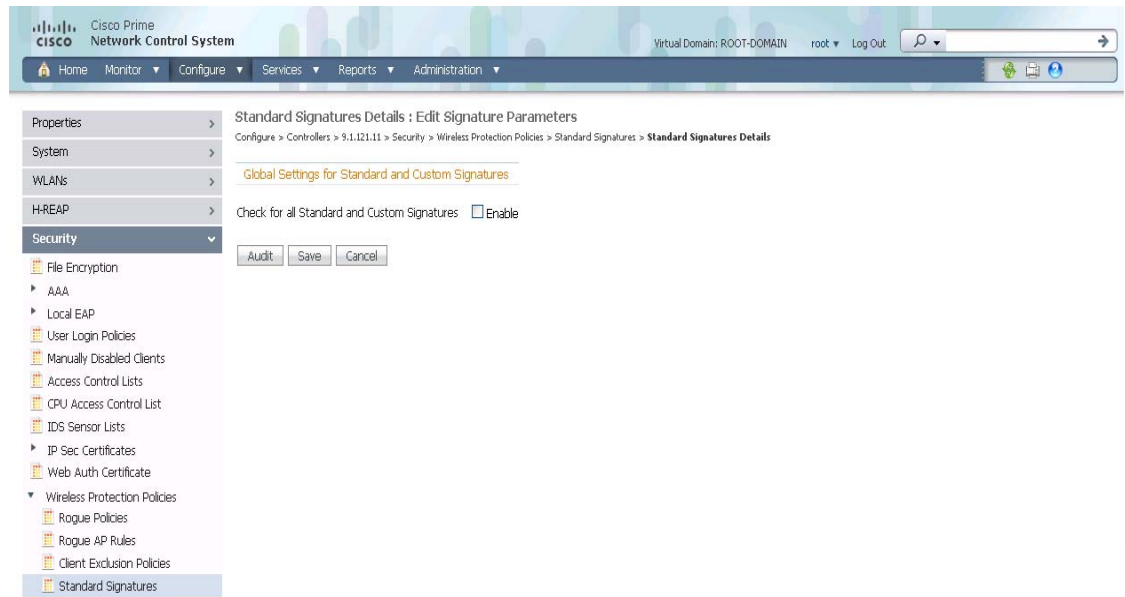

Offset	Pattern	Offset Relative To	Mask
0	0x0008	StartFrame	0x007f
6	0x888e	StartFrameBody	0xffff

Buttons for 'Audit' and 'Save' are located at the bottom of the configuration area. The page footer shows 'Alarm Browser | Alarm Summary 74 1 721'.

Step 5 From the Enabled yes or no drop-down list, choose **yes**. Because you are downloading a customized signature, you should enable the files named with the `_custom.sgi` and disable the standard signature with the same name but differing suffix. (For example, if you are customizing broadcast probe flood, you want to disable broadcast probe flood in the standard signatures but enable it in custom signatures.)

Step 6 To enable all standard and custom signatures currently on the controller, choose **Edit Signature Parameters** (from the screen in Figure 3-5) from the Select a command drop-down list, and choose **Go**. The Edit Signature Parameters page appears (see Figure 3-7).

Figure 3-7 Global Setting for Standard and Custom Signature

- Step 7** Select the Check for All Standard and Custom Signatures parameter, **Enable** check box. This enables all signatures that were individually selected as enabled in [Step 5](#). If this check box remains unselected, all files are disabled, even those that were previously enabled in [Step 5](#). When the signatures are enabled, the access points joined to the controller perform signature analysis on the received 802.11 data or management frames and report any discrepancies to the controller.
- Step 8** Click **Save**.

291024

Enabling Web Login

With web authentication, guests are automatically redirected to web authentication pages when they launch their browsers. Guests gain access to the WLAN through this web portal. Wireless LAN administrators using this authentication mechanism should have the option of providing unencrypted or encrypted guest access. Guest users can then log into the wireless network using a valid username and password, which is encrypted with SSL. Web authentication accounts may be created locally or managed by a RADIUS server. The Cisco Wireless LAN controllers can be configured to support a web authentication client. See the [“Configuring a Web Authentication Template”](#) section on page 11-64 to create a template that replaces the Web authentication page provided on the controller.

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the controller on which to enable web authentication by clicking an IP address URL in the IP Address column.
- Step 3** From the left sidebar menu, choose **Security > AAA > Web Auth Configuration**.
- Step 4** Choose the appropriate web authentication type from the drop-down list. The choices are default internal, customized web authentication, or external.
- If you choose default internal, you can still alter the page title, message, and redirect URL, as well as choose whether the logo appears. Continue to Step 5.

- If you choose customized web authentication, skip to the [“Downloading Customized Web Authentication” section on page 3-42](#).
- If you choose external, you need to enter the URL you want to redirect to after a successful authentication. For example, if the value entered for this text box is `http://www.example.com`, the user is directed to the company home page.

Step 5 Select the **Logo Display** check box if you want your company logo to display.

Step 6 Enter the title you want displayed on the Web authentication page.

Step 7 Enter the message you want displayed on the Web authentication page.

Step 8 In the Customer Redirect URL parameter, provide the URL where the user is redirected after a successful authentication. For example, if the value entered for this text box is `http://www.company.com`, the user is directed to the company home page.

Step 9 Click **Save**.

Downloading Customized Web Authentication

You can download a customized Web authentication page to the controller. A customized web page is created to establish a username and password for user web access.

When downloading customized web authentication, these strict guidelines must be followed:

- A username must be provided.
- A password must be provided.
- A redirect URL must be retained as a hidden input item after extracting from the original URL.
- The action URL must be extracted and set from the original URL.
- Scripts to decode the return status code must be included.
- All paths used in the main page should be of relative type.

Before downloading, if you chose the customized web authentication option in Step 4 of the previous section, follow these steps:

Step 1 Click the preview image to download the sample `login.html` bundle file from the server. See [Figure 3-8](#) for an example of the `login.html` file. The downloaded bundle is a `.TAR` file.

Figure 3-8 Login.html

Step 2 Open and edit the login.html file and save it as a .tar or .zip file.

Note You can edit the text of the Submit button with any text or HTML editor to read “Accept terms and conditions and Submit.”

Step 3 Make sure you have a Trivial File Transfer Protocol (TFTP) server available for the download. Keep these guidelines in mind when setting up a TFTP server:

- If you are downloading through the service port, the TFTP server must be on the same subnet as the service port because the service port is not routable.
- If you are downloading through the distribution system network port, the TFTP server can be on the same or a different subnet because the distribution system port is routable.
- A third-party TFTP server cannot run on the same computer as the Cisco NCS because the built-in TFTP server of NCS and third-party TFTP server use the same communication port.

Step 4 Click **here** in the “After editing the HTML you may click **here** to redirect to the Download Web Auth Page” link to download the .tar or .zip file to the controller(s). The Download Customized Web Auth Bundle to Controller page appears.

Note The IP address of the controller to receive the bundle and the current status are displayed.

Step 5 Choose **local machine** from the File is Located On parameter. If you know the filename and path relative to the server’s root directory, you can also choose TFTP server.

Note For a local machine download, either .zip or .tar file options exists, but NCS does the conversion of .zip to .tar automatically. If you chose a TFTP server download, only .tar files are specified.

Step 6 Enter the maximum amount of time in seconds before the controller times out while attempting to download the file in the Timeout parameter.

Step 7 The NCS Server Files In parameter specifies where the NCS server files are located. Specify the local file name in that directory or use the Browse button to navigate to it. A “revision” line in the signature file specifies whether the file is a Cisco-provided standard signature file or a site-tailored custom signature file (custom signature files must always have revision=custom).

- Step 8** If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name is populated. The local machine option initiates a two-step operation. First, the local file is copied from the administrator's workstation to the built-in TFTP server of NCS. Then the controller retrieves that file. For later operations, the file is already in the NCS server's TFTP directory, and the download web page now automatically populates the filename.
- Step 9** Click **OK**.
If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name is populated for you.
- Step 10** After completing the download, you are directed to the new page and able to authenticate.
-

Connecting to the Guest WLAN

To connect to the guest central WLAN to complete the web authentication process, follow these steps: See the [“Creating Guest User Accounts” section on page 7-9](#) for more explanation of a guest user account.

- Step 1** When you are set for open authentication and are connected, browse to the virtual interface IP address (such as /1.1.1.1/login.html).
- Step 2** When the NCS user interface displays the Login page, enter your username and password.

Note All entries are case sensitive.

The lobby ambassador has access to the templates only to add guest users.

Certificate Signing Request (CSR) Generation

To generate a Certificate Signing Request (CSR) for a third-party certificate using NCS, refer to the following document for instructions on uploading the certificate:

http://www.cisco.com/en/US/products/ps6305/products_configuration_example09186a00808a94ca.shtml.

CHAPTER 4

Performing Maintenance Operations

You can perform the actions at the system level, such as updating system softwares or downloading certificates that can be used with many items.

This chapter describes the system level tasks to perform with Cisco NCS. It contains the following sections:

- [Information About Maintenance Operations, page 4-1](#)
- [Performing System Tasks, page 4-1](#)
- [Performing NCS Operations, page 4-6](#)

Information About Maintenance Operations

A system-level task is a collection of tasks that relate to operations that apply to the NCS database as a whole. System tasks also includes restoring NCS database. For more information, see the [“Restoring the NCS Database” section on page 4-8](#).

Performing System Tasks

This sections describes how to use NCS to perform system-level tasks. This section contains the following topics:

- [Adding a Controller to the NCS Database, page 4-1](#)
- [Using NCS to Update System Software, page 4-2](#)
- [Downloading Vendor Device Certificates, page 4-3](#)
- [Downloading Vendor CA Certificates, page 4-4](#)
- [Using NCS to Enable Long Preambles for SpectraLink NetLink Phones, page 4-5](#)
- [Creating an RF Calibration Model, page 4-5](#)

Adding a Controller to the NCS Database

To add a controller to the NCS database, follow these steps:

**Note**

We recommend that you manage controllers through the controller dedicated service port for improved security. However, when you manage controllers that do not have a service port (such as 2000 series controllers) or for which the service port is disabled, you must manage those controllers through the controller management interface.

-
- Step 1** Log into the NCS user interface.
- Step 2** Choose **Configure > Controllers** to display the All Controllers page.
- Step 3** From the Select a command drop-down list, choose **Add Controller**, and click **Go**.
- Step 4** In the Add Controller page, enter the controller IP address, network mask, and required SNMP settings.
- Step 5** Click **OK**. NCS displays a Please Wait dialog box while it contacts the controller and adds the current controller configuration to the NCS database. It then returns you to the Add Controller page.
- Step 6** If NCS does not find a controller at the IP address that you entered for the controller, the Discovery Status dialog displays this message:
- ```
No response from device, check SNMP.
```
- Check these settings to correct the problem:
- The controller service port IP address might be set incorrectly. Check the service port setting on the controller.
  - NCS might not have been able to contact the controller. Make sure that you can ping the controller from the NCS server.
  - The SNMP settings on the controller might not match the SNMP settings that you entered in NCS. Make sure that the SNMP settings configured on the controller match the settings that you entered in NCS.
- Step 7** Add additional controllers if desired.
- 

## Using NCS to Update System Software

To update controller (and access point) software using NCS, follow these steps:

- 
- Step 1** Enter the **ping ip-address** command to be sure that the NCS server can contact the controller. If you use an external TFTP server, enter **ping ip-address** to be sure that the NCS server can contact the TFTP server.

**Note**

When you are downloading through a controller distribution system (DS) network port, the TFTP server can be on the same or a different subnet because the DS port is routable.

- 
- Step 2** Click the **Configure > Controllers** to navigate to the All Controllers page.
- Step 3** Select the check box of the desired controller, choose **Download Software (TFTP or FTP)** from the Select a command drop-down list, and click **Go**. NCS displays the Download Software to Controller page.

- Step 4** If you use the built-in NCS TFTP server, choose the Default Server from the Server Name list box. If you use an external TFTP server, select New from the Server Name list box and add the external TFTP server IP address.
- Step 5** Enter the file path and server file name in their respective text box (for example, *AS\_2000\_release.aes* for 2000 series controllers). The files are uploaded to the root directory which was configured for use by the TFTP server. You can change to a different directory.

---

**Note** Be sure that you have the correct software file for your controller.

---

- Step 6** Click **Download**. NCS downloads the software to the controller, and the controller writes the code to flash RAM. As NCS performs this function, it displays its progress in the Status field.
- 

## Downloading Vendor Device Certificates

Each wireless device (controller, access point, and client) has its own device certificates. For example, the controller is shipped with a Cisco-installed device certificate. This certificate is used by EAP-TLS and EAP-FAST (when not using PACs) to authenticate wireless clients during local EAP authentication. However, if you wish to use your own vendor-specific device certificate, it must be downloaded to the controller.

To download a vendor-specific device certificate to the controller, follow the instructions:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** You can download the certificates in one of two ways:
- Select the check box of the controller you choose.
  - Choose **Download Vendor Device Certificate** from the Select a command drop-down list, and click **Go**.  
or  
Click the URL of the desired controller in the IP Address column.
  - Choose **System > Commands** from the left sidebar menu.
  - Choose **TFTP** or **FTP** in the Upload/Download Command section.
  - Choose **Download Vendor Device Certificate** from the Upload/Download Commands drop-down list, and click **Go**.
- Step 3** In the Certificate Password text box, enter the password which was used to protect the certificate.
- Step 4** Specify if the certificate to download is on the TFTP server or on the local machine. If it is on the TFTP server, the name must be supplied in the Server File Name parameter. If the certificate is on the local machine, you must specify the file path in the Local File Name parameter using the **Choose File** button.
- Step 5** Enter the TFTP server name in the Server Name parameter. The default is for the NCS server to act as the TFTP server.
- Step 6** Enter the server IP address.
- Step 7** In the Maximum Retries text box, enter the maximum number of times that the TFTP server attempts to download the certificate.

- Step 8** In the Timeout text box, enter the amount of time (in seconds) that the TFTP server attempts to download the certificate.
- Step 9** In the Local File Name text box, enter the directory path of the certificate.
- Step 10** Click **OK**.
- 

## Downloading Vendor CA Certificates

Controllers and access points have a certificate authority (CA) certificate that is used to sign and validate device certificates. The controller is shipped with a Cisco-installed CA certificate. This certificate may be used by EAP-TLS and EAP-FAST (when not using PACs) to authenticate wireless clients during local EAP authentication. However, if you wish to use your own vendor-specific CA certificate, it must be downloaded to the controller. To download vendor CA certificate to the controller, follow the instructions:

- 
- Step 1** Click **Configure > Controllers**.
- Step 2** You can download the certificates in one of two ways:
- Select the check box of the controller you choose.
  - Choose **Download Vendor CA Certificate** from the Select a command drop-down list, and click **Go**.  
or  
Click the URL of the desired controller in the IP Address column.
  - Choose **System > Commands** from the left sidebar menu.
  - Choose **Download Vendor CA Certificate** from the Upload/Download Commands drop-down list, and click **Go**.
- Step 3** Specify if the certificate to download is on the TFTP server or on the local machine. If it is on the TFTP server, the name must be supplied in the Server File Name parameter in [Step 9](#). If the certificate is on the local machine, you must specify the file path in the Local File Name parameter in [Step 8](#) using the Browse button.
- Step 4** Enter the TFTP server name in the Server Name parameter. The default is for the NCS server to act as the TFTP server.
- Step 5** Enter the server IP address.
- Step 6** In the Maximum Retries text box, enter the maximum number of times that the TFTP server attempts to download the certificate.
- Step 7** In the Timeout text box, enter the amount of time (in seconds) that the TFTP server attempts to download the certificate.
- Step 8** In the Local File Name text box, enter the directory path of the certificate.
- Step 9** Click **OK**.
-

## Using NCS to Enable Long Preambles for SpectraLink NetLink Phones

A radio preamble (sometimes called a *header*) is a section of data at the head of a packet. It contains information that wireless devices need when sending and receiving packets. Short preambles improve throughput performance, so they are enabled by default. However, some wireless devices, such as SpectraLink NetLink phones, require long preambles.

To optimize the operation of SpectraLink NetLink phones on your wireless LAN, to use NCS to enable long preambles, follow these steps:

- 
- Step 1** Log into the NCS user interface.
  - Step 2** Click **Configure > Controllers** to navigate to the All Controllers page.
  - Step 3** Click the IP address of the desired controller.
  - Step 4** From the left sidebar menu, choose **802.11b/g/n > Parameters**.
  - Step 5** If the *IP Address > 802.11b/g/n Parameters* page shows that short preambles are enabled, continue to the next step. However, if short preambles are disabled, which means that long preambles are enabled, the controller is already optimized for SpectraLink NetLink phones, and you do not need to continue this procedure.
  - Step 6** Enable long preambles by unselecting the **Short Preamble** check box.
  - Step 7** Click **Save** to update the controller configuration.
  - Step 8** To save the controller configuration, click **System > Commands** from the left sidebar menu, **Save Config To Flash** from the Administrative Commands drop-down list, and **Go**.
  - Step 9** To reboot the controller, click **Reboot** from the Administrative Commands drop-down list and **Go**.
  - Step 10** Click **OK** when the following message appears:

```
Please save configuration by clicking "Save Config to flash". Do you want to continue
rebooting anyways?
```

The controller reboots. This process may take some time, during which NCS loses its connection to the controller.

---

**Note** You can view the controller reboot process with a CLI session.

---

## Creating an RF Calibration Model

If you would like to further refine NCS Location tracking of client and rogue access points across one or more floors of a building, you have the option of creating an RF calibration model that uses physically collected RF measurements to fine-tune the location algorithm. When you have multiple floors in a building with the same physical layout as the calibrated floor, you can save time calibrating the remaining floors by using the same RF calibration model for the remaining floors.

The calibration models are used as RF overlays with measured RF signal characteristics that can be applied to different floor areas. This allows the Cisco Unified Wireless Network Solution installation team to lay out one floor in a multi-floor area, use the RF calibration tool to measure and save the RF characteristics of that floor as a new calibration model, and apply that calibration model to all the other floors with the same physical layout.

# Performing NCS Operations

This section contains the following topics:

- [Verifying the Status of NCS, page 4-6](#)
- [Stopping NCS, page 4-6](#)
- [Backing Up the NCS Database, page 4-7](#)
- [Restoring the NCS Database, page 4-8](#)
- [Uninstalling NCS, page 4-10](#)
- [Upgrading WCS to NCS, page 4-10](#)
- [Upgrading the Network, page 4-12](#)
- [Reinitializing the Database, page 4-13](#)
- [Recovering the NCS Password, page 4-13](#)

## Verifying the Status of NCS

This section provides instructions for checking the status of NCS. To check the status of NCS. You can check the status at any time, follow these steps:

---

**Step 1** Log into the system as **root**.

**Step 2** Using the Linux CLI, perform one of the following:

- Navigate to the installation directory (such as `/opt/NCS1.0.X.X`) and enter `./NCSStatus`.
- Navigate to the installation directory (such as `/opt/NCS1.0.X.X`) and enter `NCSAdmin status`.

The CLI displays messages indicating the status of NCS.

---

## Stopping NCS

This section provides instructions for stopping NCS. You can stop NCS at any time. To stop NCS follow these steps:

**Note**

If any users are logged in when you stop NCS, their NCS sessions stop functioning.

---

**Step 1** Log into the system as **root**.

**Note**

To see which version of NCS you currently have installed, enter `nmsadmin.sh version`.

---

**Step 2** Using the Linux CLI, perform one of the following:

- Navigate to the shortcut location (defaulted to `/opt/NCSA.B.C.D`) and enter `./StopNCS`.
- Navigate to the installation bin directory (defaulted to `/opt/NCSA.B.C.D/bin`) and enter `StopNCS`.

The CLI displays messages indicating that NCS is stopping.

---

## Backing Up the NCS Database

This section provides instructions for backing up the NCS database. You can schedule regular backups through the NCS user interface or manually initiate a backup.

**Note** Machine specific settings (such as FTP enable and disable, FTP port, FTP root directory, TFTP enable and disable, TFTP port, TFTP root directory, HTTP forward enable and disable, HTTP port, HTTPS port, report repository directory, and all high availability settings) are not included in the backup and restore function if the backup is restored to a different device.

---

This section contains the following topics:

- [Scheduling Automatic Backups, page 4-7](#)
- [Performing a Manual Backup, page 4-8](#)

## Scheduling Automatic Backups

To schedule automatic backups of the NCS database, follow these steps:

---

- Step 1** Log into the NCS user interface.
- Step 2** Click **Administration > Background Tasks** to display the Scheduled Tasks page.
- Step 3** Click the **NCS Server Backup** task to display the **NCS Server Backup** page.
- Step 4** Select the **Enabled** check box.
- Step 5** At the **Backup Repository** parameter, Choose an existing backup repository or click create button to create a new repository.
- Step 6** If you are backing up in remote location, select the FTP Repository check box. You need to enter the FTP location, Username and Password of the remote machine.
- Step 7** In the Interval (Days) text box, enter a number representing the number of days between each backup. For example, 1 = a daily backup, 2 = a backup every other day, 7 = a weekly backup, and so on.
- Range: 1 to 360
- Default:** 7
- Step 8** In the Time of Day text box, enter the time when you want the backup to start. It must be in this format: *hh:mm* AM/PM (for example: 03:00 AM).

**Note** Backing up a large database affects the performance of the NCS server. Therefore, we recommend that you schedule backups to run when the NCS server is idle (for example, in the middle of the night).

---

- Step 9** Click **Submit** to save your settings. The backup file is saved as a .zip file in the `ftp-install-dir/ftp-server/root/NCSBackup` directory using this format: `dd-mmm-yy_hh-mm-ss.zip` (for example, 11-Nov-05\_10-30-00.zip).

## Performing a Manual Backup

To back up the NCS database on a Linux server, follow these steps:

**Note** you do not need to shutdown Oracle or the platform to do a backup.

- Step 1** Log into the system as root.
- Step 2** Create a local or remote backup directory for the NCS database with no spaces in the name (for example, `mkdir NCS1.0.X.X_Backup`).

**Note** Make sure that the directory name does not contain spaces. Spaces can generate errors.

**Note** If it is a remote backup location, you **MUST** specify the correct ftp location (For example, `ftp://hostname/location`) and user credentials.

- Step 3** You can do a backup either through Command Line
- Step 4** Perform one of the following:
- Backup the appliance and application to the repository (local or remote).  
`backup testbackup repository backup_repo`
  - Backup the application only to the repository (local or remote).  
`backup testbackup repository backup_repo application NCS`
- The CLI displays messages indicating the status of the backup.

## Restoring the NCS Database

This section provides instructions for restoring the NCS database. This section contains the following topics:

- [Restoring the NCS Database, page 4-8](#)
- [Restoring the NCS Database in a High Availability Environment, page 4-9](#)

## Restoring the NCS Database

If you are restoring the NCS database in a high availability environment, see the “[Restoring the NCS Database in a High Availability Environment](#)” section on page 4-9. To restore the NCS database from a backup file, follow these steps:

---

**Step 1** To view all local repository backups, use the below command:

**show repository backup\_repo**

---

**Note** If possible, stop all NCS user interfaces to stabilize the database.

---

**Step 2** Manually shutdown the platform as root.

**Step 3** Using the CLI, perform one of the following:

- restore the appliance and applicaion backup.

**restore testbackup-yymmdd-xxxx.tar.gpg repository backup\_repo**

- restor the appliance only backup.

**restore testbackup-yymmdd-xxxx.tar.gpg repository backup\_repo application NCS**

**Step 4** Click **Yes** if a message appears indicating that NCS is running and needs to be shut down.

---

**Note** If the restore process shuts down NCS, a restart is attempted after a successful restore. The appliance will then restart and you will have to again login and restart the dbserver, and the platform manually as root (make sure you do not start with dbclean, else you will loose your recently restored data).

---

The CLI displays messages indicating that the NCS database is being restored.

---

## Restoring the NCS Database in a High Availability Environment

During installation, you were prompted to determine if a secondary NCS server would be used for high availability support to the primary NCS server. If you opted for this high availability environment and enabled it in the Administration > High Availability page, the status appears as HA enabled. Before restoring a database, you must convert the status to HA not configured.

---

**Note** If you attempt to restore the database while the status is set to HA enabled, unexpected results may occur.

---

To change the status from HA enabled to HA not configured, follow one of these procedures:

- Click the **Remove** button in the HA Configuration page (Administration > High Availability).
- Restart the primary server. Go to the secondary HealthMonitor GUI (<https://<SecondaryNCS>:8082>), and click **Failback**.

- Use this method when one of the following instances has occurred:

The primary server is down and failover has not been executed, so then the secondary server is in SecondaryLostPrimary state.

or

The primary server is down and failover is already executed, so the secondary server is in the SecondaryActive state.

The primary server will now be in HA Not Configured mode, and you can safely restore the database.

---

## Uninstalling NCS

This section provides instructions for uninstalling NCS. You can uninstall NCS at any time, even while NCS is running.

To uninstall NCS on a Linux server, follow these steps:

- 
- Step 1** Stop NCS.
  - Step 2** Log into the system as root through an X terminal session.
  - Step 3** Using the Linux CLI, navigate to the `/opt/NCS1.0.X.X` directory (or the directory chosen during installation).
  - Step 4** Enter `./UninstallNCS`.
  - Step 5** Click **Yes** to continue the uninstall process.
  - Step 6** Click **Finish** when the uninstall process is complete.

---

**Note** If any part of the `/opt/NCS1.0.X.X` directory remains on the hard drive, manually delete the directory and all of its contents. If you fail to delete the previous NCS installation, this error message appears when you attempt to reinstall NCS: “**Cisco NCS is already installed. Please uninstall the older version before installing this version.**”

---

## Upgrading WCS to NCS

This section provides instructions for upgrading to NCS. If you are upgrading to NCS in a high availability environment, see the “[Upgrading NCS in a High Availability Environment](#)” section on [page 4-12](#).

---

**Note** NCS supports data migration from WCS releases 7.0.164.3 and 7.0.172.0. If you do not have this release of WCS, you must upgrade to either WCS 7.0.164.3 or 7.0.172.0 first and then follow the migration steps.

---

To Upgrade from WCS to NCS, perform the following:

- 
- Step 1** Stop the WCS server.
  - Step 2** Run the export command to export all the WCS data in to a export file. For Linux, run the **export.sh all** and for windows run the **export.bat all** command.

**Note** Current zip tool can only handle zip files of up to 4G in size. If the WCS DB size is larger than 10G there is high possibility that the zip file size will be more than 4G. Please request for a patch if you face this issue.

**Note** While upgrading from WCS to NCS, on running the export command, you might encounter a “could not reserve enough space” error. If you encounter this error then access either the export.bat (for Windows OS) or export.sh (for Linux OS) file and replace the instance of -Xmx1024m with -Xmx512m.

**Step 3** Copy the export zip file (for example, wcs.zip) in to a local repository folder.

**Step 4** Login to NCS as admin and stop the NCS server using the **ncs stop** command.

**Step 5** Configure the repository in NCS Appliance using the repository command.

```
ncs-appliance/admin#configure
ncs-appliance/admin(config)#repository wcs-ftp-repo
ncs-appliance/admin(config-Repository)#url ftp://172.19.28.229//
ncs-appliance/admin(config-Repository)#user ftp-user password plain ftp-user
```

**Note** Make sure wcs.zip is listed for the 'show repository <repositoryname>' command. For tftp, if directory listing is not enabled, then restore will fail. This is an expected behavior and 'show repository' will throw error message.

```
ncs-appliance/admin# show repository wcs-ftp-repo
wcs.zip
ncs-appliance/admin# show repository wcs-tftp-repo
% Protocol does not support listing directories
```

**Step 6** Execute the **ncs migrate** command to restore the WCS database.

```
ncs-appliance/admin# ncs migrate wcs-data wcs.zip repository wcs-ftp-repo
```

Using the noclientstats option, no client count and client statistics data will get migrated to NCS . By default no WCS events are migrated.

**Step 7** Run the **ncs start** command to start the NCS server after the upgrade is completed.

**Step 8** Login to the NCS User Interface using the root and the root password.

**Note** The client count, client summary, client throughput, client traffic, rogue AP, adhoc rogues, new adhoc rogues, PCI details, PCI summary and security summary reports, dashboard customizations, client station information and its statistics, all WCS events, RADIUS/TACACS server IP and credentials, and the root password are not migrated from WCS to NCS. Make sure you enable the RADIUS/TACACS server as AAA mode in **Administration > AAA > AAA Mode Settings** page and click **Save**.

## Upgrading NCS in a High Availability Environment

If you have a primary and secondary NCS, follow these steps for a successful upgrade:

- Step 1** You must first remove the HA configuration with the following steps:
- Login to the primary NCS server.
  - Choose Administration > High Availability and select HA Configuration from the left sidebar menu.
  - Click **Remove** to remove the HA configuration.

**Note** It may take a few minutes for the remove to complete.

- Step 2** You must first upgrade the secondary NCS with the following steps:
- Shut down the secondary NCS. See the “[Stopping NCS](#)” section on page 4-6 for more information.

**Note** You can use **StopNCS** for a graceful shut down. A graceful shut down does not trigger the automatic failover. Use the CLI command `<NCSROOT>\nmsadmin.bat -switchover stop` to trigger automatic failover when shutting down NCS.

- Perform an upgrade on the secondary NCS.
- Start the secondary NCS.

**Note** It will attempt to reconnect to the primary NCS, but a version mismatch error is returned.

- Step 3** Upgrade the primary NCS.
- Shut down the primary NCS. See the “[Stopping NCS](#)” section on page 4-6 for more information.
  - Perform an upgrade on the primary NCS.
  - Start the primary NCS.
- Step 4** Enable HA again on the primary NCS.
- Login to the primary NCS server.
  - Choose Administration > High Availability and select HA Configuration from the left sidebar menu.
  - Enter the HA configuration settings and click **Save** to enable high availability.

## Upgrading the Network

Network upgrades must follow a recommended procedure so that databases can remain synchronized with each other. For example, You cannot upgrade the controller portion of the network to a newer release but maintain the current NCS version and not upgrade it. The supported order of upgrade is NCS first, followed by the controller, and then any additional devices.

## Reinitializing the Database

If you need to reset the database because of a synchronization problem or a corruption of some type, enter `{install directory}/bin/dbadmin.(sh|bat) reinitdb` to reinitialize the database.

## Recovering the NCS Password

You can change the NCS application root user or FTP user password. This option provides a safeguard if you lose the root password. An executable was added to the installer `/bin` directory (`passwd.bat` for Windows and `passwd.sh` for Linux). For password recovery on a wireless location device, refer to Chapters 8 or 9 of the *Cisco 2700 Series Location Appliance Configuration Guide*. To recover the passwords and regain access to NCS, follow these steps:

**Note**

---

If you are a Linux user, you must be the root user to run the command.

---

**Note**

---

In Linux, use the `passwd.sh` to change the NCS password. The `passwd` is a built-in Linux command to change the OS password.

---

**Step 1** Change to the NCS bin folder.

**Step 2** For Linux, use the following command:

Enter `passwd.sh root-user newpassword` to change the NCS root password. The `newpassword` is the root login password you choose.

or

Enter `passwd.sh location-ftp-user newuser newpassword` to change the FTP user and password. The `newuser` and `newpassword` are the MSE or Location server user and password.

**Step 3** The following options are available with these commands:

- `-q` — to quiet the output
- `-pause` — to pause before exiting
- `-gui` — to switch to the graphical user interface
- `-force` — to skip prompting for configuration

**Step 4** Start NCS.

---

## CHAPTER 5

# Monitoring Devices

---

## Information About Monitoring

This chapter describes how to use Cisco NCS to monitor Cisco WLAN Solution device configurations. This chapter contains the following sections:

- [Monitoring Controllers, page 5-1](#)
- [Monitoring Switches, page 5-32](#)
- [Monitoring Access Points, page 5-42](#)
- [Monitoring RFID Tags, page 5-113](#)
- [Monitoring Chokepoints, page 5-115](#)
- [Monitoring Interferers, page 5-116](#)
- [Monitoring Spectrum Experts, page 5-119](#)
- [Monitoring WiFi TDOA Receivers, page 5-121](#)
- [Monitoring Radio Resource Management \(RRM\), page 5-122](#)
- [Monitoring Clients and Users, page 5-125](#)
- [Monitoring Alarms, page 5-125](#)
- [Monitoring Events, page 5-142](#)
- [Monitoring Site Maps, page 5-152](#)
- [Monitoring Google Earth Maps, page 5-152](#)

## Monitoring Controllers

Choose **Monitor > Controllers** to access the controller list page. Click a controller IP address to view its details.

This section contains the following topics:

- [Searching Controllers, page 5-2](#)
- [Viewing List of Controllers, page 5-2](#)
- [Monitoring System Parameters, page 5-3](#)
- [Monitoring Ports, page 5-9](#)
- [Monitoring Controller Security, page 5-15](#)

- [Monitoring Controllers Mobility, page 5-23](#)
- [Monitoring Controller 802.11a/n, page 5-24](#)
- [Monitoring Controllers 802.11b/g/n, page 5-28](#)

## Searching Controllers

Use the NCS Search feature to find specific controllers or to create and save custom searches.

For a controller search, you can search using the following parameters:

**Table 5-1 Search Controllers**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search for controller by    | Choose All Controllers, IP Address, Controller Name, or Network.<br><b>Note</b> Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.                                                                                            |
| Enter Controller IP Address | This field only appears if you select IP Address from the Search for controller by field.                                                                                                                                                                                                                                                                  |
| Enter Controller Name       | This field only appears if you select Controller Name from the Search for controller by field.                                                                                                                                                                                                                                                             |
| Select a Network            |                                                                                                                                                                                                                                                                                                                                                            |
| Audit Status                | Choose one of the following from the drop-down list: <ul style="list-style-type: none"> <li>– All Status</li> <li>– Mismatch—Config differences were found between NCS and controller during the last audit.</li> <li>– Identical—No config differences were found during the last audit.</li> <li>– Not Available—Audit status is unavailable.</li> </ul> |

See one of the following topics for additional information:

- [Using the Search Feature, page 2-33](#)
- [Quick Search, page 2-33](#)
- [Advanced Search, page 2-34](#)
- [Saved Searches, page 2-46](#)

## Viewing List of Controllers

Choose **Monitor > Controllers** or perform a controller search to access the controller list page.

**Note**

See the [“Advanced Search” section on page 2-34](#) for more information on performing an advanced search.

The data area of this page contains a table with the following columns:

**Table 5-2 Controller List Details**

| Parameter           | Description                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| IP Address          | Local network IP address of the controller management interface. Click an IP address in the list to display the controller details. |
| Controller Name     | Name of the Controller.                                                                                                             |
| Location            | The geographical location (such as a campus or building).                                                                           |
| Mobility Group Name | Name of the controller mobility or WPS group.                                                                                       |
| Reachability Status | Reachable or Unreachable. Click the title to toggle from ascending to descending order.                                             |

Click the title to toggle from ascending to descending order. To add, remove, or reorder columns in the table, click the **Edit View** link to go to the Edit View page.

## Configuring the Controller List Display

The **Edit View** page allows you to add, remove, or reorder columns in the Controllers table.

To edit the available columns in the controllers table, follow these steps:

- 
- Step 1** Choose **Monitor > Controllers**.
  - Step 2** Click the **Edit View** link.
  - Step 3** To add an additional column to the controllers table, click to highlight the column heading in the left list. Click **Show** to move the heading to the right list. All items in the right list are displayed in the controllers table.
  - Step 4** To remove a column from the controllers table, click to highlight the list heading in the right list. Click **Hide** to move the heading to the left list. All items in the left list are not displayed in the controllers table.
  - Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired list heading and click **Up** or **Down** to move it higher or lower in the current list.
  - Step 6** Click **Reset** to restore the default view.
  - Step 7** Click **Submit** to confirm the changes.
- 

## Monitoring System Parameters

This section provides the detailed information regarding monitoring controller system parameters and contains the following topics:

- [Monitoring System Summary, page 5-4](#)
- [Monitoring Spanning Tree Protocol, page 5-5](#)

## Monitoring System Summary

This page displays a summary of the controller parameters with a graphic displaying the status of the controller. The graphic of the front of the controller shows front-panel ports (click a port to go to **Monitor Controllers > IPaddr > Ports > General** for information about that port). You can find the links to alarms, events and access points details related to the controller.

To access this page:

- Choose **Monitor > Controllers** and click the applicable IP address.
- Choose **Monitor > Access Points**, click a list item under AP Name, and then click **Registered Controller**.
- Choose **Configure > Access Points**, choose a list item under AP Name, then click **Registered Controller**.

Click **Controllers** in the page title to view a list of all the controllers. See the [“Viewing List of Controllers” section on page 5-2](#).

The following parameters are displayed:

**Table 5-3 Monitoring System Summary**

| Parameter                     | Description                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>                |                                                                                                                                                                               |
| IP Address                    | Local network IP address of the controller management interface.                                                                                                              |
| Name                          | User-defined name of the controller.                                                                                                                                          |
| Device Type                   | Type of controller.                                                                                                                                                           |
| UP Time                       | Time in days, hours and minutes since the last reboot.                                                                                                                        |
| System Time                   | Time used by the controller.                                                                                                                                                  |
| Internal Temperature          | The temperature of the controller.                                                                                                                                            |
| Location                      | User-defined physical location of the controller.                                                                                                                             |
| Contact                       | Contact person or the owner of the controller.                                                                                                                                |
| Total Client Count            | Total number of clients currently associated with the controller.                                                                                                             |
| Current CAPWAP Transport Mode | Control and Provisioning of Wireless Access Points protocol (CAPWAP) transport mode. Communications between controllers and access points. Selections are Layer 2 or Layer 3. |
| Power Supply One              | If the power supply is available and operation. This is only for 4400 series controller.                                                                                      |
| Power Supply Two              | If the power supply is available and operation. This is only for 4400 series controller.                                                                                      |
| <b>Inventory</b>              |                                                                                                                                                                               |
| Software Version              | The operating system release.version.dot.maintenance number of the code currently running on the controller.                                                                  |
| Emergency Image Version       | An image version of the controller.                                                                                                                                           |
| Description                   | Description of the inventory item.                                                                                                                                            |
| Model No                      | Specifies the machine model as defined by the Vital Product Data.                                                                                                             |

**Table 5-3 Monitoring System Summary**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial No                             | Unique serial number for this controller.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Burned-in MAC Address                 | The burned-in MAC address for this controller.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Number of APs Supported               | The maximum number of access points supported by the controller.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Gig Ethernet/Fiber Card               | Displays the presence or absence of the optional 1000BASE-T/1000BASE-SX GigE card.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Crypto Card One                       | <p>Displays the presence or absence of an enhanced security module which enables IPSec security and provides enhanced processing power.</p> <p><b>Note</b> By default, enhanced security module is not installed on a controller.</p> <p>Maximum number of crypto cards that can be installed on a Cisco Wireless LAN controller:</p> <ul style="list-style-type: none"> <li>- Cisco 2000 Series—None</li> <li>- Cisco 4100 Series—One</li> <li>- Cisco 4400 Series—Two</li> </ul> |
| Crypto Card Two                       | Displays the presence or absence of a second enhanced security module.                                                                                                                                                                                                                                                                                                                                                                                                             |
| GIGE Port(s) Status                   | Up or Down. Click to review the status of the port.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Unique Device Identifier (UDI)</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Name                                  | Product type. Chassis for controller and Cisco AP for access points.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description                           | Description of controller and may include number of access points.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Product ID                            | Orderable product identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Version ID                            | Version of product identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Serial No                             | Unique product serial number.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Utilization</b>                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CPU Utilization                       | Displays a graph of the maximum, average, and minimum CPU utilization over the specified amount of time.                                                                                                                                                                                                                                                                                                                                                                           |
| Memory Utilization                    | Displays a graph of the maximum, average, and minimum Memory utilization over the specified amount of time.                                                                                                                                                                                                                                                                                                                                                                        |

## Monitoring Spanning Tree Protocol

The Spanning Tree Protocol (STP) is a link management protocol. Cisco WLAN Solution implements the IEEE 802.1D standard for media access control bridges.

Spanning tree algorithm provides redundancy while preventing undesirable loops in a network that are created by multiple active paths between stations. STP allows only one active path at a time between any two network devices (this prevents the loops) but establishes the redundant links as a backup if the initial link should fail.

You can access this page in the following ways:

- Choose **Monitor > Controllers**, select an IP address, and choose **System > Spanning Tree Protocol** from the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **System > Spanning Tree Protocol** from the left sidebar menu.

**Note** The controllers that do not support Spanning Tree Protocol are WISM, 2500, 5500, 7500 and SMWLC.

This page enables you to view the following Spanning Tree Algorithm parameters:

**Table 5-4 Spanning Tree Protocol Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>              |                                                                                                                                                                                                                                                                                                       |
| Spanning Tree Specification | An indication of what version of the Spanning Tree Protocol is being run. IEEE 802.1D implementations will return 'IEEE 802.1D'. If future versions of the IEEE Spanning Tree Protocol are released that are incompatible with the current version a new value will be defined.                       |
| Spanning Tree Algorithm     | Specifies if this controller will participate in the Spanning Tree Protocol. May be enabled or disabled by selecting the corresponding line on the drop-down list entry field. The factory default is disabled.                                                                                       |
| Priority                    | The value of the writable portion of the Bridge ID, that is, the first two octets of the (8 octet long) Bridge ID. The other (last) 6 octets of the Bridge ID are given by the value of Bridge MAC Address. The value may be specified as a number between 0 and 65535. The factory default is 32768. |
| <b>STP Statistics</b>       |                                                                                                                                                                                                                                                                                                       |
| Topology Change Count       | The total number of topology changes detected by this bridge since the management entity was last reset or initialized.                                                                                                                                                                               |
| Time Since Topology Changed | The total number of topology changes detected by this bridge since the management entity was last reset or initialized.                                                                                                                                                                               |
| Designated Root             | The bridge identifier of the root of the spanning tree as determined by the Spanning Tree Protocol as executed by this node. This value is used as the Root Identifier parameter in all Configuration Bridge PDUs originated by this node.                                                            |
| Root Cost                   | The cost of the path to the root as seen from this bridge.                                                                                                                                                                                                                                            |
| Root Port                   | The port number of the port which offers the lowest cost path from this bridge to the root bridge.                                                                                                                                                                                                    |

**Table 5-4** *Spanning Tree Protocol Parameters*

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Age (seconds)   | The value that all bridges use for MaxAge when this bridge is acting as the root.<br><br><b>Note</b> The 802.1D-1990 specifies that the range for this parameter is related to the value of Stp Bridge Hello Time. The granularity of this timer is specified by 802.1D-1990 to be 1 second. Valid values are 6 through 40 seconds. The factory default is 20.                                                                                                         |
| Hello Time (seconds)    | The value that all bridges use for HelloTime when this bridge is acting as the root. The granularity of this timer is specified by 802.1D-1990 to be 1 second. Valid values are 1 through 10 seconds. The factory default is 2.                                                                                                                                                                                                                                        |
| Forward Delay (seconds) | The value that all bridges use for ForwardDelay when this bridge is acting as the root. Note that 802.1D-1990 specifies that the range for this parameter is related to the value of Stp Bridge Maximum Age. The granularity of this timer is specified by 802.1D-1990 to be 1 second. An agent may return a badValue error if a set is attempted to a value which is not a whole number of seconds. Valid values are 4 through 30 seconds. The factory default is 15. |
| Hold Time (seconds)     | The minimum time period to elapse between the transmission of Configuration BPDUs through a given LAN Port: at most one Configuration BPDU shall be transmitted in any Hold Time period.                                                                                                                                                                                                                                                                               |

## Monitoring CLI Sessions

The CLI Sessions page for a controller can be accessed in the following ways:

- Choose **Monitor > Controllers**, click the applicable IP address, then choose **System > CLI Sessions** from the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then select **System > CLI Sessions** from the left sidebar menu.

This page provides a list of open command-line interface sessions. It details the following information:

**Table 5-5** *CLI Sessions Details*

| Parameter       | Description                               |
|-----------------|-------------------------------------------|
| Session Index   | Session identification.                   |
| Username        | Login username.                           |
| Connection Type | Telnet or serial session.                 |
| Connection From | IP address of the client computer system. |
| Session Time    | Elapsed active session time.              |
| Idle Time       | Elapsed inactive session time.            |

## Monitoring DHCP Statistics

NCS provides DHCP server statistics for version 5.0.6.0 controllers or later. These statistics include information on the packets sent and received, DHCP server response information, last request timestamp.

To access this page, choose **Monitor > Controllers**, click the applicable IP address, then choose **System > DHCP Statistics** from the left sidebar menu.

The DHCP Statistics page provides the following information:

**Table 5-6** *DHCP Statistics*

| Parameter              | Description                                                                                                                                                             |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server IP              | Identifies the IP address of the server.                                                                                                                                |
| Is Proxy               | Identifies whether or not this server is proxy.                                                                                                                         |
| Discover Packets Sent  | Identifies the total number of packets sent intended to locate available servers.                                                                                       |
| Request Packets Sent   | Identifies the total number of packets sent from the client requesting parameters from the server or confirming the correctness of an address.                          |
| Decline Packets        | Identifies the number of packets indicating that the network address is already in use.                                                                                 |
| Inform Packets         | Identifies the number of client requests to the DHCP server for local configuration parameters because the client already has an externally configured network address. |
| Release Packets        | Identifies the number of packets that release the network address and cancel the remaining lease.                                                                       |
| Reply Packets          | Identifies the number of reply packets.                                                                                                                                 |
| Offer Packets          | Identifies the number of packets that respond to the discover packets with an offer of configuration parameters.                                                        |
| Ack Packets            | Identifies the number of packets that acknowledge successful transmission.                                                                                              |
| Nak Packets            | Identifies the number of packets that indicate that the transmission occurred with errors.                                                                              |
| Tx Failures            | Identifies the number of transfer failures that occurred.                                                                                                               |
| Last Response Received | Provides a timestamp of the last response received.                                                                                                                     |
| Last Request Sent      | Provides a timestamp of the last request sent.                                                                                                                          |

## Monitoring WLANs

Choose **Monitor > Controllers** and click a controller IP address, and choose **WLANs** from the left sidebar menu. This page enables you to view a summary of the wireless local access networks (WLANs) that you have configured on this controller:

**Table 5-7**      **WLAN Details**

| Parameter              | Description                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------|
| WLAN ID                | Identification number of the WLAN.                                                                   |
| Profile Name           | User-defined profile name specified when initially creating the WLAN. Profile Name is the WLAN name. |
| SSID                   | User-defined SSID name.                                                                              |
| Security Policies      | Security policies enabled on the WLAN.                                                               |
| No of Mobility Anchors | Mobility anchors are a subset of a mobility group specified as the anchor controllers for a WLAN.    |
| Admin Status           | Status of the WLAN is either enabled or disabled.                                                    |
| No. of Clients         | Current number of clients currently associated with this WLAN.                                       |

## Monitoring Ports

This section provides the detailed information regarding monitoring controller port parameters and contains the following topics:

- [Monitoring General Ports, page 5-9](#)
- [Monitoring CDP Interface Neighbors, page 5-14](#)

## Monitoring General Ports

The Ports > General page provides information regarding physical ports on the selected controller. Click a port number to view details for that port. See the “[Port Details](#)” section on [page 5-10](#) for more information.

General port information includes the following:

**Table 5-8**      **General Ports**

| Parameter       | Description                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port            | Click the port number to view port details. See the <a href="#">“Port Details” section on page 5-10</a> for more information.                                                                                                                                               |
| Physical Mode   | Displays the physical mode of all ports. Selections include: <ul style="list-style-type: none"> <li>- 100 Mbps Full Duplex</li> <li>- 100 Mbps Half Duplex</li> <li>- 10 Mbps Full Duplex</li> <li>- 10 Mbps Half Duplex</li> </ul>                                         |
| Admin Status    | Displays the state of the port of either Enable or Disable.                                                                                                                                                                                                                 |
| STP State       | Displays the STP state of the port of either Forwarding or Disabled.                                                                                                                                                                                                        |
| Physical Status | Displays the actual port physical interface: <ul style="list-style-type: none"> <li>- Auto Negotiate</li> <li>- Half Duplex 10 Mbps</li> <li>- Full Duplex 10 Mbps</li> <li>- Half Duplex 100 Mbps</li> <li>- Full Duplex 100 Mbps</li> <li>- Full Duplex 1 Gbps</li> </ul> |
| Link Status     | Red (down/failure), Yellow (alarm), Green (up/normal).                                                                                                                                                                                                                      |

To access the Monitor > Ports > General page, do one of the following:

- Choose **Configure > Controllers**, click the applicable IP address. From the left sidebar menu, choose **General** under Ports.
- Choose **Monitor > Controllers**, click the applicable, and click a port to access this page.
- Choose **Monitor > Access Points** and click a list item under AP Name, click **Registered Controller**, then click a port to access this page.
- Choose **Monitor > Clients** and click a list item under AP Name, then click **Registered Controller**, then click a port to access this page.

## Port Details

### Note

Click **Alarms** to open the Monitor Alarms page. See the [“Monitoring Alarms” section on page 5-125](#) for more information.

Click **Events** to open the Monitor Events page. See the [“Monitoring Events” section on page 5-142](#) for more information.

The Port Detail page includes the following information:

**Table 5-9 Port Details**

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Operational Status                        | Displays the operational status of the controller: Options are UP or DOWN.                                                                                                                                                                                                                                                                                                                           |
| Unknown Protocol Packets                  | The number of packets of unknown type which were received from this server on this port.                                                                                                                                                                                                                                                                                                             |
| <b>Traffic (Received and Transmitted)</b> |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Total Bytes                               | The total number of packets received.                                                                                                                                                                                                                                                                                                                                                                |
| Packets                                   | <p>The total number of packets (including bad packets) received that were within the indicated octet range in length (excluding framing bits but including FCS octets).</p> <p>Ranges include:</p> <ul style="list-style-type: none"> <li>- 64 Octets</li> <li>- 65-127 Octets</li> <li>- 128-255 Octets</li> <li>- 256-511 Octets</li> <li>- 512-1023 Octets</li> <li>- 1024-1518 Octets</li> </ul> |
| <b>Packets (Received and Transmitted)</b> |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Total                                     | Total number of packets received/transmitted.                                                                                                                                                                                                                                                                                                                                                        |
| Unicast Packets                           | The number of subnetwork-unicast packets delivered/sent to a higher-layer protocol.                                                                                                                                                                                                                                                                                                                  |
| Broadcast Packets                         | The total number of packets received/sent that were directed to the broadcast address.                                                                                                                                                                                                                                                                                                               |
| Packets Discarded                         | Packets Discarded (Received/Transmitted): The number of inbound/outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.                                                                                                |
| Errors in Packets                         | The total number of packets received that were with errors.                                                                                                                                                                                                                                                                                                                                          |
| <b>Received packets with MAC errors</b>   |                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 5-9 Port Details

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Jabbers                   | <p>The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).</p> <p><b>Note</b> This definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10Base-5) and section 10.3.1.4 (10Base-2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 and 150 ms.</p> |
| Fragments/Undersize       | The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Alignment Errors          | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with a non-integral number of octets.                                                                                                                                                                                                                                                                                                                                                                       |
| FCS Errors                | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with an integral number of octets.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmit discards</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Single Collision Frames   | A count of the number of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Multiple Collision Frames | A count of the number of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Deferred Transmissions    | A count of frames for which transmission on a particular interface fails due to deferred transmissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Late Collisions           | A count of frames for which transmission on a particular interface fails due to late collisions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Excessive Collisions      | A count of frames for which transmission on a particular interface fails due to excessive collisions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Ether Stats</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 5-9 Port Details**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CRC Align Errors            | The number of incoming packets with the Checksum (FCS) alignment error. This represents a count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.                                                                                                                                                     |
| Undersize Packets           | The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Oversize Packets            | The total number of frames that exceeded the maximum permitted frame size. This counter has a maximum increment rate of 815 counts per second at 10 Mbps.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Ether Stats Collisions      | The number of packets with collision errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SQE Test Errors             | Signal Quality Error Test errors (that is, Heartbeat) during transmission. This tests the important collision detection electronics of the transceiver, and lets the Ethernet interface in the computer know that the collision detection circuits and signal paths are working correctly. The errors indicate a count of times that the SQE TEST ERROR message is generated by the PLS sublayer for a particular interface. The SQE TEST ERROR message is defined in section 7.2.2.2.4 of ANSI/IEEE 802.3-1985 and its generation is described in section 7.2.4.6 of the same document. |
| Internal MAC Receive Errors | A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the FrameTooLong property, the AlignmentErrors property, or the FCSErrors property. The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of receive errors on a particular interface that are not otherwise counted.           |

**Table 5-9 Port Details**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal MAC Transmit Errors | A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the LateCollisions property, the ExcessiveCollisions property, or the CarrierSenseErrors property. The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted. |
| Carrier Sense Errors         | The Carrier Sense detects the presence of a carrier. The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Too Long Frames              | A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the FrameTooLong status is returned by the MAC layer to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.                                                                                                                                   |

## Monitoring CDP Interface Neighbors

To access the Monitor CDP Interface Neighbors page, follow these steps:

- 
- Step 1** Choose **Monitor > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **CDP Interface Neighbors** (under the **Port** heading).

**Step 4** The CDP Interface Neighbors page provides the following information:

**Table 5-10 CDP Interface Neighbor Details**

| Parameter        | Description                                                      |
|------------------|------------------------------------------------------------------|
| Local Interface  | Local Port information.                                          |
| Neighbor Name    | The name of each CDP neighbor.                                   |
| Neighbor Address | The IP address of each CDP neighbor.                             |
| Neighbor Port    | The port used by each CDP neighbor for transmitting CDP packets. |
| Capability       | The functional capability of each CDP neighbor.                  |
| Platform         | The hardware platform of each CDP neighbor device.               |
| Duplex           | Indicates Full Duplex or Half Duplex.                            |
| Software Version | The software running on the CDP neighbor.                        |

## Monitoring Controller Security

This section provides the detailed information regarding monitoring controller security and contains the following topics:

- [Monitoring RADIUS Authentication, page 5-15](#)
- [Monitoring RADIUS Accounting, page 5-17](#)
- [Monitoring Management Frame Protection, page 5-19](#)
- [Monitoring Rogue AP Rules, page 5-20](#)
- [Monitoring Guest Users, page 5-22](#)

### Monitoring RADIUS Authentication

The RADIUS authentication page displays RADIUS authentication server information and enables you to add or delete a RADIUS authentication server.

To access this page, do one of the following:

- Choose **Monitor > Controllers**, click the applicable IP address, then choose **Radius Authentication** from the Security section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **Radius Authentication** from the Security section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **Radius Authentication** from the Security section of the left sidebar menu.

The following information is displayed:

**Table 5-11 RADIUS authentication details**

| Parameter                               | Description                                                                                                                                                                                                                                             |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RADIUS Authentication Servers</b>    |                                                                                                                                                                                                                                                         |
| Server Index                            | Access priority number for RADIUS servers. Up to four servers can be configured, and controller polling of the servers starts with Index 1, Index 2 second, and so forth. Index number is based on when the RADIUS server is added to the controller.   |
| IP Address                              | The IP address of the RADIUS server.                                                                                                                                                                                                                    |
| Ping                                    | Click to icon to ping the RADIUS Server from the controller to verify the link.                                                                                                                                                                         |
| Port                                    | Controller port number for the interface protocols.                                                                                                                                                                                                     |
| Admin Status                            | Indicates whether the server is enabled or disabled.                                                                                                                                                                                                    |
| <b>Authentication Server Statistics</b> |                                                                                                                                                                                                                                                         |
| Msg Round Trip Time                     | The time interval (in milliseconds) between the most recent Access-Reply/Access-Challenge and the Access-Request that matched it from this RADIUS authentication server.                                                                                |
| First Requests                          | The number of RADIUS Access-Request packets sent to this server. This does not include retransmissions.                                                                                                                                                 |
| Retry Requests                          | The number of RADIUS Authentication-Request packets retransmitted to this RADIUS authentication server.                                                                                                                                                 |
| Accept Responses                        | The number of RADIUS Access-Accept packets (valid or invalid) received from this server.                                                                                                                                                                |
| Reject Responses                        | The number of RADIUS Access-Reject packets (valid or invalid) received from this server.                                                                                                                                                                |
| Challenge Responses                     | The number of RADIUS Access-Challenge packets (valid or invalid) received from this server.                                                                                                                                                             |
| Malformed Msgs                          | The number of malformed RADIUS Access-Response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators or Signature attributes or unknown types are not included as malformed access responses. |

Table 5-11 RADIUS authentication details

| Parameter               | Description                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending Requests        | The number of RADIUS Access-Request packets destined for this server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject or Access-Challenge, a timeout, or retransmission.     |
| Bad Authentication Msgs | The number of RADIUS Access-Response packets containing invalid authenticators or Signature attributes received from this server.                                                                                                                                                                             |
| Timeouts Requests       | The number of authentication timeouts to this server. After a timeout the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout. |
| Unknown Type Msgs       | The number of RADIUS packets of unknown type which were received from this server on the authentication port.                                                                                                                                                                                                 |
| Other Drops             | The number of RADIUS packets received from this server on the authentication port and dropped for some other reason.                                                                                                                                                                                          |

## Monitoring RADIUS Accounting

You can access this page by any of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP address, then choose **Radius Accounting** from the Security section of the left sidebar menu.
- Choose **Monitor > Clients** and click a list item under AP Name, click **Registered Controller**, then choose **Radius Accounting** from the Security section of the left sidebar menu.
- Choose **Monitor > Maps**, click an item in the **Name** column, click an access point icon, click **Controller**, then choose **Radius Accounting** from the Security section of the left sidebar menu.
- Choose **Configure > Access Points** and select a list item under AP Name, click **Registered Controller**, then choose **Radius Accounting** from the Security section of the left sidebar menu.

This page displays RADIUS accounting server information and statistics:

**Table 5-12 RADIUS Accounting Details**

| Parameter                       | Description                                                                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RADIUS Accounting Server</b> |                                                                                                                                                                                                                                                       |
| Server Index                    | Access priority number for RADIUS servers. Up to four servers can be configured, and controller polling of the servers starts with Index 1, Index 2 second, and so forth. Index number is based on when the RADIUS server is added to the controller. |
| IP Address                      | The IP address of the RADIUS server.                                                                                                                                                                                                                  |
| Ping                            | Click to icon to ping the RADIUS Server from the controller to verify the link.                                                                                                                                                                       |
| Port                            | The Port of the RADIUS Server.                                                                                                                                                                                                                        |
| Admin Status                    | Indicates whether the server is enabled or disabled.                                                                                                                                                                                                  |
| <b>Accounting Statistics</b>    |                                                                                                                                                                                                                                                       |
| Msg Round Trip Time             | The time interval (in milliseconds) between the most recent Accounting-Response and the Accounting-Request that matched it from this RADIUS accounting server.                                                                                        |
| First Requests                  | The number of RADIUS Accounting-Request packets sent. This does not include retransmissions.                                                                                                                                                          |
| Retry Requests                  | The number of RADIUS Accounting-Request packets retransmitted to this RADIUS accounting server. Retransmissions include retries where the Identifier and Acct-Delay have been updated, as well as those in which they remain the same.                |
| Accounting Responses            | The number of RADIUS packets received on the accounting port from this server.                                                                                                                                                                        |
| Malformed Msgs                  | The number of malformed RADIUS Accounting-Response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators and unknown types are not included as malformed accounting responses.              |
| Bad Authentication Msgs         | The number of RADIUS Accounting-Response packets which contained invalid authenticators received from this server.                                                                                                                                    |

**Table 5-12 RADIUS Accounting Details**

| Parameter         | Description                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending Requests  | The number of RADIUS Accounting-Request packets sent to this server that have not yet timed out or received a response. This variable is incremented when an Accounting-Request is sent and decremented due to receipt of an Accounting-Response, a timeout or a retransmission.                                      |
| Timeouts Requests | The number of accounting timeouts to this server. After a timeout the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as an Accounting-Request as well as a timeout. |
| Unknown Type Msgs | The number of RADIUS packets of unknown type which were received from this server on the accounting port.                                                                                                                                                                                                             |
| Other Drops       | The number of RADIUS packets which were received from this server on the accounting port and dropped for some other reason.                                                                                                                                                                                           |

## Monitoring Management Frame Protection

This page displays the Management Frame Protection (MFP) summary information. MFP provides for the authentication of 802.11 management frames. Management frames can be protected to detect adversaries who are invoking denial of service attacks, flooding the network with probes, interjecting as rogue access points, and affecting the network performance by attacking the QoS and radio measurement frames.

If one or more of the WLANs for the controller has MFP enabled, the controller sends each registered access point a unique key for each BSSID the access point uses for those WLANs. Management frames sent by the access point over the MFP enabled WLANs will be signed with a Frame Protection Information Element (IE). Any attempt to alter the frame invalidates the message causing the receiving access point configured to detect MFP frames to report the discrepancy to the WLAN controller.

Access this page in one of the following ways:

- Choose **Monitor > Controllers**. From the Controllers > Search Results page, click the applicable IP Address, then choose **Management Frame Protection** from the Security section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **Management Frame Protection** from the Security section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **Management Frame Protection** from the Security section of the left sidebar menu.

The following parameters are displayed:

**Table 5-13 MFP Details**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Management Frame Protection  | Indicates if infrastructure MFP is enabled globally for the controller.                                                                                                                                                                                                                                                                                                                                                                                          |
| Controller Time Source Valid | The Controller Time Source Valid field indicates whether the controller time is set locally (by manually entering the time) or through an external source (such as NTP server). If the time is set by an external source, the value of this field is "True." If the time is set locally, the value is "False." The time source is used for validating the timestamp on management frames between access points of different controllers within a mobility group. |
| <b>WLAN Details</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| WLAN ID                      | The WLAN ID, 1 through 17.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| WLAN Name                    | User-defined profile name when initially creating the WLAN. Both the SSID name and profile name are user-defined. The WLAN name is same as the profile name.                                                                                                                                                                                                                                                                                                     |
| MFP Protection               | Management Frame Protection is either enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Status                       | Status of the WLAN is either enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>AP Details</b>            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AP Name                      | Operator defined name of access point.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MFP Validation               | Management Frame Protection is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Radio                        | 802.11a or 802.11b/g.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Operation Status             | Displays the operational status of the: either UP or DOWN.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Protection                   | Full (All Frames).                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Validation                   | Full (All Frames).                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Monitoring Rogue AP Rules

Rogue AP rules automatically classify rogue access points based on criteria such as authentication type, matching configured SSIDs, client count, and RSSI values. NCS applies the rogue access point classification rules to the controllers and respective access points.

These rules can limit a rogue appearance on maps based on RSSI level (weaker rogue access points are ignored) and time limit (a rogue access point is not flagged unless it is seen for the indicated period of time).

Rogue AP Rules also help reduce false alarms.

**Note**

Rogue classes include the following types:

**Malicious Rogue**—A detected access point that matches the user-defined malicious rules or has been manually moved from the Friendly AP category.

**Friendly Rogue**—Known, acknowledged, or trusted access point or a detected access point that matches user-defined friendly rules.

**Unclassified Rogue**—A detected access point that does not match the malicious or friendly rules.

Choose **Monitor > Controllers**. From the Controllers > Search Results page, click the applicable IP Address, then choose **Rogue AP Rules** from the Security section of the left sidebar menu.

The **Rogue AP Rules** page provides a list of all rogue access point rules currently applied to this controller.

The following information is displayed for rogue access point rules:

- Rogue AP Rule name—Click the link to view Rogue AP Rule details.
- Rule Type—Malicious or Friendly.
  - Malicious Rogue—A detected access point that matches the user-defined Malicious rules or has been manually moved from the Friendly AP category.
  - Friendly Rogue—Known, acknowledged, or trusted access point or a detected access point that matches user-defined Friendly rules.
- Priority—Indicates the priority level for this rogue AP rule.

**Note**

See the [“Configuring a Rogue AP Rules Template” section on page 11-78](#) for more information on Rogue AP Rules.

## Rogue AP Rules Details

The Rogue AP Rules Details page displays the following information:

**Table 5-14** *Rogue AP Rule Details*

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Name | Name of the rule.                                                                                                                                                                                                                                                                                                                                                     |
| Rule Type | Malicious or Friendly <ul style="list-style-type: none"> <li>– Malicious Rogue—A detected access point that matches the user-defined Malicious rules or has been manually moved from the Friendly AP category.</li> <li>– Friendly Rogue—Known, acknowledged, or trusted access point or a detected access point that matches user-defined Friendly rules.</li> </ul> |

**Table 5-14** *Rogue AP Rule Details*

| Parameter               | Description                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type              | Match any or match all conditions.                                                                                                                                                                                                                                                       |
| Enabled Rule Conditions | Indicates all enabled rule conditions including: <ul style="list-style-type: none"> <li>- Open Authentication</li> <li>- Match Managed AP SSID</li> <li>- Match User Configured SSID</li> <li>- Minimum RSSI</li> <li>- Time Duration</li> <li>- Minimum Number Rogue Clients</li> </ul> |

**Note**

See the [“Configuring a Rogue AP Rules Template”](#) section on page 11-78 for more information on Rogue AP Rules.

## Monitoring Guest Users

Choose **Monitor > Controllers**. From the Controllers > Search Results page, click the applicable IP Address, then choose **Guest Users** from the Security section of the left sidebar menu.

NCS allows you to monitor guest users from the Guest Users page as well as from the NCS home page.

The Guest Users page provides a summary of the guest access deployment and network use.

The following information is displayed for guest users currently associates on the network:

**Table 5-15** *Guest User Details*

| Parameter          | Description                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Guest User Name    | Indicates the guest user login name.                                                                                                        |
| Profile            | Indicates the profile to which the guest user is connected.                                                                                 |
| Lifetime           | Indicates the length of time that the guest user account is active. Length of time appears in days, hours, and minutes or as Never Expires. |
| Start Time         | Indicates when the guest user account was activated.                                                                                        |
| Remaining Lifetime | Indicates the remaining time for the guest user account.                                                                                    |
| Role               | Indicates the designated user role.                                                                                                         |
| First Logged in at | Indicates the date and time of the user first log in.                                                                                       |
| Number of logins   | Indicates the total number of log ins for this guest user.                                                                                  |
| Description        | User-defined description of the guest user account for identification purposes.                                                             |

# Monitoring Controllers Mobility

## Monitoring Mobility Stats

The Mobility Stats page displays the statistics for mobility group events.

Access this page in one of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP address, then choose **Mobility Stats** from the Mobility section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **Mobility Stats** from the Mobility section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **Mobility Stats** from the Mobility section of the left sidebar menu.

The following parameters are displayed:

**Table 5-16**      **Mobility Stats**

| Parameter                            | Description                                                                                                                                                                                                                                                                              |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global Mobility Statistics</b>    |                                                                                                                                                                                                                                                                                          |
| Rx Errors                            | Generic protocol packet receive errors, such as packet too short or format incorrect.                                                                                                                                                                                                    |
| Tx Errors                            | Generic protocol packet transmit errors, such as packet transmission fail.                                                                                                                                                                                                               |
| Responses Retransmitted              | The Mobility protocol uses UDP and it resends requests several times if it does not receive a response. Because of network or processing delays, the responder may receive one or more retry requests after it initially responds to a request. This is a count of the response resends. |
| Handoff Requests Received            | Total number of handoff requests received, ignored or responded to.                                                                                                                                                                                                                      |
| Handoff End Requests                 | Total number of handoff end requests received. These are sent by the Anchor or the Foreign to notify the other about the close of a client session.                                                                                                                                      |
| State Transitions Disallowed         | PEM (policy enforcement module) has denied a client state transition, usually resulting in the handoff being aborted.                                                                                                                                                                    |
| Resource Unavailable                 | A necessary resource, such as a buffer, was unavailable, resulting in the handoff being aborted.                                                                                                                                                                                         |
| <b>Mobility Responder Statistics</b> |                                                                                                                                                                                                                                                                                          |
| Handoff Requests Ignored             | Number of handoff requests/client announces that were ignored. The controller simply had no knowledge of that client.                                                                                                                                                                    |
| Ping Pong Handoff Requests Dropped   | Number of handoff requests that were denied because the handoff period was too short (3 sec).                                                                                                                                                                                            |

**Table 5-16**      **Mobility Stats**

| <b>Parameter</b>                     | <b>Description</b>                                                                                                                                                                                     |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Handoff Requests Dropped             | Number of handoff requests that were dropped due to either an incomplete knowledge of the client or a problem with the packet.                                                                         |
| Handoff Requests Denied              | Number of handoff requests that were actively denied.                                                                                                                                                  |
| Client Handoff as Local              | Number of handoffs responses sent while in the local role.                                                                                                                                             |
| Client Handoff as Foreign            | Number of handoffs responses sent while in the foreign role.                                                                                                                                           |
| Anchor Requests Received             | Number of anchor requests received.                                                                                                                                                                    |
| Anchor Requests Denied               | Number of anchor requests denied.                                                                                                                                                                      |
| Anchor Requests Granted              | Number of anchor requests granted.                                                                                                                                                                     |
| Anchor Transferred                   | Number of anchors transferred because the client has moved from a foreign controller to controller on the same subnet as the current anchor.                                                           |
| <b>Mobility Initiator Statistics</b> |                                                                                                                                                                                                        |
| Handoff Requests Sent                | Number of clients that have associated with controller and have been announced to the mobility group.                                                                                                  |
| Handoff Replies Received             | Number of handoff replies that have been received in response to the requests sent.                                                                                                                    |
| Handoff as Local Received            | Number of handoffs in which the entire client session has been transferred.                                                                                                                            |
| Handoff as Foreign Received          | Number of handoffs in which the client session was anchored elsewhere.                                                                                                                                 |
| Handoff Denies Received              | Number of handoffs that were denied.                                                                                                                                                                   |
| Anchor Request Sent                  | Number of anchor requests that were sent for a three party (foreign to foreign) handoff. Handoff was received from another foreign and the new controller is requesting the anchor to move the client. |
| Anchor Deny Received                 | Number of anchor requests that were denied by the current anchor.                                                                                                                                      |
| Anchor Grant Received                | Number of anchor requests that were approved by the current anchor.                                                                                                                                    |
| Anchor Transfer Received             | Number of anchor transfers that were received by the current anchor.                                                                                                                                   |

## Monitoring Controller 802.11a/n

This section provides detailed information regarding monitoring 802.11a/n parameters and contains the following topics:

- [Monitoring 802.11a/n Parameters, page 5-25](#)
- [Monitoring 802.11a/n RRM Groups, page 5-26](#)

## Monitoring 802.11a/n Parameters

Access this parameters page in one of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP address, then choose **Parameters** from the 802.11a/n section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **Parameters** from the 802.11a/n section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **Parameters** from the 802.11a/n section of the left sidebar menu.

This page displays the following 802.11a/n parameters:

**Table 5-17** 802.11 a/n Parameters

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MAC Operation Parameters</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| RTS Threshold                   | Indicates the number of octets in an MPDU, below which an RTS/CTS handshake is not performed.<br><br><b>Note</b> An RTS/CTS handshake is performed at the beginning of any frame exchange sequence where the MPDU is a data or management type, the MPDU has an individual address in the Address1 field, and the length of the MPDU is greater than this threshold. Setting this attribute higher than the maximum MSDU size turns off the RTS/CTS handshake for data or management type frames transmitted by this STA. Setting this attribute to zero turns on the RTS/CTS handshake for all transmitted data or management type frames. |
| Short Retry Limit               | The maximum number of transmission attempts of a frame (less than or equal to dot11RTSThreshold) made before a failure condition is indicated. The default value is 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Long Retry Limit                | The maximum number of transmission attempts of a frame (greater than dot11RTSThreshold) made before a failure condition is indicated. The default value is 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Max Tx MSDU Lifetime            | The elapsed time in TU, after the initial transmission of an MSDU, after which further attempts to transmit the MSDU are terminated. The default value is 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 5-17 802.11 a/n Parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                           |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Rx Lifetime                         | The elapsed time in TU, after the initial reception of a fragmented MMPDU or MSDU, after which further attempts to reassemble the MMPDU or MSDU are terminated. The default value is 512.                                                                                             |
| <b>Physical Channel Parameters</b>      |                                                                                                                                                                                                                                                                                       |
| TI Threshold                            | The threshold being used to detect a busy medium (frequency). CCA shall report a busy medium upon detecting the RSSI above this threshold.                                                                                                                                            |
| Channel Agility Enabled                 | Physical channel agility functionality is or is not implemented.                                                                                                                                                                                                                      |
| <b>Station Configuration Parameters</b> |                                                                                                                                                                                                                                                                                       |
| Medium Occupancy Limit                  | Indicates the maximum amount of time, in TU, that a point coordinator may control the usage of the wireless medium without relinquishing control for long enough to allow at least one instance of DCF access to the medium. The default value is 100, and the maximum value is 1000. |
| CFP Period                              | The number of DTIM intervals between the start of CFPs. It is modified by MLME-START.request primitive.                                                                                                                                                                               |
| CFP Max Duration                        | The maximum duration of the CFP in TU that may be generated by the PCF. It is modified by MLME-START.request primitive.                                                                                                                                                               |
| CF Pollable                             | When this attribute is implemented, it indicates that the client is able to respond to a CF-Poll with a data frame within a SIFS time. This attribute is not implemented if the STA is not able to respond to a CF-Poll with a data frame within a SIFS time.                         |
| CF Poll Request                         | Specifies whether CFP is requested by the client.                                                                                                                                                                                                                                     |
| DTIM Period                             | The number of beacon intervals that shall elapse between transmission of Beacon frames containing a TIM element whose DTIM Count field is 0. This value is transmitted in the DTIM Period field of Beacon frames.                                                                     |

## Monitoring 802.11a/n RRM Groups

Access the RRM Grouping page in one of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP address, then choose **Grouping** or **WPS Grouping** from the 802.11a/n section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **RRM Grouping** or **WPS Grouping** from the 802.11a/n section of the left sidebar menu.

- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **RRM Grouping** or **WPS Grouping** from the 802.11a/n section of the left sidebar menu.

This page displays the following 802.11a RRM groups parameters:

**Table 5-18 802.11 a/n RRM Groups**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>802.11a Grouping Control</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Grouping Mode                   | Dynamic grouping has two modes: on and off. When the grouping is off, no dynamic grouping occurs. Each controller optimizes only its own access point's parameters. When grouping is on, the controller forms groups and elects leaders to perform better dynamic parameter optimization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Grouping Role                   | There are five grouping roles: <ul style="list-style-type: none"> <li>– None—This grouping role appears when the RF Group Mode is configured as Off.</li> <li>– Auto-Leader—This grouping role appears when the RF Group Mode is configured as Automatic and the controller is elected as a leader by the automatic grouping algorithm.</li> <li>– Auto-Member—This grouping role appears when the RF Group Mode is configured as Automatic and the controller is selected as a member by the automatic grouping algorithm.</li> <li>– Static-Leader—This grouping role appears when the RF Group Mode is configured as Leader.</li> <li>– Static-member—This grouping role appears when the RF Group Mode is configured as automatic and the controller joins the leader as a result of the join request from the leader.</li> </ul> |
| Group Leader IP Address         | This is the IP address of the group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Group Leader MAC Address        | This is the MAC address of the group leader for the group containing this controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Is 802.11a Group Leader         | Yes, if this controller is the group leader or No if the controller is not the group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Last Update Time (secs)         | The elapsed time since the last group update in seconds. This is only valid if this controller is a group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 5-18 802.11 a/n RRM Groups

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Update Interval (secs) | When grouping is on, this interval (in seconds) represents the period with which the grouping algorithm is run by the Group Leader. Grouping algorithm will also run when the group contents changes and the automatic grouping is enabled. A dynamic grouping can be started upon request from the system administrator. Default value is 3600 seconds. |
| <b>Group Members</b>         |                                                                                                                                                                                                                                                                                                                                                          |
| Group Member Name            | Name of group member(s).                                                                                                                                                                                                                                                                                                                                 |
| Group Member IP Address      | IP address of group member(s).                                                                                                                                                                                                                                                                                                                           |
| Member Join Reason           | Current state of the member(s).                                                                                                                                                                                                                                                                                                                          |

## Monitoring Controllers 802.11b/g/n

This section provides the detailed information regarding monitoring 802.11b/g/n parameters and contains the following topics:

- [Monitoring 802.11b/g/n Parameters, page 5-28](#)
- [Monitoring 802.11b/g/n RRM Groups, page 5-30](#)

### Monitoring 802.11b/g/n Parameters

Access this parameters page in one of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP Address, then choose **Parameters** from the 802.11b/g/n section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **Parameters** from the 802.11b/g/n section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **Parameters** from the 802.11b/g/n section of the left sidebar menu.

This page displays the following 802.11b/g parameters:

**Table 5-19 802.11 b/g/n Parameters**

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MAC Operation Parameters</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| RTS Threshold                           | Indicates the number of octets in an MPDU, below which an RTS/CTS handshake is not performed.<br><br><b>Note</b> An RTS/CTS handshake is performed at the beginning of any frame exchange sequence where the MPDU is a data or management type, the MPDU has an individual address in the Address1 field, and the length of the MPDU is greater than this threshold. Setting this attribute higher than the maximum MSDU size turns off the RTS/CTS handshake for data or management type frames transmitted by this STA. Setting this attribute to zero turns on the RTS/CTS handshake for all transmitted data or management type frames. |
| Short Retry Limit                       | The maximum number of transmission attempts of a frame (less than or equal to dot11RTSThreshold) made before a failure condition is indicated. The default value is 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Long Retry Limit                        | The maximum number of transmission attempts of a frame (greater than dot11RTSThreshold) made before a failure condition is indicated. The default value is 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Max Tx MSDU Lifetime                    | The elapsed time in TU, after the initial transmission of an MSDU, after which further attempts to transmit the MSDU are terminated. The default value is 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Max Rx Lifetime                         | The elapsed time in TU, after the initial reception of a fragmented MMPDU or MSDU, after which further attempts to reassemble the MMPDU or MSDU are terminated. The default value is 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Physical Channel Parameters</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TI Threshold                            | The threshold being used to detect a busy medium (frequency). CCA shall report a busy medium upon detecting the RSSI above this threshold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Channel Agility Enabled                 | Physical channel agility functionality is or is not implemented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Station Configuration Parameters</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 5-19 802.11 b/g/n Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Medium Occupancy Limit | Indicates the maximum amount of time, in TU, that a point coordinator may control the usage of the wireless medium without relinquishing control for long enough to allow at least one instance of DCF access to the medium. The default value is 100, and the maximum value is 1000. |
| CFP Period             | The number of DTIM intervals between the start of CFPs. It is modified by MLME-START.request primitive.                                                                                                                                                                               |
| CFP Max Duration       | The maximum duration of the CFP in TU that may be generated by the PCF. It is modified by MLME-START.request primitive.                                                                                                                                                               |
| CF Pollable            | When this attribute is implemented, it indicates that the client is able to respond to a CF-Poll with a data frame within a SIFS time. This attribute is not implemented if the STA is not able to respond to a CF-Poll with a data frame within a SIFS time.                         |
| CF Poll Request        | Specifies whether CFP is requested by the client.                                                                                                                                                                                                                                     |
| DTIM Period            | The number of beacon intervals that shall elapse between transmission of Beacon frames containing a TIM element whose DTIM Count field is 0. This value is transmitted in the DTIM Period field of Beacon frames.                                                                     |

## Monitoring 802.11b/g/n RRM Groups

Access the RRM Group page in one of the following ways:

- Choose **Monitor > Controllers** and click the applicable IP address, then choose **RRM Grouping** or **WPS Grouping** from the 802.11b/g/n section of the left sidebar menu.
- Choose **Monitor > Access Points**, click a list item under AP Name, click **Registered Controller**, then choose **RRM Grouping** or **WPS Grouping** from the 802.11b/g/n section of the left sidebar menu.
- Choose **Monitor > Clients**, click a list item under AP Name, click **Registered Controller**, then choose **RRM Grouping** or **WPS Grouping** from the 802.11b/g/n section of the left sidebar menu.

This page displays the following 802.11b/g RRM groups parameters:

**Table 5-20 802.11 b/g/n RRM groups**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>802.11 b/g/n Grouping Control</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Grouping Mode                        | Dynamic grouping has two modes: on and off. When the grouping is off, no dynamic grouping occurs. Each controller optimizes only its own access point's parameters. When grouping is on, the controller forms groups and elects leaders to perform better dynamic parameter optimization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Grouping Role                        | There are five grouping roles: <ul style="list-style-type: none"> <li>– None—This grouping role appears when the RF Group Mode is configured as Off.</li> <li>– Auto-Leader—This grouping role appears when the RF Group Mode is configured as Automatic and the controller is elected as a leader by the automatic grouping algorithm.</li> <li>– Auto-Member—This grouping role appears when the RF Group Mode is configured as Automatic and the controller is selected as a member by the automatic grouping algorithm.</li> <li>– Static-Leader—This grouping role appears when the RF Group Mode is configured as Leader.</li> <li>– Static-member—This grouping role appears when the RF Group Mode is configured as automatic and the controller joins the leader as a result of the join request from the leader.</li> </ul> |
| Group Leader IP Address              | This is the IP address of the group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Group Leader MAC Address             | This is the MAC address of the group leader for the group containing this controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Is 802.11a Group Leader              | Yes, if this controller is the group leader or No if the controller is not the group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Last Update Time (secs)              | The elapsed time since the last group update in seconds. This is only valid if this controller is a group leader.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 5-20** 802.11 b/g/n RRM groups

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Update Interval (secs) | When grouping is on, this interval (in seconds) represents the period with which the grouping algorithm is run by the Group Leader. Grouping algorithm will also run when the group contents changes and the automatic grouping is enabled. A dynamic grouping can be started upon request from the system administrator. Default value is 3600 seconds. |
| <b>Group Members</b>         |                                                                                                                                                                                                                                                                                                                                                          |
| Group Member Name            | Name of group member(s).                                                                                                                                                                                                                                                                                                                                 |
| Group Member IP Address      | IP address of group member(s).                                                                                                                                                                                                                                                                                                                           |
| Member Join Reason           | Current state of the member(s).                                                                                                                                                                                                                                                                                                                          |

## Monitoring Switches

Choose **Monitor > Switches** to view the detailed information about the switches. The following sections provide more detailed information regarding monitoring switches:

- [Searching Switches, page 5-32](#)
- [Viewing List of Switches, page 5-33](#)
- [Monitoring Switch System Parameters, page 5-33](#)
- [Monitoring Switch Interfaces, page 5-39](#)
- [Monitoring Switch Clients, page 5-41](#)

## Searching Switches

Use the NCS search feature to find specific switches or to create and save custom searches.

You can configure the following parameters when performing an advanced search for switches (see [Table 5-21](#)):

**Table 5-21** Search Switches Parameters

| Parameter              | Options                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search for Switches by | Choose All Switches, IP Address, or Switch Name. You can use wildcards (*). For example, if you select IP Address and enter 172*, NCS returns all switches that begin with IP address 172. |
| Items per page         | Select the number of switches to return per page.                                                                                                                                          |

See one of the following topics for additional information:

- [Using the Search Feature, page 2-33](#)
- [Quick Search, page 2-33](#)

- [Advanced Search, page 2-34](#)

## Viewing List of Switches

Choose **Monitor > Switches** to view a list of switches. From this page you can view a summary of switches including the default information shown in [Table 5-22](#):

**Table 5-22 Viewing List of Switches**

| Parameter           | Description                                                                            |
|---------------------|----------------------------------------------------------------------------------------|
| IP Address          | The IP address assigned to the switch. Click a list item to view access point details. |
| Device Name         | Name of the switch.                                                                    |
| Device Type         | Type of switch.                                                                        |
| Reachability Status | Indicates OK if the switch is reachable or Unreachable if the switch is not reachable. |
| Endpoint Count      | Number of endpoints on the switch.                                                     |

## Configuring the Switch List Page

The **Edit View** page allows you to add, remove, or reorder columns in the Switches table.

To edit the available columns in the table, follow these steps:

- 
- Step 1** Choose **Monitor > Switches**.
  - Step 2** Click the **Edit View** link.
  - Step 3** To add an additional column to the table, click to highlight the column heading in the left column. Click **Show** to move the heading to the right column. All items in the right column are displayed in the table.
  - Step 4** To remove a column from the table, click to highlight the column heading in the right column. Click **Hide** to move the heading to the left column. All items in the left column are not displayed in the table.
  - Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired column heading and click **Up** or **Down** to move it higher or lower in the current list.
  - Step 6** Click **Reset** to restore the default view.
  - Step 7** Click **Submit** to confirm the changes.
- 

## Monitoring Switch System Parameters

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. This section provides the detailed information regarding each switch details page and contains the following topics:

- [Viewing Switch Summary Information, page 5-34](#)
- [Viewing Switch Memory Information, page 5-35](#)

- [Viewing Switch Environment Information, page 5-35](#)
- [Viewing Switch Module Information, page 5-36](#)
- [Viewing Switch VLAN Information, page 5-36](#)
- [Viewing Switch VTP Information, page 5-36](#)
- [Viewing Switch Physical Ports Information, page 5-37](#)
- [Viewing Switch Sensor Information, page 5-37](#)
- [Viewing Switch Spanning Tree Information, page 5-38](#)
- [Viewing Switch Stacks Information, page 5-39](#)
- [Viewing Switch NMSP and Location Information, page 5-39](#)

## Viewing Switch Summary Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. [Table 5-23](#) describes the summary information that is displayed.

**Table 5-23** Viewing Switches Summary Information

| <b>General</b>                        |                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------|
| IP Address                            | IP address of the switch.                                                                                |
| Device Name                           | Name of the switch.                                                                                      |
| Device Type                           | Switch type.                                                                                             |
| Up Time                               | Time since last reboot.                                                                                  |
| System Time                           | Time on the switch.                                                                                      |
| Reachability Status                   | which can be: <ul style="list-style-type: none"> <li>• Reachable</li> <li>• Unreachable</li> </ul>       |
| Location                              | Location of the switch.                                                                                  |
| Contact                               | Contact name for the switch.                                                                             |
| Cisco Identity Capable                | Specifies if the switch is identity-capable.                                                             |
| Location Capable                      | Specifies if the switch is capable of storing the location information.                                  |
| CPU Utilization                       | Displays a graph of the maximum, average, and minimum CPU utilization over the specified amount of time. |
| <b>Unique Device Identifier (UDI)</b> |                                                                                                          |
| Name                                  | Product type.                                                                                            |
| Description                           | Description of UDI.                                                                                      |
| Product ID                            | Orderable product identifier.                                                                            |
| Version ID                            | Version of product identifier.                                                                           |
| Serial Number                         | Unique product serial number.                                                                            |
| <b>Inventory</b>                      |                                                                                                          |
| Software Version                      | Version of software currently running on the switch.                                                     |
| Model No.                             | Model number of the switch.                                                                              |

**Table 5-23 Viewing Switches Summary Information (continued)**

| <b>Port Summary</b>       |                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------|
| Number of Ports Up        | Number of ports up on the switch.                                                                           |
| Number of Ports Down      | Number of ports down on the switch.                                                                         |
| <b>Memory Utilization</b> | Displays a graph of the maximum, average, and minimum memory utilization over the specified amount of time. |

## Viewing Switch Memory Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Memory**. [Table 5-24](#) describes the memory information that is displayed.

**Table 5-24 Viewing Switches Memory Information**

| <b>Memory Pool</b> |                                     |
|--------------------|-------------------------------------|
| Type               | Type of memory.                     |
| Name               | Name assigned to the memory pool.   |
| Used (MB)          | Amount of memory (in MB) used.      |
| Free (MB)          | Amount of memory (in MB) available. |

## Viewing Switch Environment Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Environment**. [Table 5-25](#) describes the environment information that is displayed.

**Table 5-25 Viewing Switches Environment Information**

| <b>Power Supply</b>   |                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model Name            | Model name of the power supply.                                                                                                                                                       |
| Description           | Description of the power supply.                                                                                                                                                      |
| Operational Status    | Status of the associated power supply, which can be <ul style="list-style-type: none"> <li>• Green—Power supply is operational.</li> <li>• Red—Power supply is inoperable.</li> </ul> |
| Manufacturer Name     | Name of the power supply manufacturer.                                                                                                                                                |
| Free                  | Power supply free slots.                                                                                                                                                              |
| Vendor Equipment Type | Description of vendor equipment type.                                                                                                                                                 |
| <b>Fans</b>           |                                                                                                                                                                                       |
| Name                  | Name of fan.                                                                                                                                                                          |

**Table 5-25 Viewing Switches Environment Information**

|                       |                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Description           | Description of fan.                                                                                                                            |
| Operational Status    | Status of the fan which can be <ul style="list-style-type: none"> <li>• Green—Fan is operational.</li> <li>• Red—Fan is inoperable.</li> </ul> |
| Vendor Equipment Type | Description of vendor equipment type.                                                                                                          |
| Serial Number         | Serial number of the fan.                                                                                                                      |

## Viewing Switch Module Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Modules**. [Table 5-26](#) describes the module information that is displayed.

**Table 5-26 Viewing Switches Modules Information**

| <b>Modules</b>       |                                                           |
|----------------------|-----------------------------------------------------------|
| Product Name         | Name of the module.                                       |
| Physical Location    | Location where the module is contained.                   |
| Number of Ports      | Number of ports supported by the module.                  |
| Operational State    | Operational status of the module.                         |
| Equipment Type       | Type of equipment.                                        |
| Inline Power Capable | Specifies whether the module has inline power capability. |

## Viewing Switch VLAN Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **VLANs**. [Table 5-27](#) describes the VLAN information that is displayed.

**Table 5-27 Viewing Switches VLANs Information**

| <b>VLANs</b> |                   |
|--------------|-------------------|
| VLAN ID      | ID of the VLAN.   |
| VLAN Name    | Name of the VLAN. |
| VLAN Type    | Type of VLAN.     |

## Viewing Switch VTP Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **VTP**. [Table 5-28](#) describes the VTP information that is displayed.

**Table 5-28 Viewing Switches VTP Information**

| <b>VTP</b>      |                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VTP Domain Name | Name of the VTP domain.                                                                                                                                                                                                                                                       |
| VTP Version     | Version of VTP in use.                                                                                                                                                                                                                                                        |
| VTP Mode        | The VTP mode, which can be: <ul style="list-style-type: none"> <li>• Client</li> <li>• Server</li> <li>• Transparent—Does not generate or listen to VTP messages, but forwards messages.</li> <li>• Off—Does not generate, listen to, or forward any VTP messages.</li> </ul> |
| Pruning Enabled | Specifies whether VTP pruning is enabled.                                                                                                                                                                                                                                     |

## Viewing Switch Physical Ports Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Physical Ports**. [Table 5-29](#) describes the physical ports information that is displayed.

**Table 5-29 Viewing Switches Physical Ports Information**

| <b>Physical Ports</b> |                                            |
|-----------------------|--------------------------------------------|
| Port Name             | Name of the physical port.                 |
| Port Description      | Description of the physical port.          |
| Residing Module       | Module on which the physical port resides. |
| Vendor Equipment Type | Description of vendor equipment type.      |

## Viewing Switch Sensor Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Sensors**. [Table 5-30](#) describes the sensor information that is displayed.

**Table 5-30 Viewing Switches Sensors Information**

| <b>Sensors</b>     |                                    |
|--------------------|------------------------------------|
| Sensor Name        | Name of the sensor.                |
| Sensor Description | Description of the sensor.         |
| Type               | Type of sensor.                    |
| Vendor Sensor Type | Description of vendor sensor type. |
| Equipment Name     | Name of equipment.                 |

**Table 5-30 Viewing Switches Sensors Information**

|           |                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precision | When in the range 1 to 9, Sensor Precision is the number of decimal places in the fractional part of a Sensor Value fixed-point number. When in the range -8 to -1, Sensor Precision is the number of accurate digits in a Sensor-Value fixed-point number. |
| Status    | Operational status of the sensor.                                                                                                                                                                                                                           |

## Viewing Switch Spanning Tree Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Spanning Tree**. [Table 5-31](#) describes the spanning tree information that is displayed.

**Table 5-31 Viewing Switches Spanning Tree Information**

| <b>Spanning Tree</b> |                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| STP Instance ID      | ID of the STP. Click on a STP Instance ID to see the spanning tree details as described in <a href="#">Viewing Spanning Tree Details</a> . |
| VLAN ID              | ID of the VLAN.                                                                                                                            |
| Root Path Cost       | Root cost of the path.                                                                                                                     |
| Designated Root      | Forwarding port.                                                                                                                           |
| Bridge Priority      | Priority of the bridge.                                                                                                                    |
| Root Bridge Priority | Priority number of the root bridge.                                                                                                        |
| Max Age (sec)        | STP timer value for maximum age (in seconds).                                                                                              |
| Hello Interval (sec) | STP timer value (in seconds).                                                                                                              |

## Viewing Spanning Tree Details

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Spanning Tree**, then click on an STP instance ID to see the spanning tree details as described in [Table 5-32](#).

**Table 5-32 Viewing Spanning Tree Details**

| <b>Spanning Tree</b> |                              |
|----------------------|------------------------------|
| STP Port             | Name of the STP port.        |
| Port Role            | Role of the port.            |
| Port Priority        | Priority number of the port. |
| Path Cost            | Cost of the path.            |
| Port State           | State of the port.           |
| Port Type            | Type of port.                |

## Viewing Switch Stacks Information

Choose **Monitor > Switches**, then click an IP address under the IP Address column to view details about the switch. From the System menu, choose **Stacks**. [Table 5-33](#) describes the spanning tree information that is displayed.

**Table 5-33 Viewing Switches Stacks Information**

| Stacks           |                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address      | MAC address of the stack.                                                                                                                                                                           |
| Role             | Role of the stack, which can be: <ul style="list-style-type: none"> <li>• Master—Stack master</li> <li>• Member—Active member of the stack</li> <li>• Not Member—Non-active stack member</li> </ul> |
| Switch Priority  | Priority number of the switch.                                                                                                                                                                      |
| State            | Current state of the stack.                                                                                                                                                                         |
| Software Version | Software image running on the switch.                                                                                                                                                               |

## Viewing Switch NMSP and Location Information

You can view the NMSP and Location information for a switch using the System left side-bar menu.

To view the NMSP and Location information for a switch, choose **NCS > Monitor > Switches > Switch IP Address > System > NMSP and Location**.

The NMSP and Location page appears.

You can view the NMSP Status in the NMSP Status pane and Location information in the Location pane.

For more information on NMSP and Location, see the [Configuring Switch NMSP and Location](#).

## Monitoring Switch Interfaces

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces**, then select one of the following interfaces:

- [Monitoring Switch Ethernet Interfaces](#)
- [Monitoring Switch IP Interfaces](#)
- [Monitoring Switch VLAN Interfaces](#)
- [Monitoring Switch EtherChannel Interfaces](#)

## Monitoring Switch Ethernet Interfaces

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces > Ethernet Interfaces**. [Table 5-34](#) describes the Ethernet interface information that is displayed:

**Table 5-34 Viewing Switch Ethernet Interfaces**

|                    |                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | Name of the Ethernet interface. Click on an Ethernet interface name to see details as described in <a href="#">Monitoring Switch Ethernet Interface Details</a> . |
| MAC Address        | MAC address of the Ethernet interface.                                                                                                                            |
| Speed (Mbps)       | Estimate of the Ethernet interface's current bandwidth in bits per second.                                                                                        |
| Operational Status | Current operational state of the Ethernet interface.                                                                                                              |
| MTU                | Size of the largest packet that can be sent/received on the interface.                                                                                            |
| Desired VLAN Mode  | VLAN mode.                                                                                                                                                        |
| Access VLAN        | VLAN on which the port is configured.                                                                                                                             |

### Monitoring Switch Ethernet Interface Details

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces > Ethernet Interfaces**, then click on an Ethernet interface name in the Name column. [Table 5-35](#) describes the Ethernet interface detail information that is displayed:

**Table 5-35 Viewing Switch Ethernet Interface Details**

| <b>Ethernet Interfaces</b>         |                                                                                                                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                               | Name of the Ethernet interface.                                                                                                                                                                   |
| Admin Status                       | Administration status of the interface.                                                                                                                                                           |
| Duplex Mode                        | Duplex mode configured on the interface.                                                                                                                                                          |
| <b>VLAN Switch Port</b>            |                                                                                                                                                                                                   |
| Operational VLAN Mode              | Specifies the operational mode of the VLAN switch port, which can be either an access port or a trunk port.                                                                                       |
| Desired VLAN Mode                  | VLAN mode, which can be truck, access, dynamic, or desirable.                                                                                                                                     |
| Access VLAN                        | VLAN on which the port is configured.                                                                                                                                                             |
| Operational Truck Encapsulation    | Trunk encapsulation, which can be <i>802.1Q</i> or <i>none</i> .                                                                                                                                  |
| <b>VLAN Trunk</b>                  |                                                                                                                                                                                                   |
| Native VLAN                        | Untagged VLAN on the trunk switch port.                                                                                                                                                           |
| Prune Eligible                     | Specifies whether VLANs on the trunk port can be pruned.                                                                                                                                          |
| Allows VLANs                       | List of allowed VLANs on the trunk port.                                                                                                                                                          |
| Desired Trunking Encapsulation     | Trunk encapsulation.                                                                                                                                                                              |
| Trunking Encapsulation Negotiation | Specifies that the interface negotiate with the neighboring interface to become an ISL (preferred) or 802.1Q trunk, depending on the configuration and capabilities of the neighboring interface. |

### Monitoring Switch IP Interfaces

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces > IP Interfaces**. [Table 5-36](#) describes the IP interface information that is displayed:

**Table 5-36 Viewing Switch IP Interfaces**

|              |                                 |
|--------------|---------------------------------|
| Interface    | Name of the interface.          |
| IP Address   | IP address of the interface.    |
| Address Type | Type of address (IPv4 or IPv6). |

## Monitoring Switch VLAN Interfaces

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces > VLAN Interfaces**. [Table 5-37](#) describes the VLAN interface information that is displayed:

**Table 5-37 Viewing Switch VLAN Interfaces**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| Port Name            | Name of the VLAN port.                                                      |
| VLAN ID              | ID of the VLAN port.                                                        |
| Operational Status   | Current operational state of the VLAN interface.                            |
| Admin Status         | Current administrative state of the VLAN interface.                         |
| Port Type            | Type of VLAN port.                                                          |
| Maximum Speed (Mbps) | Maximum supported speed for the VLAN interface.                             |
| MTU                  | Size of the largest packet that can be sent/received on the VLAN interface. |

## Monitoring Switch EtherChannel Interfaces

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Interfaces > EtherChannel Interfaces**. [Table 5-38](#) describes the EtherChannel interface information that is displayed:

**Table 5-38 Viewing Switch EtherChannel Interfaces**

|                         |                                                                    |
|-------------------------|--------------------------------------------------------------------|
| Name                    | Name of the EtherChannel interface.                                |
| Channel Group ID        | Numeric identifier for the EtherChannel.                           |
| Control Method          | Protocol for managing the EtherChannel, which can be LACP or TAGP. |
| Actor Admin Key         | Channel Identifier.                                                |
| Number of (LAG) Members | Number of ports configured.                                        |

## Monitoring Switch Clients

Choose **Monitor > Switches**, then click an IP address under the IP Address column. From the System menu, choose **Clients**. [Table 5-39](#) describes the EtherChannel interface information that is displayed:

**Table 5-39 Viewing Current Associated Client**

|             |                            |
|-------------|----------------------------|
| IP Address  | IP address of the client.  |
| MAC Address | MAC address of the client. |

**Table 5-39 Viewing Current Associated Client**

|                            |                                              |
|----------------------------|----------------------------------------------|
| User Name                  | User Name of the client.                     |
| Vendor Name                | Vendor Name of the client.                   |
| Map Location               | Location of the client.                      |
| VLAN                       | VLAN on which the client is configured.      |
| Interface                  | Interface on which the client is configured. |
| Association Time           | Timestamp of the client association.         |
| Authorization Profile Name | Authorization Profile Name stored.           |

## Monitoring Access Points

This section provides access to the controller access points summary details. Use the main date area to access the respective access point details.

Choose **Monitor > Access Points** to access this page. This section provides more detailed information regarding monitoring access points and contains the following topics:

- [Searching Access Points, page 5-42](#)
- [Viewing List of Access Points, page 5-43](#)
- [Generating a Report for Access Points, page 5-46](#)
- [Monitoring Access Points Details, page 5-56](#)
- [Monitoring Access Point Radio Details, page 5-68](#)
- [Monitoring Mesh Access Points, page 5-77](#)
- [Retrieving the Unique Device Identifier on Controllers and Access Points, page 5-83](#)
- [Monitoring Coverage Hole, page 5-84](#)
- [Monitoring Rogue Access Points, page 5-86](#)
- [Monitoring Adhoc Rogues, page 5-100](#)
- [Searching Rogue Clients Using Advanced Search, page 5-105](#)
- [Monitoring Rogue Access Point Location, Tagging, and Containment, page 5-107](#)

## Searching Access Points

Use the NCS Search feature to find specific access points or to create and save custom searches. See one of the following topics for additional information:

- [Using the Search Feature, page 2-33](#)
- [Quick Search, page 2-33](#)
- [Advanced Search, page 2-34](#)
- [Saved Searches, page 2-46](#)

## Viewing List of Access Points

Choose **Monitor > Access Points** or perform an access point search to access this page.

This page enables you to view a summary of access points including the following default information:

**Table 5-40 Access Point Search Results**

| Parameter            | Description                                                                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Name Ethernet MAC | The name assigned to the access point. Click a list item to view access point details. See the <a href="#">“Monitoring Access Points Details”</a> section on page 5-56 for more information.                                                                                                                              |
| IP Address           | Local IP address of the access point.                                                                                                                                                                                                                                                                                     |
| Radio                | Protocol of the rogue access point is 802.11a, 802.11b or 802.11g. Click a list item to view access point radio details. See the <a href="#">“Monitoring Access Point Radio Details”</a> section on page 5-68 for more information.                                                                                       |
| Map Location         | Click a list item to go to the location indicated on the list.                                                                                                                                                                                                                                                            |
| Controller           | Click a list item to display a graphic and information about the controller. See the <a href="#">“Monitoring System Summary”</a> section on page 5-4 for more information.                                                                                                                                                |
| Client Count         | Displays the total number of clients currently associated with the controller.                                                                                                                                                                                                                                            |
| Admin Status         | Displays the administration state of the access point as either enabled or disabled.                                                                                                                                                                                                                                      |
| AP Mode              | Displays the operational mode of the access point.                                                                                                                                                                                                                                                                        |
| Oper Status          | Displays the operational status of the Cisco WLAN Solution device, either Up or Down. If the admin status is disabled, the operation status is labeled as down and there will be no alarms.                                                                                                                               |
| Alarm Status         | Alarms are color coded as follows: <ul style="list-style-type: none"> <li>– Clear—No Alarm</li> <li>– Red—Critical Alarm</li> <li>– Orange—Major Alarm</li> <li>– Yellow—Minor Alarm</li> </ul> <p><b>Note</b> This status is radio alarm status ONLY and does not includes the admin status in the operation status.</p> |

## Configuring the Access Point List Display

To add, remove, or reorder columns in the table, click the **Edit View** link to go to the Edit View page. The following are optional access point parameters available for the search results:

**Table 5-41** *Edit View Search Results*

| Parameters            | Description                                                                                                                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Type               | Indicates the type of access point (unified or autonomous).                                                                                                                                                                                                                                                                    |
| Antenna Azim. Angle   | Indicates the horizontal angle of the antenna.                                                                                                                                                                                                                                                                                 |
| Antenna Diversity     | Indicates if antenna diversity is enabled or disabled. Antenna diversity refers to the access point sampling the radio signal from two integrated antenna ports to choose the preferred antenna.                                                                                                                               |
| Antenna Elev. Angle   | Indicates the elevation angle of the antenna.                                                                                                                                                                                                                                                                                  |
| Antenna Gain          | The peak gain of the dBi of the antenna for directional antennas and the average gain in dBi for omni-directional antennas connected to the wireless network adapter. The gain is in multiples of 0.5 dBm. An integer value 4 means $4 \times 0.5 = 2$ dBm of gain.                                                            |
| Antenna Mode          | Indicates the antenna mode such as omni, directional, or non-applicable.                                                                                                                                                                                                                                                       |
| Antenna Name          | Indicates the antenna name or type.                                                                                                                                                                                                                                                                                            |
| Audit Status          | Indicates one of the following audit statuses: <ul style="list-style-type: none"> <li>– Mismatch—Config differences were found between NCS and controller during the last audit.</li> <li>– Identical—No config differences were found during the last audit.</li> <li>– Not Available—Audit status is unavailable.</li> </ul> |
| Base Radio MAC        | Indicates the MAC address of the base radio.                                                                                                                                                                                                                                                                                   |
| Bridge Group Name     | Indicates the name of the bridge group used to group the access points, if applicable.                                                                                                                                                                                                                                         |
| CDP Neighbors         | Indicates all directly connected Cisco devices.                                                                                                                                                                                                                                                                                |
| Channel Control       | Indicates whether the channel control is automatic or custom.                                                                                                                                                                                                                                                                  |
| Channel Number        | Indicates the channel on which the Cisco Radio is broadcasting.                                                                                                                                                                                                                                                                |
| Controller Port       | Indicates the number of controller ports.                                                                                                                                                                                                                                                                                      |
| Google Earth Location | Indicates whether or not a Google Earth location is assigned and indicates the location.                                                                                                                                                                                                                                       |
| Location              | Indicates the physical location of the access point.                                                                                                                                                                                                                                                                           |

**Table 5-41** Edit View Search Results

| Parameters            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Hops             | Indicates the number of hops between access points.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OfficeExtend AP       | Specifies whether or not OfficeExtend access is enabled. If it is disabled, the access point is remotely deployed which increases the security risk.                                                                                                                                                                                                                                                                                                                                                                                                            |
| PoE Status            | Indicates the power over ethernet status of the access point. The possible values include: <ul style="list-style-type: none"> <li>– Low—The access point draws low power from the ethernet.</li> <li>– Lower than 15.4 volts—The access point draws lower than 15.4 volts from the ethernet.</li> <li>– Lower than 16.8 volts—The access point draws lower than 16.8 volts from the ethernet.</li> <li>– Normal—The power is high enough for the operation of the access point.</li> <li>– Not Applicable—The power source is not from the ethernet.</li> </ul> |
| Primary Controller    | Indicates the name of the primary controller for this access point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Radio MAC             | Indicates the radio MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Reg. Domain Supported | Indicates whether or not the regulatory domain is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Serial Number         | Indicates the access point serial number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Slot                  | Indicates the slot number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Tx Power Control      | Indicates whether the transmission power control is automatic or custom.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Tx Power Level        | Indicates the transmission power level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Up Time               | Indicates how long the access point has been up in days, hours, minutes and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WLAN Override Names   | Indicates the WLAN override profile names.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| WLAN Override         | Indicates whether WLAN Override is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring the List of Access Points Display

The **Edit View** page allows you to add, remove, or reorder columns in the Access Points table.

To edit the available columns in the alarms table, follow these steps:

---

**Step 1** Choose **Monitor > Access Points**.

- Step 2** Click the **Edit View** link.
- Step 3** To add an additional column to the access points table, click to highlight the column heading in the left column. Click **Show** to move the heading to the right column. All items in the right column are displayed in the table.
- Step 4** To remove a column from the access points table, click to highlight the column heading in the right column. Click **Hide** to move the heading to the left column. All items in the left column are not displayed in the table.
- Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired column heading and click **Up** or **Down** to move it higher or lower in the current list.
- Step 6** Click **Reset** to restore the default view.
- Step 7** Click **Submit** to confirm the changes.

**Note**

See the “[Viewing List of Access Points](#)” section on page 5-43 for additional access point parameters than can be added through Edit View.

## Generating a Report for Access Points

To generate a report for access points, follow these steps:

- Step 1** Choose **Monitor > Access Points**.
- Step 2** Click to select the access point(s) for which you want to run a report.
- Step 3** Choose the applicable report from the Select a report drop-down list.
- Step 4** Click **Go**.

The following reports are available:

**Table 5-42** Access Point Reports

| Report                | Description                                                | Reference                                                           |
|-----------------------|------------------------------------------------------------|---------------------------------------------------------------------|
| Load                  | Generates a report with load information.                  | <a href="#">Monitoring Traffic Load, page 5-48</a>                  |
| Dynamic Power Control | Generates a report with Dynamic Power Control information. | <a href="#">Monitoring Dynamic Power Control, page 5-49</a>         |
| Noise                 | Generates a report with Noise information.                 | <a href="#">Monitoring Access Points Noise, page 5-50</a>           |
| Interference          | Generates a report with Interference information.          | <a href="#">Monitoring Access Points Interference, page 5-50</a>    |
| Coverage (RSSI)       | Generates a report with Coverage (RSSI) information.       | <a href="#">Monitoring Access Points Coverage (RSSI), page 5-51</a> |
| Coverage (SNR)        | Generates a report with Coverage (SNR) information.        | <a href="#">Monitoring Access Points Coverage (SNR), page 5-51</a>  |

**Table 5-42 Access Point Reports**

| Report                 | Description                                                                                                                                                                                                                                                               | Reference                                                                  |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Up/Down Statistics     | Time in days, hours and minutes since the last reboot. Generates a report with Up Time information.                                                                                                                                                                       | <a href="#">Monitoring Access Points Up/Down Statistics, page 5-51</a>     |
| Voice Statistics       | Generates a report for selected access points showing radio utilization by voice traffic.                                                                                                                                                                                 | <a href="#">Monitoring Access Points Voice Statistics, page 5-52</a>       |
| Voice TSM Table        | Generates a report for selected access points and radio, organized by client device showing QoS status, PLR, and latency of its voice traffic stream.                                                                                                                     | <a href="#">Monitoring Access Points Voice TSM Table, page 5-52</a>        |
| Voice TSM Reports      | Graphical representation of the TSM table except that metrics from the clients are averaged together on the graphs.                                                                                                                                                       | <a href="#">Monitoring Access Points Voice TSM Reports, page 5-54</a>      |
| 802.11 Counters        | Displays counters for access points at the MAC layer. Statistics such as error frames, fragment counts, RTS/CTS frame count, and retried frames are generated based on the filtering criteria and can help interpret performance (and problems, if any) at the MAC layer. | <a href="#">Monitoring Access Points 802.11 Counters, page 5-54</a>        |
| AP Profile Status      | Displays access point load, noise, interference, and coverage profile status.                                                                                                                                                                                             | <a href="#">Monitoring Access Points AP Profile Status, page 5-55</a>      |
| Air Quality vs. Time   | Displays the air quality index of the wireless network during the configured time duration.                                                                                                                                                                               | <a href="#">Monitoring Air Quality, page 5-56</a>                          |
| Traffic Stream Metrics | Useful in determining the current and historical quality of service (QoS) for given clients at the radio level. It also displays uplink and downlink statistics such as packet loss rate, average queuing delay, distribution of delayed packets, and roaming delays.     | <a href="#">Monitoring Access Points Traffic Stream Metrics, page 5-55</a> |
| Tx Power and Channel   | Displays the channel plan assignment and transmit power level trends of devices based on the filtering criteria used when the report was generated. It could help identify unexpected behavior or issues with network performance.                                        | <a href="#">Monitoring Access Points Tx Power and Channel, page 5-55</a>   |

**Table 5-42 Access Point Reports**

| Report                | Description                                                                                                                                                                                                                                                                                                                                   | Reference                                              |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| VoIP Calls Graph      | Helps analyze wireless network usage from a voice perspective by providing details such as the number and duration of VoIP calls (per radio) on the network over time. To be able to gather useful data from this report, VoIP snooping must be enabled on the WLAN. This report displays information in a graph.                             | <a href="#">Monitoring VoIP Calls, page 5-56</a>       |
| VoIP Calls Table      | Provides the same information as the VoIP Calls Graph report but in table form.                                                                                                                                                                                                                                                               | <a href="#">Monitoring VoIP Calls, page 5-56</a>       |
| Voice Statistics      | Helps analyze wireless network usage from a voice perspective by providing details such as percentage of bandwidth used by voice clients, voice calls, roaming calls, and rejected calls (per radio) on the network. To be able to gather useful data from this report, make sure call admission control (CAC) is supported on voice clients. | <a href="#">Monitoring Voice Statistics, page 5-56</a> |
| Worst Air Quality APs |                                                                                                                                                                                                                                                                                                                                               | <a href="#">Monitoring Air Quality, page 5-56</a>      |

## Monitoring Traffic Load

Traffic Load is the total amount of bandwidth used for transmitting and receiving traffic. This enables WLAN managers to track network growth and plan network growth ahead of client demand.

To access the access point load report, follow these steps:

- 
- Step 1** Choose **Monitor > Access Points**.
  - Step 2** Select the check box(es) of the applicable access point(s).
  - Step 3** From the Generate a report for selected APs drop-down list, choose **Load**.
  - Step 4** Click **Go**. The Load report displays for the selected access points.

This page displays the following load data:

**Table 5-43 Traffic Load**

| Parameter             | Description                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Name               | Click the access point name to view access point details. See the <a href="#">“Monitoring Access Points Details”</a> section on page 5-56 for more information.                                                                                          |
| Radio                 | Protocol of the rogue access point is either 802.11a, 802.11b or 802.11g. Click the radio to view On-Demand Statistics for this access point. See the <a href="#">“Monitoring Access Point Radio Details”</a> section on page 5-68 for more information. |
| Attached Client Count | Number of clients attached (Actual and Threshold.)                                                                                                                                                                                                       |
| Channel Utilization   | 802.11a RF utilization threshold between 0 and 100 percent (Actual and Threshold).                                                                                                                                                                       |
| Receive Utilization   | 802.11a or 802.11b/g RF receive utilization threshold between 0 and 100 percent.                                                                                                                                                                         |
| Transmit Utilization  | 802.11a or 802.11b/g RF transmit utilization threshold between 0 and 100 percent.                                                                                                                                                                        |
| Status                | Status of the client connection.                                                                                                                                                                                                                         |

## Monitoring Dynamic Power Control

To access the access point Load report, follow these steps:

- Step 1** Choose **Monitor > Access Points**.
- Step 2** Select the check box(es) of the applicable access point(s).
- Step 3** From the Generate a report for selected APs drop-down list, choose **Dynamic Power Control**.
- Step 4** Click **Go**. The Dynamic Power Control report displays for the selected access points.

This page displays dynamic control parameters for access points as follows:

**Table 5-44 Dynamic Power Control**

| Parameter | Description                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Name   | This is the name assigned to the access point. Click an access point name in the list to access its parameters. See the <a href="#">“Monitoring Access Points Details”</a> section on page 5-56 for more information.                    |
| Radio     | Protocol of the rogue access point is either 802.11a, or 802.11b/g. Click a Cisco Radio on the list to access its parameters. See the <a href="#">“Monitoring Access Point Radio Details”</a> section on page 5-68 for more information. |

Table 5-44 Dynamic Power Control

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current Power Level   | <p>Displays the operating transmit power level from the transmit power table. Access point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.</p> <p><b>Note</b> The power levels and available channels are defined by the Country Code Setting, and are regulated on a country by country basis.</p>                                                                                                   |
| Power Assignment Mode | <p>Dynamic transmit power assignment has three modes:</p> <ul style="list-style-type: none"> <li>– Automatic—The transmit power will be periodically updated for all Cisco 1000 Series lightweight access points that permit this operation.</li> <li>– On Demand—Transmit power is updated when the Assign Now button is selected.</li> <li>– Fixed—No dynamic transmit power assignments occur and value are set to their global default. The default is Automatic.</li> <li>– Recommended Power Level.</li> </ul> |

## Monitoring Access Points Noise

To access the access point Noise report, follow these steps:

**Step 1** Choose **Monitor > Access Points**.

**Step 2** Select the check box(es) of the applicable access point(s).

**Note** If multiple access points are selected, they must have the same radio type.

**Step 3** From the Generate a report for selected APs drop-down list, choose **Noise**.

**Step 4** Click **Go**. The Noise report displays for the selected access points.

This page displays a bar graph of noise (RSSI in dBm) for each channel.

## Monitoring Access Points Interference

To access the access point Interference report, follow these steps:

**Step 1** Choose **Monitor > Access Points**.

**Step 2** Select the check box(es) of the applicable access point(s).

---

**Note** If multiple access points are selected, they must have the same radio type.

---

**Step 3** From the Generate a report for selected APs drop-down list, choose **Interference**.

**Step 4** Click **Go**. The Interference report displays for the selected access points.

This page displays a bar graph of interference (RSSI in dBm) for each channel:

- High interference -40 to 0 dBm.
  - Marginal interference -100 to -40 dBm.
  - Low interference -110 to -100 dBm.
- 

## Monitoring Access Points Coverage (RSSI)

To access the access point Coverage (RSSI) report, follow these steps:

---

**Step 1** Choose **Monitor > Access Points**.

**Step 2** Select the check box(es) of the applicable access point(s).

**Step 3** From the Generate a report for selected APs drop-down list, choose **Coverage (RSSI)**.

**Step 4** Click **Go**. The Coverage (RSSI) report displays for the selected access points.

This page displays a bar graph of client distribution by received signal strength showing the number of clients versus RSSI in dBm.

---

## Monitoring Access Points Coverage (SNR)

To access the access point Coverage (SNR) report, follow these steps:

---

**Step 1** Choose **Monitor > Access Points**.

**Step 2** Select the check box(es) of the applicable access point(s).

**Step 3** From the Generate a report for selected APs drop-down list, choose **Coverage (SNR)**.

**Step 4** Click **Go**. The Coverage (SNR) report displays for the selected access points.

This page displays a bar graph of client distribution by signal-to-noise ratio showing the number of clients versus SNR.

---

## Monitoring Access Points Up/Down Statistics

To access the access point Up/Down Statistics report, follow these steps:

---

**Step 1** Choose **Monitor > Access Points**.

**Step 2** Select the check box of the applicable access point.

- Step 3** From the Generate a report for selected APs drop-down list, choose **Up/Down Statistics**. Click **Go**. The Up/Down Statistics report displays for the selected access points.

---

**Note** Up Time is time in days, hours, and minutes since the last reboot.

---

This page displays a line graph of access point up time graphed against time.

If you select more than one access point, the following message appears:

Please select only one AP for the Up Time Report.

---

## Monitoring Access Points Voice Statistics

This generates a report for selected access points showing radio utilization by voice traffic. The report includes the number of current calls.

---

**Note** Voice Statistics reports are only applicable for CAC/WMM clients.

---

To access the access point Voice Statistics report, follow these steps:

---

- Step 1** Choose **Monitor > Access Points**.
- Step 2** Select the check box(es) of the applicable access point(s).
- Step 3** From the Generate a report for selected APs drop-down list, choose **Voice Statistics**. Click **Go**. The Voice Statistics report displays for the selected access points. The page displays the following access point voice statistics:
- AP Name—Select an item under AP Name. For more information, see the [“Monitoring Access Points Details”](#) section on page 5-56.
  - Radio—Select an item under Radio. For more information, see the [“Monitoring Access Point Radio Details”](#) section on page 5-68.
  - Calls in Progress—Number of calls in progress.
  - Roaming Calls in Progress—Number of roaming calls in progress.
  - Bandwidth in Use—Percentage of bandwidth in use.
- 

## Monitoring Access Points Voice TSM Table

This generates a report for selected access points and radio, organized by client device showing QoS status, PLR, and latency of its voice traffic stream.

To access the access point Voice TSM Table report, follow these steps:

---

- Step 1** Choose **Monitor > Access Points**.
- Step 2** Select the check box of the applicable access point.

**Step 3** From the Generate a report for selected APs drop-down list, choose **Voice TSM Table**.

**Step 4** Click **Go**. The Voice TSM Table report displays for the selected access point.

The page displays the following voice TSM data:

**Table 5-45 Voice TSM table**

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time                              | Time that the statistics were gathered from the access point(s).                                                                                                                                                                                                                                                                                                                    |
| Client MAC                        | MAC address of the client. This shows a list of the clients evaluated during the most recent 90 second interval. The client could be a VoIP phone, laptop, PDA and refers to any client attached to the access point collecting measurements.                                                                                                                                       |
| QoS                               | QoS values (packet latency, packet jitter, packet loss, roaming time) which can affect the WLAN are monitored. Access points and clients measure the metrics, access points collect the measurements and send them to the controller. The access points update the controller with traffic stream metric information every 90 seconds and 10 minutes of data is stored at one time. |
| % PLR (Downlink)                  | Percentage of packets lost on the downlink (access point to client) during the 90 second interval.                                                                                                                                                                                                                                                                                  |
| % PLR (Uplink)                    | Percentage of packets lost on the uplink (client to access point) during the 90 second interval.                                                                                                                                                                                                                                                                                    |
| Avg Queuing Delay (ms) (Downlink) | Average queuing delay in milliseconds for the downlink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.                                          |
| Avg Queuing Delay (ms) (Uplink)   | Average queuing delay in milliseconds for the uplink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.                                            |
| % Packets > 40 ms Queuing Delay   | Percentage of queuing delay packets greater than 40 ms.                                                                                                                                                                                                                                                                                                                             |
| % Packets > 20 ms Queuing Delay   | Percentage of queuing delay packets greater than 20 ms.                                                                                                                                                                                                                                                                                                                             |
| Roaming Delay                     | Roaming delay in milliseconds. Roaming delay, which is measured by clients, is measured beginning when the last packet is received from the old access point and ending when the first packet is received from the new access point after a successful roam.                                                                                                                        |

## Monitoring Access Points Voice TSM Reports

This report provides a graphical representation of the TSM table except that metrics from the clients are averaged together on the graphs.

To access the access point Voice TSM report, follow these steps:

- 
- Step 1** Choose **Monitor > Access Points**.
  - Step 2** Select the check box of the applicable access point.
  - Step 3** From the Generate a report for selected APs drop-down list, choose **Voice TSM Reports**.  
Click **Go**. The Voice TSM Table report displays for the selected access point.

This page displays line graphs of the following downlink and uplink metric information, including times and dates:

**Table 5-46**      **Voice TSM Reports**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Average Queuing Delay (ms)               | Average queuing delay in milliseconds. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed. |
| % Packet with less than 10 ms delay      | Percentage of packets with less than 10 milliseconds delay.                                                                                                                                                                                                                                                               |
| % Packet with more than 10 < 20 ms delay | Percentage of packets with more than 10 milliseconds delay but less than 20 milliseconds delay.                                                                                                                                                                                                                           |
| % Packet with more than 20 < 40 ms delay | Percentage of packets with more than 20 milliseconds delay but less than 40 milliseconds delay.                                                                                                                                                                                                                           |
| % Packet with more than 40 ms delay      | Percentage of packets with more than 40 milliseconds delay.                                                                                                                                                                                                                                                               |
| Packet Loss Ratio                        | Ratio of lost packets.                                                                                                                                                                                                                                                                                                    |
| Total Packet Count                       | Number of total packets.                                                                                                                                                                                                                                                                                                  |
| Roaming Count                            | Number of packets exchanged for roaming negotiations in this 90 seconds metrics page.                                                                                                                                                                                                                                     |
| Roaming Delay                            | Roaming delay in milliseconds.                                                                                                                                                                                                                                                                                            |

---

## Monitoring Access Points 802.11 Counters

Displays counters for access points at the MAC layer. Statistics such as error frames, fragment counts, RTS/CTS frame count, and retried frames are generated based on the filtering criteria and can help interpret performance (and problems, if any) at the MAC layer.

See the “[802.11 Counters](#)” section on page 14-144 for more information on 802.11 Counters reports.

## Monitoring Access Points AP Profile Status

Displays access point load, noise, interference, and coverage profile status.

See the “AP Profile Status” section on page 14-91 for more information on AP Profile Status reports.

## Monitoring Access Points Radio Utilization

See the “Network Utilization” section on page 14-149 for more information on Radio Utilization reports.

## Monitoring Access Points Traffic Stream Metrics

Useful in determining the current and historical quality of service (QoS) for given clients at the radio level. It also displays uplink and downlink statistics such as packet loss rate, average queuing delay, distribution of delayed packets, and roaming delays.

See the “Traffic Stream Metrics” section on page 14-151 for more information on Traffic Stream Metrics reports.

## Monitoring Access Points Tx Power and Channel

See the “Tx Power and Channel” section on page 14-154 for more information on Tx Power and Channel reports.

The Current Tx Power Level setting controls the maximum conducted transmit power. The maximum available transmit power varies according to the configured channel, individual country regulation, and access point capability. See the *Product Guide* or data sheet at [www.cisco.com](http://www.cisco.com) for each specific model to determine the access point capability.

The Current Tx Power Level setting of 1 represents the maximum conducted power setting for the access point. Each subsequent power level (for example, 2, 3, 4, and so on.) represents approximately a 50% (or 3dBm) reduction in transmit power from the previous power level.

**Note**

---

The actual power reduction may vary slightly for different models of access points.

---

Based on the configured antenna gain, the configured channel, and the configured power level, the actual transmit power at the access point can be reduced so that the specific country regulations are not exceeded.

**Note**

---

Irrespective of whether you choose Global or Custom assignment method, the actual conducted transmit power at the access point is verified such that country specific regulations are not exceeded.

---

### Command Buttons

- Save—Save the current settings.
- Audit—Discover the present status of this access point.

## Monitoring VoIP Calls

VoIP calls reports helps analyze wireless network usage from a voice perspective by providing details such as the number and duration of VoIP calls (per radio) on the network over time. To be able to gather useful data from this report, VoIP snooping must be enabled on the WLAN. This report displays information in a graph.

Click VoIP Calls Graph from the Report Launch Pad to open the VoIP Calls Graph Reports page. From this page, you can enable, disable, delete, or run currently saved report templates. See [VoIP Calls Graph, page 14-156](#) for more information.

## Monitoring Voice Statistics

Voice Statistics report helps analyze wireless network usage from a voice perspective by providing details such as percentage of bandwidth used by voice clients, voice calls, roaming calls, and rejected calls (per radio) on the network. To be able to gather useful data from this report, make sure call admission control (CAC) is supported on voice clients. See [Voice Statistics, page 14-159](#) for more information.

## Monitoring Air Quality

To facilitate an "at a glance" understanding of where interference problems are impacting the network, it rolls up the detailed information into a high-level, easy-to-understand metric referred to as Air Quality (AQ). AQ is reported at a channel, floor, and system level and it supports AQ alerts, so that you can be automatically notified when AQ falls below a desired threshold. See [Monitoring CleanAir Air Quality Events, page 5-147](#) for more information.

## Monitoring Access Points Details

Access Points Details page enables you to view access point information for a single AP.

Choose **Monitor > Access Points** and click a list item under AP Name to access this page. Depending on the type of access point, the following tabs may be displayed. This section provides the detailed information regarding each Access Points Details page tab and contains the following topics:

- [General Tab, page 5-56](#)
- [Interfaces Tab, page 5-64](#)
- [CDP Neighbors Tab, page 5-66](#)
- [Current Associated Clients Tab, page 5-66](#)
- [SSID Tab, page 5-67](#)

### General Tab

**Note**

---

The General tab parameters differ between lightweight and autonomous access points.

---

- [General Parameters—Lightweight Access Points](#)
- [General Parameters—Autonomous](#)

## General Parameters—Lightweight Access Points

Table 5-47 General- LightWeight Access Points

| Parameter                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AP Name                                                         | Operator defined name of access point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AP IP address, Ethernet MAC address, and Base Radio MAC address | IP address, Ethernet MAC address and Radio MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Country Code                                                    | <p>The codes of the supported countries. Up to 20 countries can be supported per controller.</p> <p><b>Note</b> Access points may not operate properly if they are not designed for use in your country of operation. For a complete list of country codes supported per product, refer to <a href="http://www.cisco.com/en/US/docs/wireless/wcs/4.0/configuration/guide/wscod.html">http://www.cisco.com/en/US/docs/wireless/wcs/4.0/configuration/guide/wscod.html</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |
| Link Latency Settings                                           | <p>You can configure link latency on the controller to measure the link between an access point and the controller. See the “<a href="#">Configuring Link Latency Settings for Access Points</a>” section on page 9-203 for more information.</p> <ul style="list-style-type: none"> <li>– Current Link Latency (in msec)—The current round-trip time (in milliseconds) of heartbeat packets from the access point to the controller and back.</li> <li>– Minimum Link Latency (in msec)—Because link latency has been enabled or reset, the minimum round-trip time (in milliseconds) of heartbeat packets from the access point to the controller and back.</li> <li>– Maximum Link Latency (in msec)—Because link latency has been enabled or reset, the maximum round-trip time (in milliseconds) of heartbeat packets from the access point to the controller and back.</li> </ul> |
| LWAPP/CAPWAP Uptime                                             | Displays how long the LWAPP/CAPWAP connection has been active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LWAPP?CAPWAP Join Taken Time                                    | Displays how long the LWAPP/CAPWAP connection has been joined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Admin Status                                                    | The administration state of the access point as either enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AP Mode</b>                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 5-47 General- LightWeight Access Points

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local          | <p>Default mode. Data clients are serviced while configured channels are scanned for noise and rogues. The access point goes off-channel for 50 ms and listens for rogues. It cycles through each channel for the period specified under the Auto RF configuration.</p> <p><b>Note</b> To configure Local or H-REAP access points for Cisco Adaptive wIPS feature, choose Local or H-REAP and select the <b>Enhanced wIPS Engine Enabled</b> check box.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |
| Monitor        | <p>Radio receive only mode. The access point scans all configured channels every 12 seconds. Only deauthenticated packets are sent in the air with an access point configured this way. A monitor mode access point detects rogues, but it cannot connect to a suspicious rogue as a client to prepare for the sending of RLDP packets.</p> <p><b>Note</b> To configure access points for Cisco Adaptive wIPS feature, select <b>Monitor</b>. Select the <b>Enhanced wIPS Engine Enabled</b> check box and choose <b>wIPS</b> from the Monitor Mode Optimization drop-down list.</p> <p>Before you can enable an access point to be in wIPS mode, you must disable the access point radios. If you do not disable the access point radio, an error message displays.</p> <p><b>Note</b> Once you have enabled the access point for wIPS, re-enable the radios.</p> |
| Rogue Detector | <p>The access point radio is turned off and the access point listens to wired traffic only. The controllers that operate in this mode monitor the rogue access points. The controller sends all the rogue access point and client MAC address lists to the rogue detector, and the rogue detector forwards this information to the WLC. The MAC address list is compared to what the WLC access points heard over the network. If the MAC addresses match, you can determine which rogue access points are connected on the wired network.</p>                                                                                                                                                                                                                                                                                                                     |

Table 5-47 General- LightWeight Access Points

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sniffer               | The access point captures and forwards all the packets on a particular channel to a remote machine that runs AiroPeek. These packets contain information such as timestamp, signal strength, packet size, and so on. This feature can only be enabled if you run AiroPeek, which is a third-party network analyzer software that supports the decoding of data packets. For more information on AiroPeek, see <a href="http://www.wildpackets.com">www.wildpackets.com</a> . |
| H-REAP                | Enables hybrid REAP for up to six access points. The H-REAP access points can switch client data traffic locally and perform client authentication locally when their connection to the controller is lost.<br><br><b>Note</b> H-REAP must be selected to configure an OfficeExtend access point. When the AP mode is H-REAP, H-REAP configuration options display including the option to enable OfficeExtend AP and to enable Least Latency Controller Join.               |
| Bridge                | This is a special mode where an autonomous access point functions as a wireless client and connects to a lightweight access point. The bridge and its wired clients are listed as client in NCS if the AP mode is set to Bridge, and the access point is bridge capable.                                                                                                                                                                                                     |
| Spectrum Expert       | This mode allows a CleanAir-enabled access point to be used extensively for interference detection on all monitored channels. All other functions such as IDS scanning and Wi-Fi are suspended.                                                                                                                                                                                                                                                                              |
| Enhanced wIPs Engine  | Enabled or Disabled, to enable the monitoring of the security attacks using Cisco Adaptive wIPS feature.                                                                                                                                                                                                                                                                                                                                                                     |
| Operational Status    | Registered or Not Registered, as determined by the controller.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Registered Controller | The controller to which the access point is registered. Click to display the registered controller details. See the “ <a href="#">Monitoring System Summary</a> ” section on page 5-4 for more information.                                                                                                                                                                                                                                                                  |
| Primary Controller    | The name of the primary controller for this access point.                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 5-47 General- LightWeight Access Points

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Number           | The SNMP name of the access point primary controller. The access point attempts to associate with this controller first for all network operations and in the event of a hardware reset.                                                                                                                                                                                                                                                                                                                                                              |
| AP Uptime             | Displays how long the access point has been active to receive and transmit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Map Location          | Customer-definable location name for the access point. Click to look at the actual location on a map. See <b>Monitor &gt; Access Points &gt; name &gt; Map Location</b> for more information.                                                                                                                                                                                                                                                                                                                                                         |
| Google Earth Location | Indicates whether a Google Earth location is assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Location              | The physical location where the access point is placed (or Unassigned).                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Statistics Timer      | This counter sets the time in seconds that the access point sends its DOT11 statistics to the controller.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PoE Status            | The power over ethernet status of the access point. The possible values include: <ul style="list-style-type: none"> <li>- Low—The access point draws low power from the Ethernet.</li> <li>- Lower than 15.4 volts—The access point draws lower than 15.4 volts from the Ethernet.</li> <li>- Lower than 16.8 volts—The access point draws lower than 16.8 volts from the Ethernet.</li> <li>- Normal—The power is high enough for the operation of the access point.</li> <li>- Not Applicable—The power source is not from the Ethernet.</li> </ul> |
| Rogue Detection       | Indicates whether or not Rogue Detection is enabled. See the <a href="#">“”</a> section on page 5-152 for more information on rogue detection. <p><b>Note</b> Rogue detection is disabled automatically for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect a large number of rogue devices. For more information regarding OfficeExtend access points, see the <i>Cisco Wireless LAN Controller Configuration Guide</i>.</p>                                                  |

Table 5-47 General- LightWeight Access Points

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OfficeExtend AP                       | Indicates whether or not the access point is enabled as an OfficeExtend access point. The default is Enabled.                                                                                                                                                                                                                                                                                                                                  |
| Encryption                            | Indicates whether or not encryption is enabled.<br><br><b>Note</b> Enabling or disabling encryption functionality causes the access point to reboot which then causes a loss of connectivity for clients.<br><br><b>Note</b> DTLS data encryption is enabled automatically for OfficeExtend access points to maintain security. Encryption is only available if the access point is connected to a 5500 series controller with a Plus license. |
| Least Latency Join                    | The access point switches from a priority order search (primary, secondary, and then tertiary controller) to a search for the controller with the best latency measurement (least latency). The controller with the least latency provides the best performance.                                                                                                                                                                               |
| Telnet Access                         | Indicates whether or not Telnet Access is enabled.                                                                                                                                                                                                                                                                                                                                                                                             |
| SSH Access                            | Indicates whether or not SSH is enabled.<br><br><b>Note</b> An OfficeExtend access point may be connected directly to the WAN which could allow external access if the default password is used by the access point. Because of this, Telnet and SSH access are disabled automatically for OfficeExtend access points.                                                                                                                         |
| <b>Versions</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Software Version                      | The operating system release.version.dot.maintenance number of the code currently running on the controller.                                                                                                                                                                                                                                                                                                                                   |
| Boot Version                          | The operating system bootloader version number.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Inventory Information</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AP Type                               | Type of Access Point                                                                                                                                                                                                                                                                                                                                                                                                                           |
| AP Model                              | Access point model number.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Cisco IOS Version                     | The Cisco IOS version details                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AP Certificate Type                   | Either Self Signed or Manufacture Installed.                                                                                                                                                                                                                                                                                                                                                                                                   |
| H-REAP Mode Supported                 | Indicates if H-REAP mode is supported or not.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>wIPS Profile (when applicable)</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 5-47** General- LightWeight Access Points

| Parameter                             | Description                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------|
| Profile Name                          | Click the user-assigned profile name to view wIPS profile details.                |
| Profile Version                       |                                                                                   |
| <b>Unique Device Identifier (UDI)</b> |                                                                                   |
| Name                                  | Name of Cisco AP for access points.                                               |
| Description                           | Description of access point.                                                      |
| Product ID                            | Orderable product identifier.                                                     |
| Version ID                            | Version of product identifier.                                                    |
| Serial Number                         | Unique product serial number.                                                     |
| Run Ping Test Link                    | Click to ping the access point. The results are displayed in a pop-up dialog box. |
| Alarms Link                           | Click to display alarms associated with this access point.                        |
| Events Link                           | Click to display events associated with this access point.                        |

**General Parameters—Autonomous****Note**

For autonomous clients, NCS *only* collects client counts. The client counts in the Monitor page and reports have autonomous clients included. Client search, client traffic graphs, or other client reports (such as Unique Clients, Busiest Clients, Client Association) do *not* include clients from autonomous access points.

**Table 5-48** General Parameters - Autonomous

| Parameters                             | Description                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AP Name                                | Operator defined name of access point.                                                                                                                                                                      |
| AP IP address and Ethernet MAC address | IP address, Ethernet MAC address of the access point.                                                                                                                                                       |
| AP UpTime                              | Indicates how long the access point has been up in number of days, hours, minutes, and seconds.                                                                                                             |
| Map Location                           | Customer-definable location name for the access point. Click to look at the actual location on a map. See the “ <a href="#">Monitoring Maps</a> ” section on <a href="#">page 6-8</a> for more information. |
| WGB Mode                               | Indicates whether or not the access point is in work group bridge mode.                                                                                                                                     |
| <b>SNMP Info</b>                       |                                                                                                                                                                                                             |

**Table 5-48 General Parameters - Autonomous**

| Parameters                            | Description                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------|
| SysObjectId                           | System Object ID.                                                                                            |
| SysDescription                        | The system device type and current version of firmware.                                                      |
| SysLocation                           | The physical location of the device, such as a building name or room in which it is installed.               |
| SysContact                            | The name of the system administrator responsible for the device.                                             |
| <b>Versions</b>                       |                                                                                                              |
| Software Version                      | The operating system release.version.dot.maintenance number of the code currently running on the controller. |
| CPU Utilization                       | Displays the maximum, average, and minimum CPU utilization over the specified amount of time.                |
| Memory Utilization                    | Displays the maximum, average, and minimum memory utilization over the specified amount of time.             |
| <b>Inventory Information</b>          |                                                                                                              |
| AP Type                               | Autonomous or lightweight.                                                                                   |
| AP Model                              | The Access Point model number.                                                                               |
| AP Serial Number                      | Unique serial number for this access point.                                                                  |
| H-REAP Mode Supported                 | If H-REAP mode is supported or not.                                                                          |
| <b>Unique Device Identifier (UDI)</b> |                                                                                                              |
| Name                                  | Name of Cisco AP for access points.                                                                          |
| Description                           | Description of access point.                                                                                 |
| Product ID                            | Orderable product identifier.                                                                                |
| Version ID                            | Version of product identifier.                                                                               |
| Serial Number                         | Unique product serial number.                                                                                |

**Note** Memory and CPU utilization charts are displayed.

**Note** Click **Alarms** to display the alarms associated with the access point.  
Click **Events** to display events associated with the access point.

## Interfaces Tab

The Interfaces tab displays the following parameters:

**Table 5-49** *Interfaces Tab*

| Parameter              | Description                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>       |                                                                                                                                                                                                                                                                                                                                         |
| Admin Status           | Indicates whether the Ethernet interface is enabled.                                                                                                                                                                                                                                                                                    |
| Operational Status     | Indicates whether the Ethernet interface is operational.                                                                                                                                                                                                                                                                                |
| Rx Unicast Packets     | Indicates the number of unicast packets received.                                                                                                                                                                                                                                                                                       |
| Tx Unicast Packets     | Indicates the number of unicast packets sent.                                                                                                                                                                                                                                                                                           |
| Rx Non-Unicast Packets | Indicates the number of non-unicast packets received.                                                                                                                                                                                                                                                                                   |
| Tx Non-Unicast Packets | Indicates the number of non-unicast packets sent.                                                                                                                                                                                                                                                                                       |
| <b>Radio Interface</b> |                                                                                                                                                                                                                                                                                                                                         |
| Protocol               | 802.11a/n or 802.11b/g/n.                                                                                                                                                                                                                                                                                                               |
| Admin Status           | Indicates whether the access point is enabled or disabled.                                                                                                                                                                                                                                                                              |
| CleanAir Capable       | Indicates whether the access point is able to use CleanAir.                                                                                                                                                                                                                                                                             |
| CleanAir Status        | Indicates the status of CleanAir.                                                                                                                                                                                                                                                                                                       |
| Channel Number         | Indicates the channel on which the Cisco Radio is broadcasting.                                                                                                                                                                                                                                                                         |
| Extension Channel      | Indicates the secondary channel on which Cisco radio is broadcasting.                                                                                                                                                                                                                                                                   |
| Power Level            | Access Point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.                                                                                                                                                             |
| Channel Width          | Indicates the channel bandwidth for this radio interface. See the <a href="#">“Configuring 802.11a/n RRM Dynamic Channel Allocation”</a> section on page 9-121 for more information on configuring channel bandwidth.<br><br>Minimum (default) setting is 20 MHz. Maximum setting is the maximum channel width supported by this radio. |
| Antenna Name           | Identifies the type of antenna.                                                                                                                                                                                                                                                                                                         |

**Table 5-50** *Interface properties*

| Parameter              | Description                                                                               |
|------------------------|-------------------------------------------------------------------------------------------|
| AP Name                | Name of the Access Point.                                                                 |
| Link speed             | Indicates the speed of the interface in Mbps.                                             |
| RX Bytes               | Indicates the total number of bytes in the error-free packets received on the interface.  |
| RX Unicast Packets     | Indicates the total number of unicast packets received on the interface.                  |
| RX Non-Unicast Packets | Indicates the total number of non-unicast or mulitcast packets received on the interface. |

**Table 5-50** *Interface properties*

| <b>Parameter</b>       | <b>Description</b>                                                                                                                                                                          |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input CRC              | Indicates the total number of CRC error in packets received on the interface.                                                                                                               |
| Input Errors           | Indicates the sum of all errors in the packets while receiving on the interface.                                                                                                            |
| Input Overrun          | Indicates the number of times the receiver hardware was incapable of handing received data to a hardware buffer because the input rate exceeded the receiver capability to handle the data. |
| Input Resource         | Indicates the total number of resource errors in packets received on the interface.                                                                                                         |
| Runts                  | Indicates the number of packets that are discarded because they are smaller than the medium minimum packet size.                                                                            |
| Throttle               | Indicates the total number of times the interface advised a sending NIC that it was overwhelmed by packets being sent and to slow the pace of delivery.                                     |
| Output Collision       | Indicates the total number of packet retransmitted due to an Ethernet collision.                                                                                                            |
| Output Resource        | Indicates the total number of resource errors in packets transmitted on the interface.                                                                                                      |
| Output Errors          | Indicates the sum of all errors that prevented the final transmission of packets out of the interface.                                                                                      |
| Operational Status     | Indicates the operational state of the physical Ethernet interface on the AP.                                                                                                               |
| Duplex                 | Indicates the duplex mode of an interface.                                                                                                                                                  |
| TX Bytes               | Indicates the total number of bytes in the error-free packets transmitted on the interface.                                                                                                 |
| TX Unicast Packets     | Indicates the total number of unicast packets transmitted on the interface.                                                                                                                 |
| TX Non-Unicast Packets | Indicates the total number of non-unicast or mulitcast packets transmitted on the interface.                                                                                                |
| Input Aborts           | Indicates the total number of packet aborted while receiving on the interface.                                                                                                              |
| Input Frames           | Indicates the total number of packet received incorrectly having a CRC error and a non-integer number of octets on the interface.                                                           |
| Input Drops            | Indicates the total number of packets dropped while receiving on the interface because the queue was full.                                                                                  |
| Unknown Protocol       | Indicates the total number of packet discarded on the interface due to an unknown protocol.                                                                                                 |
| Giants                 | Indicates the number of packets that are discarded because they exceed the medium's maximum packet size.                                                                                    |
| Interface Resets       | Indicates the number of times that an interface has been completely reset.                                                                                                                  |

**Table 5-50** *Interface properties*

| Parameter          | Description                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| Output No Buffer   | Indicates the total number of packets discarded because there was no buffer space.                              |
| Output Underrun    | Indicates the number of times the transmitter has been running faster than the router can handle.               |
| Output Total Drops | Indicates the total number of packets dropped while transmitting from the interface because the queue was full. |

## CDP Neighbors Tab

The CDP Neighbors tab displays the following parameters:

**Note** This tab is visible only when the CDP is enabled.

**Table 5-51** *CDP Neighbors*

| Parameters       | Description                                            |
|------------------|--------------------------------------------------------|
| AP Name          | The name assigned to the access point.                 |
| AP IP Address    | IP address of the access point.                        |
| Port No          | Port number connected or assigned to the access point. |
| Local Interface  | Identifies the local interface.                        |
| Neighbor Name    | Name of the neighboring Cisco device.                  |
| Neighbor Address | Network address of the neighboring Cisco device.       |
| Neighbor Port    | Port of the neighboring Cisco device.                  |
| Duplex           | Indicates Full Duplex or Half Duplex.                  |
| Interface Speed  | Speed at which the interface operates.                 |

## Current Associated Clients Tab

The Current Associated Clients tab displays the following parameters:

**Note** This tab is visible only when there are clients associated to the AP (CAPWAP or Autonomous AP).

**Table 5-52** *Current Associated Clients*

| Parameter  | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username   | Click the username to view the Monitor Client Details page for this client. See the <a href="#">“Monitoring Clients and Users”</a> section on page 10-10 for more information. |
| IP Address | IP address of the associated client.                                                                                                                                           |

**Table 5-52** *Current Associated Clients*

| Parameter          | Description                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client MAC Address | Click the client MAC address to view the Monitor Client Details page for this client. See the <a href="#">“Monitoring Clients and Users”</a> section on page 10-10 for more information. |
| Association Time   | Date and time of the association.                                                                                                                                                        |
| UpTime             | Time duration of the association.                                                                                                                                                        |
| SSID               | User-defined SSID name.                                                                                                                                                                  |
| SNR (dB)           | Signal to Noise Ratio in dB of the associated client.                                                                                                                                    |
| RSSI               | Received signal strength indicator in dBm.                                                                                                                                               |
| Bytes Tx           | This indicates the total amount of data that has passed through the ethernet interface either way.                                                                                       |
| Bytes Rx           | This indicate the total amount of data that has been received through the ethernet interface either way                                                                                  |

When the access point is not associated with the controller, then the database is used to retrieve the data (rather than the controller itself). If the access point is not associated, the following parameters appears:

|                         |                            |
|-------------------------|----------------------------|
| User Name               |                            |
| IP Address              | Local IP Address           |
| Client MAC Address      | Client MAC Address         |
| Association Time        |                            |
| Session Length          | Time length of the session |
| SSID                    | User-defined SSID name.    |
| Protocol                |                            |
| Avg. Session Throughput |                            |
| Traffic (MB) as before  |                            |

**Note**

Click the **Edit View** link to add, remove or reorder columns in the Current Associated Clients table. See the [“Configuring the List of Access Points Display”](#) section on page 5-45 for adding a new parameter using the Edit View.

**SSID Tab**

The SSID tab displays the following parameters:

**Note** This tab is visible only when the access point is Autonomous AP and there are SSID's configured on the AP.

**Table 5-53** *Current Associated Clients*

| Parameter           | Description                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSID                | Service Set Identifier being broadcast by the access point radio.                                                                                                                                         |
| SSID Vlan           | SSID on an access point is configured to recognize a specific VLAN ID or name.                                                                                                                            |
| SSID Vlan Name      | SSID on an access point is configured to recognize a specific VLAN ID or name.                                                                                                                            |
| MB SSID Broadcast   | SSID broadcast disabled essentially makes your Access Point invisible unless a wireless client already knows the SSID, or is using tools that monitor or 'sniff' traffic from an AP's associated clients. |
| MB SSID Time Period | Within this specified time period, internal communication within the SSID continues to work.                                                                                                              |

## Monitoring Access Point Radio Details

Choose **Monitor** > **Access Points** and click a list item under Radio to access this page.

Choose **Monitor** > **Maps**, then click an item in the Name column, then click an access point icon to access this page.

Choose **Monitor** > **Access Points** and click a list item under AP Name, click 802.11a or 802.11b under AP Interfaces to access this page. This page enables you to view access point information for a single 802.11a or 802.11b/g Cisco Radio.

The default is to show On Demand Statistics. Use the View drop-down list to select a different view:

- Choose On Demand Statistics, and click **Go** to display [“Monitoring On Demand Statistics”](#).
- Choose Operational Parameters, and click **Go** to display [“Monitoring Operational Parameters”](#).
- Choose 802.11 MAC Counters, and click **Go** to display [“Monitoring 802.11 MAC Counters”](#).
- Choose View Alarms and, click **Go** to display [“Monitoring View Alarms”](#).
- Choose View Events and, click **Go** to display [“Monitor View Events”](#).

## Monitoring On Demand Statistics

To view On Demand Statistics for an access point, click the Radio of the applicable access point from the Monitor > Access Points page. The Radio Details page defaults to On Demand Statistics. See the [“Monitoring Access Point Radio Details”](#) section on page 5-68 for more information on radio details.

**Note**

You can also select On Demand Statistics from the View drop-down list located on the Radio Details page.

This page enables you to view the following access point 802.11a or 802.11b Cisco Radio statistics for a single access point.

**General**

- AP Name—Click to view the access point details. See the [“Monitoring Access Points Details” section on page 5-56](#) for more information.
- AP MAC Address
- Radio
- CleanAir Capable—Indicates if the access point is CleanAir Capable.
- AP in SE-Connect Mode—Yes or No. Indicates if the access point is connected in SE-Connect mode.
- CleanAir Enabled—Indicates if CleanAir is enabled on this access point.
- CleanAir Sensor Status—Indicates the operational status of the CleanAir sensor (Up or Down).
- Admin Status—Enabled or disabled.
- Operational Status—Displays the operational status of the Cisco Radios (Up or Down).
- Controller—Click to display controller system details. See the [“Monitoring System Summary” section on page 5-4](#) for more information.
- Channel—The channel upon which the Cisco Radio is broadcasting.
- Extension Channel—Indicates the secondary channel on which Cisco radio is broadcasting.
- Channel Width—Indicates the channel bandwidth for this radio interface. See the [“Configuring 802.11a/n RRM Dynamic Channel Allocation” section on page 9-121](#) for more information on configuring channel bandwidth.
- Power Level—Access Point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.  
The power levels and available channels are defined by the Country Code setting, and are regulated on a country by country basis.
- Port—(1 to 24) Port to which the access point is connected.
- Map Location—Click to display the floor map showing the access point location.

**Management Frame Protection**

- Protection Capability—All Frames
- Validation Capability—All Frames
- MFP Version Supported—Management Frame Protection version supported and configured.

**Profile Information**

- Noise Profile—Notification sent when Noise Profile state changes between Success and Failure.

- Interference Profile—Notification sent when Interference Profile state changes between Success and Failure.
- Load Profile—Notification sent when Load Profile state changes between Success and Failure.
- Coverage Profile—Notification sent when Coverage Profile state changes between Success and Failure.

**Note** Click Success or Failure to view associated alarms.

### Noise by Channel (dBm)

Graph showing channel and noise.

### Interference by Channel (dBm%)

Graph showing the percentage of interference per channel.

**Note** Channel Utilization is a combination of Receive Power (RX) + Transmit Power (TX) + Interference. Interference—Access points report on the percentage of the medium taken up by interfering 802.11 transmissions (this can be from overlapping signals from foreign APs, as well as non-neighbors).

**Note** The channel list (as configured from the RRM page) is scanned completely using the “channel scan duration” parameter under monitor intervals. For example, if scanning all 11 channels in 2.4 GHz, and using the default duration (180 seconds), you get:  $180/11 = 16.36$  seconds approximately between each channel that is being scanned.

### Load Statistics

- RX Utilization—802.11a or 802.11b/g RF receive utilization threshold between 0 and 100 percent.
- TX Utilization—802.11a or 802.11b/g RF transmit utilization threshold between 0 and 100 percent.
- Channel Utilization—802.11a RF utilization threshold between 0 and 100 percent (Subcolumns for Actual and Threshold).
- Attached Client Count—The number of clients attached.

### General Tab

The General tab displays the following information:

#### % Client Count by RSSI

Graph with % and Received Signal Strength Indicator.

#### % Client Count by SNR

Graph with % and Signal-to-Noise Ratio.

### Channel Utilization (% Busy)

Graph displaying the channel number on the x-axis and channel utilization on the y-axis.

### Noise by Channel(dBm)

Graph displaying the channel on the x-axis and power in dBm on the y-axis.

### Rx Neighbors

- Radio MAC Address
- AP Name—Click to view access point details.
- Map—Click to view the map.
- Mobility Group-Leader IP Address
- Neighbor Channel
- Channel Bandwidth
- RSSI (dBm)

### Channel Utilization Statistics

- Time
- Picc—Percentage of time consumed by received frames from co-channel APs and clients.
- Pib—Percentage of time consumed by interference on the channel which cannot be correctly demodulated.

**Note**

---

Picc and Pib values should give a good indication of the percentage of time the access point is busy because of co channel interference.

---

## CleanAir Tab

The CleanAir tab provides the following information:

### Air Quality

This graph displays the air quality index of the wireless network. A value of 100 indicates the air quality is best and a value of 1 indicates maximum interference.

### Interference Power

This graph displays the interference power of the interfering devices on the channel number.

### Non-WiFi Channel Utilization

This graph displays the non-WiFi channel utilization of the wireless network.

## Active Interferers

This section displays the details of the active interferers on the wireless network. The following details are available:

- Interferer Name—The name of the interfering device.
- Affected Channels—The channel the interfering device is affecting.
- Detected Time—The time at which the interference was detected.
- Severity—The severity index of the interfering device.
- Duty Cycle(%)—The duty cycle (in percentage) of the interfering device.
- RSSI(dBm)—The Received Signal Strength Indicator of the interfering device.

## View Drop-Down List

- Choose On Demand Statistics, and click **Go** to display On Demand Statistics for this access point radio. See the “[Monitoring On Demand Statistics](#)” section on page 5-68 for more information.
- Choose Operational Parameters, and click **Go** to display Operational parameters for this access point radio. See the “[Monitoring Operational Parameters](#)” section on page 5-72 for more information.
- Choose 802.11 MAC Counters, and click **Go** to display 802.11 MAC Counters for this access point radio. See the “[Monitoring 802.11 MAC Counters](#)” section on page 5-75 for more information.
- Choose View Alarms, and click **Go** to display alarms for this access point radio. See the “[Monitoring View Alarms](#)” section on page 5-76 for more information.
- Choose View Events, and click **Go** to display events for this access point radio. See the “[Monitor View Events](#)” section on page 5-77 for more information.

## Monitoring Operational Parameters

To view Operational Parameters for an access point radio, follow these steps:

- 
- Step 1** Choose **Monitor > Access Points**, click the radio for the applicable access point.
  - Step 2** From the **View** drop-down list, choose Operational Parameters.
  - Step 3** Click **Go**.
- 

This page enables you to view configuration information for a single 802.11a or 802.11b Cisco radio.

### General

- AP Name—Click to view the access point details. See the “[Monitoring Access Points Details](#)” section on page 5-56 for more information.
- AP MAC Address
- Radio
- Admin Status—Enabled or disabled.
- Operational Status—Displays the operational status of the Cisco Radios (Up or Down).
- Controller—Click to display controller system details. See the “[Monitoring System Summary](#)” section on page 5-4 for more information.

- Channel—The channel upon which the Cisco Radio is broadcasting.
- Extension Channel—Indicates the secondary channel on which Cisco radio is broadcasting.
- Channel Width—Indicates the channel bandwidth for this radio interface. See the “[Configuring 802.11a/n RRM Dynamic Channel Allocation](#)” section on page 9-121 for more information on configuring channel bandwidth.
- Power Level—Access Point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power. The power levels and available channels are defined by the Country Code setting, and are regulated on a country by country basis.
- Port—(1 to 24) Port to which the access point is connected.
- Map Location—Click to display the floor map showing the access point location.

### Station Configuration Parameters

- Configuration Type—Automatic or Custom.
- Number of WLANs—1 (one) is the default.
- Medium Occupancy Limit—Indicates the maximum amount of time, in TU, that a point coordinator may control the usage of the wireless medium without relinquishing control for long enough to allow at least one instance of DCF access to the medium. The default value is 100, and the maximum value is 1000.
- CFP Period—The number of DTIM intervals between the start of CFPs.
- CFP Max. Duration—The maximum duration of the CFP in TU that may be generated by the PCF.
- BSSID—MAC address of the access point.
- Beacon Period—The rate at which the SSID is broadcast by the access point, from 100 to 600 milliseconds.
- DTIM Period—The number of beacon intervals that shall elapse between transmission of Beacon frames containing a TIM element whose DTIM Count field is 0. This value is transmitted in the DTIM Period field of Beacon frames.
- Country String—Identifies the country in which the station is operating. The first two octets of this string are the two character country code.

### Physical Channel Parameters

- Current Channel—Current operating frequency channel.
- Configuration—Locally customized or globally controlled.
- Current CCA Mode—CCA method in operation. Valid values:
  - Energy detect only (edonly) = 01.
  - Carrier sense only (csonly) = 02.
  - Carrier sense and energy detect (edandcs)= 04.
  - Carrier sense with timer (cswithtimer)= 08.
  - High rate carrier sense and energy detect (hrcsanded)=16.
- ED/TI Threshold—The Energy Detect and Threshold being used to detect a busy medium (frequency). CCA reports a busy medium upon detecting the RSSI above this threshold.

## Physical Antenna Parameters

- Antenna Type—Internal or External.
- Diversity—Enabled via the internal antennas or via either Connector A or Connector B. (Enabled or Disabled).

## RF Recommendation Parameters

- Channel—802.11a Low Band, Medium Band, and High Band; 802.11b/g.
- Tx Power Level—Zero (0) if Radio Resource Management (RRM) disabled, 1 - 5 if Radio Resource Management (RRM) is enabled.
- RTS/CTS Threshold—Zero (0) if Radio Resource Management (RRM) disabled, 1 - 5 if Radio Resource Management (RRM) is enabled.
- Fragmentation Threshold—Zero (0) if Radio Resource Management (RRM) is disabled.

## MAC Operation Parameters

- Configuration Type—Automatic or Custom.
- RTS Threshold—This attribute indicates the number of octets in an MPDU, below which an RTS/CTS handshake is not performed.  
An RTS/CTS handshake is performed at the beginning of any frame exchange sequence where the MPDU is a Data or Management type, the MPDU has an individual address in the Address1 field, and the length of the MPDU is greater than this threshold. Setting this attribute to be larger than the maximum MSDU size turns off the RTS/CTS handshake for Data or Management type frames transmitted by this STA. Setting this attribute to zero turns on the RTS/CTS handshake for all frames of Data or Management type transmitted by this STA. The default value of this attribute shall be 2347.
- Short Retry Limit—The maximum number of transmission attempts of a frame, the length of which is less than or equal to dot11RTSThreshold, that shall be made before a failure condition is indicated. The default value of this attribute is 7.
- Long Retry Limit—The maximum number of transmission attempts of a frame, the length of which is greater than dot11RTSThreshold, that shall be made before a failure condition is indicated. The default value of this attribute shall be 4.
- Fragmentation Threshold—The current maximum size, in octets, of the MPDU that may be delivered to the PHY. An MSDU shall be broken into fragments if its size exceeds the value of this attribute after adding MAC headers and trailers. An MSDU or MMPDU shall be fragmented when the resulting frame has an individual address in the Address1 field, and the length of the frame is larger than this threshold. The default value for this attribute shall be the lesser of 2346 or the aMPDUMaxLength of the attached PHY and shall never exceed the lesser of 2346 or the aMPDUMaxLength of the attached PHY. The value of this attribute shall never be less than 256.
- Max Tx MSDU Lifetime—The elapsed time in TU, after the initial transmission of an MSDU, after which further attempts to transmit the MSDU shall be terminated. The default value of this attribute is 512.
- Max Rx Lifetime—The MaxReceiveLifetime shall be the elapsed time in TU, after the initial reception of a fragmented MMPDU or MSDU, after which further attempts to reassemble the MMPDU or MSDU shall be terminated. The default value is 512.

## Tx Power

- # Supported Power Levels—Five or fewer power levels, depending on operator preference.
- Tx Power Level x—Access point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.

---

**Note** The power levels and available channels are defined by the Country Code setting, and are regulated on a country by country basis.

---

- Tx Power Configuration—Globally controlled or customized for this access point (Custom or Global).
- Current Tx Power Level—Displays the operating transmit power level from the transmit power table.

## Monitoring 802.11 MAC Counters

To view Operational Parameters for an access point radio, follow these steps:

- 
- Step 1** Choose **Monitor > Access Points**, click the radio for the applicable access point.
  - Step 2** From the **View** drop-down list, choose **802.11 MAC Counters**.
  - Step 3** Click **Go**.
- 

This page enables you to view 802.11 MAC Counter information for a single 802.11a or 802.11b Cisco Radio.

## General

- AP Name—Click to view the access point details. See the [“Monitoring Access Points Details” section on page 5-56](#) for more information.
- AP MAC Address
- Radio
- Admin Status—Enabled or disabled.
- Operational Status—Displays the operational status of the Cisco Radios (Up or Down).
- Controller—Click to display controller system details. See the [“Monitoring System Summary” section on page 5-4](#) for more information.
- Channel—The channel upon which the Cisco Radio is broadcasting.
- Extension Channel—Indicates the secondary channel on which Cisco radio is broadcasting.
- Channel Width—Indicates the channel bandwidth for this radio interface. See the [“Configuring 802.11a/n RRM Dynamic Channel Allocation” section on page 9-121](#) for more information on configuring channel bandwidth.

**Note** Minimum (default) setting is 20 MHz. Maximum setting is the maximum channel width supported by this radio.

- **Power Level**—Access Point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.  
The power levels and available channels are defined by the Country Code setting, and are regulated on a country by country basis.
- **Port**—(1 to 24) Port to which the access point is connected.
- **Map Location**—Click to display the floor map showing the access point location.

## RF Counters

- **Tx Fragment Count**—This counter is incremented for each successfully received MPDU Data or Management type.
- **Multicast Tx Frame Count**—This counter increments only when the multicast bit is set in the destination MAC address of a successfully transmitted MSDU. When operating as a STA in an ESS, where these frames are directed to the access point, this implies having received an acknowledgment to all associated MPDUs.
- **Tx Failed Count**—This counter increments when an MSDU is successfully transmitted after one or more retransmissions.
- **Retry Count**—This counter increments when an MSDU is successfully transmitted after one or more retransmissions.
- **Multiple Retry Count**—This counter increments when an MSDU is successfully transmitted after more than one retransmission.
- **Frame Duplicate Count**—This counter increments when a frame is received that the Sequence Control field indicates is a duplicate.
- **RTS Success Count**—This counter increments when a CTS is received in response to an RTS.
- **RTS Failure Count**—This counter increments when a CTS is not received in response to an RTS.
- **ACK Failure Count**—This counter increments when an ACK is not received when expected.
- **Rx Fragment Count**—The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).
- **Multicast Rx Framed Count**—This counter increments when a MSDU is received with the multicast bit set in the destination MAC address.
- **FCS Error Count**—This counter increments when an FCS error is detected in a received MPDU.
- **Tx Frame Count**—This counter increments for each successfully transmitted MSDU.
- **WEP Undecryptable Count**—This counter increments when a frame is received with the WEP subfield of the Frame Control field set to one and the WEP On value for the key mapped to the AT MAC address indicates that the frame should not have been encrypted or that frame is discarded due to the receiving STA not implementing the privacy option.

## Monitoring View Alarms

To access the **View Alarms** page from the Monitor Access Points page, follow these steps:

**Note**

When the AP is disassociated, in the Monitor > Access Points page, the radio status will have critical status. There will be only one alarm, **AP disassociated**. This is because radio alarms will be correlated to AP disassociated alarm.

**Note**

When the controller goes down, the controller inventory dashlet shows the controller status as critical. But the radio inventory dashlet, will retain the last known status. In Monitor > Access Point page, the AP alarm status is shown as "Unknown".

- 
- Step 1** Choose **Monitor > Access Points**.
- Step 2** Select the Radio Type in the Radio Type column of the applicable access point.
- Step 3** From the **View** drop-down list, choose **View Alarms**.
- Step 4** Click **Go**.

For more information on Viewing Alarms, see the [“Monitoring Alarms” section on page 5-125](#).

---

## Monitor View Events

To access the **View Events** page from the Monitor Access Points page, follow these steps:

- 
- Step 1** Choose **Monitor > Access Points**.
- Step 2** Select the Radio Type in the Radio Type column of the applicable access point.
- Step 3** From the **View** drop-down list, select **View Events**.
- Step 4** Click **Go**.

For more information on viewing events, see the [“Monitoring Events” section on page 5-142](#).

---

## Monitoring Mesh Access Points

Mesh Health monitors the overall health of Cisco Aironet 1500 and 1520 series outdoor access points as well as Cisco Aironet 1130 and 1240 series indoor access points when configured as mesh access points, except as noted. Tracking this environmental information is particularly critical for access points that are deployed outdoors. The following factors are monitored:

- Temperature: Displays the internal temperature of the access point in Fahrenheit and Celsius (Cisco Aironet 1510 and 1520 outdoor access points only).
- Heater status: Displays the heater as on or off (Cisco Aironet 1510 and 1520 outdoor access points only)
- AP Up time: Displays how long the access point has been active to receive and transmit.
- LWAPP Join Taken Time: Displays how long it took to establish the LWAPP connection (excluding Cisco Aironet 1505 access points).

- **LWAPP Up Time:** Displays how long the LWAPP connection has been active (excluding Cisco Aironet 1505 access points).

Mesh Health information is displayed in the General Properties page for mesh access points.

To view the mesh health details for a specific mesh access point, follow these steps:

---

**Step 1** Choose **Monitor > Access Points**. A listing of radios belonging to access points appears.

**Note** The radio status (not an access point status) is displayed when you choose Monitor > Access Points. The given status is updated frequently from traps and wireless status polling and takes several minutes to reflect actual radio status. The overall status of an access point can be found by viewing the access point on a map.

---

**Note** You can also use the New Search button to display the mesh access point summary. With the New Search option, you can further define the criteria of the access points that appear. Search criteria include AP Type, AP Mode, Radio Type, and 802.11n Support.

---

**Step 2** Click the AP Name link to display details for that mesh access point. The General tab for that mesh access point appears.

**Note** You can also access the General tab for a mesh access point from a Cisco NCS map page. To display the page, double-click the mesh access point label. A tabbed page appears and displays the General tab for the selected access point.

---

To add, remove, or reorder columns in the table, click the **Edit View** link in the Monitor > Access Points page.

## Mesh Statistics for an Access Point

Mesh Statistics are reported when a child mesh access point authenticates or associates with a parent mesh access point.

Security entries are removed and no longer displayed when the child mesh access point disassociates from the controller.

The following mesh security statistics are displayed for mesh access points:

- Bridging
- Queue
- Security

To view the mesh statistics for a specific mesh access point, follow these steps.

---

**Step 1** Choose **Monitor > Access Points**. A listing of radios belonging to access points appears.

**Note** The radio status (not an access point status) is displayed when you choose Monitor > Access Points. The given status is updated frequently from traps and wireless status polling and takes several minutes to reflect actual radio status. The overall status of an access point can be found by viewing the access point on a map.

**Note** You can also use the New Search button to display the access point summary. With the New Search option, you can further define the criteria of the access points that display. Search criteria include AP Name, IP address, MAC address, Controller IP or Name, Radio type, and Outdoor area.

**Step 2** Click the **AP Name** link of the target mesh access point.

A tabbed page appears and displays the General Properties page for the selected access point.

**Step 3** Click the **Mesh Statistics** tab (see [Figure 5-1](#)). A three-tabbed Mesh Statistics page appears.

**Note** The Mesh Statistics tab and its subordinate tabs (Bridging, Queue and Security) only appear for mesh access points. The Mesh Link Alarms and Mesh Link Events links are accessible from each of the three tabbed panels.

**Note** You can also access the Mesh Securities page for a mesh access point from a Cisco NCS map. To display the page, double-click the mesh access point label.

Summaries of the Bridging, Queue and Security Statistics and their definitions are provided in [Table 5-54](#), [Table 5-55](#) and [Table 5-56](#) respectively.

**Table 5-54 Bridging Mesh Statistics**

| Parameter                  | Description                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Role                       | The role of the mesh access point. Options are mesh access point (MAP) and root access point (RAP).                                                                                                                                                  |
| Bridge Group Name          | The name of the bridge group to which the MAP or RAP is a member. We recommend assigning membership in a bridge group name. If one is not assigned, a MAP is by default assigned to a default bridge group name.                                     |
| Backhaul Interface         | The radio backhaul for the mesh access point.                                                                                                                                                                                                        |
| Routing State              | The state of parent selection. Values that display are seek, scan and maint. Maint appears when parent selection is complete.                                                                                                                        |
| Malformed Neighbor Packets | The number of malformed packets received from the neighbor. Examples of malformed packets include malicious floods of traffic such as malformed or short DNS packets and malformed DNS replies.                                                      |
| Poor Neighbor SNR          | The number of times the signal-to-noise ratio falls below 12 dB on the backhaul link.                                                                                                                                                                |
| Excluded Packets           | The number of packets received from excluded neighbor mesh access points.                                                                                                                                                                            |
| Insufficient Memory        | The number of insufficient memory conditions.                                                                                                                                                                                                        |
| RX Neighbor Requests       | The number of broadcast and unicast requests received from the neighbor mesh access points.                                                                                                                                                          |
| RX Neighbor Responses      | The number of responses received from the neighbor mesh access points.                                                                                                                                                                               |
| TX Neighbor Requests       | The number of unicast and broadcast requests sent to the neighbor mesh access points.                                                                                                                                                                |
| TX Neighbor Responses      | The number of responses sent to the neighbor mesh access points.                                                                                                                                                                                     |
| Parent Changes             | The number of times a mesh access point (child) moves to another parent.                                                                                                                                                                             |
| Neighbor Timeouts          | The number of neighbor timeouts.                                                                                                                                                                                                                     |
| Node Hops                  | The number of hops between the MAP and the RAP. Click the value link to display a dialog box which enables you to configure details of what is reported, how often the node hop value is updated, and view a graphical representation of the report. |

**Table 5-55 Queue Mesh Statistics**

| Parameter        | Description                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Silver Queue     | The average and peak number of packets waiting in the silver (best effort) queue during the defined statistics time interval. Packets dropped and queue size is also summarized. |
| Gold Queue       | The average and peak number of packets waiting in the gold (video) queue during the defined statistics time interval. Packets dropped and queue size is also summarized.         |
| Platinum Queue   | The average and peak number of packets waiting in the platinum (voice) queue during the defined statistics time interval. Packets dropped and queue size is also summarized.     |
| Bronze Queue     | The average and peak number of packets waiting in the bronze (background) queue during the defined statistics time interval. Packets dropped and queue size is also summarized.  |
| Management Queue | The average and peak number of packets waiting in the management queue during the defined statistics time interval. Packets dropped and queue size is also summarized.           |

**Table 5-56 Security Mesh Statistics**

| Parameter                       | Description                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Packets Transmitted             | Summarizes the total number of packets transmitted during security negotiations by the selected mesh access point.              |
| Packets Received                | Summarizes the total number of packets received during security negotiations by the selected mesh access point.                 |
| Association Request Failures    | Summarizes the total number of association request failures that occur between the selected mesh access point and its parent.   |
| Association Request Timeouts    | Summarizes the total number of association request time outs that occur between the selected mesh access point and its parent.  |
| Association Request Success     | Summaries the total number of successful association requests that occur between the selected mesh access point and its parent. |
| Authentication Request Failures | Summarizes the total number of failed authentication requests that occur between the selected mesh access point and its parent. |

**Table 5-56 Security Mesh Statistics (continued)**

| <b>Parameter</b>                  | <b>Description</b>                                                                                                                                                                                                                                                |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Request Timeouts   | Summarizes the total number of authentication request timeouts that occur between the selected mesh access point and its parent.                                                                                                                                  |
| Authentication Request Success    | Summarizes the total number of successful authentication requests between the selected mesh access point and its parent mesh node.                                                                                                                                |
| Reassociation Request Failures    | Summarizes the total number of failed reassociation requests between the selected mesh access point and its parent.                                                                                                                                               |
| Reassociation Request Timeouts    | Summarizes the total number of reassociation request timeouts between the selected mesh access point and its parent.                                                                                                                                              |
| Reassociation Request Success     | Summarizes the total number of successful reassociation requests between the selected mesh access point and its parent.                                                                                                                                           |
| Reauthentication Request Failures | Summarizes the total number of failed reauthentication requests between the selected mesh access point and its parent.                                                                                                                                            |
| Reauthentication Request Timeouts | Summarizes the total number of reauthentication request timeouts that occurred between the selected mesh access point and its parent.                                                                                                                             |
| Reauthentication Request Success  | Summarizes the total number of successful reauthentication requests that occurred between the selected mesh access point and its parent.                                                                                                                          |
| Invalid Association Request       | Summarizes the total number of invalid association requests received by the parent mesh access point from the selected child mesh access point. This state might occur when the selected child is a valid neighbor but is not in a state that allows association. |
| Unknown Association Requests      | Summarizes the total number of unknown association requests received by the parent mesh access point from its child. The unknown association requests often occur when a child is an unknown neighbor mesh access point.                                          |
| Invalid Reassociation Request     | Summarizes the total number of invalid reassociation requests received by the parent mesh access point from a child. This might happen when a child is a valid neighbor but is not in a proper state for reassociation.                                           |
| Unknown Reassociation Request     | Summarizes the total number of unknown reassociation requests received by the parent mesh access point from a child. This might happen when a child mesh access point is an unknown neighbor.                                                                     |

# Retrieving the Unique Device Identifier on Controllers and Access Points

The unique device identifier (UDI) standard uniquely identifies products across all Cisco hardware product families, enabling customers to identify and track Cisco products throughout their business and network operations and to automate their asset management systems. The standard is consistent across all electronic, physical, and standard business communications. The UDI consists of five data elements:

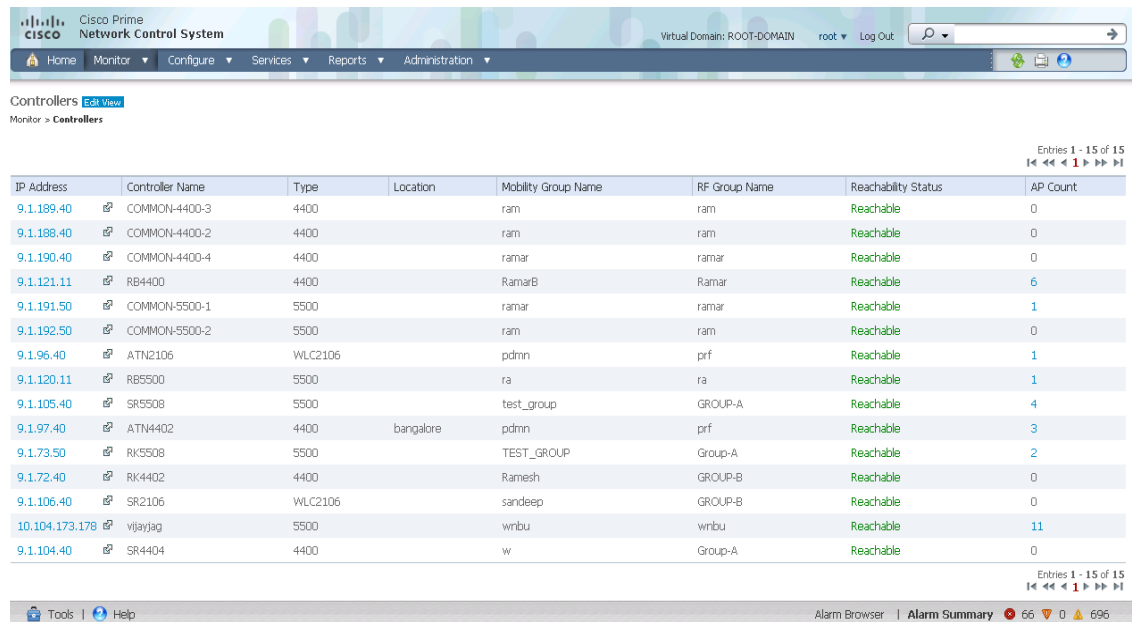

- The orderable product identifier (PID)
- The version of the product identifier (VID)
- The serial number (SN)
- The entity name
- The product description

The UDI is burned into the EEPROM of controllers and lightweight access points at the factory and can be retrieved through the GUI.

To retrieve the UDI on controllers and access points, perform the following steps:

**Step 1** Choose **Monitor > Controllers/Access Points**. The Controllers/Access Points page appears (see [Figure 5-2](#)).

**Figure 5-2** Monitor > Controllers Page

**Step 2** Click the IP address of the controller/access point (see in [Figure 5-2](#)) whose UDI information you want to retrieve. Data elements of the controller/access point UDI display. These elements are described in [Table 5-57](#):

**Table 5-57** Maximum Number of Crypto Cards That Can Be Installed on a Cisco Wireless LAN Controller

| Type of Controller | Maximum Number of Crypto Cards |
|--------------------|--------------------------------|
| Cisco 2000 Series  | None                           |

**Table 5-57** Maximum Number of Crypto Cards That Can Be Installed on a Cisco Wireless LAN Controller

| Type of Controller | Maximum Number of Crypto Cards |
|--------------------|--------------------------------|
| Cisco 4100 Series  | One                            |
| Cisco 4400 Series  | Two                            |

## Monitoring Coverage Hole

Coverage holes are areas where clients cannot receive a signal from the wireless network. The Cisco Unified Network Solution, radio resource management (RRM) identifies these coverage hole areas and reports them to the NCS, enabling the IT manager to fill holes based on user demand.

NCS is informed about the reliability-detected coverage holes by the controllers. NCS alerts the user about these coverage holes. For more information on finding coverage holes, refer to Cisco Context-Aware Services documentation at this location:  
[http://www.cisco.com/en/US/docs/wireless/mse/3350/5.2/CAS/configuration/guide/msecg\\_ch7\\_CAS.html](http://www.cisco.com/en/US/docs/wireless/mse/3350/5.2/CAS/configuration/guide/msecg_ch7_CAS.html)

**Note** Coverage holes are displayed as alarms. Pre-coverage holes are displayed as events.

## Monitoring Pre-Coverage Holes

To view pre-coverage hole events, perform these steps:

- Step 1** Choose **Monitor > Events** to display all current events.
- Step 2** To view pre-coverage hole events only, click the **Advanced Search** link.
- Step 3** In the New Search page, change the Search Category drop-down to **Events**.
- Step 4** From the Event Category drop-down list, choose **Pre Coverage Hole**, and click **Go**.

The Pre-Coverage Hole Events page provides the information described in the following table (see [Table 5-58](#)):

**Table 5-58** Pre-Coverage Hole Parameters

| Parameter          | Description                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Severity           | Pre-coverage hole events are always considered informational (Info).                                                                                                        |
| Client MAC Address | MAC address of the client affected by the pre-coverage hole.                                                                                                                |
| AP MAC Address     | MAC address of the applicable access point.                                                                                                                                 |
| AP Name            | The name of the applicable access point.                                                                                                                                    |
| Radio Type         | The radio type (802.11b/g or 802.11a) of the applicable access point.                                                                                                       |
| Power Level        | Access point transmit power level: 1 = Maximum power allowed per country code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power. |

**Table 5-58** Pre-Coverage Hole Parameters (continued)

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client Type               | Client type can be any of the following:<br>laptop(0)<br>pc(1)<br>pda(2)<br>dot11mobilephone(3)<br>dualmodephone(4)<br>wgb(5)<br>scanner(6)<br>tabletpc(7)<br>printer(8)<br>projector(9)<br>videoconfsystem(10)<br>camera(11)<br>gamingsystem(12)<br>dot11deskphone(13)<br>cashregister(14)<br>radiotag(15)<br>rfidsensor(16)<br>server(17) |
| WLAN Coverage Hole Status | Determines if the current coverage hole state is enabled or disabled.                                                                                                                                                                                                                                                                       |
| WLAN                      | The name for this WLAN.                                                                                                                                                                                                                                                                                                                     |
| Date/Time                 | The date and time the event occurred. Click the title to toggle between ascending and descending order.                                                                                                                                                                                                                                     |

**Step 5** Choose a Client MAC Address to view pre-coverage hole details.

- General—Provides the following information:
  - Client MAC Address
  - AP MAC Address
  - AP Name
  - Radio Type
  - Power Level
  - Client Type
  - Category
  - Created
  - Generated By
  - Device AP Address

- Severity
  - Neighbor AP's—Indicates the MAC addresses of nearby access points, their RSSI values, and their radio types.
  - Message—Describes what device reported the pre-coverage hole and on which controller it was detected.
  - Help—Provides additional information, if available, for handling the event.
- 

## Monitoring Rogue Access Points

This section describes security solutions for rogue devices. A rogue device is an unknown access point or client that is detected by managed access points in your network.

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain-text or other denial of service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as usernames and passwords. The hacker can then transmit a series of clear-to-send (CTS) frames. This action mimics an access point informing a particular client to transmit and instructing all others to wait, which results in legitimate clients being unable to access network resources. Therefore, wireless LAN service providers have a strong interest in banning rogue access points from the air space.

Because rogue access points are inexpensive and readily available, employees sometimes plug unauthorized rogue access points into existing LANs and build ad-hoc wireless networks without IT department knowledge or consent. These rogue access points can be a serious breach of network security as they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. Even more alarming, wireless users frequently publish insecure access point locations, increasing the odds of having enterprise security breached.

## Detecting Rogue Devices

The controllers continuously monitor all nearby access points and automatically discover and collect information on rogue access points and clients. When a controller discovers a rogue access point, it uses the Rogue Location Discovery Protocol (RLDP) to determine if the rogue is attached to your network.

**Note**

---

NCS consolidates all of the controllers rogue access point data.

---

You can configure controllers to use RLDP on all access points or only on access points configured for monitor (listen-only) mode. The latter option facilitates automated rogue access point detection in a crowded RF space, allowing monitoring without creating unnecessary interference and without affecting regular data access point functionality. If you configure a controller to use RLDP on all access points, the controller always chooses the monitor access point for RLDP operation if a monitor access point and a local (data) access point are both nearby. If RLDP determines that the rogue is on your network, you can choose to either manually or automatically contain the detected rogue. See [“Configuring Rogue Policies”](#) for information on enabling RLDP.

**Note**

Rogue access point partitions are associated with one of the detecting access points (the one with the latest or strongest RSSI value). If there is detecting access point information, NCS uses the detecting controller. If the rogue access point is detected by two controllers which are in different partitions, the rogue access point partition may be changed at any time.

- [Viewing Rogue AP Event History Details, page 5-100](#)
- [Monitoring Adhoc Rogue Alarms, page 5-100](#)

## Classifying Rogue Access Points

Classification and reporting of rogue access points occurs through the use of rogue states and user-defined classification rules that enable rogues to automatically move between states. You can create rules that enable the controller to organize and display rogue access points as Friendly, Malicious, or Unclassified.

**Note**

NCS consolidates all of the controllers rogue access point data.

By default, none of the classification rules are enabled. Therefore, all unknown access points are categorized as Unclassified. When you create a rule, configure conditions for it, and enable the rule, the unclassified access points are reclassified. Whenever you change a rule, it is applied to all access points (friendly, malicious, and unclassified) in the Alert state only.

**Note**

Rule-based rogue classification does not apply to ad-hoc rogues and rogue clients.

**Note**

The 5500 series controllers support up to 2000 rogues (including acknowledged rogues); the 4400 series controllers, Cisco WiSM, and Catalyst 3750G Integrated Wireless LAN Controller Switch support up to 625 rogues; and the 2100 series controllers and Controller Network Module for Integrated Services Routers support up to 125 rogues. Each controller limits the number of rogue containments to three per radio (or six per radio for access points in monitor mode).

When the controller receives a rogue report from one of its managed access points, it responds as follows:

1. The controller verifies that the unknown access point is in the friendly MAC address list. If it is, the controller classifies the access point as Friendly.
2. If the unknown access point is not in the friendly MAC address list, the controller starts applying rogue classification rules.

3. If the rogue is already classified as Malicious, Alert or Friendly, Internal or External, the controller does not reclassify it automatically. If the rogue is classified differently, the controller reclassifies it automatically only if the rogue is in the Alert state.
4. The controller applies the first rule based on priority. If the rogue access point matches the criteria specified by the rule, the controller classifies the rogue according to the classification type configured for the rule.
5. If the rogue access point does not match any of the configured rules, the controller classifies the rogue as Unclassified.
6. The controller repeats the previous steps for all rogue access points.
7. If RLDP determines that the rogue access point is on the network, the controller marks the rogue state as Threat and classifies it as Malicious automatically, even if no rules are configured. You can then manually contain the rogue (unless you have configured RLDP to automatically contain the rogue), which would change the rogue state to Contained. If the rogue access point is not on the network, the controller marks the rogue state as Alert, and you can manually contain the rogue.
8. If desired, you can manually move the access point to a different classification type and rogue state.

As mentioned previously, the controller can automatically change the classification type and rogue state of an unknown access point based on user-defined rules, or you can manually move the unknown access point to a different classification type and rogue state. [Table 5-59](#) shows the allowable classification types and rogue states from and to which an unknown access point can be configured.

**Table 5-59 Allowable Classification Type and Rogue State Transitions**

| From                                        | To                            |
|---------------------------------------------|-------------------------------|
| Friendly (Internal, External, Alert)        | Malicious (Alert)             |
| Friendly (Internal, External, Alert)        | Unclassified (Alert)          |
| Friendly (Alert)                            | Friendly (Internal, External) |
| Malicious (Alert, Threat)                   | Friendly (Internal, External) |
| Malicious (Contained, Contained Pending)    | Malicious (Alert)             |
| Unclassified (Alert, Threat)                | Friendly (Internal, External) |
| Unclassified (Contained, Contained Pending) | Unclassified (Alert)          |
| Unclassified (Alert)                        | Malicious (Alert)             |

If the rogue state is Contained, you have to uncontain the rogue access point before you can change the classification type. If you want to move a rogue access point from Malicious to Unclassified, you must delete the access point and allow the controller to reclassify it.

Rogue access points classification types include:

- Malicious—Detected but untrusted or unknown access points with a malicious intent within the system. They also refer to access points that fit the user-defined malicious rules or have been manually moved from the friendly access point classification. See [“Malicious Rogue APs”](#) for more information.
- Friendly—Known, acknowledged, or trusted access points. They also refer to access points that fit the user-defined friendly rogue access point rules. Friendly rogue access points cannot be contained. See [“Friendly Rogue APs”](#) for more information. For more information on configuring friendly access point rules, see [“Configuring a Friendly Access Point Template”](#).

- **Unclassified**—Rogue access point that are not classified as either malicious or friendly. These access points can be contained and can be moved manually to the friendly rogue access point list. See for more information. See [“Unclassified Rogue APs”](#) for more information.

## Malicious Rogue APs

Malicious rogue access points are detected but untrusted or unknown access points with a malicious intent within the system. They also refer to access points that fit the user-defined malicious rules or have been manually moved from the friendly access point classification.

The Security dashboard of the NCS home page displays the number of malicious rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active malicious rogue access points.

Malicious rogue access point states include:

- **Alert**—Indicates that the access point is not on the neighbor list or part of the user-configured Friendly AP list.
- **Contained**—The unknown access point is contained.
- **Threat**—The unknown access point is found to be on the network and poses a threat to WLAN security.
- **Contained Pending**—Indicates that the containment action is delayed due to unavailable resources.
- **Removed**—This unknown access point was seen earlier but is not seen now.

Click an underlined number in any of the time period categories for detailed information regarding the malicious rogue access points. See [“Monitoring Rogue Access Points”](#) for more information.

## Friendly Rogue APs

Friendly rogue access points are known, acknowledged or trusted access points. They also refer to access points that fit the user-defined friendly rogue access point rules. Friendly rogue access points cannot be contained.

### Note

---

Only NCS user can add a rogue access point MAC address to the Friendly AP list. The NCS will not apply the Friendly AP MAC address to controllers.

---

The Security dashboard of the NCS home page displays the number of friendly rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active friendly rogue access points.

Friendly rogue access point states include:

- **Internal**—If the unknown access point is inside the network and poses no threat to WLAN security, you would manually configure it as Friendly, Internal. For example, the access points in your lab network.
- **External**—If the unknown access point is outside the network and poses no threat to WLAN security, you would manually configure it as Friendly, External. For example, the access points belonging to a neighboring coffee shop.
- **Alert**—The unknown access point is not on the neighbor list or part of the user-configured Friendly AP list.

Click an underlined number in any of the time period categories for detailed information regarding the friendly rogue access points. See [“Monitoring Rogue Access Points”](#) for more information.

To delete a rogue access point from the Friendly AP list, ensure that both the NCS and controller remove the rogue access point from the Friendly AP list. Change the rogue access point from Friendly AP Internal or External to Unclassified or Malicious Alert.

## Unclassified Rogue APs

An unclassified rogue access point refers to a rogue access point that is not classified as either malicious or friendly. These access points can be contained and can be moved manually to the friendly rogue access point list.

The Security dashboard of the NCS home page displays the number of unclassified rogue access points for each applicable state for the past hour, the past 24 hours, and the total number of active unclassified rogue access points.

Unclassified rogue access point states include:

- Pending—On first detection, the unknown access point is put in the Pending state for 3 minutes. During this time, the managed access points determine if the unknown access point is a neighbor access point.
- Alert—The unknown access point is not on the neighbor list or part of the user-configured Friendly AP list.
- Contained—The unknown access point is contained.
- Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources.

Click an underlined number in any of the time period categories for further information. See [“Monitoring Rogue Access Points”](#).

## Monitoring Rogue AP Alarms

Rogue access point radios are unauthorized access points detected by one or more Cisco 1000 Series lightweight access points. To open the Rogue AP Alarms page, do one of the following:

- Search for rogue APs. See [“Using the Search Feature”](#) for more information about the search feature.
- From the NCS home page, click the Security dashboard. This page displays all the rogue access points detected in the past hour and the past 24 hours. Click the rogue access point number to view the rogue access point alarms.
- Click the **Malicious AP** number link in the Alarm Summary.

### Note

If there are multiple alarm pages, the page numbers are displayed at the top of the page with a scroll arrow on each side. Use it to view additional alarms.

### Note

Rogue access point partitions are associated with one of the detecting access points (the one with the latest or strongest RSSI value). If there is detecting access point information, NCS uses the detecting controller. If the rogue access point is detected by two controllers which are in different partitions, the rogue access point partition may be changed at any time.

The Rogue AP Alarms page contains the following parameters:

**Note** When NCS polls, some data may change or get updated. Because of this, some of the displayed rogue data (including Strongest AP RSSI, No. of Rogue Clients, Channel, SSID, and Radio Types) can change during the life of the rogue.

- Severity—Indicates the severity of the alarm including:

| Icon | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | Critical                                                                                                                                                                                                                                                                                                                                                      |
|      | Major                                                                                                                                                                                                                                                                                                                                                         |
|      | Minor                                                                                                                                                                                                                                                                                                                                                         |
|      | Warning                                                                                                                                                                                                                                                                                                                                                       |
|      | Info                                                                                                                                                                                                                                                                                                                                                          |
|      | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

You can use the Severity Configuration feature to determine the level of severity for the following rogue access point alarm types:

- Rogue detected
- Rogue detected contained
- Rogue detected on network

See “[Configuring Alarm Severities](#)” for more information.

- Rogue MAC Address—Indicates the MAC address of the rogue access points. See “[Viewing Rogue AP Alarm Details](#)”.
- Vendor—Rogue access point vendor name or Unknown.
- Classification Type—Pending, Malicious, Friendly, or Unclassified.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Strongest AP RSSI—Displays the strongest AP RSSI for this rogue access point across the life of the rogue. The strongest AP RSSI over the life of the rogue displays to indicate the nearest distance that existed between the rogue access point and your building or location. The higher the RSSI, the closer the location.
- No. of Rogue Clients—Indicates the number of rogue clients associated to this rogue access point.

---

**Note** This number comes from the NCS database. It is updated every two hours. From the **Monitor > Alarms > Alarm Details** page, this number is a real-time number. It is updated each time you open the Alarm Details page for this rogue access point.

---

- Owner—Name of person to which this alarm is assigned, or (blank).
- Last Seen Time—Indicates the date and time that the rogue access point was last seen.
- State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point. See [“Classifying Rogue Access Points”](#) for additional information.
  - Malicious rogue states include: Alert, Contained, Threat, Contained Pending, and Removed. See [“Malicious Rogue APs”](#) for more information.
  - Friendly rogue states include: Internal, External, and Alert. See [“Friendly Rogue APs”](#) for more information.
  - Unclassified rogue states include: Pending, Alert, Contained, and Contained Pending. See [“Unclassified Rogue APs”](#) for more information.
- SSID—Indicates the service set identifier being broadcast by the rogue access point radio. It is blank if the SSID is not being broadcast.
- Map Location—Indicates the map location for this rogue access point.
- Acknowledged—Displays whether or not the alarm is acknowledged by the user.

You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality. See [“Acknowledging Alarms”](#) for more information.

---

**Note** The alarm remains in NCS, and you can search for all Acknowledged alarms using the alarm search functionality.

---

**Caution**

---

When you choose to contain a rogue device, the following warning appears: “There may be legal issues following this containment. Are you sure you want to continue?” The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another network could have legal consequences.

---

**Select a command Menu**

Select one or more alarms by selecting their respective check boxes, select one of the following commands from the Select a command drop-down list, and click **Go**.

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Clear—Clear the selected alarm(s). Indicates that the alarm is no longer detected by any access point.

---

**Note** Once the severity is Clear, the alarm is deleted from NCS after 30 days.

---

- Acknowledge Alarm—Acknowledge the alarm to prevent it from showing up in the Alarm Summary page. See [“Acknowledging Alarms”](#) for more information.

---

**Note** The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.

---

- Unacknowledge Alarm—Unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the All **Alarms** > **Email Notification** page to view and configure email notifications. See [“Monitoring RFID Tags”](#) for more information.
- Severity Configuration—Allows you to change the severity level for newly-generated alarms. See [“Configuring Alarm Severities”](#) for more information.
- Detecting APs—View the Cisco 1000 Series lightweight access points that are currently detecting the rogue access point. See [“Detecting Access Points”](#) for more information.
- Map (High Resolution)—Click to display a high-resolution map of the rogue access point location.
- Rogue Clients—Click to view a list of rogue clients associated with this rogue access point. The Rogue Clients page displays the Client MAC Address, when it was last heard, its current status, its controller, and the Rogue access point. See [“Viewing Rogue Client Details”](#) for more information. This information can also be accessed by using the NCS Search feature. See [“Using the Search Feature”](#) or [“Advanced Search”](#) for more information.
- Set State to ‘Unclassified - Alert’—Choose this command to tag the rogue access point as the lowest threat, continue monitoring the rogue access point, and to turn off Containment. See [“Unclassified Rogue APs”](#) for more information on Unclassified rogues.
- Set State to ‘Malicious - Alert’—Choose this command to tag the rogue access point as ‘Malicious’. See [“Malicious Rogue APs”](#) for more information on Malicious rogues.
- Set State to ‘Friendly - Internal’—Choose this command to tag the rogue access point as internal, add it to the Known Rogue APs list, and to turn off Containment. See [“Friendly Rogue APs”](#) for more information on Friendly rogues.
- Set State to ‘Friendly - External’—Choose this command to tag the rogue access point as external, add it to the Known Rogue APs list, and to turn off Containment. See [“Friendly Rogue APs”](#) for more information on Friendly rogues.
- 1 AP Containment—Target the rogue access point for containment by one access point. (Lowest containment level.)
- 2 AP Containment—Target the rogue access point for containment by two Cisco 1000 Series lightweight access points.
- 3 AP Containment—Target the rogue access point for containment by three Cisco 1000 Series lightweight access points.
- 4 AP Containment—Target the rogue access point for containment by four Cisco 1000 Series lightweight access points. (Highest containment level.)

---

**Note** The higher the threat of the rogue access point, the higher the containment required.

---

**Caution**

Attempting to contain a rogue access point may lead to legal consequences. When you select any of the AP Containment commands and click **Go**, a message “Containing a Rogue AP may have legal consequences. Do you want to continue?” appears. Click **OK** if you are sure or click **Cancel** if you do not wish to contain any access points.

## Viewing Rogue AP Alarm Details

Rogue access point radios are unauthorized access points detected by Cisco 1000 Series lightweight access points. Alarm event details for each rogue access point are available from the Rogue AP Alarms list page.

To view alarm events for a rogue access point radio, click the rogue MAC address for the applicable alarm from the **Monitor > Alarms** page for rogue access point alarms.

**Note**

All Alarm Details page fields (except No. of Rogue Clients) are populated through polling and are updated every two hours.

The number of rogue clients is a real-time number and is updated each time you access the Alarm Details page for a rogue access point alarm.

**Note**

When NCS polls, some data may change or get updated. Because of this, some of the displayed rogue data (including Strongest AP RSSI, No. of Rogue Clients, Channel, SSID, and Radio Types) can change during the life of the rogue.

The Alarm Details page displays the following information:

- General
  - Rogue MAC Address—MAC address of the rogue access points.
  - Vendor—Rogue access point vendor name or Unknown.

**Note**

When a rogue access point alarm displays for Airlink, the vendor displays as Alpha instead of Airlink.

- Rogue Type—Indicates the rogue type such as AP.
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Owner—Indicates the owner or is left blank.
- Acknowledged—Indicates whether or not the alarm is acknowledged by the user.

You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality. See “[Acknowledging Alarms](#)” for more information.

- Classification Type—Malicious, Friendly, or Unclassified.
- State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Channel Number—Indicates the channel of the rogue access point.
- Containment Level—Indicates the containment level of the rogue access point or Unassigned (not contained).
- Radio Type—Lists all radio types applicable to this rogue access point.
- Strongest AP RSSI—Displays the strongest AP RSSI for this rogue access point across the life of the rogue. The strongest AP RSSI over the life of the rogue displays to indicate the nearest distance that existed between the rogue access point and your building or location. The higher the RSSI, the closer the location.
- No. of Rogue Clients—Indicates the number of rogue clients associated to this rogue access point.

**Note** The number of rogue clients is the only real-time field in the **Monitor > Alarm > Alarm Details** page. It updates each time you open the Alarm Details page for this rogue access point. All other fields on the Alarm Details page are populated through polling and are updated every two hours.

- First Seen Time—Indicates the date and time when the rogue access point was first detected. This information is populated from the controller.
- Last Seen Time—Indicates the date and time when the rogue access point was last detected. This information is populated from the controller.
- Modified—Indicates when the alarm event was modified.
- Generated By—Indicates how the alarm event was generated (either NMS or from a trap).  
NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS.  
Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- Severity—The severity of the alarm including:

| Icon | Meaning  |
|------|----------|
|      | Critical |
|      | Major    |
|      | Minor    |
|      | Warning  |

| Icon                                                                              | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

You can use the Severity Configuration feature to determine the level of severity for rogue access points. See [“Configuring Alarm Severities”](#) for more information.

- Previous Severity—The previous severity of the alarm: Critical, Major, Minor, Clear.
- Event Details—Click the Event History link to view the event details.
- Rogue AP History—Click the Rogue AP History link to view the Rogue Alarm details.
- Switch Port Trace Status—Indicates the switch port trace status. Switch port trace status may include: Traced, but not found, Traced and found, Not traced, Failed. See [“Configuring Switch Port Tracing”](#) for more information.
- Switch Port Tracing Details—Provides the most recent switch port tracing details. To view additional trace details, use the **Click here for more details** link. See [“Configuring Switch Port Tracing”](#) for more information.
- Rogue Clients—Lists rogue clients for this access point including the client MAC address, the last date and time the client was heard, and the current client status. See [“Viewing Rogue Client Details”](#) for more information.

**Note** The number of rogue clients is the only real-time field on the **Monitor > Alarm > Alarm Details** page. It updates each time you open the Alarm Details page for this rogue access point. All other fields on the Alarm Details page are populated through polling and are updated every two hours.

- Message—Displays the most recent message regarding this rogue access point. A message is sent for the following: When the rogue access point is first detected, for any trap sent, and for any changed state.
- Annotations—Lists current notes regarding this rogue access point. To add a new note, click **New Annotation**. Type the note and click **Post** to save and display the note or **Cancel** to close the page without saving the note.
- Location Notifications—Displays the number of location notifications logged against the client. Clicking a link displays the notifications.
- Location—Provides location information, if available.

**Note** The switch port tracing will not update any of the rogue attributes such as severity, state, and so on. As the rogue attributes are not updated by switch port tracing, alarms would not be triggered if a rogue is discovered to be 'on network' using switch port tracing.

## Select a command Menu

The Select a command drop-down list located on the Rogue AP Alarm Details page provides the following options. Select an option from the drop-down list and click **Go**.

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Clear—Clear the selected alarm(s).
- Acknowledge Alarm—Acknowledge the alarm to prevent it from showing up in the Alarm Summary page. See [“Acknowledging Alarms”](#) for more information.

---

**Note** The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.

---

- Unacknowledge—Unacknowledge an already acknowledged alarm.
- Trace Switch Port—Click to run a switch port trace for this rogue access point. See [“Configuring Switch Port Tracing”](#) for more information.
- Event History—Click to view a list of events for this rogue access point. See [“Monitoring Rogue Alarm Events”](#) for more information.
- Refresh from Network—Click to sync up the rogue APs from the network.
- View Detecting AP on Network—View the Cisco 1000 Series lightweight access points that are currently detecting the rogue access point. See [“Detecting Access Points”](#) for more information.

---

**Note** Detecting AP Name, Radio, SSID information might be empty as the information is not available on controller. Refresh the page after the rogue AP task is completed to see the AP details.

---

- View Details by Controller—View the classification type and state of the rogue APs reported by the controller.
- Map (High Resolution)—Click to display a high-resolution map of the rogue access point location.
- Rogue Clients—Click to view a list of rogue clients associated with this rogue access point. The Rogue Clients page displays the Client MAC Address, when it was last heard, its current status, its controller, and the Rogue access point. See [“Viewing Rogue Client Details”](#) for more information. This information can also be accessed by using the NCS Search feature. See [“Using the Search Feature”](#) or [“Advanced Search”](#) for more information.
- Set State to ‘Unclassified - Alert’—Choose this command to tag the rogue access point as the lowest threat, continue monitoring the rogue access point, and to turn off Containment. See [“Unclassified Rogue APs”](#) for more information on Unclassified rogues.
- Set State to ‘Malicious - Alert’—Choose this command to tag the rogue access point as ‘Malicious’. See [“Malicious Rogue APs”](#) for more information on Malicious rogues.
- Set State to ‘Friendly - Internal’—Choose this command to tag the rogue access point as internal, add it to the Known Rogue APs list, and to turn off Containment. See [“Friendly Rogue APs”](#) for more information on Friendly rogues.

- Set State to 'Friendly - External'—Choose this command to tag the rogue access point as external, add it to the Known Rogue APs list, and to turn off Containment. See [“Friendly Rogue APs”](#) for more information on Friendly rogues.
- 1 AP Containment—Target the rogue access point for containment by one access point. (Lowest containment level.)
- 2 AP Containment—Target the rogue access point for containment by two Cisco 1000 Series lightweight access points.
- 3 AP Containment—Target the rogue access point for containment by three Cisco 1000 Series lightweight access points.
- 4 AP Containment—Target the rogue access point for containment by four Cisco 1000 Series lightweight access points. (Highest containment level.)

---

**Note** The higher the threat of the rogue access point, the higher the containment required.

---

## Viewing Rogue Client Details

You can view a list of rogue clients in several ways:

- Perform a search for rogue clients using the NCS Search feature. See the [“Using the Search Feature” section on page 2-33](#) for more information.
- View the list of rogue clients for a specific rogue access point from the Alarm Details page for the applicable rogue access point. Click the Rogue MAC Address for the applicable rogue client to view the Rogue Client details page.
- From the Alarms Details page of a rogue access point, select **Rogue Clients** from the Select a command drop-down list.

The Rogue Clients page displays the Client MAC Address, when it was last heard, its current status, its controller, and the associated rogue access point.

---

**Note** Rogue client statuses include: Contained (the controller contains the offending device so that its signals no longer interfere with authorized clients); Alert (the controller forwards an immediate alert to the system administrator for further action); and Threat (the rogue is a known threat).

---

Click the Client MAC Address for the rogue client to view the Rogue Client details page. The Rogue Client details page displays the following information:

- General—Information includes: client MAC address, number of access points that detected this client, when the client was first and last heard, the rogue access point MAC address, and the client current status.
- Location Notifications—Indicates the number of notifications for this rogue client including: absence, containment, distance, and all. Click the notification number to open the applicable **Monitor > Alarms** page.
- APs that detected the rogue client—Provides the following information for all access points that detected this rogue client: base radio MAC address, access point name, channel number, radio type, RSSI, SNR, and the date/time that the rogue client was last heard.
- Location—Provides location information, if available.

---

**Note** The higher the threat of the rogue access point, the higher the containment required.

---

### Select a command

The Select a command drop-down list on the Rogue Client details page includes the following options:

- Set State to ‘Unknown - Alert’—Choose this command to tag the rogue client as the lowest threat, continue monitoring the rogue client, and to turn off Containmentment.
- 1 AP Containmentment—Target the rogue client for containmentment by one access point. (Lowest containmentment level.)
- 2 AP Containmentment—Target the rogue client for containmentment by two access points.
- 3 AP Containmentment—Target the rogue client for containmentment by three access points.
- 4 AP Containmentment—Target the rogue client for containmentment by four access points. (Highest containmentment level.)
- Map (High Resolution)—Click to display a high-resolution map of the rogue client location.
- Location History—Click to display the history of the rogue client location based on RF fingerprinting.

### Viewing Rogue AP History Details

To view the history of a rogue AP alarms, click the Rogue AP History link in the Rogue AP Alarm page.

The Rogue AP History page displays the following information:

- Severity—The severity of the alarm.
- Rogue MAC Address—MAC address of the rogue access points.
- Classification Type—Malicious, Friendly, or Unclassified.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Strongest AP RSSI—Displays the strongest AP RSSI for this rogue access point across the life of the rogue. The strongest AP RSSI over the life of the rogue displays to indicate the nearest distance that existed between the rogue access point and your building or location. The higher the RSSI, the closer the location.
- No. of Rogue Clients—Indicates the number of rogue clients associated to this rogue access point.

---

**Note** The number of rogue clients is the only real-time field on the Monitor > Alarm > Alarm Details page. It updates each time you open the Alarm Details page for this rogue access point. All other fields on the Alarm Details page are populated through polling and are updated every two hours.

---

- First Seen Time—Indicates the date and time when the rogue access point was first detected. This information is populated from the controller.
- Last Seen Time—Indicates the date and time when the rogue access point was last detected. This information is populated from the controller.
- State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point.

- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Category—Indicates the category of this alarm such as Security or NCS.
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Channel Number—Indicates the channel of the adhoc rogue.
- Containment Level—Indicates the containment level of the adhoc rogue or Unassigned.
- Switch Port Trace Status—Indicates the switch port trace status. Switch port trace status may include: Traced, but not found, Traced and found, Not traced, Failed.

Click the Rogue MAC Address to view the specific rogue AP history details page. The rogue AP history details page displays the above details and also displays the actual alarm message.

## Viewing Rogue AP Event History Details

To view the event details of a rogue AP, click the Event History link in the Rogue AP Alarm page.

The Rogue AP Event History page displays the following information:

- Severity—The severity of the alarm.
- Rogue MAC Address—MAC address of the rogue access points.
- Vendor—Rogue access point vendor name or Unknown.
- Classification Type—Malicious, Friendly, or Unclassified.
- On Network—Indicates whether the rogue detection occurred. The controller detected the rogue (Yes or No).
- Date/Time—The date and time that the event was generated.
- Radio Type—Lists all radio types applicable to this rogue access point.
- State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)

## Monitoring Adhoc Rogues

If the MAC address of a mobile client operating in an adhoc network is not in the authorized MAC address list, then it is identified as an adhoc rogue.

- [Monitoring Adhoc Rogue Alarms](#)
- [Viewing Adhoc Rogue Alarm Details](#)

## Monitoring Adhoc Rogue Alarms

The Adhoc Rogue Alarms page displays alarm events for adhoc rogues. To access the Adhoc Rogue Alarms page, do one of the following:

- Perform a search for adhoc rogue alarms. See [“Using the Search Feature”](#) for more information.
- From the NCS home page, click the Security dashboard. This page displays all the adhoc rogues detected in the past hour and the past 24 hours. Click the adhoc rogue number to view the adhoc rogue alarms.

If there are multiple alarm pages, the page numbers are displayed at the top of the page with a scroll arrow on each side. Use this to view additional alarms.

The Adhoc Rogue Alarms page contains the following parameters:

**Note** When NCS polls, some data may change or get updated. Because of this, some of the displayed rogue data (including Strongest AP RSSI, No. of Rogue Clients, Channel, SSID, and Radio Types) can change during the life of the rogue.

- Severity—Indicates the severity of the alarm including:

| Icon | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | Critical                                                                                                                                                                                                                                                                                                                                                      |
|      | Major                                                                                                                                                                                                                                                                                                                                                         |
|      | Minor                                                                                                                                                                                                                                                                                                                                                         |
|      | Warning                                                                                                                                                                                                                                                                                                                                                       |
|      | Info                                                                                                                                                                                                                                                                                                                                                          |
|      | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

You can use the Severity Configuration feature to determine the level of severity for the following adhoc rogue alarm types:

- Adhoc Rogue auto contained
- Adhoc Rogue detected
- Adhoc Rogue detected on network
- Adhoc Rogue detected on network

See [“Configuring Alarm Severities”](#) for more information.

- Rogue MAC Address—Indicates the MAC address of the rogue. See [“Viewing Adhoc Rogue Alarm Details”](#) for more information.
- Vendor—Indicates the adhoc rogue vendor name, or Unknown.
- Radio Type—Lists all radio types applicable to this rogue access point.

- **Strongest AP RSSI**—Displays the strongest AP RSSI for this rogue across the life of the rogue. The strongest AP RSSI over the life of the rogue displays to indicate the nearest distance that existed between the rogue and your building or location. The higher the RSSI, the closer the location.
- **No. of Rogue Clients**—Indicates the number of rogue clients associated to this rogue access point.

---

**Note** The number of rogue clients is the only real-time field on the **Monitor > Alarm > Alarm Details** page. It updates each time you open the Alarm Details page for this rogue access point. All other fields on the Alarm Details page are populated through polling and are updated every two hours.

---

- **Owner**—Indicates the owner or is left blank.
- **Last Seen Time**—Indicates the date and time that the alarm was last viewed.
- **State**—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
- **SSID**—The Service Set Identifier that is being broadcast by the rogue adhoc radio. It is blank if there is no broadcast.
- **Map Location**—Indicates the map location for this adhoc rogue.
- **Acknowledged**—Displays whether or not the alarm is acknowledged by the user.

You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality. See [“Acknowledging Alarms”](#) for more information.

## Select a command Menu

Select one or more alarms by selecting their respective check boxes, select one of the following commands from the Select a command drop-down list, and click **Go**.

- **Assign to me**—Assign the selected alarm(s) to the current user.
- **Unassign**—Unassign the selected alarm(s).
- **Delete**—Delete the selected alarm(s).
- **Clear**—Clear the selected alarm(s).
- **Acknowledge**—Acknowledge the alarm to prevent it from showing up in the Alarm Summary page. See [“Acknowledging Alarms”](#) for more information.

---

**Note** The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.

---

- **Unacknowledge**—Unacknowledge an already acknowledged alarm.
- **Email Notification**—Takes you to the **All Alarms > Email Notification** page to view and configure email notifications. See [“Monitoring RFID Tags”](#) for more information.
- **Detecting APs**—View the access points that are currently detecting the rogue adhoc. See [“Detecting Access Points”](#) for more information.
- **Map (High Resolution)**—Click to display a high-resolution map of the adhoc rogue location.

- **Rogue Clients**—Click to view a list of rogue clients associated with this adhoc rogue. The Rogue Clients page displays the Client MAC Address, when it was last heard, its current status, its controller, and the adhoc rogue.
- **Set State to 'Alert'**—Choose this command to tag the adhoc rogue as the lowest threat, continue monitoring the rogue access point, and to turn off Containment.
- **Set State to 'Internal'**—Choose this command to tag the adhoc rogue as internal, add it to the Known Rogue APs list, and to turn off Containment.
- **Set State to 'External'**—Choose this command to tag the adhoc rogue as external, add it to the Known Rogue APs list, and to turn off Containment.
- **1 AP Containment**—Target the adhoc rogue for containment by one access point. (Lowest containment level.)
- **2 AP Containment**—Target the adhoc rogue for containment by two access points.
- **3 AP Containment**—Target the adhoc rogue for containment by three access points.
- **4 AP Containment**—Target the adhoc rogue for containment by four access points. (Highest containment level.)

**Caution**

Attempting to contain an adhoc rogue may lead to legal consequences. When you select any of the AP Containment commands and click **Go**, a message “Containing a Rogue AP may have legal consequences. Do you want to continue?” appears. Click **OK** if you are sure, or click **Cancel** if you do not wish to contain any access points.

## Viewing Adhoc Rogue Alarm Details

Alarm event details for each adhoc rogue are available from the Adhoc Rogue Alarms page.

To view alarm events for a adhoc rogue radio, click the applicable Rogue MAC Address from the Adhoc Rogue Alarms page.

This page displays alarm events for a rogue access point radio. Rogue access point radios are unauthorized access points detected by Cisco 1000 Series lightweight access points.

**Note**

When NCS polls, some data may change or get updated. Because of this, some of the displayed rogue data (including Strongest AP RSSI, No. of Rogue Clients, Channel, SSID, and Radio Types) can change during the life of the rogue. The following information is available:

- **General**
  - **Rogue MAC Address**—Media Access Control address of the adhoc rogue.
  - **Vendor**—Adhoc rogue vendor name or Unknown.
  - **On Network**—Indicates how the rogue detection occurred.
    - Controller**—The controller detected the rogue (Yes or No).
    - Switch Port Trace**—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
  - **Owner**—Indicates the owner or left blank.
  - **Acknowledged**—Indicates whether or not the alarm is acknowledged by the user.

You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality. See “[Acknowledging Alarms](#)” for more information.

- State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
- SSID—Service Set Identifier being broadcast by the adhoc rogue radio. (Blank if SSID is not broadcast.)
- Channel Number—Indicates the channel of the adhoc rogue.
- Containment Level—Indicates the containment level of the adhoc rogue or Unassigned.
- Radio Type—Lists all radio types applicable to this adhoc rogue.
- Strongest AP RSSI—Indicates the strongest received signal strength indicator for this NCS (including all detecting access points for all controllers and across all detection times).
- No. of Rogue Clients—Indicates the number of rogue clients associated to this adhoc.

---

**Note** This number comes from the NCS database It is updated every two hours. From the **Monitor > Alarms > Alarm Details** page, this number is a real-time number. It is updated each time you open the Alarm Details page for this rogue access point.

---

- Created—Indicates when the alarm event was created.
- Modified—Indicates when the alarm event was modified.
- Generated By—Indicates how the alarm event was generated (either NMS or from a trap).  
 NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS  
 Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- Severity—Indicates the severity of the alarm including:

| Icon | Meaning  |
|------|----------|
|      | Critical |
|      | Major    |
|      | Minor    |
|      | Warning  |

| Icon                                                                              | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- Previous Severity—The previous severity of the alarm: Critical, Major, Minor, Clear. Color coded.
- Annotations—Enter any new notes in this box and click **Add** to update the alarm.
- Message—Displays descriptive information about the alarm.
- Help—Displays the latest information about the alarm.
- Event History—Click to access the **Monitor > Events** page. See “[Monitoring Events](#)” for more information.
- Annotations—Lists existing notes for this alarm.

## Searching Rogue Clients Using Advanced Search

When the access points on your wireless LAN are powered up and associated with controllers, NCS immediately starts listening for rogue access points. When a controller detects a rogue access point, it immediately notifies NCS, which creates a rogue access point alarm.

Follow these steps to find rogue access point alarms using Advanced Search.

- 
- Step 1** Click **Advanced Search** in the top right-hand corner of the NCS main page.
  - Step 2** Choose **Rogue Client** from the Search Category drop-down list.
  - Step 3** (optional) You can filter the search even further with the other search criteria if desired.
  - Step 4** Click **Search**.
  - Step 5** The list of rogue clients appears (see [Figure 5-3](#)).

Figure 5-3 Rogue Clients Page

| Client MAC Address | Last Heard               | Status | Controller     | Rogue AP          |
|--------------------|--------------------------|--------|----------------|-------------------|
| 00:40:96:b8:d4:aa  | Fri Apr 29 04:56:03 2011 | Alert  | 9.1.121.11     | 00:27:0d:eb:93:22 |

| 00:40:96:b8:d4:ab  | Fri Apr 29 05:19:07 2011 | Alert  | 10.104.173.178 | 00:23:eb:27:49:8e |
| 00:40:96:b9:4a:f5  | Fri Apr 29 05:08:44 2011 | Alert  | 10.104.173.178 | 08:1f:f3:b2:c5:51 |

**Step 6** Choose a rogue client by clicking a client MAC address. The Rogue Client detail page appears (see Figure 5-4).

Figure 5-4 Rogue Client Detail Page

Rogue Client "00:40:96:b8:d4:aa"

-- Select a command -- Go

| General                 |                   | Location                                                    |  |
|-------------------------|-------------------|-------------------------------------------------------------|--|
| Client MAC Address      | 00:40:96:b8:d4:aa | No Location Information. Client is not detected by any MSE. |  |
| Number of detecting APs | 1                 |                                                             |  |
| First Heard             |                   |                                                             |  |
| Last Heard              |                   |                                                             |  |
| Rogue AP MAC Address    |                   |                                                             |  |
| Status                  | Initializing      |                                                             |  |

| Location Notifications |   |  |  |  |  |  |
|------------------------|---|--|--|--|--|--|
| Absence                | 0 |  |  |  |  |  |
| Containment            | 0 |  |  |  |  |  |
| Distance               | 0 |  |  |  |  |  |
| All                    | 0 |  |  |  |  |  |

| APs that detected this Rogue Client |                   |                |            |      |     |                          |
|-------------------------------------|-------------------|----------------|------------|------|-----|--------------------------|
| Base Radio MAC                      | AP Name           | Channel Number | Radio Type | RSSI | SNR | Last Heard               |
| 00:26:cb:aa:de:90                   | RB_0022.bd1a.9a20 | 1              | 802.11b/g  | -56  | 19  | Fri Apr 29 04:56:03 2011 |

**Step 7** To modify the alarm, choose one of these commands from the Select a command drop-down list, and click **Go**.

- Set State to 'Unknown-Alert'—Tags the ad hoc rogue as the lowest threat, continues to monitor the ad hoc rogue, and turns off containment.
- 1 AP Containment through 4 AP Containment—Indicates the number of access points (1-4) in the vicinity of the rogue unit that send deauthenticate and disassociate messages to the client devices that are associated to the rogue unit.

- Map (High Resolution)—Displays the current calculated rogue location on the Maps > Building Name > Floor Name page.
- Location History—Displays the history of the rogue client location based on RF fingerprinting.

---

**Note** The client must be detected by an MSE for the location history to appear.

---

## Monitoring Rogue Access Point Location, Tagging, and Containment

When the Cisco Unified Network Solution is monitored using NCS, NCS generates the flags as rogue access point traps and displays the known rogue access points by MAC address. The operator can then display a map showing the location of the access points closest to each rogue access point. The next step is to mark them as Known or Acknowledged rogue access points (no further action), Alert rogue access points (watch for and notify when active), or Contained rogue access points (have between one and four access points discourage rogue access point clients by sending the clients deauthenticate and disassociate messages whenever they associate with the rogue access point).

This built-in detection, tagging, monitoring, and containment capability enables system administrators to take appropriate action:

- Locate rogue access points
- Receive new rogue access point notifications, eliminating hallway scans
- Monitor unknown rogue access points until they are eliminated or acknowledged
- Determine the closest authorized access point, making directed scans faster and more effective
- Contain rogue access points by sending their clients deauthenticate and disassociate messages from one to four access points. This containment can be done for individual rogue access points by MAC address or can be mandated for all rogue access points connected to the enterprise subnet.
- Tag rogue access points:
  - Acknowledge rogue access points when they are outside of the LAN and do not compromise the LAN or wireless LAN security
  - Accept rogue access points when they do not compromise the LAN or wireless LAN security
  - Tag rogue access points as unknown until they are eliminated or acknowledged
- Tag rogue access points as contained and discourage clients from associating with the rogue access points by having between one and four access points transmit deauthenticate and disassociate messages to all rogue access point clients. This function applies to all active channels on the same rogue access point.

### Detecting Access Points

Use the Detecting Access Points feature to view information about the Cisco lightweight access points that are detecting a rogue access point.

To access the Rogue AP Alarms details page, follow these steps:

- 
- Step 1** To display the Rogue AP Alarms page, do one of the following:

- Perform a search for rogue APs. See [“Using the Search Feature”](#) for more information about the search feature.
  - From the NCS home page, click the Security dashboard. This dashboard displays all the rogue access points detected in the past hour and the past 24 hours. Click the rogue access point number to view the rogue access point alarms.
  - Click the **Malicious AP** number link in the Alarm Summary box.
- Step 2** From the Rogue AP Alarms page, click the Rogue MAC Address for the applicable rogue access point. The Rogue AP Alarms details page appears.
- Step 3** From the Select a command drop-down list, choose **Detecting APs**.
- Step 4** Click **Go**.

Click a list item to display data about that item:

- AP Name
  - Radio
  - Map Location
  - SSID—Service Set Identifier being broadcast by the rogue access point radio.
  - Channel Number—Which channel the rogue access point is broadcasting on.
  - WEP—Enabled or disabled.
  - WPA—Enabled or disabled.
  - Pre-Amble—Long or short.
  - RSSI—Received signal strength indicator in dBm.
  - SNR—Signal-to-noise ratio.
  - Containment Type—Type of containment applied from this access point.
  - Containment Channels—Channels that this access point is currently containing.
- 

## Monitoring Rogue Alarm Events

The Events page enables you to review information about rogue alarm events. NCS generates an event when a rogue access point is detected or if you make manual changes to a rogue access point (such as changing its state). The Rogue AP Events list page displays all rogue access point events.

To access the Rogue AP Events list page, follow these steps:

- 
- Step 1** Do one of the following:
- Perform a search for rogue access point events using the Advanced Search feature of NCS. See [“Advanced Search”](#) for more information.
  - From the Rogue AP Alarms details page, click **Event History** from the Select a command drop-down list. See [“Viewing Rogue AP Alarm Details”](#) for more information.
- Step 2** The Rogue AP Events list page displays the following event information.
- Severity—Indicates the severity of the alarm including:

| Icon                                                                              | Meaning  |
|-----------------------------------------------------------------------------------|----------|
|  | Critical |
|  | Major    |
|  | Minor    |
|  | Warning  |
|  | Info     |

- Rogue MAC Address—Click the rogue MAC address to view the Rogue AP Event Details page. See [“Viewing Rogue AP Event Details”](#) for more information.
- Vendor—Rogue access point vendor name or Unknown.
- Classification Type—Malicious, Friendly, or Unclassified.
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Date/Time—The date and time that the event was generated.
- State—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)

## Viewing Rogue AP Event Details

To view rogue access point event details, follow these steps:

- 
- Step 1** From the Rogue AP Events list page, click the Rogue MAC Address link.
- Step 2** The Rogue AP Events Details page displays the following information:
- Rogue MAC Address
  - Vendor—Rogue access point vendor name or Unknown.
  - On Network—Indicates how the rogue detection occurred.
    - Controller—The controller detected the rogue (Yes or No).
    - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
  - Classification Type—Malicious, Friendly, or Unclassified.

- **State**—Indicates the state of the alarm. Possible states vary depending on the classification type of rogue access point.
- **SSID**—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- **Channel Number**—The channel on which the rogue access point is broadcasting.
- **Containment Level**—Indicates the containment level of the rogue access point or Unassigned.
- **Radio Type**—Lists all radio types applicable to this rogue access point.
- **Created**—The date and time that the event was generated.
- **Generated By**—Indicates how the alarm event was generated (either NMS or from a trap).
  - **NMS (Network Management System - NCS)**—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS.
  - **Trap**—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- **Device IP Address**
- **Severity**—Indicates the severity of the alarm including:

| Icon                                                                                | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Critical                                                                                                                                                                                                                                                                                                                                                      |
|  | Major                                                                                                                                                                                                                                                                                                                                                         |
|  | Minor                                                                                                                                                                                                                                                                                                                                                         |
|  | Warning                                                                                                                                                                                                                                                                                                                                                       |
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- **Message**—Provides details of the current event.

## Monitoring Adhoc Rogue Events

The Events page enables you to review information about adhoc rogue events. NCS generates an event when an adhoc rogue is detected or if you make manual changes to an adhoc rogue (such as changing its state). The Adhoc Rogue Events list page displays all adhoc rogue events.

To access the Rogue AP Events list page, follow these steps:

- Step 1** Do one of the following:
- Perform a search for adhoc rogues events using the Advanced Search feature of NCS. See [“Advanced Search”](#) for more information.
  - From the Adhoc Rogue Alarms details page, click **Event History** from the Select a command drop-down list. See [“Viewing Adhoc Rogue Alarm Details”](#) for more information.
- Step 2** The Rogue AP Events list page displays the following event information.
- Severity—Indicates the severity of the alarm including:

| Icon                                                                               | Meaning  |
|------------------------------------------------------------------------------------|----------|
|   | Critical |
|   | Major    |
|   | Minor    |
|   | Warning  |
|  | Info     |

- Rogue MAC Address—Click the rogue MAC address to view the Rogue AP Event Details page. See [“Viewing Adhoc Rogue Event Details”](#) for more information.
- Vendor—Rogue access point vendor name or Unknown.
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Date/Time—The date and time that the event was generated.
- State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)

## Viewing Adhoc Rogue Event Details

To view rogue access point event details, follow these steps:

- Step 1** From the Rogue AP Events list page, click the Rogue MAC Address link.

**Step 2** The Rogue AP Events Details page displays the following information:

- Rogue MAC Address
- Vendor—Rogue access point vendor name or Unknown.
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Channel Number—The channel on which the rogue access point is broadcasting.
- Containment Level—Indicates the containment level of the rogue access point or Unassigned.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Created—The date and time that the event was generated.
- Generated By—Indicates how the alarm event was generated (either NMS or from a trap).
  - NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS
  - Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- Device IP Address
- Severity—Indicates the severity of the alarm including:

| Icon                                                                                | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Critical                                                                                                                                                                                                                                                                                                                                                      |
|  | Major                                                                                                                                                                                                                                                                                                                                                         |
|  | Minor                                                                                                                                                                                                                                                                                                                                                         |
|  | Warning                                                                                                                                                                                                                                                                                                                                                       |
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- **Message**—Provides details of the current event.
- 

## Monitoring RFID Tags

The **Monitor > RFID Tags** page allows you to monitor tag status and location on NCS maps as well as review tag details.

**Note**

---

This page is only available in the Location version of NCS.

---

This section provides information on the tags detected by the location appliance.

Choose **Monitor > RFID Tags** to access this section. By default, [Tag Summary](#) page is displayed.

- [Tag Summary](#)
- [Searching Tags](#)
- [Viewing RFID Tag Search Results](#)
- [Viewing Tag List](#)

## Tag Summary

Choose **Monitor > RFID Tags** to access this page.

This page provides information on the number of tags that are detected by MSE. The following parameters are displayed on the main data area:

- **MSE Name**—Name of the MSE device.
- **Total Tags**—Click the number to view tag details. Clicking on the number gives the list of tags located by the MSE. Click on a mac address gives the tag details pertaining to that mac address.

## Searching Tags

Use the NCS Advanced Search feature to find specific or all tags.

To search for tags in NCS, follow these steps:

---

**Step 1** Click **Advanced Search**.

**Step 2** Select **Tags** from the Search Category drop-down list.

**Step 3** Identify the applicable tag search parameters including:

- **Search By**—Choose All Tags, Asset Name, Asset Category, Asset Group, MAC Address, Controller, MSE, Floor Area, or Outdoor Area.

**Note**

---

Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.

---

- Search In—Choose MSEs or NCS Controllers.
- Last detected within—Choose a time increment from 5 minutes to 24 hours. The default is 15 minutes.
- Tag Vendor—Select the check box and choose Aeroscout, G2, PanGo, or WhereNet.
- Telemetry Tags only—Check the Telemetry Tags only to search tags accordingly.

**Step 4** Click **Go**.

---

## Viewing RFID Tag Search Results

Use the NCS Advanced Search feature located at the top right of the NCS window to search for tags by asset type (name, category and group), by MAC address, by system (controller or location appliance), and by area (floor area and outdoor area).

**Note**

Search parameters may change depending on the selected category. When applicable, enter the additional parameter or filter information to help identify the Search By category.

---

You can further refine your search using the Advanced search parameters and save the search criteria for future use. Saved search criteria can be retrieved from the Saved Searches located in the navigation bar.

See [“Advanced Search”](#) or [“Saved Searches”](#) for additional information.

When you click the MAC address of a tag location in a search results page, the following details display for the tag:

- Tag vendor

**Note**

Option does not display when Asset Name, Asset Category, Asset Group or MAC Address are the search criteria for tags.

---

- Controller to which tag is associated
- Telemetry data (CCX v1 compliant tags only)
  - Telemetry data displayed is vendor-specific; however, some commonly reported details are GPS location, battery extended information, pressure, temperature, humidity, motion, status, and emergency code.

**Note**

The Telemetry data option only appears when MSE (select for location servers), Floor Area, or Outdoor Area are selected as the Search for tags by option.

---

**Note**

Only those vendor tags that support telemetry appear.

---

- Asset Information (Name, Category, Group)
- Statistics (bytes and packets received)
- Location (Floor, Last Located, MSE, map)

- Location Notification (Absence, Containment, Distance, All)

**Note** Telemetry data displayed is vendor-specific; however, some commonly reported details are GPS location, battery extended information, pressure, temperature, humidity, motion, status, and emergency code.

- Emergency Data (CCX v1 compliant tags only)

## Viewing Tag List

Click the Total Tags number link to view the Tags List for the applicable device name. The Tag List contains the following information:

- MAC Address
- Asset Name
- Asset Group
- Asset Category
- Vendor Name
- Mobility Services Engine
- Controller
- Battery Status
- Map Location

## Monitoring Chokepoints

Chokepoints are installed and configured as recommended by the Chokepoint vendor. After the chokepoint installation is complete and operational, the chokepoint can be added to NCS and placed on Floor Maps. They are pushed to the Location Server during synchronization.

Choose **Monitor > Chokepoints** to access this section. A page appears displaying a list of found chokepoints. Clicking a the link under Map Location for a particular chokepoint displays a map that shows the location of the chokepoint.

The following parameters are displayed:

- MAC Address—The MAC address of the chokepoint.
- Chokepoint Name—The user-defined name of the chokepoint.
- Entry/Exit Chokepoint—Indicates whether or not the chokepoint is an entry/exit chokepoint.
- Range—The range of the chokepoint in feet.
- Static IP—The static IP address of the chokepoint.
- Map Location—A link to a map showing the location of the chokepoint.

## Performing a Chokepoint Search

An advanced search allows you to search for chokepoints.

To perform an advanced search for a chokepoint in NCS, follow these steps:

- 
- Step 1** Click **Advanced Search** located in the top right corner of NCS.
  - Step 2** From the New Search page, select **Chokepoint** from the Search Category drop-down list.
  - Step 3** Select the method by which you want to search (by MAC address or chokepoint name) from the Search for Chokepoint by drop-down list.
  - Step 4** Enter the MAC address or chokepoint name, depending on the search method selected.
  - Step 5** Click **Search**.
- 

## Monitoring Interferers

The **Monitor > Interferer** page allows you to monitor interference devices detected by the CleanAir enabled access points.

This section provides information on the interferers detected by the CleanAir enabled access points. By default, the [Monitoring AP Detected Interferers](#) page is displayed.

- [Monitoring AP Detected Interferers, page 5-116](#)
- [Monitoring AP Detected Interferer Details, page 5-117](#)
- [Monitoring AP Detected Interferer Details Location History, page 5-118](#)
- [Configuring the Search Results Display, page 5-119](#)

## Monitoring AP Detected Interferers

Choose **Monitor > Interferers** to view all the interfering devices detected by the CleanAir enabled access points on your wireless network. This page enables you to view a summary of the interfering devices including the following default information:

- Interferer ID—A unique identifier for the interferer. Click this link to know more about the interferer.
- Type—Indicates the category of the interferer. Click to read more about the type of device. A pop-up page appears displaying more details. The categories include:
  - Bluetooth link—A Bluetooth link (802.11b/g/n only)
  - Microwave Oven—A microwave oven (802.11b/g/n only)
  - 802.11 FH—An 802.11 frequency-hopping device (802.11b/g/n only)
  - Bluetooth Discovery—A Bluetooth discovery (802.11b/g/n only)
  - TDD Transmitter—A time division duplex (TDD) transmitter
  - Jammer—A jamming device
  - Continuous Transmitter—A continuous transmitter
  - DECT-like Phone—A digital enhanced cordless communication (DECT)-compatible phone
  - Video Camera—A video camera
  - 802.15.4—An 802.15.4 device (802.11b/g/n only)

- WiFi Standard—A device using standard Wi-Fi channels
- WiFi Inverted—A device using spectrally inverted Wi-Fi signals
- WiFi Invalid Channel—A device using non-standard Wi-Fi channels
- SuperAG—An 802.11 SuperAG device
- Canopy—A Motorola Canopy device
- Radar—A radar device (802.11a/n only)
- XBox—A Microsoft Xbox (802.11b/g/n only)
- WiMAX Mobile—A WiMAX mobile device (802.11a/n only)
- WiMAX Fixed—A WiMAX fixed device (802.11a/n only)
- WiFi AOCI—A WiFi device with AOCI
- Unclassified
- Status—Indicates the status of the interfering device.
  - Active—Indicates that the interferer is currently being detected by the CleanAir capable access point.
  - Inactive—Indicates that the interferer is no longer being detected by the CleanAir capable access point or no longer reachable by NCS.
- Severity—Displays the severity ranking of the interfering device.
- Affected Band—Displays the band in which this device is interfering.
- Affected Channels—Displays the affected channels.
- Duty Cycle (%)—The duty cycle of interfering device in percentage.
- Discovered—Displays the time at which it was discovered.
- Last Updated—The last time the interference was detected.
- Floor—The location where the interfering device is present.

## Monitoring AP Detected Interferer Details

Choose **Monitor > Interferers > <Interferer ID>** to view this page. This page enables you to view the details of the interfering devices detected by the access points. This page provides the following details about the interfering device.

- Interferer Properties
  - Type—Displays the type of the interfering device detected by the AP.
- Status—The status of the interfering device. Indicates the status of the interfering device.
  - Active—Indicates that the interferer is currently being detected by the CleanAir capable access point.
  - Inactive—Indicates that the interferer is no longer being detected by the CleanAir capable access point or no longer reachable by NCS.
  - Severity—Displays the severity ranking of the interfering device.
  - Duty Cycle (%)—The duty cycle of interfering device in percentage.
  - Affected Band—Displays the band in which this device is interfering.
  - Affected Channels—Displays the affected channels.

- Discovered—Displays the time at which it was discovered.
- Last Updated—The last time the interference was detected.
- Location
  - Floor—The location where this interfering device was detected.
  - Last Located At—The last time where the interfering device was located.
  - On MSE—The Mobility Server Engine on which this interference device was located.
- Clustering Information
  - Clustered By—Displays the IP address of the controller or the MSE that clustered the interferer information from the access point.
  - Detecting APs—Displays the details of the access point that has detected the interfering device. The details include: Access Point Name (Mac), Severity, and Duty Cycle(%).
- Details—Displays a short description about the interfering type.

### Select a command

The Select a command drop-down list provides access to the location history of the interfering device detected by the access point. See [Monitoring AP Detected Interferer Details Location History](#).

## Monitoring AP Detected Interferer Details Location History

Choose **Monitor > Interferers > <Interference Device ID>**, select **Location History** from the Select a command drop-down list, and click **Go** to view this page.

- Interferer Information—Displays the basic information about the interfering device.
  - Data Collected At—The time stamp at which the data was collected.
  - Type—The type of the interfering device.
  - Severity—The severity index of the interfering device.
  - Duty Cycle—The duty cycle (in percentage) of the interfering device.
  - Affected Channels—A comma separated list of the channels affected.
- Interferer Location History—Displays the location history of the interfering devices.
  - Time Stamp
  - Floor
- Clustering Information
  - Clustered By
- Detecting APs
  - AP Name—The access point that detected the interfering device.
  - Severity—The severity index of the interfering device.
  - Duty Cycle(%)—The duty cycle (in percentage) of the interfering device.
- Location
  - Location Calculated At—Displays the time stamp at which this information was generated.
  - Floor—Displays location information of the interfering device.

- A graphical view of the location of the interfering device is displayed in a map. Click the [Enlarge](#) link to view an enlarged image.

## Configuring the Search Results Display

The Edit View page allows you to add, remove, or reorder columns in the AP Detected Interferers Summary page.

To edit the columns in the AP Detected Interferers page, follow these steps:

- 
- Step 1** Choose **Monitor > Interferers**. The AP Detected Interferers page appears showing details of the interferers detected by the CleanAir enabled access points.
  - Step 2** Click the **Edit View** link.
  - Step 3** To add an additional column to the access points table, click to highlight the column heading in the left column. Click **Show** to move the heading to the right column. All items in the right column are displayed in the table.
  - Step 4** To remove a column from the access points table, click to highlight the column heading in the right column. Click **Hide** to move the heading to the left column. All items in the left column are not displayed in the table.
  - Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired column heading and click **Up** or **Down** to move it higher or lower in the current list.
  - Step 6** Click **Reset** to restore the default view.
  - Step 7** Click **Submit** to confirm the changes.
- 

## Monitoring Spectrum Experts

A Spectrum Expert client acts as a remote interference sensor and sends dynamic interference data to NCS. This feature allows the NCS to collect and archive and monitor detailed interferer and air quality data from Spectrum Experts in the network.

To access the Monitor Spectrum Experts page, follow these steps:

- 
- Step 1** Choose **Monitor > Spectrum Experts**.
  - Step 2** From the left sidebar menu, you can access the [Spectrum Experts Summary](#) page and the [Interferers Summary](#) page.
- 

## Spectrum Experts Summary

The **Spectrum Experts > Summary** page is the default page and provides a table of the Spectrum Experts added to the system. The table provides the following Spectrum Expert information:

- **Hostname**—Displays the hostname or IP Address depending on how it was added. Click the hostname to access the [Spectrum Experts Details](#) page.

- **Active Interferers**—Indicates the current number of interferers being detected by the Spectrum Experts.
- **Affected APs**—The number of access points seen by the Spectrum Expert that are potentially affected by detected interferers.
- **Alarms**—The number of active interference traps sent by the Spectrum Expert. Click to access the Alarm page that is filtered to the active alarms for this Spectrum Expert.
- **Reachability Status**—Indicates “Reachable” in green if the Spectrum Expert is running and sending data to NCS; otherwise indicates “Unreachable” in red.
- **Location**—When the Spectrum is a wireless client, a link is available that displays the location of the Spectrum Expert. A red box around the Spectrum Expert indicates the effective range. Click to access the nearest mapped access point.

## Interferers Summary

The **Interferers > Summary** page displays a list of all the Interferers detected over a 30 day interval. The table provides the following Interferers information:

- **Interferer ID**—An identifier that is unique across different spectrum experts.
- **Category**—Indicates the category of the interferer. Categories include: Bluetooth, Cordless Phones, Microwave Ovens, 802.11 FH, Generic - Fixed-Frequency, Jammers, Generic - Frequency-Hopped, Generic - Continuous.
- **Type**—Indicates the type of Interferer. Click to access a pop-up description of the type.
- **Status**—Indicates Active or Inactive.
  - **Active**—Indicates that the interferer is currently being detected by a spectrum expert.
  - **Inactive**—Indicates that the interferer is no longer detected by a spectrum expert or the spectrum expert that saw the interferer is no longer reachable by NCS.
- **Discover Time**—Indicates the time of discovery.
- **Affected Channels**—Identifies affected channels.
- **Number of APs Affected**—An access point is listed as Affected if the following conditions are met:
  - The access point is managed by NCS.
  - The spectrum expert detects the access point.
  - The spectrum expert detects an interferer on the serving channel of the access point.
- **Power**—Indicated in dBm.
- **Duty Cycle**—Indicated in percentage.

---

**Note** 100% indicates the worst value.

---

- **Severity**—Indicates the severity ranking of the Interferer.

---

**Note** 100% indicates the worst value where 0 indicates no interference.

---

## Interferers Search

Use the NCS Search feature to find specific Interferers or to create and save custom searches. See one of the following topics for additional information:

- [Using the Search Feature](#)
- [Quick Search](#)
- [Advanced Search](#)
- [Saved Searches](#)

## Spectrum Experts Details

The Spectrum Expert Details page provides all interference details from a single Spectrum Expert. This page updates every 20 seconds providing a real-time look at what is happening on the remote Spectrum Expert and includes the following items:

- Total Interferer Count—As seen by the specific Spectrum Expert.
- Active Interferers Count Chart—Displays a pie chart that groups interferes by category.
- Active Interferer Count Per Channel—Displays the number of interferes grouped by category on different channels.
- AP List—Provides a list of access points detected by the Spectrum Expert that are on channels that have active interferers detected by the Spectrum Expert on those channels.
- Affected Clients List—Provides a list of clients that are currently authenticated/associated to the radio of one of the access points listed in the access point list.

## Monitoring WiFi TDOA Receivers

To monitor Wi-Fi TDOA receivers, follow these steps:

- 
- Step 1** Choose **Monitor > WiFi TDOA Receivers**. The WiFi TDOA Receiver summary page appears showing all mapped WiFi TDOA receivers.
- Step 2** To refine the search criteria when an extensive lists appears, you can search by MAC address or location sensor name.
- To initiate a search for a TDOA receiver by its MAC address, click the **Advanced Search** link in the NCS window. Select **WiFi TDOA Receiver** from the Search Category drop-down list and **MAC Address** from the Search by drop-down list. Enter the MAC address of the TDOA receiver in the available text box and click **Search**.
  - To initiate a search for a TDOA receiver by its name, select **Advanced Search** link in the NCS window. Select **WiFi TDOA Receiver** from the Search Category drop-down list and **WiFi TDOA Receivers** from the Search by drop-down list. Enter the name of the TDOA receiver in the available text box and click **Search**.

If no match exists, then a message indicating that appears in the page. Otherwise the search result displays.

---

**Note** See [“Using the Search Feature”](#) or [“Advanced Search”](#) for more information on the NCS Search feature.

---

The WiFi TDOA Receivers page displays the following information:

- MAC Address
- WiFi TDOA Receiver Name
- Static IP—Static IP address of the WiFi TDOA receiver.
- Oper Status—Up or down.
- Map Location—Click the Map Location link to view the floor map for this WiFi TDOA receiver. See [“Floor Area”](#) for more information on NCS floor maps.

---

**Note** See [“Configuring WiFi TDOA Receivers”](#) for more information on adding, configuring, and editing WiFi TDOA receivers.

---

## Monitoring Radio Resource Management (RRM)

The operating system security solution uses the radio resource management (RRM) function to continuously monitor all nearby access points, automatically discover rogue access points, and locate them as described in the [“”](#) section.

Radio Resource Management (RRM) built into the Cisco Unified Wireless Network monitors and dynamically corrects performance issues found in the RF environment.

NCS would receive traps whenever a change in the transmit power of the access point or channel occurred. These trap events or similar events such as RF regrouping were logged into NCS events as informational and were maintained by the event dispatcher. The reason behind the transmit power or channel changes (such as signals from neighboring access points, interference, noise, load, and the like) were not evident. You could not view these events and statistics to then perform troubleshooting practices.

Radio Resource Management (RRM) statistics helps to identify trouble spots and provides possible reasons for channel or power level changes. The dashboard provides network-wide RRM performance statistics and predicts reasons for channel changes based on grouping the events together (worst performing access points, configuration mismatch between controllers in the same RF group, coverage holes that were detected by access points based on threshold, pre-coverage holes that were detected by controllers, ratios of access points operating at maximum power, and so on).

---

**Note** The RRM dashboard information is only available for lightweight access points.

---

- [Channel Change Notifications](#)
- [Transmission Power Change Notifications](#)
- [RF Grouping Notifications](#)
- [Viewing the RRM Dashboard](#)

## Channel Change Notifications

Notifications are sent to the NCS RRM dashboard when a channel change occurs. Channel changes depend on the dynamic channel assignment (DCA) configuration where the mode can be set to auto or on demand. When the mode is *auto*, channel assignment is periodically updated for all lightweight access points which permit this operation. When the mode is set to *on demand*, channel assignments are updated based upon request. If the DCA is static, no dynamic channel assignments occur, and values are set to their global default.

When a channel change trap is received and a channel change had occurred earlier, the event is marked as Channel Revised; otherwise, the event is marked as Channel Changed. Each event for channel change can be caused by multiple reasons. The reason code is factored and equated to one irrespective of the number of reasons for the event to occur. For example, suppose a channel change is caused by signal, interference, or noise. When the reason code is received in the notification, the reason code is refactored across the reasons. If three reasons caused the event to occur, the reason code is refactored to 1/3 or 0.33 per reason. If ten channel change events are received with the same reason code, all of the three reasons are equally factored to determine the cause of the channel change.

## Transmission Power Change Notifications

Notifications are sent to the NCS RRM dashboard when transmission power changes occur. Each event for transmit power changes is caused by multiple reasons. The reason code is factored and equated to one irrespective of the number of reasons for the event to occur.

## RF Grouping Notifications

When RRM is run on the controller, dynamic grouping is done, and a new group leader is chosen. Dynamic grouping has three modes: Automatic, Off and Leader. When the grouping is Off, no dynamic grouping occurs, and each switch optimizes only its own lightweight access point parameters. When the grouping is Automatic, switches form groups and elect leaders to perform better dynamic parameter optimization. With grouping automatic, configured intervals (in seconds) represent the period with which the grouping algorithm is run. (Grouping algorithms also run when the group contents change and automatic grouping is enabled.)

## Viewing the RRM Dashboard

The RRM dashboard is accessed by choosing **Monitor > RRM**.

The dashboard is made up of the following parts:

- The RRM RF Group Summary shows the number of different RF groups.

**Note** To get the latest number of RF Groups, you have to run the configuration sync background task.

- The RRM Statistics portion shows network-wide statistics
- The Channel Change Reason portion shows why channels changed for all 802.11a/b/g/n radios.
  - Signal—The channel changed because it improved the channel quality for some other neighbor radio(s). Improving the channel quality for some other neighbor radio(s) improved the channel plan of the system as evaluated by the algorithm.
  - Wifi Interference

- Load
  - Radar
  - Noise
  - Persistent Non-Wifi Interference
  - Major Air Quality Event
  - Other
- The Channel Change shows all events complete with causes and reasons.
  - The Configuration Mismatch portion shows comparisons between leaders and members.
  - The Coverage Hole portion rates how severe the coverage holes are and gives their location.
  - The Percent Time at Maximum Power shows what percent of time the access points were at maximum power and gives the location of those access points.

The following statistics are displayed:

- Total Channel Changes—The sum total of channel changes across 802.11a/b/g/n radios, irrespective of whether the channel was updated or revised. The count is split over a 24-hour and 7-day period. If you click the percentages link or the link under the 24-hour column, a page with details for that access point only appears.
- Total Configuration Mismatches—The total number of configuration mismatches detected over a 24-hour period.
- Total Coverage Hole Events—The total number of coverage hole events over a 24-hour and 7-day period.
- Number of RF Groups—The total number of RF groups (derived from all the controllers which are currently managed by NCS).
- Configuration Mismatch—The configuration mismatch over a 24-hour period by RF group with details on the group leader.
- APs at MAX Power—The percentage of access points with 802.11a/n radios as a total percentage across all access points which are at maximum power. The maximum power levels are preset and are derived with reference to the preset value.

---

**Note** Maximum power is shown in three areas of the RRM dashboard. This maximum power portion shows the current value and is poll driven.

---

- Channel Change Causes—A graphical bar chart for 802.11a/n radios. The chart is factored based on the reason for channel change. The chart is divided into two parts, each depicting the percentage of weighted reasons causing the event to occur over a 24-hour and 7-day period. Each event for channel change can be caused by multiple reasons, and the weight is equally divided across these reasons. The net reason code is factored and equated to one irrespective of the number of reasons for the event to occur.
- Channel Change - APs with channel changes—Each event for channel change includes the MAC address of the lightweight access point. For each reason code, you are given the most channel changes that occurred for the 802.11a/n access point based on the weighted reason for channel events. This count is split over a 24-hour and 7-day period.
- Coverage Hole - APs reporting coverage holes—The top five access points filtered by IF Type 11 a/n which triggered a coverage hole event (threshold based) are displayed.

- Aggregated Percent Max Power APs—A graphical progressive chart of the total percentage of 802.11a/n lightweight access points which are operating at maximum power to accommodate coverage holes events. The count is split over a 24-hour and 7-day period.

---

**Note** This maximum power portion shows the values from the last 24 hours and is poll driven. This occurs every 15 minutes or as configured for radio performance.

---

- Percent Time at Maximum Power—A list of the top five 802.11a/n lightweight access points which have been operating at maximum power.

---

**Note** This maximum power portion shows the value from the last 24 hours and is only event driven.

---

## Monitoring Clients and Users

The Monitor Clients and Users information assists in identifying, diagnosing, and resolving client issues. Using the Monitor Clients and Users feature, you can view a client association history and statistical information. You can also troubleshoot client historical issues. These tools are useful when users complain of network performance as they move throughout a building with their laptop computers. The information may help you assess what areas experience inconsistent coverage and which areas have the potential to drop coverage. See [Managing Clients, page 10-1](#) for more information.

## Alarms and Events Overview

An event is an occurrence or detection of some condition in and around the network. For example, it can be a report about radio interference crossing a threshold, the detection of a new rogue access point, or a controller rebooting.

Events are not generated by a controller for each and every occurrence of a pattern match. Some pattern matches must occur a certain number of times per reporting interval before they are considered a potential attack. The threshold of these pattern matches is set in the signature file. Events can then generate alarms which further can generate e-mail notifications if configured as such.

An alarm is a Cisco NCS response to one or more related events. If an event is considered of high enough severity (critical, major, minor, or warning), the NCS raises an alarm until the resulting condition no longer occurs. For example, an alarm may be raised while a rogue access point is detected, but the alarm terminates after the rogue has not been detected for several hours.

One or more events can result in a single alarm being raised. The mapping of events to alarms is their correlation function. For example, some IDS events are considered to be network wide so all events of that type (regardless of which access point the event is reported from) map to a single alarm. On the other hand, other IDS events are client-specific. For these, all events of that type for a specific client MAC address map to an alarm which is also specific for that client MAC address, regardless of whether multiple access points report the same IDS violation. If the same kind of IDS violation takes place for a different client, then a different alarm is raised.

A NCS administrator currently has no control over which events generate alarms or when they time out. On the controller, individual types of events can be enabled or disabled (such as management, SNMP, trap controls, and so on).

## Viewing List of Alarms

Choose **Monitor > Alarms** to access the Alarm Browser page which provides a list of alarms. You can also hover your mouse cursor over **Alarm Browser** in the toolbar at the bottom of the NCS page to view the Alarm Browser page.

The Alarm Browser lists the following information for each alarm:

- Severity—Severity of the alarm which can be:
  - Critical
  - Major
  - Minor
  - Warning
  - Informational
- Status— Status of the alarm.
- Timestamp—Date and time that the alarm occurred.
- Category—Category assigned to the alarm such as rogue AP, controller, switch, and security.
- Condition—Condition that caused the alarm.
- Owner—Name of the person to whom this alarm is assigned, if one was entered.

- **Message**—Messages about the alarm.
- **Failure Source**—Indicates the source of the event (including name and/or MAC address).

**Note**

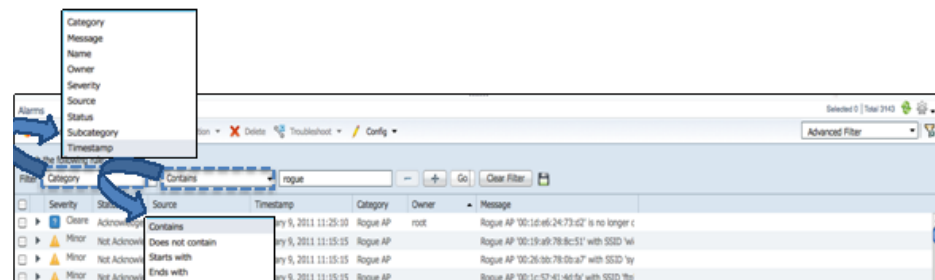

By default, acknowledged alarms are not shown in the Alarm Browser page. To change this, select **Administration > Settings > Alarms**, then unselect the Hide Acknowledged Alarms check box. You must unselect the preference of hiding acknowledged alarms if you want acknowledged alarms to show on the NCS Alarm Summary and alarms lists page.

Use the check box to select one or more alarms. To select all alarms displayed in the Alarm Browser, click the topmost box. See [Modifying Alarms](#) for more information.

## Filtering Alarms

From the **Monitor > Alarms** page, you can filter the alarms that are displayed in the Alarm Browser.

**Figure 5-5** Filtering Alarms

Choose **Monitor > Alarms**, then from the Show pulldown menu, select one of the following filters:

- **Quick Filter**—Enter text in any of the boxes to display alarms that contain the text you enter. For example, if you enter **AP** in the Category field, AP and Rogue AP alarms are displayed. It provides an optional filtered view of alarms for wired and wireless alarms.
- **Advance Filter**—This filter provides an advanced alarm search capability. It provides ability to search on specific fields with various conditions like contains, does not contain, starts with, ends with and so on. Additionally advanced filters allows nesting of AND/OR conditions. Select the category and operator, then enter criteria in the text field to compare against, then:
  - Click **+** to add an additional filter or **-** to remove a filter you specified.
  - Click **Go** to apply your filter.
  - Click **Clear Filter** to clear the entries you entered.
  - Click the disc icon to save your filter. Enter a name for the filter you want to save, then click **Save**.

**Note**

When a preset filter is selected and the filter button is clicked, the filter criteria is greyed out. You can only see the filter criteria but will not be able to change it. When 'All' is selected to view all the entries, clicking on the filter button shows the Quick Filter options, where you can filter the data using the filterable fields, there is also a free form text box, where you can enter text and filter the table.

- All—Displays all alarms.
- Manage Preset Filter—Displays any previously saved filters and allows you to edit and delete previously saved filters.
- Assigned to Me—Displays all alarms assigned to you.
- Unassigned Alarms—Displays all unassigned alarms.
- Alarms in Last 5 Minutes
- Alarms in Last 15 Minutes
- Alarms in Last 30 Minutes
- Alarms in the last hour
- Alarms in the last 8 hours
- Alarms in the last 24 hours
- Alarms in last 7 days
- All wired alarms—Displays all alarms for wired devices.
- All wireless alarms—Displays all alarms for wireless devices.

## Viewing Alarm Details

You can view alarm details from the **Monitor > Alarms** page by clicking the expand icon to the far left of the **Monitor > Alarms** page for the alarm for which you want to see details. The details that are displayed depend on the alarm type you selected.

**Table 5-60** Viewing Alarm Details

| Section                          | Field             | Description                                                            |
|----------------------------------|-------------------|------------------------------------------------------------------------|
| <b>General Info</b> <sup>1</sup> | Failure Source    | Indicates the source of the event (including name and/or MAC address). |
|                                  | Owner             | Name of person to which this alarm is assigned, or blank.              |
|                                  | Acknowledged      | Displays whether or not the alarm is acknowledged by the user.         |
|                                  | Category          | The category of the alarm (for example, AP, Rogue AP, or Security).    |
|                                  | Created           | Month, day, year, hour, minute, second, AM or PM alarm created.        |
|                                  | Modified          | Month, day, year, hour, minute, second, AM or PM alarm last modified.  |
|                                  | Generated By      | Device that generated the alarm.                                       |
|                                  | Severity          | Level of security: Critical, Major, Minor, Warning, Clear, Info.       |
|                                  | Previous Severity | The severity of the alarm the after the most recent polling cycle.     |

Table 5-60 Viewing Alarm Details

| Section     | Field           | Description                                                                                                                                                                                                                          |
|-------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Info | Device Name     | Name of the device.                                                                                                                                                                                                                  |
|             | Device Address  | IP address of the device.                                                                                                                                                                                                            |
|             | Device Contact  | Contact information for the device.                                                                                                                                                                                                  |
|             | Device Location | Location of the device.                                                                                                                                                                                                              |
|             | Device Status   | Status of the device.                                                                                                                                                                                                                |
| Messages    |                 | Device information retrieved from log messages.                                                                                                                                                                                      |
| Annotation  |                 | Lists current notes regarding this rogue access point. To add a new note, click <b>New Annotation</b> . Type the note and click <b>Post</b> to save and display the note or <b>Cancel</b> to close the page without saving the note. |

1. The General information may vary depending on the type of alarm. For example, some alarm details may include location and switch port tracing information.

From the Alarms list page, you can also view the events for the alarm you selected as explained in [Viewing Events Related to Alarms, page 5-129](#).

## Viewing Events Related to Alarms

When you select **Monitor > Alarms** page, you can view alarm summary information by hovering your mouse over an alarm severity in the Severity column and clicking the icon that appears.

A dialog appears displaying the top 5 events related to the alarm you selected.

Click **Events** to display *all* events associated with the selected alarm.

## Modifying Alarms

From the **Monitor > Alarms** page, you can modify the alarms by selecting the checkbox next to an alarm and then clicking one of the tasks at the top of the Alarm Browser page:

### Note

The alarms that appear on the Monitor > Alarms page depend on the settings you specify on the Administration > Settings page. See [Modifying Alarm Settings, page 5-132](#) for more information.

- Change Status—Change the alarm status to one of the following:
  - Acknowledge—You can acknowledge the alarm. By default, acknowledged alarms are not displayed in the Alarm Browser page. Acknowledged alarms remain in NCS and you can search for all acknowledged alarms using the alarm search functionality. See [“Acknowledging Alarms”](#) for more information.
  - Unacknowledge—You can choose to unacknowledge an already acknowledged alarm.
  - Clear—Clear the selected alarm(s). The alarm is removed from the Alarm Browser. Cleared alarms remain in NCS and you can search for all cleared alarms using the alarm search functionality

---

**Note** Once the severity is Clear, the alarm is deleted from NCS after 30 days by default. You can modify this setting on the Administration > Settings page.

---

- Assign—For the selected alarm, you can
  - Assign to me—Assigns the alarm to the specified user.
  - Unassign—Removes the specified owner from the alarm.
- Annotation—Enter an annotation for the selected alarm, then click **Post**. The annotation you entered appears when you view the alarm details.
- Delete—Delete the selected alarm(s). Indicates that the alarm is no longer detected by any device.

## Specifying Email Notifications for Alarms

From the **Monitor > Alarms** page, you can set up email notifications for alarms based on the alarm category and severity level.

---

**Step 1** Choose **Monitor > Alarms**, then click **Email Notification**.

**Step 2** Select the Enable checkbox next to the alarm category for which you want to set up email notifications, then click **Save**.

NCS will send email notifications when alarms for the categories you specified occur.

---

## Modifying the Alarm Browser

Choose **Monitor > Alarms** to view a list of alarms. You can also click **Alarm Browser** in the toolbar at the bottom of the NCS page. You can modify the following information displayed in the Alarm Browser:

- To reorder the columns, drag and drop the column headings into any position.
- Click on a column heading to sort the information by that column. By default, the column is sorted in descending order. Click the column heading again to change the sort the column in ascending order.

---

**Note** Not every column is sortable. Hover your mouse cursor over a column heading, and NCS will display whether the column is sortable.

---

- To customize which columns are displayed, click the Settings icon, then click **Columns**. Select the checkbox next to columns you want to appear, and unselect the boxes for the columns you do not want to appear in the Alarm Browser window.

## Viewing the Alarm Summary

When NCS receives an alarm message from a controller, switch, or NCS, it displays an alarm indicator in the Alarm Summary. The Alarm Summary is at the bottom of the NCS page and displays the total count of critical, major, and minor alarms currently detected by NCS. Hover your mouse cursor over the Alarm Summary, and the alarm details are displayed as shown in [Figure 5-6](#).

Figure 5-6 NCS Alarm Summary

|                             | Critical | Major | Minor |
|-----------------------------|----------|-------|-------|
| Alarm Summary               | 66       | 0     | 691   |
| AP                          | 14       | 0     | 27    |
| Context Aware Notifications | 0        | 0     | 0     |
| Controller                  | 45       | 0     | 0     |
| Coverage Hole               | 0        | 0     | 0     |
| Mesh Links                  | 0        | 0     | 0     |
| Mobility Service            | 3        | 0     | 0     |
| NCS                         | 0        | 0     | 7     |
| Performance                 | 0        | 0     | 0     |
| Rogue AP                    | 0        | 0     | 656   |

**Note**

The alarms that appear on the Alarm Summary and on the Monitor > Alarms page depends on the settings you specify on the Administration > Settings page. By default, acknowledged alarms are not shown. See [Modifying Alarm Settings, page 5-132](#) for more information.

Alarms are color coded as follows:

- Red—Critical Alarm
- Orange—Major Alarm
- Yellow—Minor Alarm

Alarms indicate the current fault or state of an element, and alarms are usually generated by one or more events. The alarm can be cleared but the event remains. See [Alarms and Events Overview](#) for more information about alarms.

**Note**

By default, alarm counts refresh every minute. You can modify when alarms are refreshed on the Administration > User Preferences page.

When you hover your mouse cursor over the Alarm Summary, a window appears listing the number of critical, major, and minor alarms for each of alarm category. You can specify which alarm categories are displayed in the Alarm Summary on the Administration > User Preferences page. By default, all categories are displayed:

- Alarm Summary—Displays a summary of the total alarms for all alarm categories.
- AP—Display counts for AP alarms such as AP Disassociated from controller, Thresholds violation for Load, Noise or Interference, AP Contained as Rogue, AP Authorization Failure, AP regulatory domain mismatch, or Radio card Failure.
- Context Aware Notifications
- Controller—Displays counts for controller alarms, such as reachability problems from NCS and other controller failures (fan failure, POE controller failure, AP license expired, link down, temperature sensor failure, and low temperature sensed).
- Coverage Hole—Displays counts for coverage hole alarms generated for access points whose clients are not having enough coverage set by thresholds. See the [“Monitoring Maps”](#) for more information.
- Mesh Links—Displays counts for mesh link alarms, such as poor SNR, console login, excessive parent change, authorization failure, or excessive association failure.
- Mobility Services—Displays counts for location alarms such as reachability problems from NCS and location notifications (In/Out Area, Movement from Marker, or Battery Level).

- NCS—Displays counts for NCS alarms.
- Performance—Displays counts for performance alarms.
- Rogue AP—Displays counts for malicious rogue access points alarms.
- Rogue Adhoc—Displays counts for unclassified rogue access point alarms.
- Security—Displays counts for security alarms such as Signature Attacks, AP Threats/Attacks, and Client Security Events.
- Switch—Displays counts for switch alarms such as authentication errors.

## Modifying Alarm Settings

You can modify the following settings for alarms:

- Alarm count refresh rate—See [Modifying Alarm Count Refresh Rate](#)
- Alarm severity levels—See [Configuring Alarm Severity Levels](#)

## Modifying Alarm Count Refresh Rate

By default, alarm counts refresh every minute. You can modify the refresh rate by selecting **Administration > User Preferences**, and then selecting a new value for the Refresh Alarm Count in the Alarm Summary Every menu.

## Configuring Alarm Severity Levels

The Administration > Settings > Severity Configuration page allows you to change the severity level for newly generated alarms.

**Note**

---

Existing alarms remain unchanged.

---

To reconfigure the severity level for a newly generated alarm, follow these steps:

- 
- Step 1** Choose **Administration > Settings**.
  - Step 2** From the left sidebar menu, select **Severity Configuration**.
  - Step 3** Select the check box of the alarm condition whose severity level you want to change.
  - Step 4** From the Configure Security Level drop-down list, select from the following severity levels:
    - Critical
    - Major
    - Minor
    - Warning
    - Informational
    - Reset to Default
  - Step 5** Click **Go**.

- Step 6** Click **OK** to confirm the change or **Cancel** to leave the security level unchanged.
- 

## Working with Alarms

You can view, assign, and clear alarms and events on access points and mobility services engine using NCS.

This section also describes on how to have email notifications of alarms sent to you.

- [Assigning and Unassigning Alarms](#)
- [Deleting and Clearing Alarms](#)
- [Acknowledging Alarms](#)

### Assigning and Unassigning Alarms

To assign and unassign an alarm to yourself, follow these steps:

- Step 1** Perform an advanced search for access point alarms. See [“Advanced Search”](#) for more information.

- Step 2** Select the alarms that you want to assign to yourself by selecting their corresponding check boxes.

**Note** To unassign an alarm assigned to you, Unselect the box next to the appropriate alarm. You cannot unassign alarms assigned to others.

---

- Step 3** From the Select a command drop-down list, choose **Assign to Me** (or **Unassign**) and click **Go**.

If you choose Assign to Me, your username appears in the Owner column. If you choose Unassign, the username column becomes empty.

---

### Deleting and Clearing Alarms

To delete or clear an alarm from a mobility services engine, follow these steps:

- Step 1** From the **Monitor > Alarms** page, select the alarms that you want to delete or clear by selecting their corresponding check boxes.

**Note** If you delete an alarm, NCS removes it from its database. If you clear an alarm, it remains in the NCS database, but in the Clear state. You clear an alarm when the condition that caused it no longer exists.

---

- Step 2** From the Select a command drop-down list, choose **Delete** or **Clear**, and click **Go**.

**Note**

To set up cleanup of old alarms and cleared alarms, choose **Administration > Settings > Alarms**. See “[Configuring Alarms](#)” for more information.

## Acknowledging Alarms

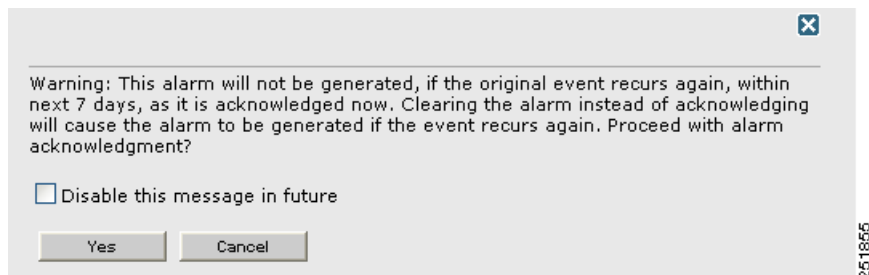

You may want certain alarms to be removed from the Alarms List. For example, if you are continuously receiving an interference alarm from a certain access point on the 802.11g interface, you may want to stop that access point from being counted as an active alarm on the Alarm Summary page or any alarms list. In this scenario, you can find the alarm for the 802.11g interface in the Alarms list, select the check box, and choose **Acknowledge** from the Select a command drop-down list.

Now if the access point generates a new violation on the same interface, NCS will not create a new alarm, and the Alarm Summary page shows no new alarms. However, if the interference violation is created on another interface, such as 802.11a, a new alarm is created.

By default, acknowledged alarms are not displayed in either the Alarm Summary page or any alarm list page. Also, no emails are generated for these alarms after you have marked them as acknowledged. By default, acknowledged alarms are not included for any search criteria. To change this default, go to the **Administration > Settings > Alarms** page and disable the **Hide Acknowledged Alarms** preference.

When you acknowledge an alarm, the following warning appears as a reminder that a recurrence of the problem does not generate another alarm unless this functionality is disabled (see [Figure 5-7](#)).

**Figure 5-7 Alarm Warning**

**Note**

When you acknowledge an alarm, a warning displays as a reminder that a recurrence of the problem does not generate another alarm unless this functionality is disabled. Use the **Administration > User Preferences** page to disable this warning message.

You can also search for all previously acknowledged alarms to reveal the alarms that were acknowledged during the last seven days. NCS automatically deletes cleared alerts that are more than seven days old so your results can only show activity for the last seven days. Until an existing alarm is deleted, a new alarm cannot be generated for any managed entity for which NCS has already generated an alarm.

## Monitoring Access Point Alarms

The Access Point Alarms page displays the access point based alarms on your network.

To access the AP alarms page, do one of the following:

- Perform a search for AP alarms. See [“Using the Search Feature”](#) for more information.
- Click the Access Point number link in the Alarm Summary box.

The Monitor AP Alarms page contains the following parameters:

- Severity—Indicates the severity of the alarm including:

| Icon                                                                                | Meaning                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Critical                                                                                                                                                                                                                                                                                                                                       |
|    | Major                                                                                                                                                                                                                                                                                                                                          |
|    | Minor                                                                                                                                                                                                                                                                                                                                          |
|    | Warning                                                                                                                                                                                                                                                                                                                                        |
|    | Info                                                                                                                                                                                                                                                                                                                                           |
|    | Unknown<br><b>Note</b> When the controller goes down, the controller inventory dashlet shown the controller status as critical. But the radio inventory dashlet, will retain the last known status. In Monitor > AP page, the AP alarm status is shown as "Unknown".                                                                           |
|  | Clear—Displays if the rogue is no longer detected by any access point.<br><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.<br><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days. |

- Failure Source—Device that generated the alarm.
- Owner—Name of the person to which this alarm is assigned, or blank.
- Date/Time—The time at which the alarm was generated.
- Message—The associated message displayed in the NCS alarm browser.
- Category—Indicates the category assigned to the alarm such as rogue AP, controller, switch, and security.
- Condition—Condition that caused the alarm.
- Acknowledged—Displays whether or not the alarm is acknowledged by the user. See [“Acknowledging Alarms”](#) for more information.

## Monitoring Air Quality Alarms

The Air Quality Alarms page displays air quality alarms on your network.

To access the air quality alarms page, do one of the following:

- Perform a search for Performance alarms. See [“Using the Search Feature”](#) for more information.
- Click the Performance number link in the Alarm Summary box.

The Monitor Air Quality Alarms page contains the following parameters:

- Severity—Indicates the severity of the alarm including:

| Icon                                                                              | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Critical                                                                                                                                                                                                                                                                                                                                                      |
|  | Major                                                                                                                                                                                                                                                                                                                                                         |
|  | Minor                                                                                                                                                                                                                                                                                                                                                         |
|  | Warning                                                                                                                                                                                                                                                                                                                                                       |
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- Failure Source—Device that generated the alarm.
- Owner—Name of the person to which this alarm is assigned, or blank.
- Date/Time—The time at which the alarm was generated.
- Message—The associated message displayed in the NCS alarm browser.
- Acknowledged—Displays whether or not the alarm is acknowledged by the user. See [“Acknowledging Alarms”](#) for more information.

### Select a command Menu

Select one or more alarms by selecting their respective check boxes, select one of the following commands from the Select a command drop-down list, and click **Go**.

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Clear—Clear the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Acknowledge—Acknowledge the alarm to prevent it from showing up in the Alarm Summary page. See [“Acknowledging Alarms”](#) for more information.

**Note** The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.

- Unacknowledge—Unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the **All Alarms > Email Notification** page to view and configure email notifications. See [“Monitoring RFID Tags”](#) for more information.

## Monitoring CleanAir Security Alarms

The CleanAir Security Alarms page displays security alarms on your network.

To access the security alarms page, do one of the following:

- Perform a search for Security alarms. See [“Using the Search Feature”](#) for more information.
- Click the Security number link in the Alarm Summary box.

The Monitor CleanAir Security Alarms page contains the following parameters:

- Severity—Indicates the severity of the alarm including:

| Icon | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | Critical                                                                                                                                                                                                                                                                                                                                                      |
|      | Major                                                                                                                                                                                                                                                                                                                                                         |
|      | Minor                                                                                                                                                                                                                                                                                                                                                         |
|      | Warning                                                                                                                                                                                                                                                                                                                                                       |
|      | Info                                                                                                                                                                                                                                                                                                                                                          |
|      | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- Failure Source—Device that generated the alarm.
- Owner—Name of the person to which this alarm is assigned, or blank.
- Date/Time—The time at which the alarm was generated.
- Message—The associated message displayed in the NCS alarm browser.
- Acknowledged—Displays whether or not the alarm is acknowledged by the user. See [“Acknowledging Alarms”](#) for more information.

## Select a command Menu

Select one or more alarms by selecting their respective check boxes, select one of the following commands from the Select a command drop-down list, and click **Go**.

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Clear—Clear the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Acknowledge—Acknowledge the alarm to prevent it from showing up in the Alarm Summary page. See [“Acknowledging Alarms”](#) for more information.

---

**Note** The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.

---

- Unacknowledge—Unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the **All Alarms > Email Notification** page to view and configure email notifications. See [“Monitoring RFID Tags”](#) for more information.

## Monitoring Email Notifications

The Cisco NCS includes a built-in email notification function which can notify the network operator when critical alarms occur.

The email notification filter page allows you to add a filter for each alert category. Severity level is set to critical by default when the alert category is enabled, but you can choose a different severity level for different categories. Email notifications are generated only for the severity levels that are configured.

To configure e-mail notifications, follow these steps:

- 
- Step 1** Choose **Monitor > Alarms**.
  - Step 2** From the Select a command drop-down list, choose **Email Notification**.
  - Step 3** Click **Go**.
  - Step 4** Click an Alarm Category to edit severity level and e-mail recipients for its e-mail notifications.
  - Step 5** Select the severity level check box(es) (Critical, Major, Minor, or Warning) for which you want a notification sent.
  - Step 6** Enter the notification recipient e-mail addresses in the To text box.

---

**Note** Separate multiple e-mail addresses with a comma.

---

- Step 7** Click **OK**.
- Step 8** Select the **Enabled** check box for applicable alarm categories to activate the delivery of e-mail notifications.

**Step 9** Click **OK**.

---

## Monitoring Severity Configurations

You can change the severity level for newly generated alarms.

**Note** Existing alarms remain unchanged.

---

To change the severity level of newly-generated alarms, follow these steps:

---

- Step 1** Choose **Administration > Setting**.
  - Step 2** Choose **Severity Configuration** from the left sidebar menu.
  - Step 3** Select the check box of the alarm condition for which you want to change the severity level.
  - Step 4** From the **Configure Severity Level** drop-down list, choose the new severity level (Critical, Major, Minor, Warning, Informational, Reset to Default).
  - Step 5** Click **Go**.
  - Step 6** Click **OK** to confirm the change.
- 

## Monitoring Cisco Adaptive wIPS Alarms

Alarms from Cisco Adaptive wIPS DoS (Denial of Service) and security penetration attacks are classified as security alarms. You can view these wIPS alarms and their details in the **Monitor > Alarms** section of NCS.

To view a list of wIPS DoS and security penetration attack alarms, follow these steps:

---

- Step 1** Perform a search for Security alarms using the Advanced Search feature. See [“Advanced Search”](#) for more information on performing an advanced search.

The following information is provided for wIPS alarms:

- **Severity**—Severity levels include critical, major, info, warning, and clear.
- **Failure Object**—Displays the name and IP or MAC address of the object for which the alarm was generated. Click the Failure Object to view alarm details. See [“Monitoring Cisco Adaptive wIPS Alarm Details”](#) for more information on viewing wIPS alarm details.
- **Date/Time**—Displays the date and time that the alarm occurred.
- **Message**—Displays a message explaining why the alarm occurred (such as the applicable wIPS policy).
- **Acknowledged**—Displays whether or not the alarm is acknowledged by the user.
- **Category**—Indicates the category of this alarm such as Security.
- **Condition**—Displays a description of what caused this alarm to be triggered.

When there are multiple alarm pages, the page numbers are displayed at the top of the page with a scroll arrow on each side. Use this to view additional alarms.

To add, remove, or reorder columns in the table, click the **Edit View** link to go to the Edit View page.

---

## Select a command

Using the **Select a command** drop-down list, you can perform the following actions on the selected alarms:

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Delete—Delete the selected alarm(s).
- Clear—Clear the selected alarm(s).
- Acknowledge—You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.
- Unacknowledge—You can choose to unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the All **Alarms** > **Email Notification** page to view and configure email notifications.

To perform an action on the selected alarm, follow these steps:

---

- Step 1** Select an alarm by selecting its check box.
  - Step 2** From the Select a command drop-down list, select a the applicable command.
  - Step 3** Click **Go**.
- 

## Monitoring Cisco Adaptive wIPS Alarm Details

Choose **Monitor** > **Alarms** > <*failure object*> to view details of the selected Cisco wIPS alarm. The following Alarm Details are provided for Cisco Adaptive wIPS alarms:

- General
  - Detected By wIPS AP—The access point that detected the alarm.
  - wIPS AP IP Address—The IP address of the wIPS access point.
  - Owner—Name of person to which this alarm is assigned or left blank.
  - Acknowledged—Displays whether or not the alarm is acknowledged by the user.
  - Category—For wIPS, the alarm category is Security.
  - Created—Month, day, year, hour, minute, second, AM or PM that the alarm was created.
  - Modified—Month, day, year, hour, minute, second, AM or PM that the alarm was last modified.
  - Generated By—Indicates how the alarm event was generated (either NMS or from a trap).

NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS

Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.

- Severity—Level of severity including critical, major, info, warning, and clear.
- Last Disappeared—The date and time that the potential attack last disappeared.
- Channel—The channel on which the potential attack occurred.
- Attacker Client/AP MAC—The MAC address of the client or access point that initiated the attack.
- Attacker Client/AP IP Address—The IP address of the client or access point that initiated the attack.
- Target Client/AP IP Address—The IP address of the client or access point targeted by the attacker.
- Controller IP Address—The IP address of the controller to which the access point is associated.
- MSE—The IP address of the associated mobility services engine.
- Controller MAC address—The MAC address of the controller to which the access point is associated.
- wIPS access point MAC address
- Forensic File
- Event History—Takes you to the “[Monitoring Alarms](#)” page to view all events for this alarm.
- Annotations—Enter any new notes in this box and click **Add** to update the alarm. Notes are displayed in the “Annotations” display area.
- Messages—Displays information about the alarm.
- Audit Report—Click to view config audit alarms details. This report is only available for Config Audit alarms.

Configuration audit alarms are generated when audit discrepancies are enforced on config groups.

---

**Note** If enforcement fails, a critical alarm is generated on the config group. If enforcement succeeds, a minor alarm is generated on the config group. The alarms have links to the audit report where you can view a list of discrepancies for each controller.

---

- Rogue Clients—If the failure object is a rogue access point, information about rogue clients is displayed.

### Select a command

Select one or more alarms by selecting their respective check boxes, selecting one of the following commands, and clicking **Go**.

- Assign to me—Assign the selected alarm(s) to the current user.
- Unassign—Unassign the selected alarm(s).
- Delete—Delete the selected alarm(s).

- Clear—Clear the selected alarm(s).
- Acknowledge—You can acknowledge the alarm to prevent it from showing up in the Alarm Summary page. The alarm remains in NCS and you can search for all Acknowledged alarms using the alarm search functionality.
- Unacknowledge—You can choose to unacknowledge an already acknowledged alarm.
- Email Notification—Takes you to the All **Alarms** > **Email Notification** page to view and configure email notifications.
- Event History—Takes you to the Monitor **Alarms** > **Events** page to view events for Rogue Alarms.

## Monitoring Events

One or more events may generate an abnormal state or alarm. The alarm can be cleared, but the event remains. Choose **Monitor** > **Events** to access the Events page, which displays the following information:

- Description—Describes the event details.
- Time—Indicates the date and time the event was generated.
- Severity—Event severities include: Critical, Major, Minor, Warning, Cleared, or Information.
- Failure Source—Indicates the source of the event (including name and/or MAC address).
- Category—Type of event such as Rogue AP, Security, or AP

Click on any column heading to sort by that column.

Use the quickview icon to disclose more information on the event. The additional information for the event is divided into general information and the message. In the general information, the failure source, the category, severity, generated time and IP address. The message of the event is also displayed. (See [Figure 5-8](#))

**Figure 5-8** Viewing Events

Events

Total 5888

| Description                                               | Time                        | Severity | Failure Source                 | Category |
|-----------------------------------------------------------|-----------------------------|----------|--------------------------------|----------|
| Access point 'SR-1250-B1B4' associated with controller 'S | May 26, 2011 5:31:14 AM UTC | Critical | SR-1250-B1B4,00:21:55:60:f3:10 | AP       |

**General Info**

Failure Source: SR-1250-B1B4,00:21:55:60:f3:10  
 Category: AP  
 Generated: Thu May 26 2011 05:31:14 UTC  
 Generated By: Controller  
 Device IP Address: 9.1.105.40  
 Severity: Critical

**Messages**

Access point 'SR-1250-B1B4' associated with controller 'SR5508' draws low power from Ethernet. Failure reason: 'The AP draws 15.4 watts from Ethernet'.

291082

**Note** Events also has preset, quick and advanced filters similar to alarms. These filters work in same way as the filters in alarms.

When you filter the table using the Search feature, the Events page may display the additional information. See [“Advanced Search”](#)(Advanced Search results for Events) for more information on performing a search. The additional information includes:

- Coverage Hole Events
  - Access Point Name
  - Failed Clients—Number of clients that failed due to the coverage hole.
  - Total Clients—Total number of clients affected by the coverage hole.
  - Radio Type—The radio type (802.11b/g or 802.11a) of the applicable access point.
  - Coverage Threshold
- Rogue AP Events
  - Vendor—Rogue access point vendor name or Unknown.
  - Classification Type—Indicates the type of rogue access point including Malicious, Friendly, or Unclassified.
  - On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
  - Radio Type—Lists all radio types applicable to this rogue access point.
  - State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
  - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)

---

**Note** See [“Monitoring Rogue Alarm Events”](#) or [“Viewing Rogue AP Event Details”](#) for more information on rogue access points events.

---

- Adhoc Rogue Events
  - Vendor—Rogue access point vendor name or Unknown.
  - On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
  - Radio Type—Lists all radio types applicable to this rogue access point.
  - State—Indicates the state of the alarm. Possible states for adhoc rogues include Threat, Alert, Internal, External, Contained, Contained Pending, and Removed.
  - SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Interference
  - Detected By—IP address of the device that detected the interference.
  - ID—ID of the device that detected the interference.
- Mesh Links

- Client
- Context Aware Notification
- Pre Coverage Hole
  - Client MAC Address—MAC address of the client affected by the Pre Coverage Hole.
  - AP MAC Address—MAC address of the applicable access point.
  - Radio Type—The radio type (802.11b/g or 802.11a) of the applicable access point.
  - Power Level—Access Point transmit power level (1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, 5 = 0.195 to 6.25% power).
  - Client Type—Client type can be laptop(0), pc(1), pda(2), dot11mobilephone(3), dualmodephone(4), wgb(5), scanner(6), tabletpc(7), printer(8), projector(9), videoconfsystem(10), camera(11), gamingsystem(12), dot11deskphone(13), cashregister(14), radiotag(15), rfidsensor(16), server(17)
  - WLAN Coverage Hole Status

If there is more than one page of events, the number of pages is displayed with a scroll arrow on each side. Use this to view additional events.

This section contains the following topics:

- [Searching Events](#)
- [Monitoring Failure Objects](#)
- [Monitoring Events for Rogue APs](#)
- [Viewing Adhoc Rogue Event Details](#)
- [Monitoring Cisco Adaptive wIPS Events](#)
- [Monitoring Cisco Adaptive wIPS Events](#)
- [Working with Events](#)

## Searching Events

Use the NCS Search feature to find specific events or to create and save custom searches. See one of the following topics for additional information:

- [Using the Search Feature](#)
- [Quick Search](#)
- [Advanced Search](#)
- [Saved Searches](#)

## Monitoring Failure Objects

**Note**

---

The event categories Location Servers and Location Notifications appear only in the Cisco NCS Location version.

---

Choose **Monitor > Events**, then click the expand icon to the far left of the **Monitor > Events** page for the event for which you want to see details. Details about the event are displayed. Depending on the type of event you selected, the associated details will vary.

- General Info
  - Failure Source—Indicates the source of the event (including name and/or MAC address).
  - Category—Type of alarm such as Security or AP.
  - Generated—Date and time that the event was generated.
  - Generated By—Indicates how the alarm event was generated (either NMS or from a trap).
    - NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS.
    - Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
  - Device IP Address—IP address of the alarm-generating device.
  - Severity—Level of severity including critical, major, info, warning, and clear.
- Messages—Message explaining why the event occurred.

## Monitoring Events for Rogue APs

Choose **Monitor > Events**. From the left sidebar menu Event Category, choose **Rogue AP** to display the [Monitoring Events](#) page for rogue access points. Click an item under Rogue MAC Address to display this page.

This page displays alarm events for a rogue access point radio. Rogue access point radios are unauthorized access points detected by controllers. The following parameters appear:

### General

- Rogue MAC Address
- Vendor
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Owner—Name of person to which this alarm is assigned, or (blank).
- State—State of this radio relative to the network or Port. Rogue access point radios appear as “Alert” when first scanned by the Port, or as “Pending” when operating system identification is still underway.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Containment Level—An access point which is being contained will either not be able to provide service at all, or will provide exceedingly slow service. There is a level associated with the containment activity which indicates how many Cisco 1000 Series lightweight access points to use in containing the threat. This service must be initiated and halted by the administrator. Containment Type - Contained if the rogue access point clients have been contained at Level 1 through Level 4 under Update Status, otherwise Unassigned.

- Channel—Indicates the band at which the adhoc rogue is broadcasting.
- Radio Type—Lists all radio types applicable to this rogue access point.
- Created—Date and time that the event occurred.
- Generated By—Indicates how the alarm event was generated (either NMS or from a trap).
  - NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS.
  - Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- Device IP Address—IP address of the alarm-generating device.
- Severity—Level of severity, Critical, Major, Minor, Warning, Clear, Info. Color coded.

Message—Displays descriptive information about the alarm.

Help—Displays information about the alarm.

**Note**

---

Use the Advance Search feature to find specific events. See [Advanced Search](#) for more information.

---

## Monitoring Events for Adhoc Rogues

Choose **Monitor > Events**. From the left sidebar menu Event Category, choose **Adhoc Rogue** to display the [Monitoring Events](#) page for adhoc rogue. Click an item under Rogue MAC Address to display adhoc rogue event details.

### General

- Rogue MAC Address
- Vendor
- On Network—Indicates how the rogue detection occurred.
  - Controller—The controller detected the rogue (Yes or No).
  - Switch Port Trace—The rogue was detected by a switch port trace. Indicated by one of the following: Traced but not found, Traced and found, Not traced.
- Owner—Name of person to which this alarm is assigned, or (blank).
- State—State of this radio relative to the network or Port. Rogue access point radios appear as “Alert” when first scanned by the Port, or as “Pending” when operating system identification is still underway.
- SSID—Service Set Identifier being broadcast by the rogue access point radio. (Blank if SSID is not broadcast.)
- Containment Level—An access point which is being contained will either not be able to provide service at all, or will provide exceedingly slow service. There is a level associated with the containment activity which indicates how many Cisco 1000 Series lightweight access points to use in containing the threat. This service must be initiated and halted by the administrator. Containment Type - Contained if the rogue access point clients have been contained at Level 1 through Level 4 under Update Status, otherwise Unassigned.

- Channel—Indicates the band at which the adhoc rogue is broadcasting.
- Created—Date and time that the event occurred.
- Generated By—Indicates how the alarm event was generated (either NMS or from a trap).
  - NMS (Network Management System - NCS)—Generated through polling. NCS periodically polls the controllers and generates events. NCS generates events when the traps are disabled or when the traps are lost for those events. In this case “Generated by” will be NMS.
  - Trap—Generated by the controller. NCS process these traps and raises corresponding events for them. In this case “Generated by” will be Controller.
- Device IP Address—IP address of the alarm-generating device.
- Severity—Level of severity, Critical, Major, Minor, Warning, Clear, Info. Color coded.

Message—Displays descriptive information about the alarm.

Help—Displays information about the alarm.

## Monitoring Cisco Adaptive wIPS Events

Choose **Monitor > Events** to view wIPS events. One or more events may generate an abnormal state or alarm. The alarm can be cleared, but the event remains. For more information regarding monitoring events, see “[Monitoring Events](#).”

The following sections provide additional information regarding Cisco Adaptive wIPS:

- [Configuring wIPS Profiles](#)
- [NCS Services](#)
- [wIPS Policy Alarm Encyclopedia](#)

Perform an events search to narrow the results to mobility services engine or Security events only. To view mobility services engine or Security events only, follow these steps:

- 
- Step 1** Choose **Monitor > Events**.
- Step 2** From the left sidebar menu, choose **Mobility Service** or **Security** from the Event Category drop-down list.
- Step 3** Click **Go**.

---

**Note** If there is more than one page of events, the number of pages is displayed with a scroll arrow on each side. Use this to view additional events.

---

## Monitoring CleanAir Air Quality Events

You can use NCS to view the events generated on the air quality of the wireless network.

To view air quality events, follow these steps:

- 
- Step 1** Click Advanced Search in the NCS window.

The New Search page appears.

- Step 2** In the New Search page, choose Events from the Search Category drop-down list.
- Step 3** From the Severity drop-down list, choose the type of severity you want to search the air quality events.
- Step 4** From the Event Category drop-down list, choose Performance.
- Step 5** Click Go.

The air quality events page displays the following information:

- Severity—Indicates the severity of the alarm including:

| Icon                                                                               | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Critical                                                                                                                                                                                                                                                                                                                                                      |
|   | Major                                                                                                                                                                                                                                                                                                                                                         |
|   | Minor                                                                                                                                                                                                                                                                                                                                                         |
|   | Warning                                                                                                                                                                                                                                                                                                                                                       |
|   | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- Failure Source—Device that generated the alarm.
- Date/Time—The time at which the alarm was generated.

## Viewing Air Quality Event Details

To view air quality event details, follow these steps:

- Step 1** From the Air Quality Events page, click an item under Failure Source to access the alarm details page. See [Monitoring CleanAir Air Quality Events](#).
- Step 2** The air quality event page displays the following information:
  - Failure Source—Device that generated the alarm.
  - Category—The category this event comes under. In this case, Performance.
  - Created—The time stamp at which the event was generated.
  - Generated by—The device that generated the event.
  - Device IP Address—The IP address of the device that generated the event.

- Severity—The severity of the event.
- Alarm Details—A link to the related alarms associated with this event. Click the link to know more about the alarm details.
- Message—Describes the air quality index on this access point.

## Monitoring Interferer Security Risk Events

You can use NCS to view the security events generated on your wireless network.

To view interferer security events, follow these steps:

- 
- Step 1** Click **Advanced Search** in the NCS window.  
The New Search page appears.
- Step 2** In the New Search page, choose **Events** from the Search Category drop-down list.
- Step 3** From the Severity drop-down list, choose the type of severity you want to search the air quality events.
- Step 4** From the Event Category drop-down list, choose **Security**.
- Step 5** Click **Go**.

The interferer security events page displays the following information:

- Severity—Indicates the severity of the alarm including:

| Icon                                                                                | Meaning                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Critical                                                                                                                                                                                                                                                                                                                                                      |
|  | Major                                                                                                                                                                                                                                                                                                                                                         |
|  | Minor                                                                                                                                                                                                                                                                                                                                                         |
|  | Warning                                                                                                                                                                                                                                                                                                                                                       |
|  | Info                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Clear—Displays if the rogue is no longer detected by any access point.</p> <p><b>Note</b> Rogues can be detected by multiple access points. If one access point no longer detects the rogue but the other access point does, Clear is not sent.</p> <p><b>Note</b> Once the severity of a rogue is Clear, the alarm is deleted from NCS after 30 days.</p> |

- Failure Source—Device that generated the alarm.
- Date/Time—The time at which the alarm was generated.

## Viewing Interferer Security Risk Event Details

To view interferer security event details, follow these steps:

- 
- Step 1** In the Interferer Security Event details page, click an item under Failure Source to access the alarm details page. See [Monitoring Interferer Security Risk Events](#).
- Step 2** The air quality event page displays the following information:
- Failure Source—Device that generated the alarm.
  - Category—The category this event comes under. In this case, Security.
  - Created—The time stamp at which the event was generated.
  - Generated by—The device that generated the event.
  - Device IP Address—The IP address of the device that generated the event.
  - Severity—The severity of the event.
  - Alarm Details—A link to the related alarms associated with this event. Click the link to know more about the alarm details.
  - Message—Describes the interferer device affecting the access point.

## Monitoring Health Monitor Events

You can use NCS to view the events generated by the Health Monitor.

To view the health monitor events, follow these steps:

- 
- Step 1** Click Advanced Search in the NCS window.  
The New Search page appears.
- Step 2** In the New Search page, choose Events from the Search Category drop-down list.
- Step 3** From the Severity drop-down list, choose the type of severity you want to search the health monitor events.
- Step 4** From the Event Category drop-down list, choose NCS.
- Step 5** Click Go.

The health monitor events page displays the following information:

- Severity—Indicates the severity of the alarm including:

| Icon                                                                                | Meaning  |
|-------------------------------------------------------------------------------------|----------|
|  | Critical |
|  | Major    |
|  | Minor    |
|  | Warning  |

| Icon                                                                              | Meaning |
|-----------------------------------------------------------------------------------|---------|
|  | Info    |
|  | Clear   |

- Failure Source—Device that generated the alarm.
- Date/Time—The time at which the alarm was generated.
- Message—Describes the health details.

## Viewing Health Monitor Event Details

To view health monitor event details, follow these steps:

- 
- Step 1** From the Health Monitor Events page, click an item under Failure Source to access the alarm details page. See the [“Monitoring Health Monitor Events”](#) section on page 5-150.
- Step 2** The health monitor event page displays the following information:
- Failure Source—Device that generated the alarm.
  - Category—The category this event comes under. In this case, NCS.
  - Created—The time stamp at which the event was generated.
  - Generated by—The device that generated the event.
  - Device IP Address—The IP address of the device that generated the event.
  - Severity—The severity of the event.
  - Alarm Details—A link to the related alarms associated with this event. Click the link to know more about the alarm details.
  - Message—Describes the event through a message.

## Working with Events

You can use NCS to view mobility services engine and access point events. You can search and display events based on their severity (critical, major, minor, warning, clear, info) and event category or you can search for a mobility services engine and access point by its IP address, MAC address or name.

A successful event search displays the event severity, failure object, date and time of the event, and any messages for each event.

To display events, follow these steps:

- 
- Step 1** In Cisco NCS, click **Monitor > Events**.
- Step 2** In the Events page:
- If you want to display the events for a specific element and you know its IP address, MAC address, or Name, enter that value in the Quick Search text box (left pane). Click **Go**.

- To display events by severity and category, select the appropriate options from the Severity and Event Category drop-down lists (left pane). Click **Search**.

**Step 3** If NCS finds events that match the search criteria, it displays a list of these events.

**Note** For more information about an event, click the failure object associated with the event. Additionally, you can sort the events summary by each of the column headings.

## Monitoring Site Maps

Maps provide a summary view of all your managed systems on campuses, buildings, outdoor areas, and floors. With the NCS database, you can add maps and view your managed system on realistic campus, building, and floor maps. See [Monitoring Maps, page 6-1](#) for more information.

## Monitoring Google Earth Maps

You can enable location presence by mobility server to provide expanded Civic (city, state, postal code, country) and GEO (longitude, latitude) location information beyond the Cisco default setting (campus, building, floor, and X, Y coordinates). This information can then be requested by clients on a demand basis for use by location-based services and applications. Location Presence can be configured when a new campus, building, floor, or outdoor area is being added or configured at a later date. See [Monitoring Google Earth Maps, page 6-111](#) for more information.

# CHAPTER 6

## Monitoring Maps

---

This chapter describes how to add maps to the Cisco NCS database and use them to monitor your LAN. With the NCS database, you can add maps and view your managed system on realistic campus, building, and floor maps.

### Note

Additionally, you can enable location presence by mobility server to provide expanded Civic (city, state, postal code, country) and GEO (longitude, latitude) location information beyond the Cisco default setting (campus, building, floor, and X, Y coordinates). This information can then be requested by clients on a demand basis for use by location-based services and applications. Location Presence can be configured when a new campus, building, floor, or outdoor area is being added or configured at a later date.

---

### Note

A mobility server should be synchronized before Location Presence is enabled. For details on enabling location presence and assigning its parameters, refer to *Cisco Context-Aware Services documentation*. This configuration guide also covers verifying location accuracy, using chokepoints, using Wi-Fi TDOA receivers, applying calibration models and other context-aware planning and verification topics.

---

This chapter contains the following sections:

# Information About Maps

This section contains the following topics:

- [Maps](#), page 6-2
- [Campus](#), page 6-3
- [Building](#), page 6-3
- [Floor Area](#), page 6-3
- [Outdoor Area](#), page 6-4
- [Access Points](#), page 6-4
- [Chokepoints](#), page 6-4
- [Wi-Fi TDOA Receivers](#), page 6-4
- [Map Editor](#), page 6-4

## Maps

Maps provide a summary view of all your managed systems on campuses, buildings, outdoor areas, and floors. The available information includes:

- Total APs—Number of total access points for each map.
- 802.11a/n Radios and 802.11b/g/n Radios—Number of 802.11a/n and 802.11b/g/n radios associated with each map.
- Out of Service (OOS) Radios—Number of 802.11a/n and 802.11b/g/n radios associated with each map.
- Clients—Number of clients associated to access points on the map.
- AP Heat Maps—A real time wireless RF graphical representation of data which shows RF coverage throughout a facility or campus through the use of a heat map. For more Information on Heat APs refer [Understanding RF Heatmap Calculation](#), page 6-109.

---

**Note** This number is based on the most recent Client Statistics Poll. The number of clients located on the map by MSE may not match this number.

---

- 802.11a/n and 802.11b/g/n Avg Air Quality—Indicates the average Air Quality (AQ) for 802.11a/n and 802.11b.g.n radios.
- 802.11a/n and 802.11b/g/n Min Air Quality—Indicates the minimum Air Quality (AQ) for 802.11a/n and 802.11b/g/n radios.
- Status—Indicates the current status of the map.
  - Red circle—Critical fault
  - Yellow triangle—Minor fault
  - Green square—Ok

---

**Note** To view or edit current maps, choose **Monitor > Site Maps** (see [Figure 6-1](#)) and select the appropriate map from the list. Use the Select a command drop-down list to access additional functionality.

---

Figure 6-1 Site Maps Page

| Name              | Type       | Total APs | a/n Radios | b/g/n Radios | Critical Radio Alarms | Clients | Status |
|-------------------|------------|-----------|------------|--------------|-----------------------|---------|--------|
| System Campus     | Campus     | 0         | 0          | 0            | 0                     | 0       | 🟢      |
| C-SR              | Campus     | 0         | 0          | 0            | 0                     | 0       | 🔴      |
| C-SR > BGL25      | Building   | 0         | 0          | 0            | 0                     | 0       | 🟢      |
| C-SR > BGL25 > F5 | Floor Area | 0         | 0          | 0            | 0                     | 0       | 🟢      |

The left sidebar menu lists all campuses, buildings, and floors in a tree view. When you click a campus, building, or floor in the Maps Tree View menu, the main area of the Page displays corresponding information.

**Note**

Click **Edit View** to change the information displayed for the listed maps. See the “[Configuring Edit View](#)” section on page 6-9 for more information.

**Note**

Root Area (listed in the Maps Tree View menu) displays a list of buildings that are not in campuses. Status and object counts for Root Area buildings are not aggregated.

Use the Select a command drop-down list for additional map functionality.

## Campus

A campus is the area in which a building, an outdoor area or set of surrounding buildings are situated.

## Building

A structure that has a roof and walls and stands more or less permanently in one place.

## Floor Area

The floor area is the area of each floor of the building measured to the outer surface of the outer walls including the area of lobbies, cellars, elevator shafts and in multi-dwelling buildings all the common spaces.

## Outdoor Area

An area which includes building or set of buildings or could be just plain land that is not an indoor area.

## Access Points

Access Points (APs) are specially configured nodes on wireless local area networks (WLANs). Access points act as a central transmitter and receiver of WLAN radio signals. Access points support Wi-Fi wireless communication standards.

## Chokepoints

Installation of chokepoints provides enhanced location information for RFID tags. When an active Cisco Compatible Extensions version 1 compliant RFID tag enters the range of a chokepoint, it is stimulated by the chokepoint. The MAC address of this chokepoint is then included in the next beacon sent by the stimulated tag. All access points that detect this tag beacon then forward the information to the controller and location appliance. See [“Configuring ChokePoints” section on page 6-56](#) for more information.

## Wi-Fi TDOA Receivers

TDoA technology uses a time-based method to calculate the location. Each Wi-Fi TDoA receivers report the time of arrival of the signal from the tag to its respective receiver. The Cisco Mobility Services Engine correlates the time of arrival for all the tag signals from all the TDoA receivers to find the intersection points of known distances. The greater the number of receivers used in the calculation, the more accurately the tag can be located. Wi-Fi TDoA receivers are typically used for calculating location information in manufacturing or retail warehouse environments (where there are lots of machines or high ceilings or both), in outdoor environments, or in other line-of-site environments. See [“Configuring Wi-Fi TDOA Receivers” section on page 6-59](#) for more information.

## Map Editor

You can use the NCS map editor to define, draw, and enhance floor plan information. The map editor enables you to create obstacles to consider when you compute RF prediction heat maps for access points. You can also add coverage areas for MSEs that locate clients and tags in that particular area.

With the map editor, you can perform the following functions:

- Save—Saves the current map image.
- Recompute prediction—Updates the RF prediction heatmap if any changes are made to the existing floor map image.
- Reload Last Saved—Loads the last saved map image.
- Select all—Selects all the obstacles and coverage areas that you have created.
- Unselect—Deselects the obstacles and coverage areas that are selected.
- Move selected Obstacles—Moves the selected obstacles to a different location on the map.
- Duplicate selected Obstacles—Creates a copy of the selected obstacles.
- Zoom in/Zoom out— Zoom in or out on the image you are currently viewing.

- Show floor image—Use this to display the floor image.
- Show obstacles—Use this to display the obstacles.
- Larger resolution/Medium resolution/Smaller resolution—Increase or decrease the resolution of the floor map image.
- SNAP Mode—Use this to snap an obstacle to its nearest obstacle while drawing.
- ORTHO Mode—Use to draw a horizontal or vertical obstacle. This is especially useful when you want to draw all the obstacles at right angles.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature and contains the following topics:

- [Guidelines for Using the Map Editor, page 6-5](#)
- [Guidelines for Placing Access Points, page 6-5](#)
- [Guidelines for Inclusion and Exclusion areas on a Floor, page 6-7](#)

## Guidelines for Using the Map Editor

Consider the following when modifying a building or floor map using the map editor:

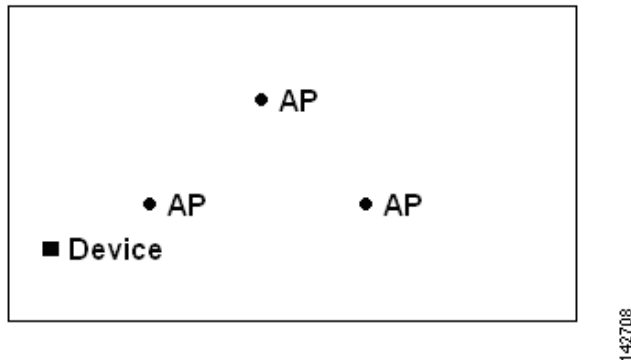

- We recommend that you use the map editor to draw walls and other obstacles rather than importing an .FPE file from the legacy floor plan editor.
  - If necessary, you can still import .FPE files. To do so, navigate to the desired floor area, choose **Edit Floor Area** from the Select a command drop-down list, click **Go**, select the **FPE File** check box, and browse to and choose the .FPE file.
- You can add any number of walls to a floor plan with the map editor; however, the processing power and memory of a client workstation may limit the refresh and rendering aspects of NCS.
  - We recommend a practical limit of 400 walls per floor for machines with 1-GB RAM or less.
- All walls are used by NCS when generating RF coverage heatmaps.
  - However, the MSEs use no more than 50 heavy walls in its calculations, and the MSE does not use light walls in its calculations because those attenuations are already accounted for during the calibration process.

If you have a high resolution image (near 12 megapixels), you may need to scale down the image resolution with an image editing software prior to using map editor.

## Guidelines for Placing Access Points

Place access points along the periphery of coverage areas to keep devices close to the exterior of rooms and buildings (see [Figure 6-2](#)). Access points placed in the center of these coverage areas provide good data on devices that would otherwise appear equidistant from all other access points.

**Figure 6-2** *Access Points Clustered Together*

By increasing overall access point density and moving access points towards the perimeter of the coverage area, location accuracy is greatly improved (see [Figure 6-3](#)).

**Figure 6-3** *Improved Location Accuracy by Increasing Density*

In long and narrow coverage areas, avoid placing access points in a straight line (see [Figure 6-4](#)). Stagger them so that each access point is more likely to provide a unique snapshot of a device location.

**Figure 6-4** *Refrain From Straight Line Placement*

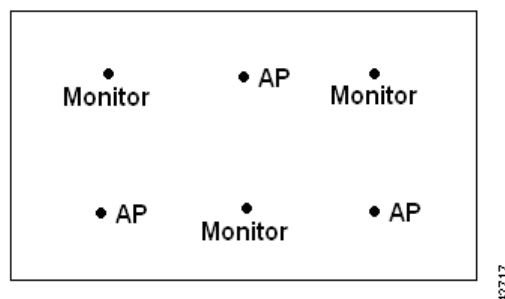

Although the design in [Figure 6-4](#) may provide enough access point density for high bandwidth applications, location suffers because each access point view of a single device is not varied enough; therefore, location is difficult to determine.

Move the access points to the perimeter of the coverage area and stagger them. Each has a greater likelihood of offering a distinctly different view of the device, resulting in higher location accuracy (see [Figure 6-5](#)).

**Figure 6-5** Improved Location Accuracy by Staggering Around Perimeter

Designing a location-aware wireless LAN, while planning for voice as well, is better done with a few things in mind. Most current wireless handsets support only 802.11b/n, which offers only three non-overlapping channels. Therefore, wireless LANs designed for telephony tend to be less dense than those planned to carry data. Also, when traffic is queued in the Platinum QoS bucket (typically reserved for voice and other latency-sensitive traffic), lightweight access points postpone their scanning functions that allow them to peak at other channels and collect, among other things, device location information. The user has the option to supplement the wireless LAN deployment with access points set to monitor-only mode. Access points that perform only monitoring functions do not provide service to clients and do not create any interference. They simply scan the airwaves for device information.

Less dense wireless LAN installations, such as voice networks, find their location accuracy greatly increased by the addition and proper placement of monitor access points (see [Figure 6-6](#)).

**Figure 6-6** Less Dense Wireless LAN Installations

Verify coverage using a wireless laptop, handheld, or phone to ensure that no fewer than three access points are detected by the device. To verify client and asset tag location, ensure that NCS reports client devices and tags within the specified accuracy range (10 m, 90%).

**Note** If you have a ceiling-mounted AP with an integrated omni-directional antenna, the antenna orientation does not really need to be set in NCS. However, if you mount that same AP on the wall, you will have to set the antenna orientation to 90 degrees.

## Guidelines for Inclusion and Exclusion areas on a Floor

Inclusion and exclusion areas can be any polygon shape and must have at least three points.

You can only define one inclusion region on a floor. By default, an inclusion region is defined for each floor when it is added to NCS. The inclusion region is indicated by a solid aqua line, and generally outlines the region.

You can define multiple exclusion regions on a floor.

Newly defined inclusion and exclusion regions appear on heatmaps only after the mobility services engine recalculates location.

## Monitoring Maps

This section contains the following topics:

- [Configuring Maps, page 6-8](#)
- [Configuring Buildings, page 6-16](#)
- [Configuring Campus, page 6-23](#)
- [Configuring Outdoor Areas, page 6-25](#)
- [Configuring Floor Areas, page 6-28](#)
- [Configuring ChokePoints, page 6-56](#)
- [Configuring WiFi TDOA Receivers, page 6-59](#)
- [Managing RF Calibration Models, page 6-62](#)
- [Managing Location Presence Information, page 6-68](#)

## Configuring Maps

This section contains the following topics:

- [Viewing a Map, page 6-8](#)
- [Editing a Map, page 6-10](#)
- [Deleting a Map, page 6-10](#)
- [Copying a Map, page 6-11](#)
- [Exporting a Map, page 6-12](#)
- [Importing a Map, page 6-13](#)
- [Editing Map Properties, page 6-14](#)

## Viewing a Map

To view a current campus map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the campus map to open its details page (see [Figure 6-7](#)).

Figure 6-7 Campus View

**Step 3** The Select a command drop-down list provides the following options:

- New Floor Area—See the “Adding Floor Areas to a Campus Building” section on page 6-28 for more information.
- Edit Building—See the “Editing a Map” section on page 6-10 for more information.
- Delete Building— See the “Deleting a Map” section on page 6-10 for more information.
- Copy Building—See the “Managing RF Calibration Models” section on page 6-62 for more information.
- Edit Location Presence Information—See the “Managing Location Presence Information” section on page 6-68 for more information.

**Note** Use the **Monitor > Site Maps > Campus View** main navigation bar at the top of the campus image to enlarge or decrease the size of the map view and to hide or show the map grid (which displays the map size in feet or meters).

### Configuring Edit View

The Edit View page enables you to choose which columns appear in the maps list page.

**Note** Name and Type are fixed columns. They cannot be moved or hidden.

Column names appear in one of the following lists:

- Hide Information—Lists columns that do not appear in the table. The Hide button points to this list.
- View Information—Lists columns that do appear in the table. The Show button points to this list.

To display a column in a table, click it in the Hide Information list, then click **Show**. To remove a column from a table, click it in the View Information list, then click **Hide**. You can select more than one column by pressing the Shift or Control key.

To change the position of a column in the View Information list, click it, then click **Up** or **Down**. The higher a column is in the list, the farther left it appears in the table.

### Edit View Command Buttons

The following command buttons appear in the Edit View page:

- **Reset**—Set the table to the default display.
- **Show**—Move the highlighted columns from the Hide Information list to the View Information list.
- **Hide**—Move the highlighted columns from the View Information list to the Hide Information list.
- **Up**—Move the highlighted columns upward in the list (further to the left in the table).
- **Down**—Move the highlighted columns downward in the list (further to the right in the table).
- **Submit**—Save the changes to the table columns and return to the previous page.
- **Cancel**—Undo the changes to the table columns and return to the previous page.

### Editing a Map

To edit a current campus map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Click the name of the campus map to open its details page.
  - Step 3** From the Select a command drop-down list, choose **Edit Campus**.
  - Step 4** Make any necessary changes to the Campus Name, and the Contact.

**Note**

To change the unit of measurement (feet or meters), choose **Monitor > Site Maps** and select **Properties** from the Select a command drop-down list.

---

- Step 5** Click **Next**.
- Step 6** Make any additional changes to Maintain Aspect Ratio or Dimensions (feet).
- Step 7** Click **OK**.

**Note**

System Campus is part of all partitions. Also, you can not edit or delete a system campus.

---

### Deleting a Map

Follow these steps to delete a map:

- 
- Step 1** From the **Monitor > Site Maps** page, Select the check box(es) for the map(s) that you want to delete.
  - Step 2** Click **Delete** at the bottom of the map list or choose **Delete Maps** from the Select a command drop-down list, and click **Go**.
  - Step 3** Click **OK** to confirm the deletion.

**Note**

---

Deleting a campus or building also deletes all of its container maps. The access points from all deleted maps are moved to an Unassigned state. System Campus can not be deleted, however buildings or floors in system campus can be modified.

---

## Copying a Map

The following guidelines apply to the copying process:

- Only the child elements are copied to the new map.
- The selected map is copied to the current applicable partition.
- Overlapping areas are not checked when buildings are copied. You should edit these after copying the map for proper positioning.
- If the selected map is above ground, the first available floor above ground is used for the copy.
- If the selected map is a basement, the first available basement is used for the copy.
- The following are *not* copied:
  - Access points and their positioning coordinates.
  - Planning mode data.

**Note**

---

You can not copy a System Campus.

---

To copy a map, follow these steps:

- Step 1** From the Monitor > Site Maps page, select the check box of the map that you want to copy.
- Step 2** From the Select a command drop-down list, click **Copy Maps**. The Copy Maps dialog box opens (see Figure 6-8).

**Figure 6-8 Copy Maps**

Copy Maps

Selected Map **BGL25 [Building]**

Copy Selected Map To

Copy Option

Map Only

Map and Map Details [includes coverage areas, perimeter, obstacles, location regions, markers, rails ...]

Copy Cancel

Footnotes

1. Only the child elements are copied to the new map specified. If a map with the new name already exists, the copying process stops.
2. APs and their positioning coordinates are not copied.
3. The planning mode data is not copied.
4. The selected map is copied to the current applicable virtual domain.
5. Overlapping areas are not checked when buildings are copied. They should be edited for proper positioning.
6. If the selected map is above ground, the first available floor above ground is used for copy.
7. If the selected map is a basement, first available basement is used for copy.

291032

- Step 3** Enter the name of the new map to which you want to copy the current map.

**Note** If a map with the new name already exists, the copying process stops.

- Step 4** Select the Copy Option (Map Only or Map and Map Details).

**Note** Map and Map Details includes coverage areas, perimeters, obstacles, location regions, markers, and rails.

- Step 5** Click **Copy** to complete the copying process or **Cancel** to close the dialog box without copying the current map.

## Exporting a Map

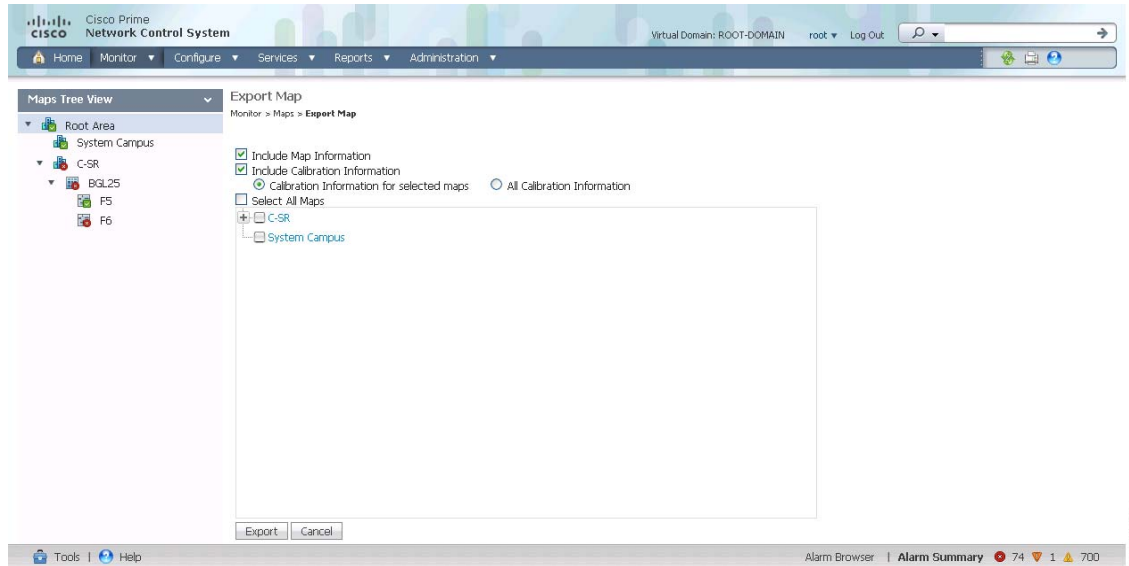

The Export Map feature allows you to export map or calibration information to XML. The exported XML will be in an encrypted format and will not be readable. XML and images are bundled, tarred, and zipped into a file for a successful import into another NCS.

To export a map, follow these steps:

- Step 1** Choose **Monitor > Site Maps** page.

- Step 2** From the Select a command drop-down list, Choose **Export Maps**. The Export Map page appears. (see Figure 6-9)

**Figure 6-9** Export Map

- Step 3** Select the maps that you want to export.
- Step 4** Click **Export** to export the selected map data.

## Importing a Map

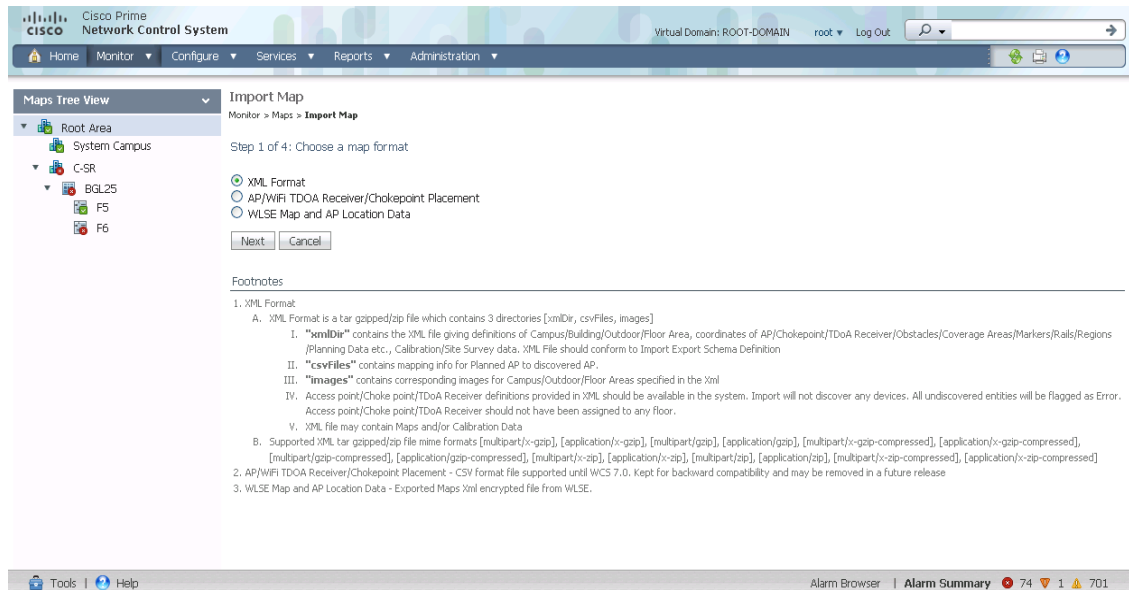

The Import Map feature allows you to import map information from external sources such as XML, WLSE and CSV. During import, the XML may be encrypted (if exported from NCS) or unencrypted. To import a map, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** From the Select a command drop-down list, choose **Import Maps**. The Import Map page appears.

**Note** It is important that APs are first added to the NCS Server prior to importing maps, since APs in the maps are also included during the export process. APs that have not been added to NCS server but are present in exported floor maps will result in error being displayed during importing these maps into NCS. If APs are unassociated or unreachable, will result in the same error, you will have to manually add these APs to your maps after the importing process.

Figure 6-10 Import Map

**Step 3** Choose the map format.

**Step 4** Select one of the following formats.

- XML
- AP/WiFi TDOA Receiver/Chokepoint Placement
- WLSE Map and AP Location Data

**Note** The XML format option is available only to the root user.

**Note** Aeroscout engine fails to start MSE if NCS map names have special characters such as '&'.

**Step 5** Click **Next**.

**Step 6** Click **Browse** to select the file that you want to import.

**Step 7** Click **Import** to import the selected data.

## Editing Map Properties

To edit your map properties, follow these steps:

**Note** Users with Map Read-Write permissions can only edit the map properties.

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** From the Select a command drop-down list, choose **Properties**.

**Step 3** Click **Go**.

**Step 4** Edit the information in [Table 6-1](#).

**Table 6-1** *Map Properties Parameters*

| Parameter or Control                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unit of Dimension                          | Set dimension measurement in feet or meters for all NCS maps.                                                                                                                                                                                                                                                                                                                                                                  |
| Wall Usage Calibration                     | Choose to use or not use walls, or set to automatic.                                                                                                                                                                                                                                                                                                                                                                           |
| Refresh Map From Network                   | <p>Enable refresh of map data for Cisco NCS to update maps by polling the Cisco WLAN Solution each time an Cisco WLAN Solution operator requests a map update. Select disable for Cisco NCS to update maps from its stored database.</p> <p> <b>Note</b> Updates to the database may not be frequent enough to keep the map data current.</p> |
| Advanced Debug Mode                        | This option must be enabled on both the location appliance and NCS to allow use of the location accuracy testpoint feature.                                                                                                                                                                                                                                                                                                    |
| Use Dynamic Heatmaps                       | This option must be enabled to allow use of dynamic heatmaps. By default it is enabled.                                                                                                                                                                                                                                                                                                                                        |
| Minimum Number of APs for Dynamic Heatmaps | Dynamic heatmap of an AP is calculated only if it receives the RSSI strengths from a number of neighboring APs, which should be greater than or equal to this parameter value. The minimum and default is 4 and the maximum number of APs is 10.                                                                                                                                                                               |
| Recomputation Frequency (Hours)            | <p>Configure the time when you want the data to be polled and refreshed when you are not actively using the maps. You can always refresh the data and get the latest heatmaps when you are actively using the maps. The default is 6 hours. The minimum is 1 hour and the maximum is 24 hours.</p> <p><b>Note</b> We recommend minimum number of APs as 4 and 6 hours as recomputation frequency for maximum performance.</p>  |

## Filtering Maps

At the **Monitor > Site Maps**, the list of maps can be filtered based on type and status. To filter your map list, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Choose the map type from the Type drop-down list. Map types include All, Campus, Building, Outdoor Area, and Floor Area.
- Step 3** To further sort the map list by status, choose the status type from the Status drop-down list. Status types include All, Critical, Major, Minor.
-  **Note** Status indicates the most serious level of alarm on an access point located on this map or one of its children.
- 
- Step 4** When the filtering criteria is selected, click **Go**. The list displays maps which fit the filtering criteria.
- 

## Configuring Buildings

You can add buildings to the NCS database regardless of whether you have added campus maps to the database. This section explains how to add a building to a campus map or a standalone building (one that is not part of a campus) to the Cisco NCS database.

This section contains the following topics:

- [Adding a Building to a Campus Map, page 6-16](#)
- [Viewing a Building, page 6-21](#)
- [Editing a Building, page 6-21](#)
- [Deleting a Building, page 6-22](#)
- [Moving a Building, page 6-22](#)

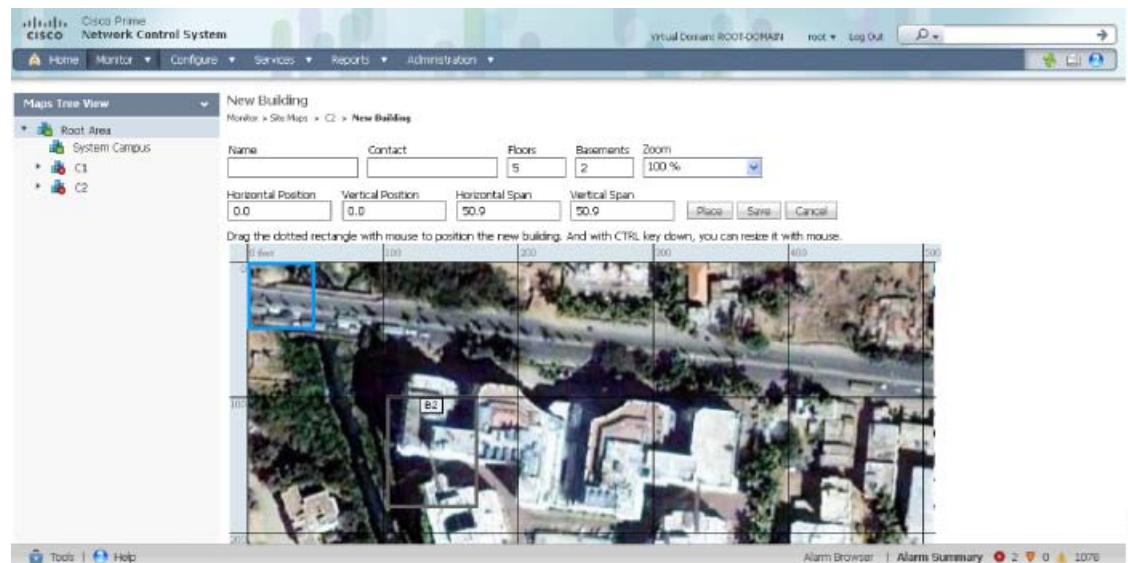

### Adding a Building to a Campus Map

Follow these steps to add a building to a campus map in the NCS database:

- 
- Step 1** Choose **Monitor > Site Maps** to display the Maps page.
- Step 2** Click the desired campus. NCS displays the **Site Maps > Campus Name** page.
- Step 3** From the **Select a command** drop-down list, choose **New Building** and click **Go** (see [Figure 6-11](#)).

Figure 6-11 New Building

**Step 4** On the Campus Name > New Building page, follow these steps to create a virtual building in which to organize related floor plan maps:

- a. Enter the building name.
- b. Enter the building contact name.
- c. Enter the number of floors and basements.
- d. Enter the horizontal position (distance from the corner of the building rectangle to the left edge of the campus map) and the vertical position (distance from the corner of the building rectangle to the top edge of the campus map) in feet.

**Note** To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the Select a command drop-down list.

- e. Enter an approximate building horizontal span and vertical span (width and depth on the map) in feet.

**Note** The horizontal and vertical span should be larger than or the same size as any floors that you might add later.

**Tip** You can also use **Ctrl-click** to resize the bounding area in the upper left corner of the campus map. As you change the size of the bounding area, the Horizontal Span and Vertical Span parameters of the building change to match your actions.

- f. Click **Place** to put the building on the campus map. NCS creates a building rectangle scaled to the size of the campus map.
- g. Click the building rectangle and drag it to the desired position on the campus map.

**Note** After adding a new building, you can move it from one campus to another without having to recreate it.

- h. Click **Save** to save this building and its campus location to the database. NCS saves the building name in the building rectangle on the campus map.

**Note** A hyperlink associated with the building takes you to the corresponding Map page.

**Step 5** (Optional) To assign location presence information for the new outdoor area, do the following:

- a. Choose **Edit Location Presence Info** from the Select a command drop-down list. Click **Go**. The Location Presence page appears (see [Figure 6-12](#)).

**Note** By default, the Override Child Element's Presence Info check box is selected. This option should remain selected if you want to propagate the campus location to all buildings and floors on that campus. When adding buildings to the campus map, you can import the campus location information. The campus address cannot be imported to a building if the check box is unselected. This option should be deselected if you want to assign building-specific addresses to buildings on its campus rather than one campus address to all.

**Figure 6-12 Location Presence**

Location Presence  
Monitor > Site Maps > Location Presence

Select a Map to update the Presence information

Area Type: Floor Area  
Campus: C-SR  
Building: BGL25  
Floor: --Select Floor--  
Selected Map: Building: C-SR > BGL25

Civic Address | GPS Markers | Advanced

Name:   
Street:   
House Number:   
House Number Suffix:   
Address Line 2:   
State:   
Postal Code:   
Country:

Override Child's Presence Information

Save Cancel Clear Import From Parent

Tools | Help Alarm Browser | Alarm Summary 74 1 7x

- b. Click either the **Civic Address**, **GPS markers**, or **Advanced** tab.
  - Civic Address identifies the campus by name, street, house number, house number suffix, city (address line2), state, postal code, and country.
  - GPS Markers identify the campus by longitude and latitude.

- Advanced identifies the campus with expanded civic information such as neighborhood, city division, country, and postal community name.

**Note** Each selected parameter is inclusive of all of those above it. For example, if you choose Advanced, it can also provide GPS and Civic location information upon client demand. The selected setting must match what is set on the location server level (Services > Mobility Services).

**Note** If a client requests location information such as GPS Markers for a campus, building, floor, or outdoor area that is not configured for that parameter, an error message is returned.

- By default, the Override Child Element's Presence Info check box is selected. There is no need to alter this setting for standalone buildings.

**Step 6** Click **Save**.

## Adding a Standalone Building

Follow these steps to add a standalone building to the NCS database:

**Step 1** Choose **Monitor > Site Maps** to display the Maps page.

**Step 2** From the Select a command drop-down list, choose **New Building** and click **Go** (see [Figure 6-11](#)).

**Figure 6-13** *New Standalone Building*

**Step 3** In the Maps > New Building page, follow these steps to create a virtual building in which to organize related floor plan maps:

- Enter the building name.

- b. Enter the building contact name.

**Note** After adding a new building, you can move it from one campus to another without having to recreate it.

- c. Enter the number of floors and basements.

- d. Enter an approximate building horizontal span and vertical span (width and depth on the map) in feet.

**Note** To change the unit of measurement (feet or meters), click Monitor > Site Maps and choose **Properties** from the Select a command drop-down list.

**Note** The horizontal and vertical span should be larger than or the same size as any floors that you might add later.

- e. Click **OK** to save this building to the database.

**Step 4** (Optional) To assign location presence information for the new building, do the following:

- a. Choose **Location Presence** from the Select a command drop-down list. Click **Go**. The Location Presence page appears (see [Figure 6-12](#)).
- b. Click either the Civic, GPS markers, or Advanced tab.
  - Civic Address identifies the campus by name, street, house number, house number suffix, city (address line2), state, postal code, and country.
  - GPS Markers identify the campus by longitude and latitude.
  - Advanced identifies the campus with expanded civic information such as neighborhood, city division, county, and postal community name.

**Note** Each selected parameter is inclusive of all of those above it. For example, if you select Advanced, it can also provide GPS and Civic location information upon client demand. The selected setting must match what is set on the location server level (Services > Mobility Services).

**Note** If a client requests location information such as GPS Markers for a campus, building, floor, or outdoor area that is not configured for that parameter, an error message is returned.

- c. By default, the Override Child Element's Presence Info check box is selected. This option should remain selected if you want to propagate the campus location to all buildings and floors on that campus. When adding buildings to the campus map, you can import the location information. The campus address cannot be imported to a building if the check box is unselected. This option should be deselected if you want to assign building-specific addresses to buildings on its campus rather than one campus address to all.

**Step 5** Click **Save**.

**Note**

---

The standalone buildings are automatically placed in System Campus.

---

## Viewing a Building

To view a current building map, follow these steps:

---

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** Click the name of the building map to open its details page. The Building View page provides a list of floor maps and map details for each floor.

**Note**

---

From the Building View page, you can click the Floor column heading to sort the list ascending or descending by floor.

---

The map details include:

- Floor area
- Floor index—Indicates the floor level. A negative number indicates a basement floor level.
- Contact
- Status—Indicates the most serious level of alarm on an access point located on this map or one of its children.
- Number of total access points located on the map.
- Number of 802.11a/n and 802.11b/g/n radios located on the map.
- Number of out of service (OOS) radios.
- Number of clients—Click the number link to view the Monitor > Clients page. See the [“Monitoring Clients and Users”](#) section on page 10-10 for more information.

**Step 3** The Select a command drop-down list provides the following options:

- New Floor Area—See the [“Adding Floor Areas to a Campus Building”](#) section on page 6-28 or the [“Adding Floor Plans to a Standalone Building”](#) section on page 6-32 for more information.
  - Edit Building—See the [“Editing a Building”](#) section on page 6-21 for more information.
  - Delete Building—See the [“Deleting a Building”](#) section on page 6-22 for more information.
  - Copy Building—See the [“Copying a Map”](#) section on page 6-11 for more information.
  - Edit Location Presence Info—See the [“Managing Location Presence Information”](#) section on page 6-68 for more information.
- 

## Editing a Building

To edit a current building map, follow these steps:

---

**Step 1** Choose **Monitor > Site Maps**.

- Step 2** Click the name of the building map to open its details page.
- Step 3** From the Select a command drop-down list, choose **Edit Building**.
- Step 4** Make any necessary changes to Building Name, Contact, Number of Floors, Number of Basements, and Dimensions (feet).

---

**Note** To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the Select a command drop-down list.

---

- Step 5** Click **OK**.
- 

## Deleting a Building

To delete a current building map, follow these steps:

---

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Select the check box for the building that you want to delete.
- Step 3** Click **Delete** at the bottom of the map list (or choose **Delete Maps** from the Select a command drop-down list and click **Go**).
- Step 4** Click **OK** to confirm the deletion.

---

**Note** Deleting a building also deletes all of its container maps. The access points from all deleted maps are moved to an Unassigned state.

---

## Moving a Building

To move a building to a different campus, follow these steps:

---

- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Select the check box of the applicable building.
  - Step 3** From the Select a command drop-down list, choose **Move Buildings**.
  - Step 4** Click **Go**.
  - Step 5** Choose the Target Campus from the drop-down list.
  - Step 6** Select the buildings that you want to move. Unselect any buildings that will remain in their current location.
  - Step 7** Click **OK**.
-

## Configuring Campus

This section contains the following topics:

- [Adding a Campus Map, page 6-23](#)
- [Editing a Campus Map, page 6-24](#)
- [Editing a Campus Map, page 6-24](#)
- [Deleting a Campus Map, page 6-25](#)

### Adding a Campus Map

Follow these steps to add a single campus map to the NCS database:

**Step 1** Save the map in .PNG, .JPG, .JPEG, or .GIF format.

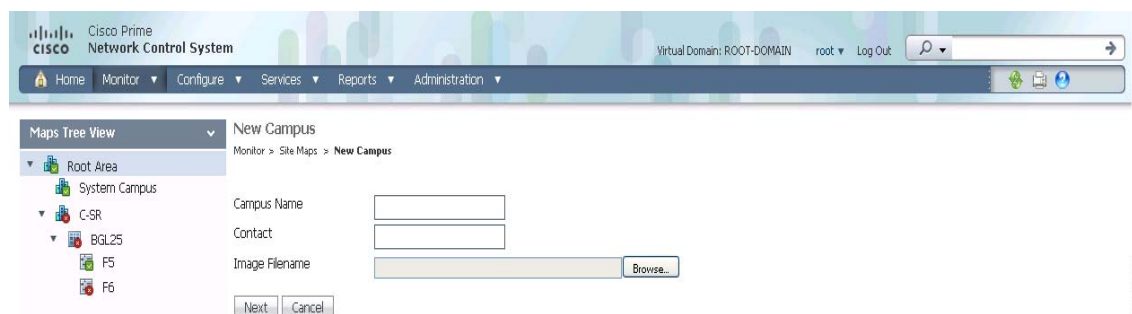

**Note** The map can be of any size because NCS automatically resizes the map to fit its working areas.

**Step 2** Browse to and import the map from anywhere in your file system.

**Step 3** Choose **Monitor > Site Maps** to display the Maps page (see [Figure 6-14](#)).

**Figure 6-14** *New Campus*

**Step 4** From the **Select a command** drop-down list, choose **New Campus** and click **Go**.

**Step 5** In the **Maps > New Campus** page, enter the campus name, and campus contact name.

**Step 6** Browse to and choose the image filename containing the map of the campus and click **Open**.

**Step 7** Select the **Maintain Aspect Ratio** check box to prevent length and width distortion when NCS resizes the map.

**Step 8** Enter the horizontal and vertical span of the map in feet.

**Note** To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the **Select a command** drop-down list. The horizontal and vertical span should be larger than any building or floor plan to be added to the campus.

**Step 9** Click **OK** to add this campus map to the NCS database. NCS displays the Maps page, which lists maps in the database, map types, and campus status.

291037

- Step 10** (Optional) To assign location presence information, click the newly created campus link at the Monitor > Site Maps page. See the [“Managing Location Presence Information”](#) section on page 6-68 for more information.
- 

## Viewing a Campus Map

To view a current campus map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the campus map to open its details page.
- Step 3** The Select a command drop-down list provides the following options:
- New Building—See the [“Adding a Building to a Campus Map”](#) section on page 6-16 for more information.
  - New Outdoor Area—See the [“Adding an Outdoor Area”](#) section on page 6-25 for more information.
  - Edit Campus—See the [“Editing a Campus Map”](#) section on page 6-24 for more information.
  - Delete Campus—See the [“Deleting a Campus Map”](#) section on page 6-25 for more information.
  - Copy Campus—See the [“Copying a Map”](#) section on page 6-11 for more information.
  - Edit Location Presence Information—See the [“Managing Location Presence Information”](#) section on page 6-68 for more information.

**Note** Use the Monitor > Site Maps > Campus View main navigation bar at the top of the campus image to enlarge or decrease the size of the map view and to hide or show the map grid (which displays the map size in feet or meters).

---

## Editing a Campus Map

The edit feature allows you to make changes to a current campus map. You can change the campus name, contact person, image, and map dimensions.

To edit a current campus map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the campus map to open its details page.
- Step 3** From the Select a command drop-down list, choose **Edit Campus**.
- Step 4** Make any necessary changes to Campus Name, Contact, or Image File.
- Step 5** Click **Next**.
- Step 6** Make any additional changes to Maintain Aspect Ratio or Dimensions (feet).

**Note** To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the Select a command drop-down list.

---

**Step 7** Click **OK**.

---

## Deleting a Campus Map

To delete a current campus map, follow these steps:

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** Select the check box for the campus that you want to delete.

**Step 3** Click **Delete** at the bottom of the map list or choose **Delete Maps** from the Select a command drop-down list, and click **Go**.

**Step 4** Click **OK** to confirm the deletion.

**Note** Deleting a campus also deletes all of its container maps. The access points from all deleted maps are moved to an Unassigned state.

---

## Configuring Outdoor Areas

This section contains the following topics:

- [Adding an Outdoor Area, page 6-25](#)
- [Editing Outdoor Areas, page 6-27](#)
- [Deleting Outdoor Areas, page 6-27](#)

## Adding an Outdoor Area

**Note** You can add an outdoor area to a campus map in the NCS database regardless of whether you have added outdoor area maps to the database.

---

To add an outdoor area to a campus map, follow these steps:

**Step 1** If you want to add a map of the outdoor area to the database, save the map in .PNG, .JPG, .JPEG, or .GIF format. Then browse to and import the map from anywhere in your file system.

**Note** You do not need a map to add an outdoor area. You can simply define the dimensions of the area to add it to the database. The map can be any size because NCS automatically resizes the map to fit the workspace.

---

**Step 2** Choose **Monitor > Site Maps**.

**Step 3** Click the desired campus to display the Monitor > Site Maps > Campus View page.

**Step 4** From the Select a command drop-down list, choose **New Outdoor Area**.

**Step 5** Click **Go**. The Create New Area page opens.

**Step 6** On the New Outdoor Area page, enter the following information:

- Name—The user-defined name of the new outdoor area.
- Contact—The user-defined contact name.
- Area Type (RF Model)—Cubes And Walled Offices, Drywall Office Only, Outdoor Open Space (default).
- AP Height (feet)—Enter the height of the access point.
- Image File—Name of the file containing the outdoor area map. Use the browse button to find the file.

**Step 7** Click **Next**.

**Step 8** Enter the following information:

- Zoom—Use to zoom in or zoom out on the map that you are currently viewing.
- Maintain Image Aspect Ratio—Select this check box to maintain the aspect ratio (ratio of horizontal and vertical pixels) of the map image. Maintaining the aspect ratio prevents visual distortion of the map.
- Horizontal Position—Distance from the corner of the outdoor area rectangle to the left edge of the campus map, in feet or meters.
- Vertical Position—Distance from the corner of the outdoor area rectangle to the top edge of the campus map, in feet or meters.
- Horizontal Span—Horizontal measurement (left to right) of the outdoor area rectangle, in feet or meters.
- Vertical Span—Vertical measurement (up and down) of the outdoor area rectangle, in feet or meters.

**Tip**

The horizontal and vertical spans should be larger than or the same size. Use **Ctrl-click** to resize the bounding area in the upper-left corner of the campus map. The horizontal and vertical span parameters change to match.

**Note**

To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the Select a command drop-down list.

**Step 9** Click **Place** to put the outdoor area on the campus map. NCS creates an outdoor area rectangle scaled to the size of the campus map.

**Step 10** Click and drag the outdoor area rectangle to the desired position on the campus map.

**Step 11** Click **Save** to save this outdoor area and its campus location to the database.

**Note**

A hyperlink associated with the outdoor area takes you to the corresponding Map page.

**Step 12** (Optional) To assign location presence information for the new outdoor area, choose **Edit Location Presence Info**, and click **Go**. See the [“Managing Location Presence Information”](#) section on page 6-68 for more information.

**Note**

By default, the Override Child Element Presence Info check box is selected. There is no need to alter this setting for outdoor areas.

## Editing Outdoor Areas

To edit a current outdoor area, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the desired outdoor area map from the Name column.
- Step 3** From the Select a command drop-down list, choose **Edit Outdoor Area**.
- Step 4** Click **Go**.
- Step 5** In the Campus Name > Outdoor Area page, edit the following information:
- Name—The user-defined name of the new outdoor area.
  - Contact—The user-defined contact name.
  - New Image File—Use the Browse button to import a new image file, if necessary.
  - Maintain Image Aspect Ratio—Select this check box to maintain the aspect ratio (ratio of horizontal and vertical pixels) of the map image. Maintaining the aspect ratio prevents visual distortion of the map.
  - Horizontal Position—Distance from the corner of the outdoor area rectangle to the left edge of the campus map, in ft. or meters.
  - Vertical Position—Distance from the corner of the outdoor area rectangle to the top edge of the campus map, in ft. or meters.
  - Horizontal Span—Horizontal measurement (left to right) of the outdoor area rectangle, in ft. or meters.
  - Vertical Span—Vertical measurement (up and down) of the outdoor area rectangle, in ft. or meters.
- Step 6** Click **Place** to put the outdoor area on the campus map. NCS creates an outdoor area rectangle scaled to the size of the campus map.
- Step 7** Click and drag the outdoor area rectangle to the desired position on the campus map.
- Step 8** Click **Save** to save this outdoor area and its campus location to the database.

**Note**

A hyperlink associated with the outdoor area takes you to the corresponding Map page.

## Deleting Outdoor Areas

To delete a current outdoor area, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.

- Step 2** Select the check box for the outdoor area that you want to delete.
- Step 3** Click **Delete** at the bottom of the map list (or choose **Delete Maps** from the Select a command drop-down list, and click **Go**).
- Step 4** Click **OK** to confirm the deletion.
- 

## Configuring Floor Areas

This section explains on how to add floor plans to either a campus building or a standalone building in the NCS database and contains the following topics:

- [Adding Floor Areas to a Campus Building, page 6-28](#)
- [Adding Access Points to a Floor Area, page 6-34](#)
- [Editing Floor Areas, page 6-39](#)
- [Deleting Floor Areas, page 6-39](#)
- [Placing Access Points, page 6-40](#)
- [Configuring Floor Settings, page 6-41](#)
- [Import Map and AP Location Data, page 6-53](#)
- [Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File, page 6-54](#)
- [Changing Access Point Positions by Importing and Exporting a File, page 6-55](#)

## Adding Floor Areas to a Campus Building

After you add a building to a campus map, you can add individual floor plan and basement maps to the building.

To add a floor area to a campus building, follow these steps:

- 
- Step 1** Save your floor plan maps in .PNG, .JPG, or .GIF format.

---

**Note** The maps can be any size because NCS automatically resizes the maps to fit the workspace.

---

- Step 2** Browse to and import the floor plan maps from anywhere in your file system. You can also import CAD image files DXF, and DWG.

---

**Note** If there are problems converting the auto-cad file, an error message is displayed. NCS uses a native image conversion library to convert auto-cad files into raster formats like PNG. If the native library cannot be loaded, NCS returns the “unable to convert the auto-cad file” message. If you receive this error, make sure all the required dependencies are met for the native library. To find any dependency problems, use ldd on Linux platforms. The following dlls must be present under the /webnms/rfdlls NCS installation directory: LIBGFL254.DLL, MFC71.DLL, MSVCR71.DLL, and MSVCP71.DLL. If dependency problems occurred, you may need to install the required libraries and restart NCS.

---

**Note**

An imported auto-cad file can become blurred when you zoom. Without the zoom, the clarity is about the same as the original auto-cad file. Make sure all relevant sections are clearly visible in the original auto-cad file (DWG/DXF) and then import the auto-cad file into PNG/GIF format rather than JPEG or JPG.

**Step 3** Choose **Monitor > Site Maps**. The Maps page opens. (See [Figure 6-15](#))

**Figure 6-15** *Monitor > Site Maps*

| Name              | Type       | Total APs | a/n Radios | b/g/n Radios | Critical Radio Alarms | Clients | Status                              |
|-------------------|------------|-----------|------------|--------------|-----------------------|---------|-------------------------------------|
| System Campus     | Campus     | 0         | 0          | 0            | 0                     | 0       | <span style="color: blue;">●</span> |
| C-SR              | Campus     | 7         | 7          | 7            | 2                     | 0       | <span style="color: red;">●</span>  |
| C-SR > BGL25      | Building   | 7         | 7          | 7            | 2                     | 0       | <span style="color: red;">●</span>  |
| C-SR > BGL25 > F5 | Floor Area | 0         | 0          | 0            | 0                     | 0       | <span style="color: blue;">●</span> |
| C-SR > BGL25 > F6 | Floor Area | 7         | 7          | 7            | 2                     | 0       | <span style="color: red;">●</span>  |

**Step 4** From the Maps Tree View or the **Monitor > Site Maps** list, click the applicable campus building to open the Building View page.

**Step 5** Hover your cursor over the name within an existing building rectangle to highlight it.

**Note**

You can also access the building from the Campus View page. From the Campus View page, click the building name to open the Building View page.

**Step 6** From the Select a command drop-down list, choose **New Floor Area**.

**Step 7** Click **Go**. The New Floor Area page opens. (See [Figure 6-16](#))

**Figure 6-16** *New Floor Area*

New Floor Area  
Monitor > Site Maps > C-SR > BGL25 > **New Floor Area**

Floor Area Name:

Contact:

Floor: - Select a Floor -

Floor Type (RF Model): Cubes And Walled Offices

Floor Height (feet): 10.0

Image or CAD File:   Convert CAD File to: PNG

**Step 8** In the New Floor Area page, follow these steps to add floors to a building in which to organize related floor plan maps:

- a. Enter the floor area and contact names.
- b. Choose the floor or basement number from the Floor drop-down list.
- c. Choose the floor or basement type (RF Model).
- d. Enter the floor-to-floor height in feet.

**Note** To change the unit of measurement (feet or meters), click **Monitor > Site Maps** and choose **Properties** from the Select a command drop-down list.

- e. Select the **Image or CAD File** check box.
- f. Browse to and choose the desired floor or basement image or CAD filename, and click **Open**.

**Note** If you are importing a CAD file, use the Convert CAD File drop-down list to determine the image file for conversion.

**Tip** A JPEG (JPG) format is not recommended for an auto-cad conversion. Unless a JPEG is specifically required, use a PNG or GIF format for higher quality images.

- g. Click **Next**. At this point, if a CAD file was specified, a default image preview is generated and loaded.

**Note** NCS uses a native image conversion library to convert auto-cad files into raster formats like .PNG. When there are issues loading the native library, NCS throws the following error: "Unable to convert the auto-cad file. Reason: Error while loading the auto-cad image conversion library. Please refer online or NCS documentation for more information."

The names of the CAD file layers are listed, with check boxes to the right side of the image indicating which are enabled.

**Note** When you choose the floor or basement image filename, NCS displays the image in the building-sized grid.

**Note** The maps can be any size because NCS automatically resizes the maps to fit the workspace.

**Note** The map must be saved in .PNG, .JPG, .JPEG, or .GIF format.

- h. If you have CAD file layers, you can select or deselect as many as you want and click **Preview** to view an updated image. Click **Next** when you are ready to proceed with the selected layers.  
Enter the remaining parameters for the floor area.

Figure 6-17 Floor Area Parameters

**New Floor Area**

Monitor &gt; Maps &gt; campus\_bld01 &gt; New Floor Area

|                              |                                                           |
|------------------------------|-----------------------------------------------------------|
| <b>Floor Area Name</b>       | <input type="text" value="floor01"/>                      |
| <b>Contact</b>               | <input type="text"/>                                      |
| <b>Floor</b>                 | 2 <input type="button" value="v"/>                        |
| <b>Floor Type (RF Model)</b> | Cubes And Walled Offices <input type="button" value="v"/> |
| <b>Floor Height (feet)</b>   | <input type="text" value="10.0"/>                         |
| <b>Image File</b>            | floorplan.GIF                                             |

 Maintain Aspect Ratio**Dimensions(feet)**

|                 |                                   |
|-----------------|-----------------------------------|
| Horizontal Span | <input type="text" value="92.6"/> |
| Vertical Span   | <input type="text" value="50"/>   |

**Coordinates of top left corner(feet)**

|                     |                                |
|---------------------|--------------------------------|
| Horizontal Position | <input type="text" value="0"/> |
| Vertical Position   | <input type="text" value="0"/> |

Total Floor Area Size (sq. feet) :4633.3

 Launch Map Editor after floor creation (To rescale floor and draw walls) 

Use mouse to position the floor image by dragging it. And use CTRL key with mouse to resize the floor.

- i. Either leave the **Maintain Aspect Ratio** check box selected to preserve the original image aspect ratio or unselect the check box to change the image aspect ratio.
- j. Enter an approximate floor or basement horizontal and vertical span (width and depth on the map) in feet.

**Note** The horizontal and vertical spans should be smaller than or the same size as the building horizontal and vertical spans in the NCS database.

- k. If applicable, enter the horizontal position (distance from the corner of the outdoor area rectangle to the left edge of the campus map) and vertical position (distance from the corner of the outdoor area rectangle to the top edge of the campus map) in feet or meters.

**Tip** Use **Ctrl-click** to resize the image within the building-sized grid.

- l. If desired, select the **Launch Map Editor after floor creation** check box to rescale the floor and draw walls.
- m. Click **OK** to save this floor plan to the database. The floor is added to the Maps Tree View and the Monitor > Site Maps list.

---

**Note** Use different floor names in each building. If you are adding more than one building to the campus map, do not use a floor name that exists in another building. This overlap causes incorrect mapping information between a floor and a building.

---

**Step 9** Click any of the floor or basement images to view the floor plan or basement map.

---

**Note** You can zoom in or out to view the map at different sizes and you can add access points. See the [“Adding Access Points to a Floor Area”](#) section on page 6-34 for more information.

---

### Adding Floor Plans to a Standalone Building

After you have added a standalone building to the NCS database, you can add individual floor plan maps to the building.

To add floor plans to a standalone building, follow these steps:

---

**Step 1** Save your floor plan maps in .PNG, .JPG, or .GIF format.

---

**Note** The maps can be any size because NCS automatically resizes the maps to fit the workspace.

---

**Step 2** Browse to and import the floor plan maps from anywhere in your file system. You can import CAD files in DXF or DWG formats or any of the formats you created in Step 1.

---

**Note** If there are problems converting the auto-cad file, an error message is displayed. NCS uses a native image conversion library to convert auto-cad files into raster formats link PNG. If the native library cannot be loaded, NCS returns the “unable to convert the auto-cad file” message. If you receive this error, make sure all the required dependencies are met for the native library. To find any dependency problems, use ldd on Linux platforms. The following dlls must be present under the /webnms/rfdlls NCS installation directory: LIBGFL254.DLL, MFC71.DLL, MSVCR71.DLL, and MSVCP71.DLL. If dependency problems occurred, you may need to install the required libraries and restart NCS.

---

---

**Note** An imported auto-cad file can become blurred when you zoom. Without the zoom, the clarity is about the same as the original auto-cad file. Make sure all relevant sections are clearly visible in the original auto-cad file (DWG/DXF) and then import the auto-cad file into PNG/GIF format rather than JPEG or JPG.

---

**Step 3** Choose **Monitor > Site Maps**.

**Step 4** From the Maps Tree View or the **Monitor > Site Maps** list, choose the desired building to display the Building View page.

**Step 5** From the Select a command drop-down list, choose **New Floor Area**.

**Step 6** Click **Go**.

**Step 7** In the New Floor Area page, add the following information:

- Enter the floor area and contact names.
- Choose the floor or basement number from the Floor drop-down list.
- Choose the floor or basement type (RF Model).
- Enter the floor-to-floor height in feet.
- Select the **Image or CAD File** check box.
- Browse to and choose the desired floor or basement **Image or CAD file**, and click **Open**.

**Note** If you are importing a CAD file, use the **Convert CAD File** drop-down list to determine the image file for conversion.

**Tip** A JPEG (JPG) format is not recommended for an auto-cad conversion. Unless a JPEG is specifically required, use a PNG or GIF format for higher quality images.

**Step 8** Click **Next**. At this point, if a CAD file was specified, a default image preview is generated and loaded.

**Note** NCS uses a native image conversion library to convert auto-cad files into raster formats like .PNG. When there are issues loading the native library, NCS throws the following error: "Unable to convert the auto-cad file. Reason: Error while loading the auto-cad image conversion library. Please refer online or NCS documentation for more information."

The names of the CAD file layers are listed, with check boxes to the right side of the image indicating which are enabled.

**Note** When you choose the floor or basement image filename, NCS displays the image in the building-sized grid.

**Note** The maps can be any size because NCS automatically resizes the maps to fit the workspace.

**Note** The map must be saved in .PNG, .JPG, .JPEG, or .GIF format.

If you have CAD file layers, you can select or deselect as many as you want and click **Preview** to view an updated image. Click **Next** when you are ready to proceed with the selected layers.

**Step 9** Enter the remaining parameters for the floor area.

- Either leave the **Maintain Aspect Ratio** check box selected to preserve the original image aspect ratio or unselect the check box to change the image aspect ratio.
- Enter an approximate floor or basement horizontal and vertical span (width and depth on the map) in feet.

**Note** The horizontal and vertical spans should be smaller than or the same size as the building horizontal and vertical spans in the NCS database.

- If applicable, enter the horizontal position (distance from the corner of the outdoor area rectangle to the left edge of the campus map) and vertical position (distance from the corner of the outdoor area rectangle to the top edge of the campus map) in feet or meters.

**Tip** Use **Ctrl-click** to resize the image within the building-sized grid.

- Adjust the floor characteristics with the NCS map editor by selecting the check box next to Launch Map Editor. See the “[Map Editor](#)” section on page 6-4 for more information regarding the map editor feature.

**Step 10** Click **OK** to save this floor plan to the database. The floor is added to the Maps Tree View and the Monitor > Site Maps list.

**Step 11** Click any of the floor or basement images to view the floor plan or basement map.

**Note** You can zoom in or out to view the map at different sizes and you can add access points. See the “[Adding Access Points to a Floor Area](#)” section on page 6-34 for more information.

## Adding Access Points to a Floor Area

After you add the .PNG, .JPG, .JPEG, or .GIF format floor plan and outdoor area maps to the NCS database, you can position lightweight access point icons on the maps to show where they are installed in the buildings. To add access points to a floor area and outdoor area, follow these steps:

**Step 1** Choose **Monitor > Site Maps**. The Maps page opens. (See [Figure 6-18](#))

**Figure 6-18** Monitor Site Maps

| Name              | Type       | Total APs | a/n Radios | b/g/n Radios | Critical Radio Alarms | Clients | Status |
|-------------------|------------|-----------|------------|--------------|-----------------------|---------|--------|
| System Campus     | Campus     | 0         | 0          | 0            | 0                     | 0       |        |
| C-SR              | Campus     | 7         | 7          | 7            | 2                     | 0       |        |
| C-SR > BGL25      | Building   | 7         | 7          | 7            | 2                     | 0       |        |
| C-SR > BGL25 > F5 | Floor Area | 0         | 0          | 0            | 0                     | 0       |        |
| C-SR > BGL25 > F6 | Floor Area | 7         | 7          | 7            | 2                     | 0       |        |

**Step 2** From the Maps Tree View or the Monitor > Site Maps list, click the applicable floor to open the Floor View page.

Figure 6-19 Floor View

**Step 3** From the Select a command drop-down list, choose **Add Access Points**, and click **Go**.

**Step 4** From the Add Access Points page, select the check boxes of the access points that you want to add to the floor area.

Figure 6-20 Add Access Point

**Note** Only access points which are not yet assigned to any floor or outdoor area appear in the list.

**Note** Select the check box at the top of the list to select all access points.

**Note** NCS allows a maximum of 100 access points per floor map.

**Step 5** When all of the applicable access points are selected, click **OK** located at the bottom of the access point list.

The Position Access Points page opens.

**Figure 6-21 Position Access Points**

Each access point you have chosen to add to the floor map is represented by a gray circle (differentiated by access point name or MAC address) and is lined up in the upper left part of the floor map.

**Step 6** Click and drag each access point to the appropriate location. Access points turn blue when selected.

**Note** When you drag an access point on the map, its horizontal and vertical position appears in the boxes above.

**Note** The small black arrow at the side of each access point represents Side A of each access point, and each access point arrow must correspond with the direction in which the access points were installed.

Side A is clearly noted on each 1000 series access point and has no relevance to the 802.11a/n radio.

To adjust the directional arrow, choose the appropriate orientation on the Antenna Angle drop-down list.

When selected, the access point details display on the left side of the page. Access point details include the following:

- AP Model—Indicates the model type of the selected access point.
- Protocol—Choose the protocol for this access point from the drop-down list.
- Antenna—Choose the appropriate antenna type for this access point from the drop-down list.
- Antenna/AP Image—The antenna image reflects the antenna selected from the Antenna drop-down list. Click the arrow at the top right of the antenna image to expand the image size.
- Antenna Orientation—Depending on the antenna type, enter the Azimuth and the Elevation orientations in degrees.

---

**Note** The Azimuth option does not appear for Omnidirectional antennas because their pattern is nondirectional in azimuth.

---

---

**Note** For internal antennas, the same elevation angle applies to both radios.

---

The antenna angle is relative to the map X axis. Because the origin of the X (horizontal) and Y (vertical) axes is in the upper left corner of the map, 0 degrees points side A of the access point to the right, 90 degrees points side A down, 180 degrees points side A to the left, and so on.

The antenna elevation is used to move the antenna vertically, up or down, to a maximum of 90 degrees.

---

**Note** Make sure each access point is in the correct location on the map and has the correct antenna orientation. Accurate access point positioning is critical when you use the maps to find coverage holes and rogue access points.

---

Refer the following URL for further information about the antenna elevation and azimuth patterns:  
[http://www.cisco.com/en/US/products/hw/wireless/ps469/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/hw/wireless/ps469/tsd_products_support_series_home.html)

Figure 6-22 Selected Access Point Details

**Step 7** When you are finished placing and adjusting each access point, click **Save**.

**Note** Clicking Save causes the antenna gain on the access point to correspond to the selected antenna. This may cause radio reset.

NCS computes the RF prediction for the coverage area. These RF predictions are popularly known as *heat maps* because they show the relative intensity of the RF signals on the coverage area map.

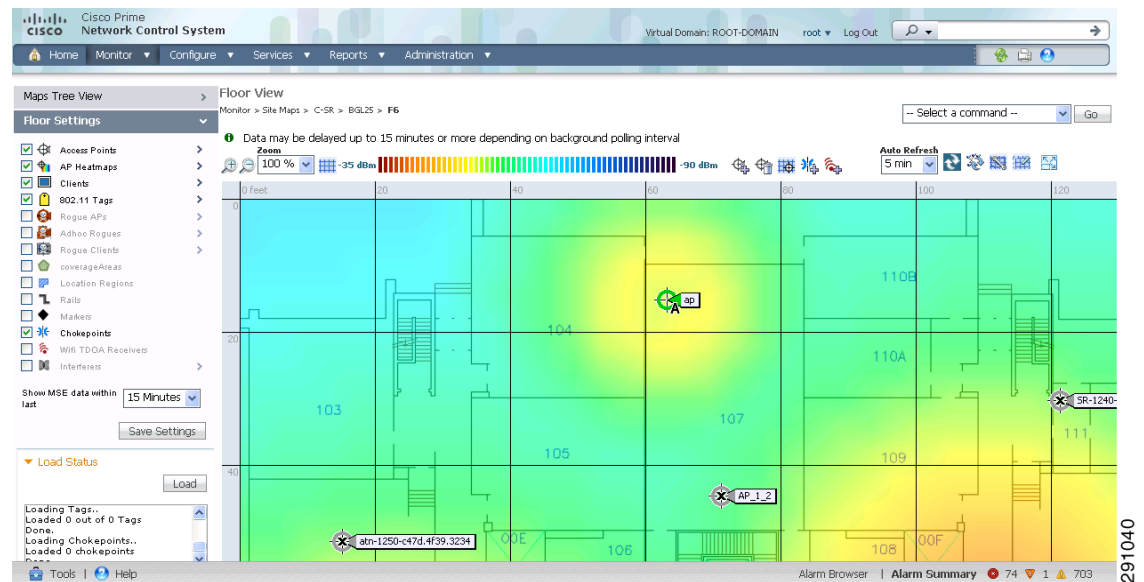

**Note** This display is only an approximation of the actual RF signal intensity because it does not take into account the attenuation of various building materials, such as drywall or metal objects, nor does it display the effects of RF signals bouncing off obstructions.

**Note** Antenna gain settings have no effect on heatmaps and location calculations. Antenna gain is implicitly associated to the antenna name. Because of this, the following apply:

- If an antenna is used and marked as “Other” in NCS, it is ignored for all heatmap and location calculations;
- If an antenna is used and marked as a Cisco antenna in NCS, that antenna gain setting (internal value on NCS) is used no matter what gain is set on the controller.

Figure 6-23 RF Prediction heatmaps

**Note** See the “Placing Access Points” section on page 6-40 for more information on placing access points on a map.

**Note** You can change the position of access points by importing or exporting a file. See the “Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File” section on page 6-54 for more information.

## Editing Floor Areas

To edit a current floor area, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the floor area to open its details page.
- Step 3** From the Select a command drop-down list, choose **Edit Floor Area**.
- Step 4** Make any necessary changes to Floor Area Name, Contact, Floor, Floor Height (feet), Floor Type (RF Model), Existing Image File, or Import New Image File.
- Step 5** Click **OK**.

## Deleting Floor Areas

To delete a current floor area, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Select the check box for the applicable floor area.
- Step 3** From the Select a command drop-down list, choose **Delete Maps**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the deletion.
- 

## Placing Access Points

To determine the best location of all devices in the wireless LAN coverage areas, you need to consider the access point density and location.

Ensure that no fewer than 3 access points, and preferably 4 or 5, provide coverage to every area where device location is required. The more access points that detect a device, the better. This high level guideline translates into the following best practices, ordered by priority:

1. Most importantly, access points should surround the desired location.
2. One access point should be placed roughly every 50 to 70 linear feet (about 17 to 20 meters). This translates into one access point every 2,500 to 5000 square feet (about 230 to 450 square meters).

**Note**

The access point must be mounted so that it is under 20 feet high. For best performance, a mounting at 10 feet would be ideal.

---

Following these guidelines makes it more likely that access points will detect tracked devices. Rarely do two physical environments have the same RF characteristics. Users may need to adjust those parameters to their specific environment and requirements.

**Note**

Devices must be detected at signals greater than  $-75$  dBm for the controllers to forward information to the location appliance. No fewer than three access points should be able to detect any device at signals below  $-75$  dBm.

---

**Note**

If you have a ceiling-mounted AP with an integrated omni-directional antenna, the antenna orientation does not really need to be set in NCS. However, if you mount that same AP on the wall, you have to set the antenna orientation to 90 degrees.

---

[Table 6-2](#) describes the orientation of the access points.

**Table 6-2**      **Antenna Orientation of the Access Points**

| Access Point                | Antenna Orientation                                                                                                                                                                                        |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1140 mounted on the ceiling | The Cisco Logo should be pointing to the floor.<br>Elevation: 0 degrees.                                                                                                                                   |
| 1240 mounted on the ceiling | The Antenna should be perpendicular to the access point.<br>Elevation: 0 degrees.                                                                                                                          |
| 1240 mounted on the wall    | The Antenna should be parallel to the access point.<br>Elevation: 0 degrees.<br><br>If the antenna is perpendicular to AP then the angle will be 90 degree (up or down does not matter as dipole is omni). |

## Configuring Floor Settings

You can modify the appearance of the floor map by selecting or unselecting various floor settings check boxes. The selected floor settings appears in the map image.

### Note

Depending on whether or not a mobility services engine is present in NCS, some of the floor settings may not display. Clients, 802.11 Tags, Rogue APs, Adhoc Rogues, Rouge Clients and Interferers are visible only if a MSE is present in NCS.

The Floor Settings options include the following:

- Access Points—[Filtering Access Point Floor Settings, page 6-46](#)
- AP Heatmaps—[Filtering Access Point Heatmap Floor Settings, page 6-49](#)
- AP Mesh Info—[Filtering AP Mesh Info Floor Settings, page 6-49](#)
- Clients—[Filtering Client Floor Settings, page 6-50](#)
- 802.11 Tags—[Filtering 802.11 Tag Floor Settings, page 6-51](#)
- Rogue APs—[Filtering Rogue AP Floor Settings, page 6-51](#)
- Rogue Adhocs—[Filtering Rogue Adhoc Floor Settings, page 6-52](#)
- Rogue Clients—[Filtering Rogue Client Floor Settings, page 6-52](#)
- Coverage Areas
- Location Regions
- Rails
- Markers
- Chokepoints
- Wi-Fi TDOA Receivers

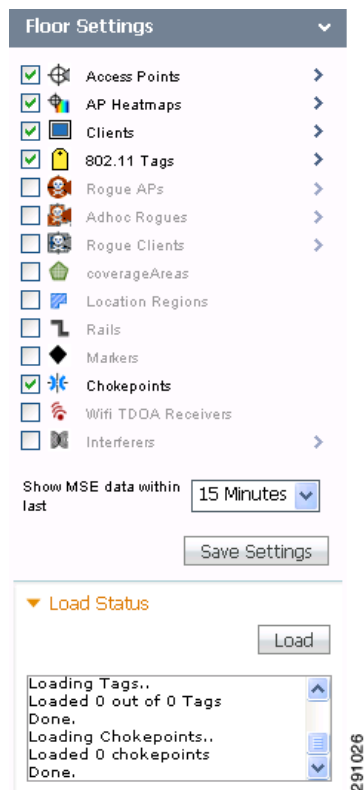

- Interferers—[Filtering Interferer Settings, page 6-53](#)

Use the blue arrows to access floor setting filters for access points, access point heatmaps, clients, 802.11 tags, rogue access points, rogue adhoc, and rogue clients. When filtering options are selected, click **OK**.

Use the Show MSE data within last drop-down list to select the timeframe for mobility services engine data. Choose to view mobility services engine data from a range including the past two minutes up to the past 24 hours. This option only appears if a mobility services engine is present on the NCS.

Click **Save Settings** to make the current view and filter settings your new default for all maps.

**Figure 6-24** Floor Settings Parameters

### Defining Inclusion and Exclusion Regions on a Floor

To further refine location calculations on a floor, you can define the areas that are included (inclusion areas) in the calculations and those areas that are not included (exclusion areas).

For example, you might want to exclude areas such as an atrium or stairwell within a building but include a work area (such as cubicles, labs, or manufacturing floors).

#### Note

If the MSE to which the floor is synchronized, is running the Aeroscout tag engine, then inclusion and exclusion regions are not calculated for tags.

### Viewing Floor Component Details

To view details regarding the components displayed on the Floor View, hover your mouse cursor over the applicable icon. A dialog box displays detailed information. [Table 6-3](#) displays floor map icons.

Table 6-3 Floor Map Icons

| Icon                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | <p>Access point icon. The color of the circle indicates the alarm status of the Cisco radios.</p> <p><b>Note</b> Each access point contains two Cisco radios. When a single protocol is selected in the Access Point filter page, the entire icon represents this radio. If both protocols are selected, the top half of the icon represents the state of the 802.11a/n radio and the bottom half represents the state of the 802.11b/g/n radio.</p> <p><b>Note</b> If a Cisco radio is disabled, a small “x” appears in the middle of the icon.</p> <p><b>Note</b> Monitor mode access points are shown with gray label to distinguish from other access points.</p> |
|    | AP heatmaps icon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|    | Client icon. Hover your mouse cursor over the icon to view client details. See the “ <a href="#">Client Details</a> ” section on page 6-105 for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|    | Tag icon. Hover your mouse cursor over the icon to view tag details. See the “ <a href="#">Tag Details</a> ” section on page 6-106 for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|  | <p>Rogue access point icon. The color of the icon indicates the type of rogue access point. For example, red indicates a malicious rogue access point and blue indicates an unknown type.</p> <p>Hover your mouse cursor over the icon to view rogue access point details. See the “<a href="#">Rogue Access Point Details</a>” section on page 6-106 for more information.</p>                                                                                                                                                                                                                                                                                       |
|  | <p>Rogue adhoc icon.</p> <p>Hover your mouse cursor over the icon to view rogue adhoc details. See the “<a href="#">Rogue Adhoc Details</a>” section on page 6-107 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|  | <p>Rogue client icon.</p> <p>Hover your mouse cursor over the icon to view rogue client details. ### Cisco 1000 Series Lightweight Access Point Icons

The icons indicate the present status of an access point. The circular part of the icon can be split in half horizontally. The worst of the two Cisco Radio colors determines the color of the large triangular pointer.

#### Note

When the icon is representing 802.11a/n and 802.11b/n, the top half displays the 802.11a/n status, and the bottom half displays the 802.11b/g/n status. When the icon is representing only 802.11b/g/n, the whole icon displays the 802.11b/g/n status. The triangle gets whatever color is more severe.

Table 6-4 shows the icons used in the Cisco NCS user interface Map displays.

**Table 6-4 Access Points Icons Description**

| Icon                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | The green icon indicates an access point (AP) with no faults. The top half of the circle represents the optional 802.11a Cisco Radio. The bottom half of the circle represents the state of the 802.11b/g Cisco Radio.                                                                                                                                                                                                                                                  |
|  | The yellow icon indicates an access point with a minor fault. The top half of the circle represents the optional 802.11a Cisco Radio. The bottom half of the circle represents the state of the 802.11b/g Cisco Radio.<br><b>Note</b> A flashing yellow icon indicates that there has been an 802.11a or 802.11b/g interference, noise, coverage or load Profile Failure. A flashing yellow icon indicates that there have been 802.11a and 802.11b/g Profile Failures. |
|  | The red icon indicates an access point (AP) with a major or critical fault. The top half of the circle represents the optional 802.11a Cisco Radio. The bottom half of the circle represents the state of the 802.11b/g Cisco Radio.                                                                                                                                                                                                                                    |
|  | The grayed-out icon with a question mark in the middle represents an unreachable access point. It is gray since its status cannot be determined.                                                                                                                                                                                                                                                                                                                        |
|  | The grayed-out icon with no question mark in the middle represents an unassociated access point.                                                                                                                                                                                                                                                                                                                                                                        |
|  | The icon with a red “x” in the center of the circle represents an access point that has been administratively disabled.                                                                                                                                                                                                                                                                                                                                                 |

Table 6-4 Access Points Icons Description (continued)

| Icon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The icon with the top half green and the lower half yellow indicates that the optional 802.11a Cisco Radio (top) has no faults, and the 802.11b/g Cisco Radio (bottom) has a minor fault. The worst of the two Cisco Radio colors determines the color of the large triangular pointer.                          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The icon with the top half green and the lower half red indicates that the optional 802.11a Cisco Radio (top) is operational with no faults, and the 802.11b/g Cisco Radio (bottom) has a major or critical fault. The worst of the two Cisco Radio colors determines the color of the large triangular pointer. |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The icon with the top half yellow and the lower half red indicates that the optional 802.11a Cisco Radio (top) has a minor fault, and the 802.11b/g Cisco Radio (bottom) has a major or critical fault. The worst of the two Cisco Radio colors determines the color of the large triangular pointer.            |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The icon with the top half yellow and the lower half green indicates that the optional 802.11a Cisco Radio (top) has a minor fault, and the 802.11b/g Cisco Radio (bottom) is operational with no faults. The worst of the two Cisco Radio colors determines the color of the large triangular pointer.          |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The icon with the top half red and the lower half green indicates that the optional 802.11a Cisco Radio (top) has a major or critical fault, and the 802.11b/g Cisco Radio (bottom) is operational with no faults. The worst of the two Cisco Radio colors determines the color of the large triangular pointer. |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The icon with the top half red and the lower half yellow indicates that the optional 802.11a Cisco Radio (top) has major or critical faults, and the 802.11b/g Cisco Radio (bottom) has a minor fault. The worst of the two Cisco Radio colors determines the color of the large triangular pointer.             |
| <br><br><br><br><br> | The icon with a red “x” on the top half (optional 802.11a) shows that the indicated Cisco Radio has been administratively disabled. The rest of the color coding is as described above. There are six possibilities as shown.                                                                                    |

Each of the access point icons includes a small black arrow that indicates the direction in which the internal Side A antenna points.

Table 6-5 shows some arrow examples used in the Cisco NCS user interface map displays.

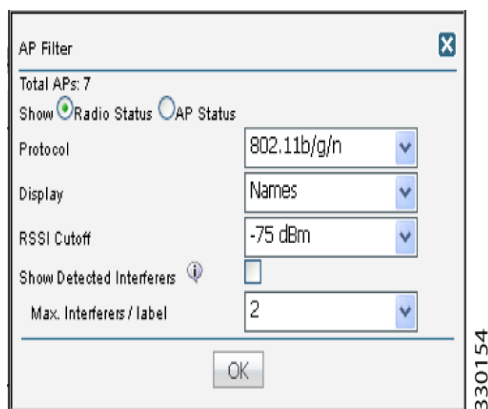

**Table 6-5**      **Arrows**

| Arrow Examples                                                                    | Direction                                     |
|-----------------------------------------------------------------------------------|-----------------------------------------------|
|  | Zero degrees, or to the right of the map.     |
|  | 45 degrees, or to the lower right on the map. |
|  | 90 degrees, or down on the map.               |

These examples show the first three 45-degree increments allowed, with an additional five at 45-degree increments.

### Filtering Access Point Floor Settings

If you enable the Access Point floor setting and then click the blue arrow to the right of the Floor Settings, the Access Point Filter dialog box opens with filtering options.

**Figure 6-25**      **Access Point Filter**

Access point filtering options include:

- Show—Select the option to display the radio status or to access point status.

**Note** Because the access point icon color is based on the access point status, the icon color may vary depending on the status selected. The default on floor maps is radio status.

- Protocol—From the drop-down list, choose which radio types to display (802.11a/n, 802.11b/g/n, or both).

**Note** The displayed heatmaps correspond with the selected radio type(s).

- Display—From the drop-down list, choose what identifying information is displayed for the access points on the map image.
  - Channels—Displays the Cisco Radio channel number or Unavailable (if the access point is not connected).

**Note** The available channels are defined by the country code setting and are regulated by country. Refer the following URL for more information:  
[http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product\\_data\\_sheet0900aecd80537b6a\\_ps430\\_Products\\_Data\\_Sheet.html](http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product_data_sheet0900aecd80537b6a_ps430_Products_Data_Sheet.html)

- TX Power Level—Displays the current Cisco Radio transmit power level (with 1 being high) or Unavailable (if the access point is not connected).

**Note** The power levels differ depending on the type of access point. The 1000 series access points accept a value between 1 and 5, the 1230 access points accept a value between 1 and 7, and the 1240 and 1100 series access points accept a value between 1 and 8.

Table 6-6 lists the transmit power level numbers and their corresponding power setting.

**Table 6-6** *Transmit Power Level Values*

| Transmit Power Level Number | Power Setting                                  |
|-----------------------------|------------------------------------------------|
| 1                           | Maximum power allowed per country code setting |
| 2                           | 50% power                                      |
| 3                           | 25% power                                      |
| 4                           | 12.5 to 6.25% power                            |
| 5                           | 6.25 to 0.195% power                           |

**Note** The power levels are defined by the country code setting and are regulated by country. Refer the following URL for more information:  
[http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product\\_data\\_sheet0900aecd80537b6a\\_ps430\\_Products\\_Data\\_Sheet.html](http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product_data_sheet0900aecd80537b6a_ps430_Products_Data_Sheet.html)

- Channel and Tx Power—Displays both the channel and transmit power level (or Unavailable if the access point is not connected).
- Coverage Holes—Displays a percentage of clients whose signal has become weaker until the client lost its connection, Unavailable for unconnected access points, or MonitorOnly for access points in monitor-only mode.

---

**Note** Coverage holes are areas in which clients cannot receive a signal from the wireless network. When you deploy a wireless network, you must consider the cost of the initial network deployment and the percentage of coverage hole areas. A reasonable coverage hole criterion for launch is between 2 and 10 percent. This means that between two and ten test locations out of 100 random test locations might receive marginal service. After launch, Cisco Unified Wireless Network Solution Radio Resource Management (RRM) identifies these coverage hole areas and reports them to the IT manager, who can fill holes based on user demand.

---

- MAC Addresses—Displays the MAC address of the access point, whether or not the access point is associated to a controller.
- Names—Displays the access point name. This is the default value.
- Controller IP—Displays the IP address of the controller to which the access point is associated or Not Associated for disassociated access points.
- Utilization—Displays the percentage of bandwidth used by the associated client devices (including receiving, transmitting, and channel utilization). Displays Unavailable for disassociated access points and MonitorOnly for access points in monitor-only mode.
- Profiles—Displays the load, noise, interference, and coverage components of the corresponding operator-defined thresholds. Displays Okay for thresholds not exceeded, Issue for exceeded thresholds, or Unavailable for unconnected access points.

---

**Note** Use the Profile Type drop-down list to select Load, Noise, Interference, or Coverage.

---

- CleanAir Status—Displays the CleanAir status of the access point, whether or not CleanAir is enabled on the access point.
- Average Air Quality—Displays the average air quality on this access point. The details include, the band, and the average air quality.
- Minimum Air Quality—Displays the minimum air quality on this access point. The details include, the band and the minimum air quality.
- Average and Minimum Air Quality—Displays the average and minimum air quality on this access point. The details include, the band, average air quality, and minimum air quality.
- Associated Clients—Displays the number of associated clients, Unavailable for unconnected access points, or MonitorOnly for access points in monitor-only mode.

---

**Note** Click the client number to view client details. See [“Monitoring Clients and Users” section on page 10-10](#) for more information.

---

- Bridge Group Names
- RSSI Cutoff—From the drop-down list, select the RSSI cutoff level. The RSSI cutoff ranges from -60 dBm to -90 dBm.
- Show Detected Interferers—Select the check box to display all interferers detected by the access point.
- Max. Interferers/label—Select the maximum number of interferer to be displayed per label from the drop-down list.

Click **OK** when all applicable filtering criteria are selected.

### Filtering Access Point Heatmap Floor Settings

A RF heatmap is a graphical representation of RF wireless data where the values taken by variables are represented in maps as colors. The current heatmap is computed based on the RSSI prediction model, Antenna Orientation and AP transmit power.

If you enable the Access Point Heatmap floor setting and click the blue arrow to the right of the Floor Settings, the Contributing APs dialog opens with heatmap filtering options. See [Understanding RF Heatmap Calculation, page 6-109](#) for more information.

Cisco NCS introduces dynamic heatmaps. When dynamic heatmaps are enabled, NCS recomputes the heatmaps to represent changed RSSI values. To configure the dynamic heatmaps, refer [Editing Map Properties, page 6-14](#).

Access point heatmap filtering options include:

- **Heatmap Type**—Select Coverage, or Air Quality. If you choose Air Quality, you can further filter the heat map type for access points with average air quality or minimum air quality. Select the appropriate radio button.

---

**Note** If you have monitor mode access points on the floor plan, you have a choice between IDS or coverage heatmap types. A coverage heatmap excludes monitor mode access points.

---

---

**Note** Only APs in 'Local', 'H-REAP', or 'Bridge' mode can contribute to the Coverage and Air Quality Heatmap.

---

- **Total APs**—Displays the number of access points positioned on the map.
- Select the access point check box(es) to determine which heatmaps display on the image map.

Click **OK** when all applicable filtering criteria are selected.

### Filtering AP Mesh Info Floor Settings

---

**Note** The AP Mesh Info option only appears when bridging access points are added to the floor.

---

When this option is selected, Cisco NCS initiates a contact with the controllers and displays information about bridging access points. The following information is displayed:

- Link between the child and the parent access point.
- An arrow that indicates the direction from child to parent access point.
- A color coded link that indicates the signal-to-noise ratio (SNR). A green link represents a high SNR (above 25 dB), an amber represents an acceptable SNR (20-25 dB), and a red link represents a very low SNR (below 20 dB).

If you enable the AP Mesh Info floor setting and click the blue arrow to the right of the floor settings, the Mesh Parent-Child Hierarchical View page opens with mesh filtering options.

You can update the map view by choosing the access points you want to see on the map. From the Quick Selections drop-down list, choose to select only root access point, various hops between the first and the fourth, or select all access points.

**Note**

For a child access point to be visible, its parent must also be selected.

Click **OK** when all applicable filtering criteria are selected.

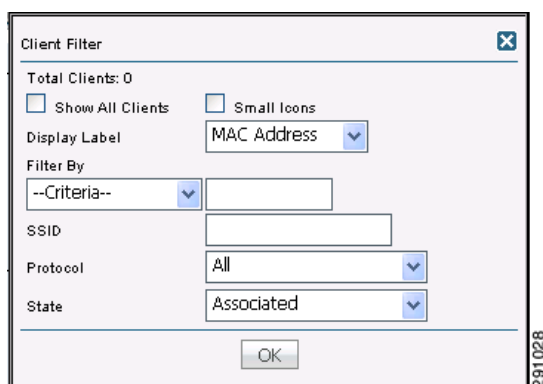

### Filtering Client Floor Settings

**Note**

The Clients option only displays if a mobility server is added in NCS.

If you enable the Clients floor setting and click the blue arrow to the right, the Client Filter dialog opens.

**Figure 6-26** Client Filter

Client filtering options include the following:

- Show All Clients—Select the check box to display all clients on the map.
- Small Icons—Select the check box to display icons for each client on the map.

**Note**

If you select the **Show All Clients** check box and **Small Icons** check box, all other drop-down list options are dimmed out.

If you unselect the **Small Icons** check box, you can choose if you want the label to display MAC address, IP address, username, asset name, asset group, or asset category.

If you unselect the **Show All Clients** check box, you can specify how you want the clients filtered and enter a particular SSID.

- Display—Choose the client identifier (IP address, username, MAC address, asset name, asset group, or asset category) to display on the map.
- Filter By—Choose the parameter by which you want to filter the clients (IP address, username, MAC address, asset name, asset group, asset category, or controller). Once selected, type the specific device in the text box.
- SSID—Enter the client SSID in the available text box.
- Protocol—Choose All, 802.11a/n, or 802.11b/g/n from the drop-down list.
  - All—Displays all the access points in the area.

- 802.11a/n—Displays a colored overlay depicting the coverage patterns for the clients with 802.11a/n radios. The colors show the received signal strength from red (–35 dBm) through dark blue (–85 dBm).
  - 802.11b/g/n—Displays a colored overlay depicting the coverage patterns for the clients with 802.11b/g/n radios. The colors show the received signal strength from red (–35 dBm) through dark blue (–85 dBm). This is the default value.
  - State—Choose All, Idle, Authenticated, Probing, or Associated from the drop-down list.
- Click **OK** when all applicable filtering criteria are selected.

### Filtering 802.11 Tag Floor Settings

If you enable the 802.11 Tags floor setting and then click the blue arrow to the right, the Tag Filter dialog opens.

Tag filtering options include the following:

- Show All Tags—Select the check box to display all tags on the map.
- Small Icons—Select the check box to display icons for each tag on the map.

**Note** If you select the **Show All Tags** check box and **Small Icons** check box, all other drop-down list options are dimmed out.

If you unselect the **Small Icons** check box, you can choose if you want the label to display MAC address, asset name, asset group, or asset category.

If you unselect the **Show All Tags** check box, you can specify how you want the tags filtered.

- Display—Choose the tag identifier (MAC address, asset name, asset group, or asset category) to display on the map.
- Filter By—Choose the parameter by which you want to filter the clients (MAC address, asset name, asset group, asset category, or controller). Once selected, type the specific device in the text box.

Click **OK** when all applicable filtering criteria are selected.

### Filtering Rogue AP Floor Settings

If you enable the Rogue APs floor setting and then click the blue arrow to the right, the Rogue AP filter dialog opens.

Rogue AP filtering options include the following:

- Show All Rogue APs—Select the check box to display all rogue access points on the map.
- Small Icons—Select the check box to display icons for each rogue access point on the map.

**Note** If you select the **Show All Rogue APs** check box and **Small Icons** check box, all other drop-down list options are dimmed out.

If you unselect the **Show All Rogue APs** check box, you can specify how you want the rogue access points filtered.

- MAC Address—If you want to view a particular MAC address, enter it in the MAC Address text box.

- State—Use the drop-down list to choose from Alert, Known, Acknowledged, Contained, Threat, or Unknown contained states.
- On Network—Use the drop-down list to specify whether or not you want to display rogue access points on the network.

Click **OK** when all applicable filtering criteria are selected.

### Filtering Rogue Adhoc Floor Settings

If you enable the Rogue Adhocs floor setting and then click the blue arrow to the right, the Rogue Adhoc filter dialog opens.

Rogue Adhoc filtering options include the following:

- Show All Rogue Adhocs—Select the check box to display all rogue adhoc on the map.
- Small Icons—Select the check box to display icons for each rogue adhoc on the map.

---

**Note** If you select the **Show All Rogue Adhocs** check box and **Small Icons** check box, all other drop-down list options are dimmed out.

If you unselect the **Show All Rogue Adhocs** check box, you can specify how you want the rogue adhocs filtered.

---

- MAC Address—If you want to view a particular MAC address, enter it in the MAC Address text box.
- State—Use the drop-down list to select from Alert, Known, Acknowledged, Contained, Threat, or Unknown contained states.
- On Network—Use the drop-down list to specify whether or not you want to display rogue adhocs on the network.

Click **OK** when all applicable filtering criteria are selected.

### Filtering Rogue Client Floor Settings

If you enable the Rogue Clients floor setting and then click the blue arrow to the right, the Rogue Clients filter dialog opens.

Rogue Clients filtering options include the following:

- Show All Rogue Clients—Select the check box to display all rogue clients on the map.
- Small Icons—Select the check box to display icons for each rogue client on the map.

---

**Note** If you select the **Show All Rogue Clients** check box and **Small Icons** check box, all other drop-down list options are dimmed out. If you unselect the **Show All Rogue Clients** check box, you can specify how you want the rogue clients filtered.

---

- Assoc. Rogue AP MAC Address—If you want to view a particular MAC address, enter it in the MAC Address text box.
- State—Use the drop-down list to choose from Alert, Contained, Threat, or Unknown contained states.

Click **OK** when all applicable filtering criteria are selected.

## Filtering Interferer Settings

If you enable Interferer floor setting and then click the blue arrow to the right, the Interferers filter dialog opens.

Interferer filtering options include:

- **Show active interferers only**—Select the check box to display all active interferers.
- **Small Icons**—Select the check box to display icons for each interferer on the map.
- **Show Zone of Impact**—Displays the approximate interference impact area. The opacity of the circle denotes its severity. A solid red circle represents a very strong interferer that will likely disrupt WiFi communications, a light pink circle represents a weak interferer.
- Click **OK** when all applicable filtering criteria are selected.

## Import Map and AP Location Data

When converting from autonomous to lightweight access points and from WLSE to NCS, one of the conversion steps is to manually re-enter the access point-related information into NCS. To speed up this process, you can export the information about access points from WLSE and import it into NCS.

**Note**

---

NCS expects a .tar file and checks for a .tar extension before importing the file. If the file you are trying to import is not a .tar file, NCS displays an error message and prompts you to import a different file.

---

**Note**

---

For more information on the WLSE data export functionality (WLSE version 2.15), see [http://<WLSE\\_IP\\_ADDRESS>:1741/debug/export/exportSite.jsp](http://<WLSE_IP_ADDRESS>:1741/debug/export/exportSite.jsp).

---

To map properties and import a tar file containing WLSE data using the NCS web interface, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** From the Select a command drop-down list, choose **Import Maps**, and Click **Go**.
  - Step 3** Choose the **WLSE Map and AP Location Data** option and click **Next**.

**Figure 6-27 Import WLSE Map and AP Location Data**

Import Map -- Select file to import  
 Monitor > Maps > Import Map -- Select file to import

Import WLSE Map and AP Location Data...

## Footnotes

1. APs imported from WLSE appear in NCS as lightweight APs rather than as autonomous APs because they are expected to have been converted.

291054

**Step 4** In the Import WLSE Map and AP Location data page, click **Browse** to select the file to import.

**Step 5** Find and select the .tar file to import and click **Open**.

NCS displays the name of the file in the Import From text box.

**Step 6** Click **Import**.

NCS uploads the file and temporarily saves it into a local directory while it is being processed. If the file contains data that cannot be processed, NCS prompts you to correct the problem and retry. Once the file has been loaded, NCS displays a report of what will be added to NCS. The report also specifies what cannot be added and why.

If some of the data to be imported already exists, NCS either uses the existing data in the case of campuses or overwrites the existing data using the imported data in the cases of buildings and floors.

**Note** If there are duplicate names between a WLSE site and building combination and a NCS campus (or top-level building) and building combination, NCS displays a message in the Pre Execute Import Report indicating that it will delete the existing building.

**Step 7** Click **Import** to import the WLSE data.

NCS displays a report indicating what was imported.

**Step 8** Choose **Monitor > Site Maps** to view the imported data.

## Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File

To change an access point, Wi-Fi TDOA receiver, or chokepoint position, follow these steps:

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** From the Select a command drop-down list, choose **Properties**.

**Step 3** At the Unit of Dimension drop-down list, choose feet or meters.

**Step 4** Select the Advanced Debug Mode **Enable** radio button.

**Step 5** Click **OK**.

- Step 6** From the Select a command drop-down list, choose **Export/Import AP/WiFi TDOA Receiver/Chokepoint Placement**.
- Step 7** In the Import/Export AP/WiFi TDOA Receiver/Chokepoint Placement page, click **Browse** to find the file you want to import.

**Note** The file must already be created and added to NCS.

**Note** The following is the correct file format:

```
[BuildingName], [FloorName], [AP/WiFi TDOA Receiver/Chokepoint Name], (aAngle),
(bAngle), [X], [Y], ([aAngleElevation, bAngleElevation, Z]), (aAntennaType, aAntennaMode,
(aAntennaPattern, (aAntennaGain)), bAntennaType, bAntennaDiversity, (bAntennaPattern,
bAntennaGain))))
```

The parameters in square brackets are mandatory, and those in parentheses are optional.

**Note** Angles must be entered in radians (X,Y), and the height is entered in feet. The aAngle and bAngle range is from  $-2\text{Pi}$  (-6.28...) to  $2\text{Pi}$  (6.28...), and the elevation ranges from  $-\text{Pi}$  (-3.14...) to  $\text{Pi}$  (3.14...).

- Step 8** Click **Import**. The RF calculation takes approximately two seconds per component.

## Changing Access Point Positions by Importing and Exporting a File

You can change an access point position by importing or exporting a file. The file contains only the lines describing the access point you want to move. This option takes less time than manually changing multiple access point positions. Follow these steps to change access point positions using the importing or exporting of a file.

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** From the Select a command drop-down list, choose **Import AP/WiFi TDOA Receiver/Chokepoint Placement or Export AP/WiFi TDOA Receiver/Chokepoint Placement** and click **Go**.
- Step 3** In Import Data from File or Export Data from File, click **Browse** to find the file you want to import. The file in the [BuildingName], [FloorName], [APName], (aAngle), (bAngle), [X], [Y], ([aAngleElevation, bAngleElevation, Z]), (aAntennaType, aAntennaMode, (aAntennaPattern, (aAntennaGain)), bAntennaType, bAntennaDiversity, (bAntennaPattern, bAntennaGain)))) format must have already been created and added to NCS. (See the [“Inspect VoWLAN Readiness” section on page 6-77](#).)

**Note** The parameters in square brackets are mandatory, and those in parentheses are optional.

**Note**

Angles must be entered in radians (X,Y), and the height is entered in feet. The aAngle and bAngle range is from  $-2\text{Pi}$  (-6.28...) to  $2\text{Pi}$  (6.28...), and the elevation ranges from  $-\text{Pi}$  (-3.14...) to  $\text{Pi}$  (3.14...).

**Step 4** Click **Import**. The RF calculation takes approximately two seconds per access point.

## Configuring ChokePoints

Using chokepoints in conjunction with active compatible extensions compliant tags provides immediate location information on a tag and its asset. When a Cisco Compatible Extension tag moves out of the range of a chokepoint, its subsequent beacon frames do not contain any identifying chokepoint information. Location determination of the tag defaults to the standard calculation methods based on RSSIs reported by the access point associated with the tag.

This section contains the following topics:

- [Using Chokepoints to Enhance Tag Location Reporting, page 6-56](#)
- [Adding Chokepoints to the NCS Database, page 6-56](#)
- [Adding a Chokepoint to a NCS Map, page 6-57](#)
- [Positioning Chokepoints, page 6-58](#)
- [Removing Chokepoints from the NCS Database and Map, page 6-59](#)

## Using Chokepoints to Enhance Tag Location Reporting

Installation of chokepoints provides enhanced location information for RFID tags. When an active Cisco Compatible Extensions version 1 compliant RFID tag enters the range of a chokepoint, it is stimulated by the chokepoint. The MAC address of this chokepoint is then included in the next beacon sent by the stimulated tag. All access points that detect this tag beacon then forward the information to the controller and location appliance.

Using chokepoints in conjunction with active compatible extensions compliant tags provides immediate location information on a tag and its asset. When a Cisco Compatible Extension tag moves out of the range of a chokepoint, its subsequent beacon frames do not contain any identifying chokepoint information. Location determination of the tag defaults to the standard calculation methods based on RSSIs reported by the access point associated with the tag.

## Adding Chokepoints to the NCS Database

Chokepoints are installed and configured as recommended by the Chokepoint vendor. After the chokepoint installation is complete and operational, the chokepoint can be entered into the location database and plotted on a NCS map.

To add a chokepoint to the NCS database, follow these steps:

- Step 1** Choose **Configure > Chokepoints**.
- Step 2** From the **Select a command** drop-down list, choose **Add Chokepoints**.
- Step 3** Click **Go**.

**Step 4** Enter the MAC address and name for the chokepoint.

**Step 5** Select the **Entry/Exit Chokepoint** check box.

**Step 6** Enter the coverage range for the chokepoint.

**Note** Chokepoint range is a visual representation only. It is product-specific. The actual range must be configured separately using the applicable chokepoint vendor software.

**Step 7** Click **OK**.

**Note** After the chokepoint is added to the database, it can be placed on the appropriate NCS floor map.

## Adding a Chokepoint to a NCS Map

To add the chokepoint to a map, follow these steps:

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** In the Maps page, choose the link that corresponds to the floor location of the chokepoint.

**Step 3** From the **Select a command** drop-down list, choose **Add Chokepoints**.

**Step 4** Click **Go**.

**Note** The Add Chokepoints summary page lists all recently-added chokepoints that are in the database but not yet mapped.

**Step 5** Select the check box next to the chokepoint that you want to place on the map.

**Step 6** Click **OK**.

A map appears with a chokepoint icon located in the top-left hand corner. You are now ready to place the chokepoint on the map.

**Step 7** Left-click the chokepoint icon and drag it to the proper location.

**Note** The MAC address, name, and coverage range of the chokepoint appear in the left pane when you click the chokepoint icon for placement.

**Step 8** Click **Save**.

You are returned to the floor map and the added chokepoint appears on the map.

**Note** The newly created chokepoint icon may or may not appear on the map depending on the display settings for that floor.

**Note** The rings around the chokepoint icon indicate the coverage area. When a CCX tag and its asset passes within the coverage area, location details are broadcast, and the tag is automatically mapped on the chokepoint coverage circle. When the tag moves out of the chokepoint range, its location is calculated as before and is no longer mapped on the chokepoint rings.

**Note** The MAC address, name, entry/exit chokepoint, static IP address, and range of the chokepoint appears when you hover a mouse cursor over its map icon.

**Step 9** If the chokepoint does not appear on the map, select the Chokepoints check box located in the Floor Settings menu.

**Note** Do not click **Save Settings** unless you want to save this display criteria for all maps.

**Note** You must synchronize network design to the mobility services engine or location server to push chokepoint information.

## Positioning Chokepoints

To position chokepoints on the map, follow these steps:

**Step 1** Left-click the chokepoint icon and drag it to the proper location.

**Note** The MAC address, name, and coverage range of the chokepoint appear in the left pane when you click the chokepoint icon for placement.

**Step 2** Click **Save** when the icon is correctly placed on the map.

**Step 3** The newly created chokepoint icon may or may not appear on the map depending on the display settings for that floor. If the icon does not appear, repeat Step 1.

**Note** The rings around the chokepoint icon indicate the coverage area. When a Cisco Compatible Extensions tag and its asset passes within the coverage area, location details are broadcast, and the tag is automatically mapped on the chokepoint coverage circle. The chokepoint range is given as a visual only, but chokepoint vendor software is required to actually configure the range. When the tag moves out of the chokepoint range, its location is calculated as before and is no longer mapped on the chokepoint rings.

**Note** MAC address, name, and range of a chokepoint display when you hover your mouse cursor over its map icon.

- Step 4** If the chokepoint does not appear on the map, choose **Layers** to view a drop-down list of possible elements to display on the map. Select the **Chokepoints** check box.
- Step 5** Click **X** to close the Layers page.

---

**Note** Do not click **Save Settings** unless you want to save this display criteria for all maps.

---

---

**Note** You can change the position of chokepoints by importing or exporting a file. See the [“Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File”](#) section on page 6-54 for more information.

---

## Removing Chokepoints from the NCS Database and Map

You can remove one or multiple chokepoints at a time.  
Follow these steps to delete a chokepoint.

- 
- Step 1** Choose **Configure > Chokepoints**:
- Step 2** Select the box(es) next to the chokepoint(s) to be deleted.
- Step 3** From the Select a command drop-down list, choose **Remove Chokepoints**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the chokepoint deletion.
- Step 6** From the Select a command drop-down list on the applicable NCS floor map page, choose **Remove Chokepoints**.
- Step 7** Click **Go**.
- Step 8** Select the check box(es) next to the chokepoint(s) to be deleted.
- Step 9** Click **OK**.
- 

## Configuring WiFi TDOA Receivers

This section contains the following topics:

- [Adding WiFi TDOA Receivers to the NCS Database, page 6-60](#)
- [Adding WiFi TDOA Receivers to a Map, page 6-60](#)
- [Positioning WiFi TDOA Receivers, page 6-60](#)
- [Removing WiFi TDOA Receivers from the Map, page 6-61](#)
- [Removing WiFi TDOA Receivers from the NCS Database, page 6-61](#)

## Adding WiFi TDOA Receivers to the NCS Database

To add WiFi TDOA receivers to the NCS database, follow these steps:

- 
- Step 1** Choose **Configure > WiFi TDOA Receivers**.
  - Step 2** From the Select a command drop-down list, choose **Add WiFi TDOA Receivers**.
  - Step 3** Click **Go**.
  - Step 4** Enter the MAC address, name, and static IP address for the WiFi TDOA receiver.

**Note** WiFi TDOA receivers are configured separately using the WiFi TDOA receiver vendor software.

---

- Step 5** Click **OK** to save the WiFi TDOA receiver entry to the database.

**Note** After the WiFi TDOA receiver is added to the database, place it on the appropriate NCS floor map. See the [“Adding WiFi TDOA Receivers to the NCS Database”](#) section on page 6-60 for more information.

---

## Adding WiFi TDOA Receivers to a Map

To add a WiFi TDOA receiver to a map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Choose the link that corresponds to the floor location of the WiFi TDOA receiver.
  - Step 3** From the Select a command drop-down list, choose **Add WiFi TDOA Receivers**.
  - Step 4** Click **Go**.

**Note** The Add WiFi TDOA Receivers summary page lists all recently-added WiFi TDOA receivers that are in the database but not yet mapped.

---

- Step 5** Select the check box next to the WiFi TDOA receiver to be added to the map.
- Step 6** Click **OK**.

A map appears with a green WiFi TDOA receiver icon located in the top-left hand corner. You are now ready to position the WiFi TDOA receiver on the map.

---

## Positioning WiFi TDOA Receivers

To position WiFi TDOA receivers on the map, follow these steps:

- 
- Step 1** Left-click the WiFi TDOA receiver icon and drag it to the proper location.

**Note** The MAC address and name of the WiFi TDOA receiver appear in the left pane when you click the WiFi TDOA receiver icon for placement.

**Step 2** Click **Save** when icon is correctly placed on the map.

**Note** The MAC address of the WiFi TDOA receiver appears when you hover a mouse cursor over its map icon.

**Step 3** If the chokepoint does not appear on the map, click **Layers** to view a drop-down list of possible elements to display on the map. Select the **WiFi TDOA Receivers** check box.

**Step 4** Click **X** to close the Layers page.

**Note** Do not select **Save Settings** unless you want to save this display criteria for all maps.

**Note** You can change the position of Wi-Fi TDOA Receivers by importing or exporting a file. See the [“Positioning Access Points, Wi-Fi TDOA Receivers, and Chokepoints by Importing or Exporting a File”](#) section on page 6-54 for more information.

## Removing WiFi TDOA Receivers from the Map

To remove a WiFi TDOA receiver from a floor map, follow these steps:

**Step 1** From the Select a command drop-down list on the applicable NCS floor map page, choose **Remove WiFi TDOA Receivers**.

**Step 2** Click **Go**.

**Step 3** Select the check box(es) next to the WiFi TDOA receiver(s) to be deleted.

**Note** You can remove multiple WiFi TDOA receivers at a time from a map.

**Step 4** Click **OK**.

## Removing WiFi TDOA Receivers from the NCS Database

To remove a WiFi TDOA receiver from the NCS database, follow these steps:

**Step 1** Choose **Configure > WiFi TDOA Receivers**.

**Step 2** Select the check box(es) next to the WiFi TDOA receiver(s) to be deleted.

---

**Note** You can remove multiple WiFi TDOA receivers at a time from the database.

---

- Step 3** From the Select a command drop-down list, choose **Remove WiFi TDOA Receivers**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the deletion.
- 

## Managing RF Calibration Models

If the provided RF models do not sufficiently characterize the floor layout, you can create a calibration model that is applied to the floor and better represents the attenuation characteristics of that floor. The calibration models are used as RF overlays with measured RF signal characteristics that can be applied to different floor areas. This enables the Cisco WLAN solution installation team to lay out one floor in a multi-floor area, use the RF calibration tool to measure, save the RF characteristics of that floor as a new calibration model, and apply that calibration model to all the other floors with the same physical layout.

You can collect data for a calibration using one of two methods:

- Point mode data collection—Calibration points are selected and their coverage area is calculated one location at a time.
- Linear mode data collection—A series of linear paths are selected and then calculated as you traverse the path. This approach is generally faster than the point mode data collection. You can also employ point mode data collection to augment data collection for locations missed by the linear paths.

---

**Note** Calibration models can only be applied to clients, rogue clients, and rogue access points. Calibration for tags is done using the Aeroscout System Manager. Refer to the following link for details on tag calibration at: <http://support.aeroscout.com>.

---

---

**Note** A client device that supports both 802.11a/n and 802.11b/g/n radios is recommended to expedite the calibration process for both spectrums.

---

Use a laptop or other wireless device to open a browser to the NCS server and perform the calibration process.

This section contains the following topics:

- [Access Current Calibration Models, page 6-63](#)
- [Apply Calibration Models to Maps, page 6-63](#)
- [Calibration Model Properties, page 6-63](#)
- [Calibration Model Details, page 6-63](#)
- [Create New Calibration Models, page 6-64](#)
- [Start Calibration Process, page 6-64](#)
- [Calibrating, page 6-67](#)

- [Apply to Maps, page 6-67](#)
- [Delete Calibration Models, page 6-67](#)

## Access Current Calibration Models

To access current calibration models, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** From the Select a command drop-down list, choose **RF Calibration Models**. The Model Name and Status for each calibration model is listed.
  - Step 3** Click the Model Name to access a specific calibration model.
- 

## Apply Calibration Models to Maps

To apply a current calibration model to a map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** From the Select a command drop-down list, choose RF Calibration Models.
  - Step 3** Click the Model Name to access the applicable calibration model.
  - Step 4** From the Select a command drop-down list, choose **Apply to Maps**.
  - Step 5** Click **Go**.
- 

## Calibration Model Properties

To view or edit current calibration models, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** From the Select a command drop-down list, choose **RF Calibration Models**.
  - Step 3** Click the Model Name to access the applicable calibration model.
  - Step 4** From the Select a command drop-down list, choose **Properties**.
  - Step 5** Click **Go** to view or edit calibration model details. See [“Calibration Model Properties” section on page 6-63](#) for more information.
- 

## Calibration Model Details

To edit calibration model details, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** From the Select a command drop-down list, choose **RF Calibration Models**.

- Step 3** Click the Model Name to access the applicable calibration model.
- Step 4** From the Select a command drop-down list, choose **Properties**.
- Step 5** Click **Go**.
- Step 6** The following parameters may be edited:
- Sweep Client Power for Location—Click to enable. You may want to enable this if a high density of access points exists and transmit power is reduced or unknown. The sweeping range of client transmit power may improve accuracy but scalability is negatively affected.
  - HeatMap Binsize—Choose 4, 8, 16, or 32 from the drop-down list.
  - HeatMap Cutoff—Determine the heatmap cutoff. A low heatmap cutoff is recommended especially if the access point density is high and RF propagation conditions are favorable. A higher cutoff value increases scalability but may cause difficulty when locating clients.
- Step 7** When any necessary changes have been made or to exit the page, click **OK**.
- 

## Create New Calibration Models

To create a new calibration model, follow these steps:

---

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** From the Select a command drop-down list, choose **RF Calibration Models**.
- Step 3** Click **Go**.
- Step 4** From the Select a command drop-down list, choose **Create New Model**.
- Step 5** Click **Go**.
- Step 6** Enter a Model Name and click **OK**.

The new model appears along with the other RF calibration models with a status of Not Yet Calibrated.

---

## Start Calibration Process

To start the calibration process, follow these steps:

---

- Step 1** Click the Model Name to open the Calibration Model > Model Name page.
- Step 2** From the Select a command drop-down list, choose **Add Data Points**.
- Step 3** Click **Go**.
- Step 4** Enter the MAC address of the device being used to perform the calibration. Manually-entered MAC addresses must be delimited with colons (such as FF:FF:FF:FF:FF:FF).

**Note** If this process is being performed from a mobile device connected to NCS through the Cisco Centralized architecture, the MAC address text box is automatically populated with the device address.

---

- Step 5** Choose the appropriate campus, building, floor, or outdoor area where the calibration is performed.

---

**Note** The calibration in outdoor area is supported from 1.0.x release onwards. You can use this option to add the calibration data points to the outdoor area. The data points can be added to the outdoor area using the same procedure for calibration.

---

**Step 6** Click **Next**.

**Step 7** When the chosen floor map and access point locations display, a grid of plus marks (+) indicates the locations where data collection for calibration is performed.

Using these locations as guidelines, you can perform either a point or linear collection of data by appropriate placement of either the Calibration Point pop-up (point) or the Start and Finish pop-ups (linear) that display on the map when the respective options are displayed.

If you want to do a point collection of data for the calibration, do the following:

- a. Choose **Point** from the Collection Method drop-down list and select the **Show Data points** check box if not already selected. A calibration point pop-up appears on the map.
- b. Position the tip of the calibration point pop-up at a data point (+), and click **Go**. A pane appears showing the progress of the data collection.

---

**Note** Rotate the calibrating client laptop during data collection so that the client is heard evenly by all access points in the vicinity.

---

- c. When the data collection is complete for a selected data point and the coverage area is plotted on the map, move the calibration point pop-up to another data point, and click **Go**.

---

**Note** The coverage area plotted on the map is color-coded and corresponds with the specific wireless LAN standard used to collect that data. Information on color-coding is provided in legend on the left side of the page. Additionally, the progress of the calibration process is indicated by two status bars above the legend, one for 802.11a/n and one for 802.11b/g/n.

---

---

**Note** To delete data points for locations selected in error, click **Delete** and move the black square that appears over the appropriate data points. Resize the square as necessary by pressing **Ctrl** and moving the mouse.

---

- d. Repeat point collection steps a to c until the calibrations status bar of the relevant spectrums (802.11a/n, 802.11b/g/n) display as 'done.'

---

**Note** The calibration status bar indicates data collection for the calibration as done, after roughly 50 distinct locations and 150 measurements have been gathered. For every location point saved in the calibration process, more than one data point is gathered. The progress of the calibration process is indicated by two status bars above the legend, one for 802.11b/g/n and one for 802.11a/n.

---

If you want to do a linear collection of data for the calibration, do the following:

- a. Choose **Linear** from the Collection Method drop-down list, and select the **Show Data points** check box if not already selected. A line appears on the map with both Start and Finish pop-ups.
- b. Position the tip of the Start pop-up at the starting data point.

- c. Position the Finish pop-up at the ending data point.
- d. Position yourself with your laptop at the starting data point, and click **Go**. Walk steadily towards the end point along the defined path. A pane displays to show that data collection is in process.

**Note** Do not stop data collection until you reach the end point even if the data collection bar indicates completion.

**Note** Only Intel and Cisco adapters have been tested. Make sure Enable Cisco Compatible Extensions and Enable Radio Management Support are enabled in the Cisco Compatible Extension Options.

- e. Press the space bar (or **Done** on the data collection panel) when you reach the end point. The collection pane displays the number of samples taken before it closes to reveal the map. The map displays all the coverage areas where data was collected.

**Note** To delete data points for locations selected in error, click **Delete** and move the black square that appears over the appropriate data points. Resize the square as necessary by pressing the **Ctrl** and moving the mouse.

**Note** The coverage area is color-coded and corresponds with the specific wireless LAN standard used to collect that data. Information on color-coding is provided in legend on the left-hand side of the page.

- f. Repeat linear collection Steps b to e until the status bar for the respective spectrum is filled in (done).

**Note** You can augment linear collection with point mode data collection to address missed coverage areas.

- Step 8** Click the name of the calibration model at the top of the page to return to the main page for that model to calibrate the data points.
- Step 9** Select **Calibrate** from the Select a command drop-down list, and click **Go**.
- Step 10** Click the **Inspect Location Quality** link when calibration completes. A map displays showing RSSI readings displays.
- Step 11** To use the newly created calibration model, you must apply the model to the floor on which it was created (and on any other floors with similar attenuation characteristics as well). Navigate to **Monitor > Site Maps** and find the specific floor to which the model is applied. At the floor map interface, choose **Edit Floor Area** from the drop-down list, and click **Go**.
- Step 12** From the Floor Type (RF Model) drop-down list, choose the newly created calibration model. Click **OK** to apply the model to the floor.

**Note**

This process can be repeated for as many models and floors as needed. After a model is applied to a floor, all location determination performed on that floor is done using the specific collected attenuation data from the calibration model.

## Calibrating

To compute the collected data points, follow these steps:

- Step 1** Click the Model Name to open the Calibration Model > Model Name page.
- Step 2** In the Calibration Model > Model Name page, choose **Calibrate** from the Select a command drop-down list.
- Step 3** Click **Go**.

## Apply to Maps

To use the newly created calibration model, you must apply the model to the floor on which it was created (along with other floors with similar attenuation characteristics).

To apply the model to the floor, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Locate the specific floor to which the model is applied.
- Step 3** From the Select a command drop-down list, choose **Edit Floor Area**.
- Step 4** Click **Go**.
- Step 5** From the Floor Type (RF Model) drop-down list, choose the newly-created calibration model.
- Step 6** Click **OK** to apply the model to the floor.

This process can be repeated for as many models and floors as needed. After a model is applied to a floor, all location determination performed on that floor is done using the specific collected attenuation data from the calibration model.

## Delete Calibration Models

To delete a calibration model, follow these steps:

- Step 1** Click the Model Name to open the Calibration Model > Model Name page.
- Step 2** From the Select a command drop-down list, choose **Delete Model**.
- Step 3** Click **Go**.

## Managing Location Presence Information

You can enable location presence through mobility services engine to provide expanded Civic (city, state, postal code, country) and GEO (longitude, latitude) location information beyond the Cisco default setting (campus, building, floor, and X, Y coordinates). This information can then be requested by clients on a demand basis for use by location-based services and applications. See the [“Enabling Location Presence for Mobility Services”](#) section on page 16-47 for more information on enabling location presence.

To view or edit current location presence information for a current map, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Select the check box of the map.
- Step 3** From the Select a command drop-down list, choose **Location Presence**.
- Step 4** Click **Go**. The Location Presence page appears.

**Note** The current map location information (Area Type, Campus, Building, and Floor) refer to the map you selected from the **Monitor > Site Maps** page. To select a different map, use the Select a Map to Update Presence Information drop-down lists to select the new map location.

**Figure 6-28** Location Presence

- Step 5** Click either the **Civic Address**, **GPS Markers**, or **Advanced** tab.

- Civic Address—Identifies the campus, building, or floor by name, street, house number, house number suffix, city (address line2), state, postal code, and country.
- GPS Markers—Identify the campus, building, or floor by longitude and latitude.
- Advanced—Identifies the campus, building, or floor with expanded civic information such as neighborhood, city division, county, and postal community name.

**Note**

Each selected parameter is inclusive of all of those above it. For example, if you select Advanced, it can also provide GPS and Civic location information upon client demand. The selected setting must match what is set on the mobility services engine level. See the [Enabling Location Presence for Mobility Services, page 16-47](#) for more information.

**Note**

If a client requests location information such as GPS Markers for a campus, building, floor, or outdoor area that is not configured for that parameter, an error message appears.

**Note**

By default, the Override Child Element Presence Info check box is selected.

## Searching Maps

You can use the following parameters in the Search Maps page:

- Search for
- Map Name
- Search in
- Save Search
- Items per page

After you click **Go**, the map search results page appears (see [Table 6-7](#)):

**Table 6-7** *Map Search Results*

| Parameter    | Options                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------|
| Name         | Clicking an item in the Name list gives a map of an existing building with individual floor area maps for each floor. |
| Type         | Campus, building, or floor area.                                                                                      |
| Total APs    | Displays the total number of Cisco radios detected.                                                                   |
| a/n Radios   | Displays the number of 802.11a/n Cisco radios.                                                                        |
| b/g/n Radios | Displays the number of 802.11b/g/n Cisco radios.                                                                      |

## Using the Map Editor

You can use the NCS map editor to define, draw, and enhance floor plan information. This section contains the following topics:

- [Opening Map Editor, page 6-70](#)
- [Using the Map Editor to Draw Polygon Areas, page 6-70](#)

- [Defining an Inclusion Region on a Floor, page 6-73](#)
- [Defining an Exclusion Region on a Floor, page 6-74](#)
- [Defining a Rail Line on a Floor, page 6-75](#)

## Opening Map Editor

Follow these steps to use the map editor:

- 
- Step 1** Choose **Monitor > Site Maps** to display the Maps page.
  - Step 2** Click the desired campus. NCS displays the Site Maps > Campus Name page.
  - Step 3** Click a campus and then a building.
  - Step 4** Click the desired floor area. NCS displays the Site Maps > Campus Name > Building Name > Floor Area Name page.
  - Step 5** From the Select a command drop-down list, choose **Map Editor**, and click **Go**. NCS displays the Map Editor page.

---

**Note** Make sure that the floor plan images are properly scaled so that all white space outside of the external walls is removed. To make sure that floor dimensions are accurate, choose the compass tool from the toolbar.

---

- Step 6** Position the reference length. When you do, the Scale menu appears with the line length supplied. Enter the dimensions (width and height) of the reference length, and click **OK**.
  - Step 7** Determine the propagation pattern at the Antenna Mode drop-down list.
  - Step 8** Make antenna adjustments by sliding the antenna orientation bar to the desired degree of direction.
  - Step 9** Choose the desired access point.
  - Step 10** Click **Save**.
- 

## Using the Map Editor to Draw Polygon Areas

If you have a building that is non-rectangular or you want to mark a non-rectangular area within a floor, you can use the map editor to draw a polygon-shaped area.

- 
- Step 1** Add the floor plan if it is not already represented in NCS (see the [“Adding Floor Areas to a Campus Building” section on page 6-28](#)).
  - Step 2** Choose **Monitor > Site Maps**.
  - Step 3** Click the Map Name that corresponds to the outdoor area, campus, building, or floor you want to edit.
  - Step 4** From the Select a command drop-down list, choose **Map Editor**, and click **Go**.
  - Step 5** In the Map Editor page, click the **Add Perimeter** icon on the toolbar (see [Figure 6-29](#)).  
A pop-up appears.

Figure 6-29 Map Editor Page

**Step 6** Enter the name of the area that you are defining. Click **OK**.

A drawing tool appears.

**Step 7** Move the drawing tool to the area you want to outline.

- Click the left mouse button to begin and end drawing a line.
- When you have completely outlined the area, double-click the left mouse button and the area is highlighted in the page (see Figure 6-30).

The outlined area must be a closed object to appear highlighted on the map.

Figure 6-30 Polygon Area

**Step 8** Click the disk icon on the toolbar to save the newly drawn area.

**Step 9** Choose **Command > Exit** to close the window. You are returned to the original floor plan.

**Note** When you return to the original floor plan view, after exiting the map editor, the newly drawn area is not seen; however, it appears in the Planning Model page when you add elements.

**Step 10** Choose **Planning Mode** from the Select a command drop-down list to begin adding elements to the newly defined polygon-shaped area.

The [Table 6-8](#) explains the color coding of obstacles.

**Table 6-8** Obstacle color coding

| Type of obstacle | Color coding                                                                        | Loss (in dB) |
|------------------|-------------------------------------------------------------------------------------|--------------|
| Thick wall       |  | 13           |
| Light wall       |  | 2            |
| Heavy door       |  | 15           |
| Light door       |  | 4            |
| Cubicle          |  | 1            |
| Glass            |  | 1.5          |

**Note**

The RF prediction heatmaps for access points approximates of the actual RF signal intensity. It takes into account the attenuation of obstacles drawn using the Map Editor but it does not take into account the attenuation of various building materials, such as drywall or metal objects, nor does it display the effects of RF signals bouncing off obstructions. The thick wall (color-coded orange) with a loss of 13 dB may not be enough to contain the RF signal beyond the walls of the heatmap.

## Defining an Inclusion Region on a Floor

To define an inclusion area, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the appropriate floor area.
- Step 3** From the Select a command drop-down list, choose **Map Editor**.
- Step 4** Click **Go**.
- Step 5** At the map, click the aqua box on the toolbar.

**Note**

A message box appears reminding you that only one inclusion area can be defined at a time. Defining a new inclusion region automatically removes the previously defined inclusion region. By default, an inclusion region is defined for each floor when it is added to NCS. The inclusion region is indicated by a solid aqua line and generally outlines the region.

- Step 6** Click **OK** in the message box that appears. A drawing icon appears to outline the inclusion area.
- Step 7** To begin defining the inclusion area, move the drawing icon to a starting point on the map and click once.
- Step 8** Move the cursor along the boundary of the area you want to include and click to end a border line. Click again to define the next boundary line.
- Step 9** Repeat [Step 8](#) until the area is outlined and then double-click the drawing icon. A solid aqua line defines the inclusion area.
- Step 10** Choose **Save** from the Command menu or click the disk icon on the toolbar to save the inclusion region.

**Note**

If you made an error in defining the inclusion area, click the area. The selected area is outlined by a dashed aqua line. Next, click the **X** icon on the toolbar. The area is removed from the floor map.

- Step 11** To return to the floor map to enable inclusion regions on heatmaps, select **Exit** from the Command menu.
- Step 12** At the floor map, select the Layers drop-down list.
- Step 13** Select the **Location Regions** check box if it is not already selected. If you want it to apply to all floor maps, click **Save settings**. Close the Layers configuration pane.
- Step 14** To resynchronize the NCS and MSE databases, choose **Services > Synchronize Services**.

---

**Note** If the two DBs are already synchronized then a resynch will happen automatically every time there is a change. There is no need for an explicit resynch.

---

**Step 15** At the Synchronize page, choose **Network Designs** from the Synchronize drop-down list and then click **Synchronize**.

Check the Sync. Status column to ensure that the synchronization is successful (two green arrows).

---

**Note** Newly defined inclusion and exclusion regions appear on heatmaps only after the mobility services engine recalculates location.

---

## Defining an Exclusion Region on a Floor

To further refine location calculations on a floor, you can define areas that are excluded (exclusion areas) in the calculations. For example, you might want to exclude areas such as an atrium or stairwell within a building. As a rule, exclusion areas are generally defined within the borders of an inclusion area.

To define an exclusion area, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Click the name of the appropriate floor area.
  - Step 3** From the Select a command drop-down list, select **Map Editor**.
  - Step 4** Click **Go**.
  - Step 5** At the map, click the purple box on the toolbar.
  - Step 6** Click **OK** in the message box that appears. A drawing icon appears to outline the exclusion area.
  - Step 7** To begin defining the exclusion area, move the drawing icon to the starting point on the map, and click once.
  - Step 8** Move the drawing icon along the boundary of the area you want to exclude and click once to start a boundary line and click again to end the boundary line.
  - Step 9** Repeat [Step 8](#) until the area is outlined and then double-click the drawing icon. The defined exclusion area is shaded in purple. when the area is completely defined. The excluded area is shaded in purple.
  - Step 10** To define additional exclusion regions, repeat [Step 5](#) to [Step 9](#).
  - Step 11** When all exclusion areas are defined, choose **Save** from the Command menu or the disk icon on the toolbar to save the exclusion region.

---

**Note** To delete an exclusion area, click the area to be deleted. The selected area is outlined by a dashed purple line. Next, click the **X** icon on the toolbar. The area is removed from the floor map.

---

**Step 12** To return to the floor map to enable exclusion regions on heatmaps, choose **Exit** from the Command menu.

**Step 13** At the floor map, choose the Layers drop-down list.

- Step 14** Select the **Location Regions** check box if it is not already selected, click **Save settings**, and close the Layers configuration pane when complete.
- Step 15** To resynchronize the NCS and location databases, choose **Services > Synchronize Services**.
- Step 16** At the Synchronize page, choose **Network Designs** from the Synchronize drop-down list and then click **Synchronize**.
- Check the Sync. Status column to ensure that the synchronization is successful (two green arrows).

## Defining a Rail Line on a Floor

You can define a rail line on a floor that represents a conveyor belt. Additionally, you can define an area around the rail area known as the snap-width to further assist location calculations. This represents the area in which you expect clients to appear. Any client located within the snap-width area is plotted on the rail line (majority) or just outside of the snap-width area (minority).

### Note

Rail line configurations do not apply to tags.

The snap-width area is defined in feet or meters (user-defined) and represents the distance that is monitored on either side (east and west or north and south) of the rail.

To define a rail with a floor, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the name of the appropriate floor area.
- Step 3** Choose **Map Editor** from the Select a command drop-down list.
- Step 4** Click **Go**.
- Step 5** At the map, click the rail icon (to the right of the purple exclusion icon) on the toolbar.
- Step 6** In the message pane that appears, enter a snap-width (feet or meters) for the rail and then click **OK**. A drawing icon appears.
- Step 7** Click the **drawing** icon at the starting point of the rail line. Click again when you want to stop drawing the line or change the direction of the line.
- Step 8** Click the **drawing** icon twice when the rail line is completely drawn on the floor map. The rail line appears on the map and is bordered on either side by the defined snap-width region.

### Note

To delete a rail line, click the area to be deleted. The selected area is outlined by a dashed purple line. Next, click the **X** icon on the toolbar. The area is removed from the floor map.

- Step 9** To return to the floor map to enable rails on heatmaps, choose **Exit** from the Command menu.
- Step 10** At the floor map, choose the Layers drop-down list.
- Step 11** Select the **Rails** check box for if it is not already selected, click **Save settings**, and close the Layers configuration panel when complete.
- Step 12** To resynchronize the NCS and mobility services engine, choose **Services > Synchronize Services**.
- Step 13** At the Synchronize page, choose **Network Designs** from the Synchronize drop-down list and then click **Synchronize**.

Check the Sync. Status column to ensure that the synchronization is successful (two green arrows).

---

## Inspecting Location Readiness and Quality

You can configure NCS to verify the ability of the existing access point deployment to estimate the true location of a client, rogue client, rogue access point, or tag within 10 meters at least 90% of the time. The location readiness calculation is based on the number and placement of access points.

You can also check the location quality and the ability of a given location to meet the location specification (10 m, 90%) based on data points gathered during a physical inspection and calibration.

### Inspect Location Readiness

The Inspect Location Readiness feature is a distance-based predictive tool that can point out problem areas with access point placement.

To access the Inspect Location Readiness tool, follow these steps:

---

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** Select the applicable floor area name to view the map.

---

**Note** If RSSI is not displayed, you can enable AP Heatmaps under the Layer menu (top-left).

---

---

**Note** If clients, tags, and access points are not displayed, verify that their respective check boxes are selected in the Layers menu. Licenses for both clients and tags must also be purchased for each to be tracked.

---

**Step 3** From the Select a command drop-down list, choose **Inspect Location Readiness**.

**Step 4** Click **Go**.

A color-coded map appears showing those areas that meet (indicated by Yes) and do not meet (indicated by No) the ten meter, 90% location specification.

---

### Inspecting Location Quality Using Calibration Data

After completing a calibration model based on data points generated during a physical tour of the area, you can inspect the location quality of the access points.

To inspect location quality based on calibration, follow these steps:

---

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** Choose **RF Calibration Model** from the Select a command list. Click **Go**.

A list of calibration models appears.

**Step 3** Click the appropriate calibration model.

Details on the calibration including date of last calibration, number of data points by signal type (802.11a, 802.11 b/g) used in the calibration, location, and coverage are displayed.

**Step 4** In the same page, click the **Inspect Location Quality** link found under the Calibration Floors heading. A color-coded map noting percentage of location errors appears.

**Note** You can modify the distance selected to see the effect on the location errors.

## Inspect VoWLAN Readiness

Voice readiness tool (the VoWLAN Readiness tool) allows you to check the RF coverage to see if it is sufficient for your voice needs. This tool verifies RSSI levels after access points have been installed.

To access the VoWLAN Readiness Tool (VRT), follow these steps:

**Step 1** Choose **Monitor > Site Maps**.

**Step 2** Select the applicable floor area name.

**Step 3** From the Select a command drop-down list, choose **Inspect VoWLAN Readiness**.

**Step 4** Choose the applicable **Band**, **AP Transmit Power**, and **Client** parameters from the drop-down lists.

**Note** By default the region map displays the region map for b/g/n band for Cisco Phone based RSSI threshold. The new settings cannot be saved.

**Step 5** Depending on the selected client, the RSSI values may not be editable.

- Cisco Phone—RSSI values are not editable.
- Custom—RSSI values are editable with the following ranges:
  - Low threshold between -95dBm to -45dBm
  - High threshold between -90dBm to -40dBm

**Step 6** The following color schemes indicate whether or not the area is Voice Ready:

- Green—Yes
- Yellow—Marginal
- Red—No

**Note** The accuracy of the Green/Yellow/Red regions depends on the RF environment and whether or not the floor is calibrated. If the floor is calibrated, the accuracy of the regions is enhanced.

## Troubleshooting Voice RF Coverage Issues

- Floors with either calibration or no calibration data:
  - Set the AP Transmit parameter to **Max** (the maximum downlink power settings). If the map still shows some yellow or red regions, more access points are required to cover the floor.
  - If calibrated model shows red or yellow regions (where voice is expected to be deployed) with the AP Transmit parameter set to Current, increasing the power level of the access points may help.

## Monitoring Mesh Networks Using Maps

You can access and view details for the following elements from a mesh network map in Cisco NCS:

- Mesh Link Statistics
- Mesh Access Points
- Mesh Access Point Neighbors

Details on how this information is accessed and displayed for each of these items is detailed in this sections. This section contains the following topics:

- [Monitoring Mesh Link Statistics Using Maps, page 6-78](#)
- [Monitoring Mesh Access Points Using Maps, page 6-81](#)
- [Monitoring Mesh Access Point Neighbors Using Maps, page 6-83](#)
- [Viewing the Mesh Network Hierarchy, page 6-85](#)
- [Using Mesh Filters to Modify Map Display of Maps and Mesh Links, page 6-87](#)

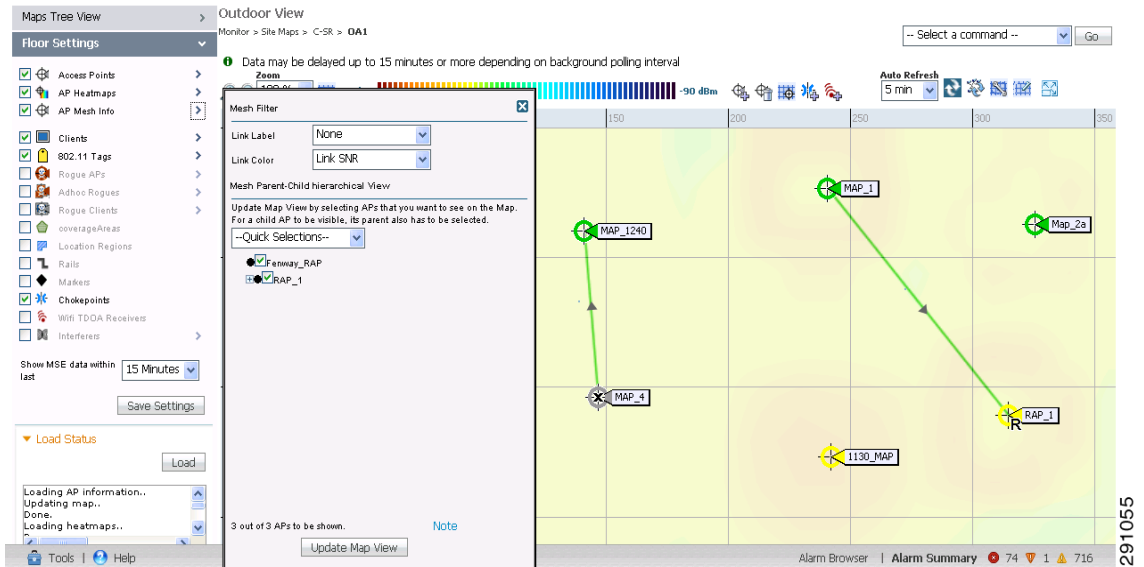

## Monitoring Mesh Link Statistics Using Maps

You can view the SNR for a specific mesh network link, view the number of packets transmitted and received on that link, and initiate a link test in the **Monitor > Site Maps** page.

To view details on a specific mesh link between two mesh access points or a mesh access point and a root access point, perform the following:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Click the **Map Name** that corresponds to the outdoor area, campus, building, or floor you want to monitor.
  - Step 3** From the left sidebar menu, click the arrow to the right of AP Mesh Info (see [Figure 6-31](#)). A Mesh Filter dialog box appears.

Figure 6-31 Mesh Filter Page

**Step 4** Move the cursor over the colored dot next to each mesh access point child to view details on the link between it and its parent. Table 6-9 summarizes the parameters that appear.

The color of the dot also provides a quick reference point of the SNR strength.

- A green dot represents a high SNR (above 25 dB).
- An amber dot represents an acceptable SNR (20-25 dB).
- A red dot represents a low SNR (below 20 dB).
- A black dot indicates a root access point.

The Bridging Link information appears.

Table 6-9 Bridging Link Information

| Parameter              | Description                                        |
|------------------------|----------------------------------------------------|
| Information fetched on | Date and time that information was compiled.       |
| Link SNR               | Link signal-to-noise ratio (SNR).                  |
| Link Type              | Hierarchical link relationship.                    |
| SNR Up                 | Signal-to-noise ratio for the uplink (dB).         |
| SNR Down               | Signal-to-noise ratio for the downlink (dB).       |
| PER                    | The packet error rate for the link.                |
| Tx Parent Packets      | The TX packets to a node while acting as a parent. |
| Rx Parent Packets      | The RX packets to a node while acting as a parent. |
| Time of Last Hello     | Date and time of last hello.                       |

**Step 5** Click either **Link Test, Child to Parent** or **Link Test, Parent to Child**. After the link test is complete, a results page appears.

**Note** A link test runs for 30 seconds.

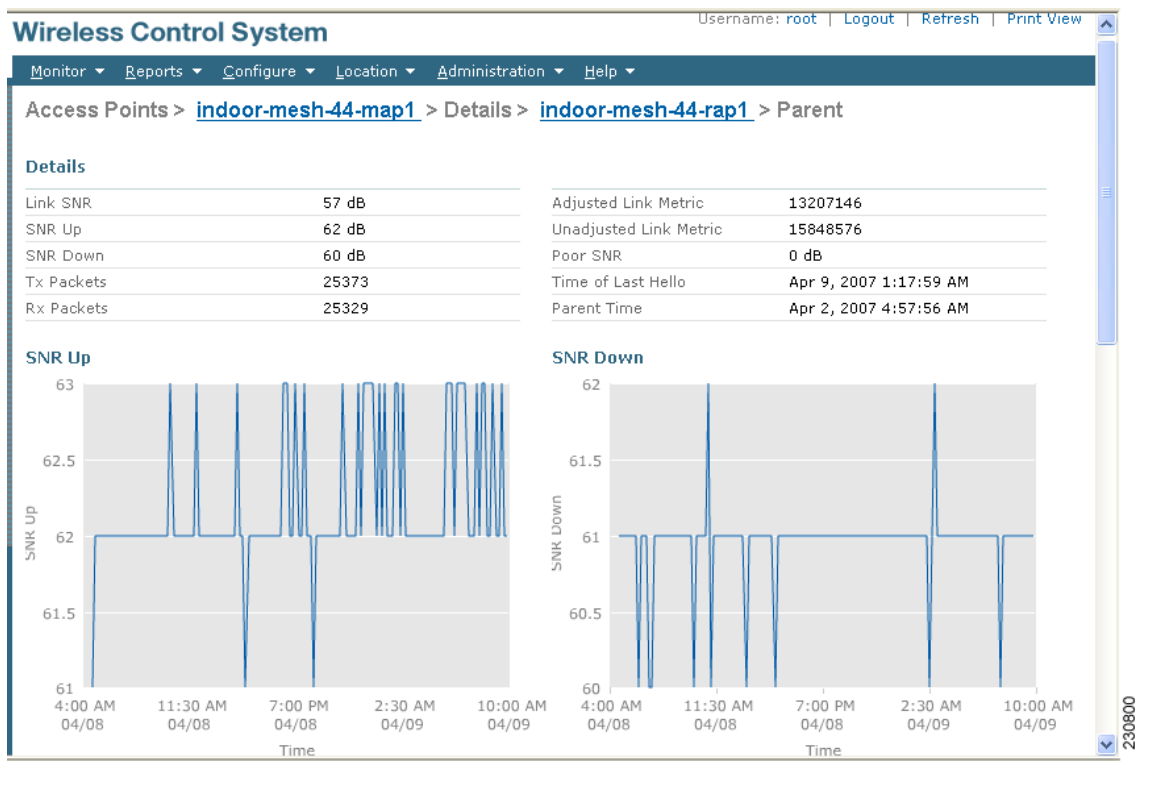

**Note** You cannot run link tests for both links (child-to-parent and parent-to-child) at the same time.

**Step 6** To view a graphical representation of SNR statistics over a period of time, click the arrow on the link. A page with multiple SNR graphs appears (see Figure 6-32).

The following graphs are displayed for the link:

- SNR Up—Plots the RSSI values of the neighbor from the perspective of the access point.
- SNR Down—Plots the RSSI values that the neighbor reports to the access point.
- Link SNR—Plots a weighed and filtered measurement based on the SNR Up value.
- The Adjusted Link Metric—Plots the value used to determine the least cost path to the root access point. This value is the ease to get to the rooftop access point and accounts for the number of hops. The lower the ease value, the less likely the path is used.
- The Unadjusted Link Metric—Plots the least cost path to get to the root access point unadjusted by the number of hops. The higher the value for the unadjusted link, the better the path.

**Figure 6-32 Mesh SNR Graphs Page (Top)**

## Monitoring Mesh Access Points Using Maps

You can view the following summary information for a mesh access point from a mesh network map:

- Parent
- Number of children
- Hop count
- Role
- Group name
- Backhaul interface
- Data Rate
- Channel

---

**Note** This information is in addition to the information shown for all access points (MAC address, access point model, controller IP address, location, height of access point, access point up time, and LWAPP up time).

---

---

**Note** You can also view detailed configuration and access alarm and event information from the map. For detailed information on the Alarms and Events displayed, see the [“Alarm and Event Dictionary” section on page 13-1](#).

---

To view summary and detailed configuration information for a mesh access point from a mesh network map, perform the following:

- 
- Step 1** In NCS, choose **Monitor > Site Maps**.
  - Step 2** Click the Map Name that corresponds to the outdoor area, campus, building, or floor location of the access point you want to monitor.
  - Step 3** To view summary configuration information for an access point, move the cursor over the access point that you want to monitor. A dialog box with configuration information for the selected access point appears (see [Figure 6-33](#)).

Figure 6-33 Mesh AP Summary Dialog Box

The screenshot displays the Cisco Prime Network Control System interface. The top navigation bar includes 'Home', 'Monitor', 'Configure', 'Services', 'Reports', and 'Administration'. The main area is titled 'Outdoor View' and shows a map with several AP locations. A detailed configuration pane for 'AP 'MAP\_4'' is open on the right, showing the following information:

| AP Info              | Mesh                   | Backhaul | Access                 |
|----------------------|------------------------|----------|------------------------|
| MAC Address          | 00:23:05:2c:76:00      |          |                        |
| AP Type              | AP 1520                |          |                        |
| AP Model             | AIR-LAP1522AG-A-K9     |          |                        |
| Controller           | 10.104.173.178         |          |                        |
| Location             | test                   |          |                        |
| AP Height            | 30.0 feet              |          |                        |
| AP Up Time           | 6 d 1 h 58 m 46 s      |          |                        |
| CAPWAP Up Time       | 4 m 49 s               |          |                        |
| Monitor Access Point | Configure Access Point |          |                        |
| Run Ping Test        | Run Ping Test          |          | Critical AP Alarms (1) |

**Step 4** To view detailed configuration information for an access point, double-click the access point appearing on the map. The configuration details for the access point appears (see Figure 6-34).

**Note** For more details on the View Mesh Neighbors link in the access point dialog box (see Figure 6-33), see the “Monitoring Mesh Access Point Neighbors Using Maps” section on page 6-83. If the access point has an IP address, a Run Ping Test link is also visible at the bottom of the mesh access point pane.

Figure 6-34 Mesh AP Detail Page

The screenshot displays the 'Access Point Details' page for 'MAP\_1'. The 'Mesh Links' tab is selected, showing a table of mesh links:

| Type             | AP Name     | AP MAC Address    | PER | Link Detail | Link Test     | Link Test     |
|------------------|-------------|-------------------|-----|-------------|---------------|---------------|
| Parent           | RAP_1       | 00:24:50:36:08:00 | -   | Details     | AP to Neigh   | Neigh to AP   |
| Tentative Parent | 1524ps-map1 | 00:21:56:e7:d8:00 |     | Details     | AP to Neigh   | Neigh to AP   |
| Neighbor         | Unknown     | 00:21:a1:f9:72:00 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |
| Neighbor         | Map_2a      | 00:24:13:0f:89:00 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |
| Tentative Parent | RAP_2       | 00:24:50:37:4c:00 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |
| Tentative Parent | Unknown     | 00:25:45:26:03:d0 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |
| Tentative Parent | RAP_1240    | 00:3a:98:89:3c:50 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |
| Tentative Parent | Unknown     | 00:3a:99:10:d8:f0 |     | Details ↓   | AP to Neigh ↓ | Neigh to AP ↓ |

Below the table, there are links for 'Mesh Link Alarms' and 'Mesh Link Events'. A 'Footnotes' section at the bottom states: '1. Link is out of date. This can be because the AP has been replaced or the APs can no longer communicate.'

**Step 5** In the Access Point configuration page, follow these steps to view configuration details for the mesh access point.

- a. Click the **General** tab to view the overall configuration of the mesh access point such as AP name, MAC address, AP Up time, associated controllers (registered and primary) operational status, and software version.

**Note** The software version for mesh access points is appended the letter *m* and the word *mesh* in parentheses.

- b. Click the **Interface** tab to view configuration details for the interfaces supported on the mesh access point. Interface options are radio and Ethernet.
- c. Click the **Mesh Links** tab to view parent and neighbor details (name, MAC address, packet error rate, and link details) for the mesh access point. You can also initiate link tests from this page.
- d. Click the **Mesh Statistics** tab to view details on the bridging, queue, and security statistics for the mesh access point. For more details on mesh statistics, see the [“Mesh Statistics for an Access Point” section on page 5-78](#).

## Monitoring Mesh Access Point Neighbors Using Maps

To view details on neighbors of a mesh access point from a mesh network map, follow these steps:

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Click the **Map Name** that corresponds to the outdoor area, campus, building, or floor you want to monitor.
- Step 3** To view detailed information on mesh links for a mesh access point, click the arrow portion of the access point label. The Access Points screen appears.
- Step 4** Click the **Mesh Links** tab (see [Figure 6-35](#)).

**Figure 6-35** *Access Points > Mesh Links Page*

Access Point Details  
Monitor > Access Points > MAP\_1

General Interfaces **Mesh Links** Mesh Statistics

| Unknown | 00:1f:ca:5c:84:e0 | Neighbor    | 4 dB  | Ch#149  |
| Unknown | 00:21:a1:f9:72:00 | Neighbor    | 4 dB  | Ch#136  |
| Unknown | 00:22:be:43:cb:00 | Neighbor    | 3 dB  | Ch#136  |
| Unknown | 00:23:04:c9:70:d0 | Neighbor    | 43 dB | Ch#149  |
| Unknown | 00:25:45:26:03:d0 | Blacklisted | 22 dB | Ch#136  |

291066

**Note**

In addition to listing the current and past neighbors in the pane that appears, labels are added to the mesh access points map icons to identify the selected access point, the neighbor access point, and the child access point. Click the **clear** link of the selected access point to remove the relationship labels from the map.

**Note**

The drop-down lists at the top of the mesh neighbors page indicate the resolution of the map (100%) displayed and how often the information displayed is updated (5 mins). You can modify these default values.

## Viewing the Mesh Network Hierarchy

You can view the parent-child relationship of mesh access points within a mesh network in an easily navigable display. You can also filter which access points display on the Map view by selecting only access points of interest.

To view the mesh network hierarchy for a selected network, perform the following:

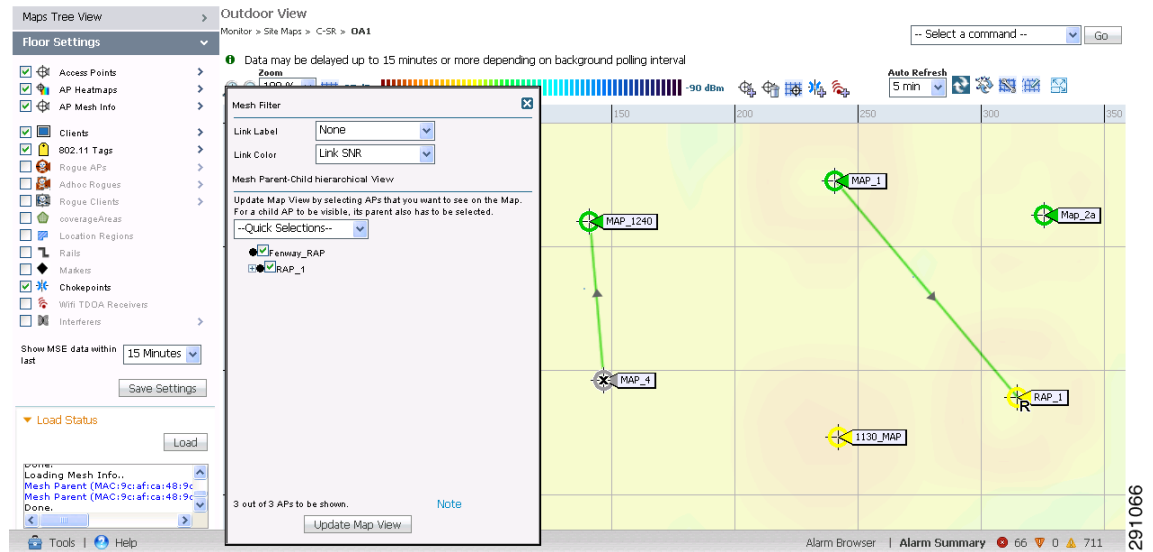

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Select the map you want to display.
- Step 3** Select the **AP Mesh Info** check box in the left sidebar menu if it is not already selected.

**Note**

The AP Mesh Info check box is only selectable if mesh access points are present on the map. It must be selected to view the mesh hierarchy.

- Step 4** Click the blue arrow to the right of the **AP Mesh Info** to display the mesh parent-child hierarchy (see [Figure 6-38](#)).

Figure 6-38 Mesh Parent-Child hierarchical View

**Step 5** Click the **plus (+)** sign next to a mesh access point to display its children.

All subordinate mesh access points are displayed when a negative (-) sign displays next to the parent mesh access point entry. For example, in Figure 6-38, the access point, *indoor-mesh-45-rap2*, has only one child, *indoor-mesh-44-map2*.

**Step 6** Move the cursor over the colored dot next to each mesh access point child to view details on the link between it and its parent. Table 6-10 summarizes the parameters that appear.

The color of the dot also provides a quick reference point of the SNR strength.

- A green dot represents a high SNR (above 25 dB).
- An amber dot represents an acceptable SNR (20-25 dB).
- A red dot represents a low SNR (below 20 dB).
- A black dot indicates a root access point.

Table 6-10 Bridging Link Information

| Parameter              | Description                                        |
|------------------------|----------------------------------------------------|
| Information fetched on | Date and time that information was compiled.       |
| Link SNR               | Link signal-to-noise ratio (SNR).                  |
| Link Type              | Hierarchical link relationship.                    |
| SNR Up                 | Signal-to-noise ratio for the uplink (dB).         |
| SNR Down               | Signal-to-noise ratio for the downlink (dB).       |
| PER                    | The packet error rate for the link.                |
| Tx Parent Packets      | The TX packets to a node while acting as a parent. |
| Rx Parent Packets      | The RX packets to a node while acting as a parent. |
| Time of Last Hello     | Date and time of last hello.                       |

## Using Mesh Filters to Modify Map Display of Maps and Mesh Links

In the mesh hierarchical page, you can also define mesh filters to determine which mesh access points display on the map based on hop values as well as what labels display for mesh links.

Mesh access points are filtered by the number of hops between them and their root access point.

To use mesh filtering, follow these steps:

- Step 1** To modify what label and color displays for a mesh link, follow these steps:
- a. In the Mesh Parent-Child Hierarchical View, choose an option from the Link Label drop-down list. Options are None, Link SNR, and Packet Error Rate.
  - b. In the Mesh Parent-Child Hierarchical View, choose an option from the Link Color drop-down list to define which parameter (Link SNR or Packet Error Rate) determines the color of the mesh link on the map.

**Note** The color of the link provides a quick reference point of the SNR strength or Packet Error Rate. [Table 6-11](#) defines the different link colors.

**Table 6-11** Definition for SNR and Packet Error Rate Link Color

| Link Color | Link SNR                                                 | Packet Error Rate (PER)                                                                |
|------------|----------------------------------------------------------|----------------------------------------------------------------------------------------|
| Green      | Represents a SNR above 25 dB (high value)                | Represents a PER of one percent (1%) or lower                                          |
| Amber      | Represents a SNR between 20 and 25 dB (acceptable value) | Represents a PER that is less than ten percent (10%) and greater than one percent (1%) |
| Red        | Represents a SNR below 20 dB (low value)                 | Represents a PER that is greater than ten percent (10%)                                |

**Note** The Link label and color settings are reflected on the map immediately (see [Figure 6-39](#)). You can display both SNR and PER values simultaneously.

- Step 2** To modify which mesh access points display based on the number of hops between them and their parents, do the following:
- a. In the Mesh Parent-Child Hierarchical View, choose the appropriate options from the Quick Selections drop-down list. A description of the options is provided in [Table 6-12](#).

**Table 6-12** Quick Selection Options

| Parameter             | Description                                                                      |
|-----------------------|----------------------------------------------------------------------------------|
| Select only Root APs  | Choose this setting if you want the map view to display root access points only. |
| Select up to 1st hops | Choose this setting if you want the map view to display 1st hops only.           |

**Table 6-12 Quick Selection Options (continued)**

|                       |                                                                            |
|-----------------------|----------------------------------------------------------------------------|
| Select up to 2nd hops | Choose this setting if you want the map view to display 2nd hops only.     |
| Select up to 3rd hops | Choose this setting if you want the map view to display 3rd hops only.     |
| Select up to 4th hops | Choose this setting if you want the map view to display 4th hops only.     |
| Select All            | Select this setting if you want the map view to display all access points. |

- b. Click **Update Map View** to refresh the screen and display the map view with the selected options.

**Note** Map view information is retrieved from the NCS database and is updated every 15 minutes.

**Note** You can also select or unselect the check boxes of access points in the mesh hierarchical view to modify which mesh access points are displayed. For a child access point to be visible, the parent access point to root access point must be selected.

**Note** If you want to have the MAC address appear with the client logo in the Monitor > Site Maps page, follow these steps:

- Go to the Maps Tree View.
- Click the > beside Clients.
- Unselect the **Small Icons** check box.

**Figure 6-39 Mesh Filter and Hop Count Configuration Page**

The screenshot shows the Cisco Prime Network Control System interface. The page title is "Access Point Details" and the breadcrumb is "Monitor > Access Points > MAP\_1". The "Interfaces" tab is selected, showing a table of interface statistics and a table of protocol configurations.

| Interface        | Admin Status | Operational Status | Rx Unicast Packets | Tx Unicast Packets | Rx Non-Unicast Packets | Tx Non-Unicast Packets |
|------------------|--------------|--------------------|--------------------|--------------------|------------------------|------------------------|
| GigabitEthernet0 | Up           | Down               | 0                  | 0                  | 0                      | 0                      |
| GigabitEthernet1 | Up           | Down               | 0                  | 0                  | 0                      | 0                      |
| GigabitEthernet2 | Up           | Down               | 0                  | 0                  | 0                      | 0                      |
| GigabitEthernet3 | Up           | Down               | 0                  | 0                  | 0                      | 0                      |

| Protocol  | Admin Status | CleanAir Capable | CleanAir Status | Channel Number | Extension Channel | Power Level | Channel Width (MHz) | Antenna      |
|-----------|--------------|------------------|-----------------|----------------|-------------------|-------------|---------------------|--------------|
| 802.11b/g | Enabled      | No               | N/A             | 9              | N/A               | 1           | 20                  | AIR-ANT2455V |
| 802.11a   | Enabled      | No               | N/A             | 165            | N/A               | 1           | 20                  | AIR-ANT5175V |

---

## Monitoring Tags Using Maps

On an NCS map, you can review the name of the access point that generated the signal for a tagged asset, its strength of signal and when the location information was last updated for the asset. This information is displayed by simply hovering the mouse cursor over the asset tag icon on the map.

To enable tag location status on a map, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Choose **Campus > Building > Floor** for the applicable mobility services engine and tag.
  - Step 3** Select the **802.11 Tags** check box in the Floor Settings pane (left), if not already selected.

---

**Note** Do not click **Save Settings** unless you want to save changes made to the Floor Settings across all maps.

---

- Step 4** Hover the mouse cursor over a tag icon (yellow tag) and a summary of its configuration appears in a dialog box.
  - Step 5** Click the **tag** icon to see tag details in a new window.
- 

## Using Planning Mode

You can calculate the recommended number and location of access points based on whether data and/or voice traffic and/or location are active.

---

**Note** Based on the throughput specified for each protocol (802.11a or 802.11 b/g), planning mode calculates the total number of access points required that would provide optimum coverage in your network.

---

## Accessing Planning Mode

To access the Planning Mode feature, follow these steps:

- 
- Step 1** Choose **Monitor > Site Maps**.
  - Step 2** Select the desired campus or building from the Name list.
  - Step 3** Click the desired floor area in the Building.
  - Step 4** From the Select a command drop-down list, choose **Planning Mode**.
  - Step 5** Click **Go**.

**Note**

---

Planning mode does not use AP type or Antenna pattern information for calculating the number of access points required. The calculation is based on the access point coverage area or the number of users per access point.

---

Planning Mode options:

- Add APs—Enables you to add access points on a map. See the “[Adding Access Points to a Floor Area](#)” section on page 6-34 for details.
- Delete APs—Deletes the selected access points.
- Map Editor—Opens the Map Editor window. See the “[Using the Map Editor](#)” section on page 6-69 for more details.
- Synchronize with Deployment—Synchronizes your planning mode access points with the current deployment scenario.
- Generate Proposal—View a planning summary of the current access points deployment.
- Planned AP Association Tool—Allows you to perform add, delete or import an AP Association from an excel or CSV file. Once an access point is defined, it can be associated to a base radio MAC address using the Planned AP Association Tool. If the AP is not discovered they get pushed into a standby bucket and get associated when discovered.

**Note**

---

AP association is subjected to a limitation that AP should not belong to any floor or outdoor area. If the AP is already assigned to a floor or outdoor area, then the standby bucket will hold the AP and when removed from the floor or outdoor, get positioned to the given floor. One Mac address cannot be put into bucket for multiple floor or outdoor areas.

---

**Note**

---

The map synchronizations works only if the AP is associated to a base radio MAC address and not to its ethernet MAC address.

---

## Using Planning Mode to Calculate Access Point Requirements

The NCS planning mode enables you to calculate the number of access points required to cover an area by placing fictitious access points on a map and allowing you to view the coverage area. Based on the throughput specified for each protocol (802.11a/n or 802.11b/g/n), planning mode calculates the total number of access points required to provide optimum coverage in your network. You can calculate the recommended number and location of access points based on the following criteria:

- traffic type active on the network: data or voice traffic or both
- location accuracy requirements
- number of active users
- number of users per square footage

To calculate the recommended number and placement of access points for a given deployment, follow these steps:

**Step 1** Choose **Monitor > Site Maps**.

The Site Map page appears (see [Figure 6-40](#)).

**Figure 6-40** *Monitor > Site Maps Page*

| Name              | Type       | Total APs | a/n Radios | b/g/n Radios | Critical Radio Alarms | Clients | Status  |
|-------------------|------------|-----------|------------|--------------|-----------------------|---------|---------|
| System Campus     | Campus     | 0         | 0          | 0            | 0                     | 0       | OK      |
| C-SR              | Campus     | 7         | 7          | 7            | 2                     | 0       | Warning |
| C-SR > BGL25      | Building   | 7         | 7          | 7            | 2                     | 0       | Warning |
| C-SR > BGL25 > F5 | Floor Area | 0         | 0          | 0            | 0                     | 0       | OK      |
| C-SR > BGL25 > F6 | Floor Area | 7         | 7          | 7            | 2                     | 0       | Warning |

**Step 2** Select the appropriate location link from the list that appears.

A color-coded map appears showing placement of all installed elements (access points, clients, tags) and their relative signal strength (see [Figure 6-41](#)).

Figure 6-41 Selected Floor Area Showing Current Access Point Assignments

- Step 3** Choose **Planning Mode** from the Select a command drop-down list (top-right), and click **Go**. A blank floor map appears.
- Step 4** Click **Add APs**.
- Step 5** In the page that appears, drag the dashed-line rectangle over the map location for which you want to calculate the recommended access points (see [Figure 6-42](#)).

**Note** Adjust the size or placement of the rectangle by selecting the edge of the rectangle and holding down the **Ctrl** key. Move the mouse as necessary to outline the targeted location.

Figure 6-42 Add APs page

- Step 6** Choose **Automatic** from the Add APs drop-down list.
- Step 7** Choose the **AP Type** and the appropriate antenna and protocol for that access point.
- Step 8** Choose the target throughput for the access point.
- Step 9** Select the check box(es) next to the **service(s)** that will be used on the floor. Options are Data/Coverage (default), Voice, Location, and Location with Monitor Mode APs. (see [Table 6-13](#)).

**Note** You must select at least one service or an error occurs.

**Note** If you select the **Advanced Options** check box, two additional access point planning options appear: Demand and Override Coverage per AP. Additionally, a Safety Margin parameter appears for the Data/Coverage and Voice safety margin options.

Table 6-13 Definition of Services Option

| Service Options | Description                                                                                                                                      |                       |                  |                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------|----------------|
| Data/Coverage   | Select this check box if data traffic is transmitted on the wireless LAN. The following densities are used depending on the band and data rates: |                       |                  |                |
|                 | Band                                                                                                                                             | Path Loss Model (dBm) | Date Rate (Mb/s) | Area (Sq. ft.) |
|                 | 802.11a                                                                                                                                          | -3.3                  | 10-12            | 6000           |
|                 | 802.11a                                                                                                                                          | -3.3                  | 15-18            | 4500           |

Table 6-13 Definition of Services Option (continued)

| Service Options | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |      |       |      |

|                 | <p>If you select the <b>Advanced Options</b> check box, you can select the desired safety margin (aggressive, safe, or very safe) of the signal strength threshold for data.</p> <ul style="list-style-type: none"> <li>• Aggressive = Minimum (-3 dBm)</li> <li>• Safe = Medium (0 dBm)</li> <li>• Very Safe = Maximum (+3 dBm)</li> </ul>                                                                                                                                                                                                                                                             |      |       |      |
| <b>Voice</b>    | <p>Select the voice check box, if voice traffic is transmitted on the wireless LAN.</p> <p>If you select the <b>Advanced Options</b> check box, you can select the desired safety margin (aggressive, safe, very safe or 7920-enabled) of the signal strength threshold for voice.</p> <ul style="list-style-type: none"> <li>• Aggressive = Minimum [-78 dBm (802.11a/b/g)]</li> <li>• Safe = Medium [-75 dBm (802.11a/b/g)]</li> <li>• Very Safe = Maximum [(-72 dBm (802.11a/b/g)]</li> </ul> <p>7920_enabled = [(-72 dBm (802.11a); -67 dBm (802.11b/g)]</p>                                        |      |       |      |
| <b>Location</b> | <p>Select this check box to ensure that the recommended access point calculation provides the true location of an element within 10 meters at least 90% of the time.</p> <p>To meet the criteria, access points are collocated within 70 feet of each other in a hexagonal pattern employing staggered and perimeter placement.</p> <p><b>Note</b> Each service option includes all services that are listed above it. For example, if you select the Location check box, the calculation considers data/coverage, voice, and location in determining the optimum number of access points required.</p> |      |       |      |
| <b>Demand</b>   | <p>Select this check box, if you want to use the total number of users or user ratio per access point as a basis for the access point calculation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |      |       |      |

Table 6-14 Definition of Advanced Services (continued)

| Service Options          | Description                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Override Coverage per AP | Select this check box, if you want to specify square foot coverage as the basis for access point coverage.                                                                                                                                                                                                                                                           |
| Safety Margin            | Select this check box to qualify relative signal strength requirements for data and voice service in the access point calculation. Options are: Aggressive, Safe, Very Safe, and 7920-enabled (voice only). Select <b>Aggressive</b> to require minimal signal strength requirements in the calculation and <b>Very Safe</b> to request the highest signal strength. |

**Step 10** Click **Calculate**.

The recommended number of access points given the selected services appears (see [Figure 6-43](#)).

Add APs Automatically:  
Resize and move the rectangle using mouse and SHIFT key over the desired coverage area and specify placement criteria. Click "Calculate" to determine the number of APs recommended by WCS. If you are satisfied with the result, press "Apply". APs will be created and automatically positioned on the map.

**Note**

Recommended calculations assume the need for consistently strong signals unless adjusted downward by the **safety margin** advanced option. In some cases, the recommended number of access points is higher than what is required.

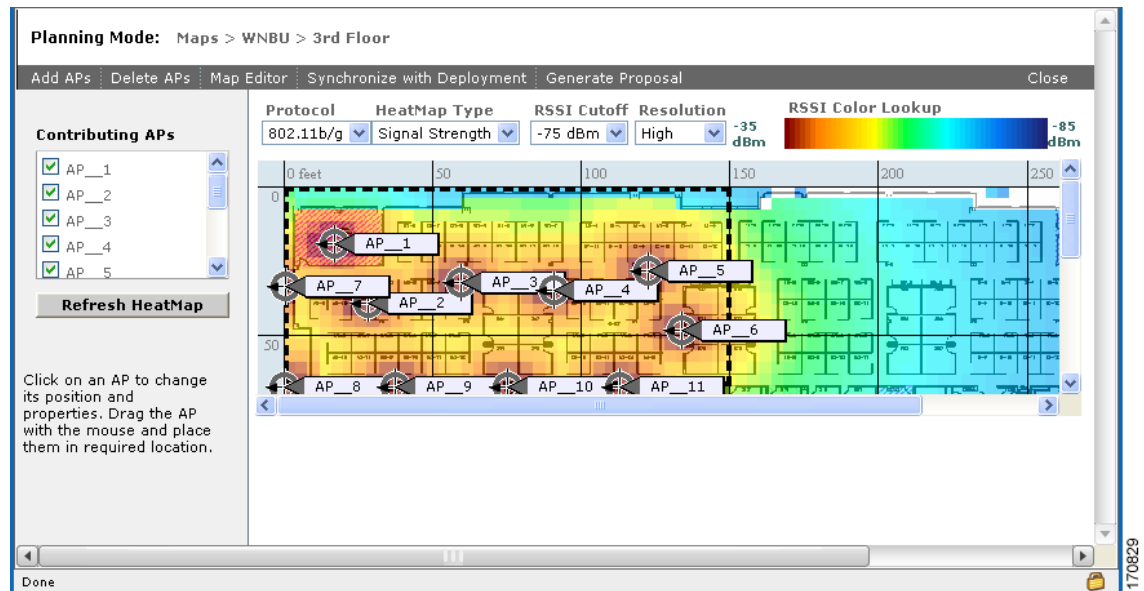

**Note** Walls are not used or accounted for in planning mode calculations.

- Step 11** Click **Apply** to generate a map that shows proposed deployment of the recommended access points in the selected area based on the selected services and parameters (see [Figure 6-44](#)).

**Figure 6-44** Recommended Access Point Deployment Given Selected Services and Parameters

- Step 12** Choose **Generate Proposal** to display a textual and graphical report of the recommended access point number and deployment based on the given input.

## Refresh Options

To prepare for monitoring your wireless LANs, become familiar with the various refresh options for a map.

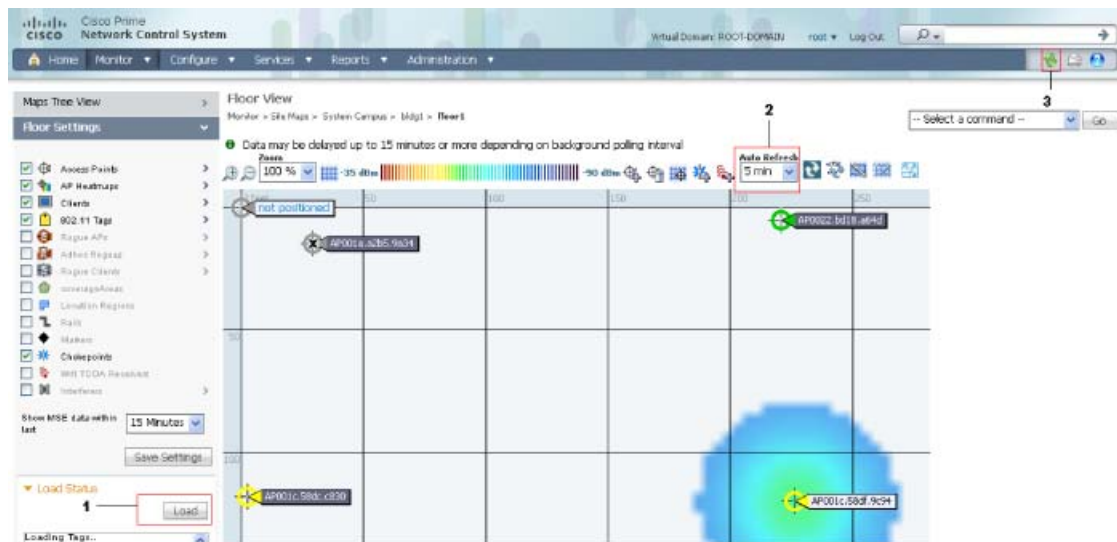

- **Load**—The Load option in the left sidebar menu refreshes map data from the NCS database on demand (see callout 1 in [Figure 6-45](#)).
- **Auto Refresh**—The Auto Refresh option (see callout 2 in [Figure 6-45](#)) provides an interval drop-down list to set how often to refresh the map data from the database.
- **Refresh from network**—By clicking the **Refresh from network** icon to the right of the Auto Refresh drop-down list (see callout 2 in [Figure 6-45](#)), you can refresh the map status and statistics directly from the controller through an SNMP fetch rather than polled data from the NCS database that is five to fifteen minutes older.

**Note** If you have monitor mode access points on the floor plan, you have a choice between IDS or coverage heatmap types. A coverage heatmap excludes monitor mode access points, and an IDS heatmap includes them.

- Refresh browser—Above the map next to the Logout and Print option is another refresh option (see callout 3 in Figure 6-45). Clicking this refreshes the complete page, or the map and its status and statistics if you are on a map page.

**Figure 6-45 Refresh Options**

## Creating a Network Design

After access points have been installed and have joined a controller, and NCS has been configured to manage the controllers, set up a network design. A *network design* is a representation within NCS of the physical placement of access points throughout facilities. A hierarchy of a single campus, the buildings that comprise that campus, and the floors of each building constitute a single network design. These steps assume that the location appliance is set to poll the controllers in that network, as well as be configured to synchronize with that specific network design, to track devices in that environment. The concept and steps to perform synchronization between NCS and the mobility service engine are explained in the *Cisco 3350 Mobility Services Engine Configuration Guide*.

## Designing a Network

Follow these steps to design a network:

- 
- Step 1** Open the NCS web interface and log in.

---

**Note** To create or edit a network design, you must log into NCS and have SuperUser, Admin, or ConfigManager access privileges.

---

**Step 2** Choose **Monitor > Site Maps**.

**Step 3** From the drop-down list on the right-hand side, choose either **New Campus** or **New Building**, depending on the size of the network design and the organization of maps. If you chose New Campus, continue to Step 4. To create a building without a campus, skip to [Step 14](#).

**Step 4** Click **Go**.

**Step 5** Enter a name for the campus network design, a contact name, and the file path to the campus image file. .bmps and .jpgs are importable.

---

**Note** You can use the Browse... button to navigate to the location.

---

**Step 6** Click **Next**.

**Step 7** Select the **Maintain Aspect Ratio** check box. Enabling this check box causes the horizontal span of the campus to be 5000 feet and adjusts the vertical span according to the aspect ratio of the image file. Adjusting either the horizontal or vertical span changes the other field in accordance with the image ratio.

You should unselect the Maintain Aspect Ratio check box if you want to override this automatic adjustment. You could then adjust both span values to match the real world campus dimensions.

**Step 8** Click **OK**.

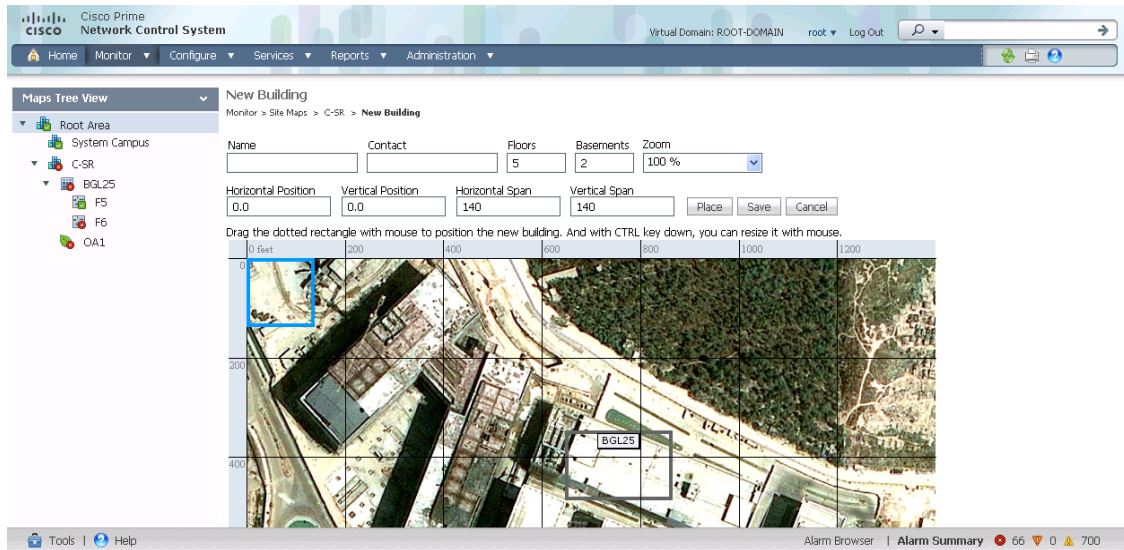

**Step 9** In the Monitor > Site Maps page, click the hyperlink associated with the above-made campus map. A page showing the new campus image is displayed.

**Step 10** From the Select a command menu on the upper right of the page, choose **New Building**, and click **Go**.

**Step 11** Enter the name of the building, the contact person, the number of floors and basements in the building, and the dimensions. Click **OK**.

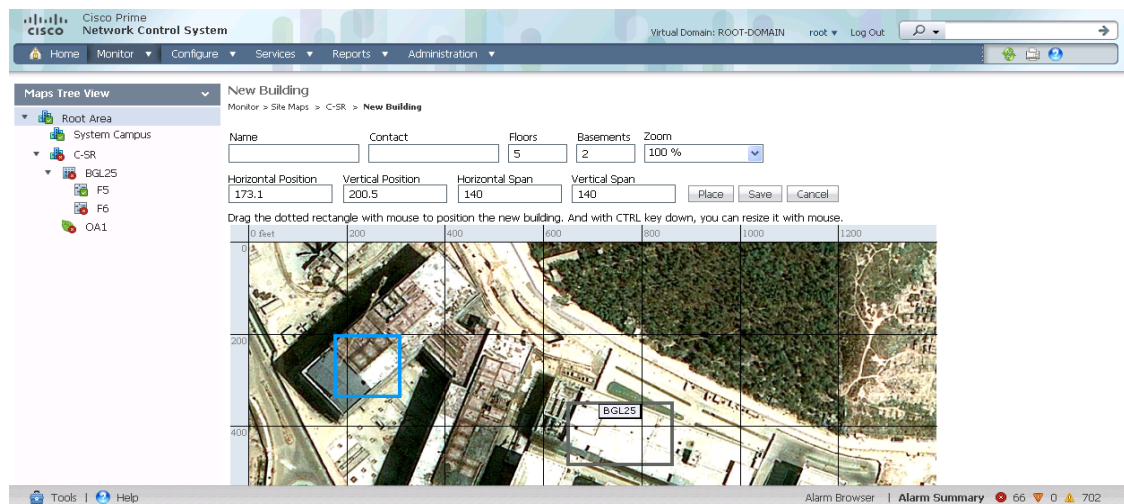

**Step 12** Indicate which building on the campus map is the correct building by clicking the blue box in the upper left of the campus image and dragging it to the intended location (see [Figure 6-46](#)). To resize the blue box, hold down the **Ctrl** key and click and drag to adjust its horizontal size. You can also enter dimensions of the building by entering numerical values in the Horizontal Span and Vertical Span fields and click **Place**. After resizing, reposition the blue box if necessary by clicking on it and dragging it to the desired location. Click **Save**.

**Figure 6-46** *Repositioning Building Highlighted in Blue*

- Step 13** NCS is then returned to the campus image with the newly created building highlighted in a green box. Click the **green box** (see [Figure 6-47](#)).

**Figure 6-47** Newly Created Building Highlighted in Blue

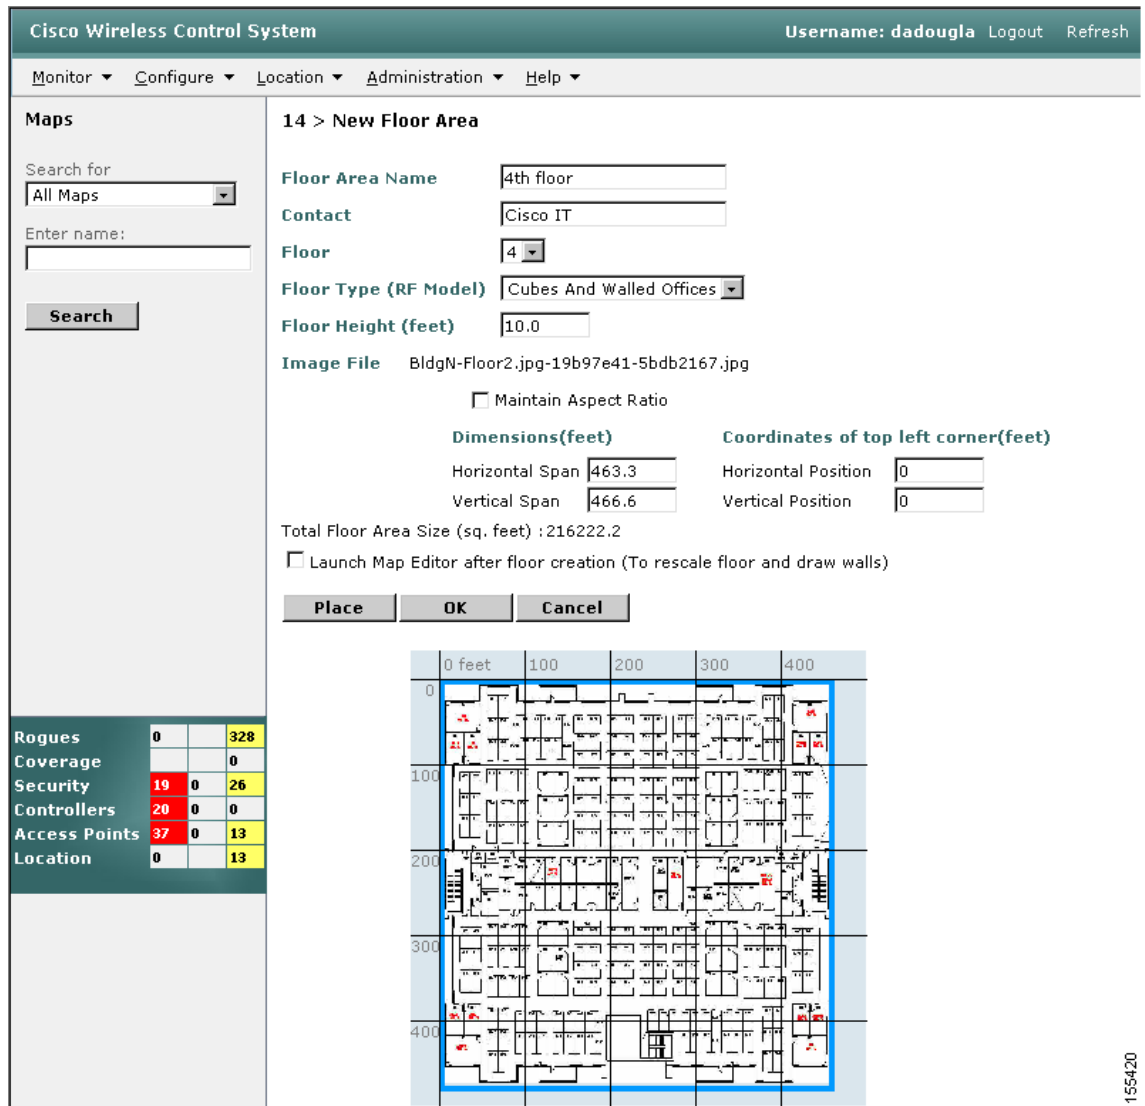

- Step 14** To create a building without a campus, choose **New Building** and click **Go**.
- Step 15** Enter the building's name, contact information, number of floors and basements, and dimension information. Click **Save**. NCS is returned to the Monitor > Site Maps page.
- Step 16** Click the hyperlink associated with the newly created building.
- Step 17** In the **Monitor > Site Maps > [Campus Name] > [Building Name]** page, go to the drop-down list and choose **New Floor Area**. Click **Go**.
- Step 18** Enter a name for the floor, a contact, a floor number, floor type, and height at which the access points are installed and the path of the floor image. Click **Next**.

  
**Note**

The Floor Type (RF Model) field specifies the type of environment on that specific floor. This RF Model indicates the amount of RF signal attenuation likely to be present on that floor. If the available models do not properly characterize a floor's makeup, details on how to create RF models specific to a floor's attenuation characteristics are available in the *Cisco 3350 Mobility Services Engine Configuration Guide*.

**Step 19** If the floor area is a different dimension than the building, adjust floor dimensions by either making numerical changes to the text fields under the Dimensions heading or by holding the **Ctrl** key and clicking and dragging the blue box around the floor image. If the floor's location is offset from the upper left corner of the building, change the placement of the floor within the building by either clicking and dragging the blue box to the desired location or by altering the numerical values under the **Coordinates of top left corner** heading (see [Figure 6-48](#)). After making changes to any numerical values, click **Place**.

| Controllers   | 20 | 0 0  |
| Access Points | 37 | 0 13 |
| Location      | 0  | 13   |

155420

- Step 20** Adjust the floor's characteristics with the NCS map editor by selecting the check box next to **Launch Map Editor**. For an explanation of the map editor feature, see the "Using the Map Editor" section on page 6-69.
- Step 21** At the new floor's image (Monitor > Site Maps > [CampusName] > [BuildingName] > [FloorName]), go to the drop-down list on the upper right and choose **Add Access Points**. Click **Go**.
- Step 22** All access points that are connected to controllers are displayed. Even controllers that NCS is configured to manage but which have not yet been added to another floor map are displayed. Select the access points to be placed on the specific floor map by checking the boxes to the left of the access point entries. Select the box to the left of the Name column to select all access points. Click **OK**.
- Step 23** Each access point you have chosen to add to the floor map is represented by a gray circle (differentiated by access point name or MAC address) and is lined up in the upper left part of the floor map. Drag each access point to the appropriate location. (Access points turn blue when you click them to relocate them.) The small black arrow at the side of each access point represents Side A of each access point, and each access point's arrow must correspond with the direction in which the access points were installed. (Side A is clearly noted on each 1000 series access point and has no relevance to the 802.11a/n radio.)
- Step 24** To adjust the directional arrow, choose the appropriate orientation on the Antenna Angle drop-down list. Click **Save** when you are finished placing and adjusting each access point's direction.
-  **Note** Access point placement and direction must directly reflect the actual access point deployment or the system cannot pinpoint the device location.
- Step 25** Repeat these steps to create campuses, buildings, and floors until each device location is properly detailed in a network design.

## Importing or Exporting WLSE Map Data

When you convert an access point from autonomous to CAPWAP and from WLSE to NCS, one of the conversion steps is to manually re-enter the access point information into NCS. This can be a time-consuming step. To speed up the process, you can export the information about access points from WLSE and import it into NCS.

**Note** NCS expects a .tar file and checks for a .tar extension before importing the file. If the file you are trying to import is not a .tar file, NCS displays an error message and prompts you to import a different file.

To map properties and import a tar file containing WLSE data using the NCS web interface, follow these steps. For more information on the WLSE data export functionality (WLSE version 2.15), see [http://<WLSE\\_IP\\_ADDRESS>:1741/debug/export/exportSite.jsp](http://<WLSE_IP_ADDRESS>:1741/debug/export/exportSite.jsp).

- Step 1** Choose **Monitor > Site Maps**.
- Step 2** Choose **Properties** from the Select a command drop-down list, and click **Go**.
- Step 3** In the Export/Import AP/LS/SP Placement, click **Browse** to select the file to import.
- Step 4** Find and select the .tar file to import and click **Open**.  
NCS displays the name of the file in the Import From field.

**Step 5** Click **Import**.

NCS uploads the file and temporarily saves it into a local directory while it is being processed. If the file contains data that cannot be processed, NCS prompts you to correct the problem and retry. After the file has been loaded, NCS displays a report of what will be added to NCS. The report also specifies what cannot be added and why.

If some of the data to be imported already exists, NCS either uses the existing data in the case of campuses or overwrites the existing data using the imported data in the cases of buildings and floors.

If there are duplicate names between a WLSE site and building combination and a NCS campus (or top-level building) and building combination, NCS displays a message in the Pre Execute Import Report indicating that it will delete the existing building.

**Step 6** Click **Import** to import the WLSE data.

NCS displays a report indicating what was imported.

**Note** Because a WLSE file has no floor number information, the structure of the floor index calculation after WLSE is imported into NCS is in descending order. You can click the floor image to go directly to the appropriate floor screen.

**Step 7** Choose **Monitor > Site Maps** to verify the imported data.

## Monitoring Device Details

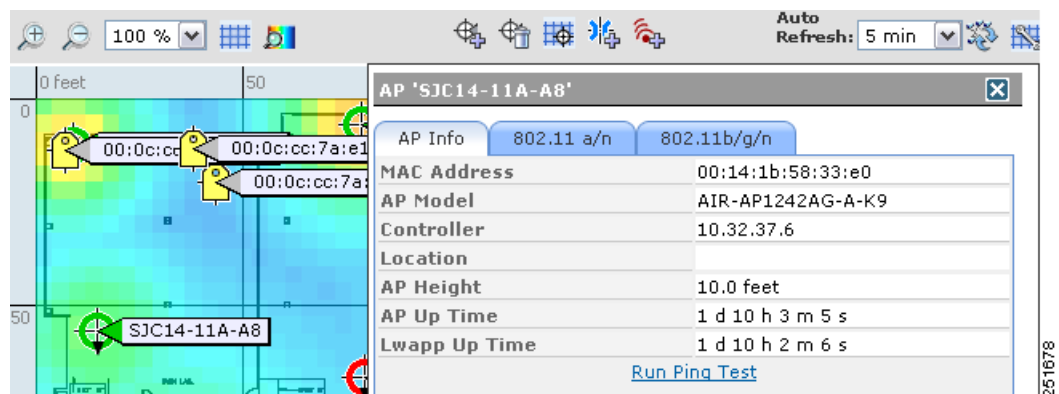

### Access Point Details

Hover your mouse cursor over an access point icon to view access point details (Figure 6-49). Click the appropriate tab to view access point and radio information.

**Note** Monitor mode access points are shown with gray labels to distinguish them from other access points.

**Figure 6-49** Access Point Details

The AP Info tab includes the following access point information:

- MAC address
- Access point model
- Controller
- Location
- Access point height
- Access point uptime
- LWAPP uptime

---

**Note** From the AP Info tab, you can run a ping test by clicking the **Run Ping Test** link.

---

The 802.11 tabs (Figure 6-50) includes the following radio information:

- Channel number
- Extension channel
- Channel width
- Transmit power level
- Client count

---

**Note** The number of clients associated to access points may not match the total number of clients.

---

- Receiving and transmitting utilization percentages
- Channel utilization percentage

---

**Note** Total utilization = (Rx + Tx + Channel utilization) scaled to 100%.

---

- Antenna name and angle
- Elevation angle

---

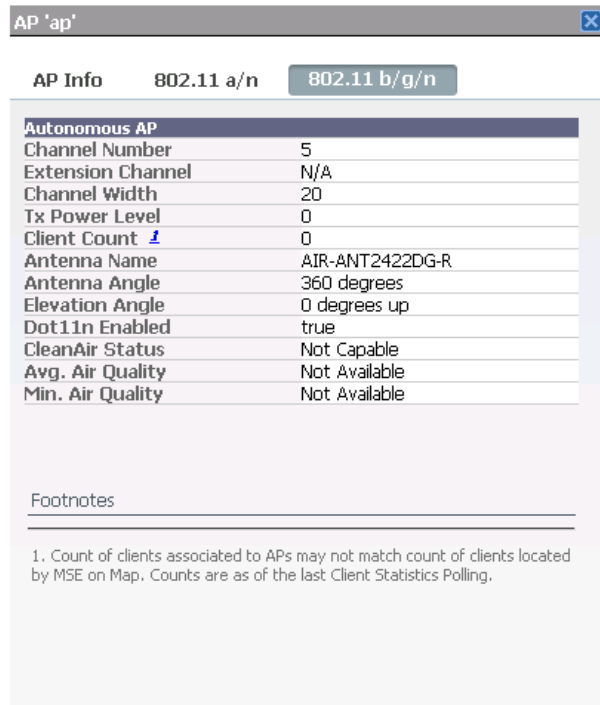

**Note** From either of the 802.11 tabs, you can view Rx neighbors and radio details for this access point by clicking the appropriate link (**View Rx Neighbors** or **View Radio Details**).

---

- Dot11n Enabled
- CleanAir Status—Displays the CleanAir status of the access point, whether or not CleanAir is enabled on the access point.
- Average Air Quality—Displays the average air quality on this access point.
- Minimum Air Quality—Displays the minimum air quality on this access point.

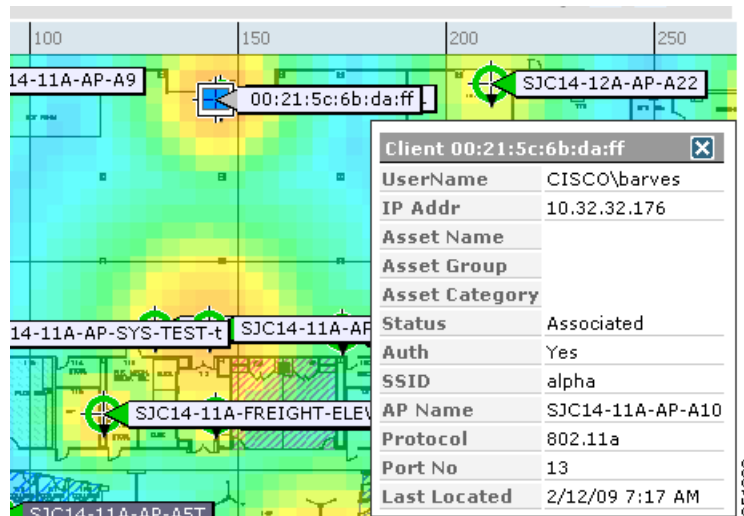

Figure 6-50 802.11 Tabs

## Client Details

Hover your mouse cursor over a client icon to view client details (Figure 6-51).

Figure 6-51 Client Details

Client details information includes the following:

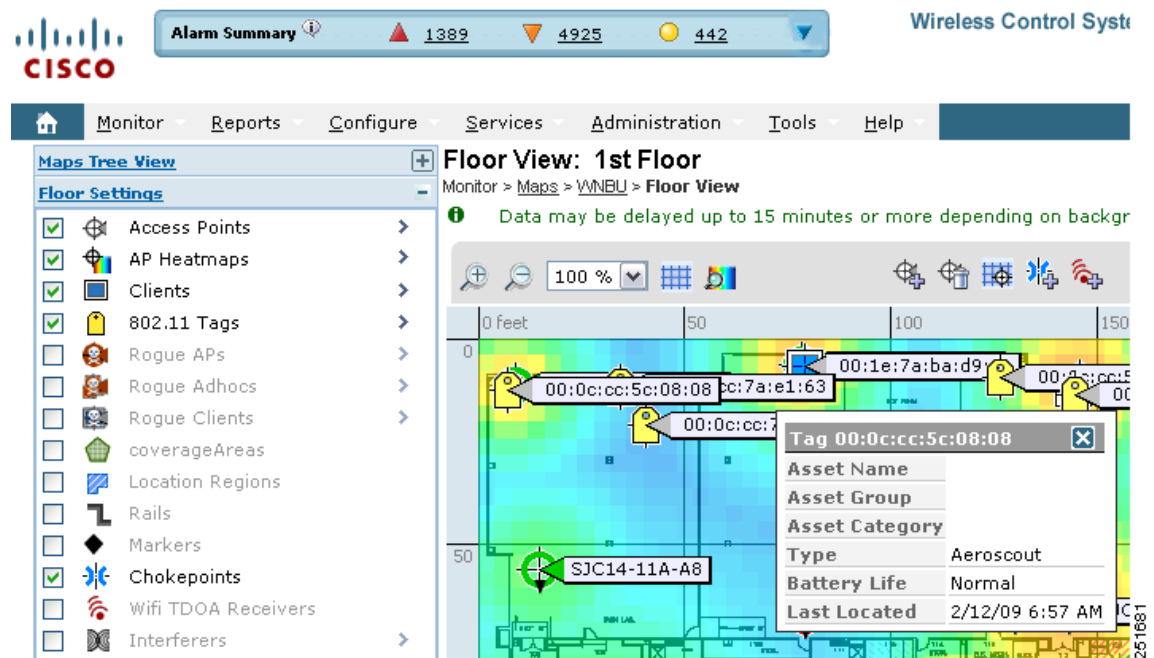

- Username
- IP address

- Asset name, group, and category
- Status
- Auth
- SSID
- Access point name
- Protocol
- Port number
- Last location

## Tag Details

Hover your mouse cursor over a tag icon to view tag details (Figure 6-52).

**Figure 6-52** Tag Details

Tag details includes the following:

- Asset name, group, and category
- Type
- Battery life
- Last located

## Rogue Access Point Details

Hover your mouse cursor over an access point icon to view rogue access point details (Figure 6-53).

**Figure 6-53** Rogue Access Point Details

Rogue access point details includes the following:

- Classification type—Friendly, malicious, or unknown.
- State
- Detecting access points
- Type
- Rogue clients
- First seen
- Last seen
- On network
- Last located

## Rogue Adhoc Details

Hover your mouse cursor over an access point icon to view rogue ad hoc details.

## Rogue Client Details

Hover your mouse cursor over an access point icon to view rogue client details ([Figure 6-54](#)).

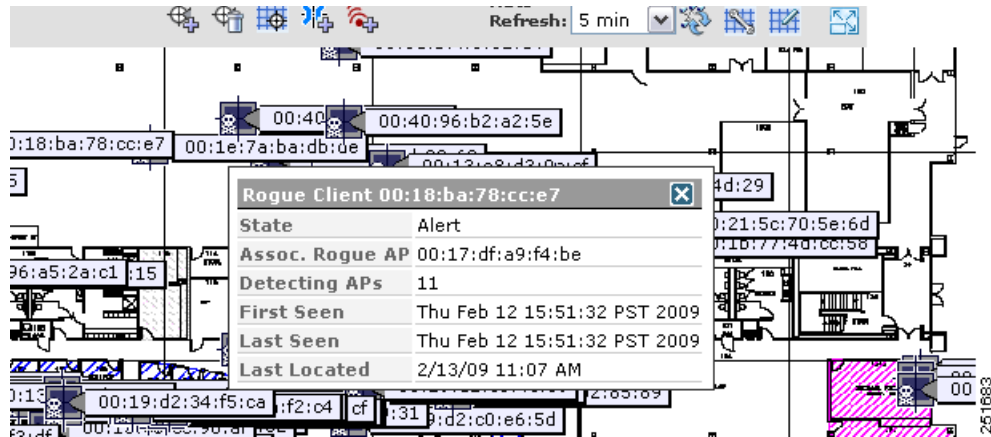

## Interferer Details

Hover your mouse cursor over an interferer icon to view its details. Interferer details includes the following:

- Interferer Name—The name of the interfering device.
- Affected Channels—The channel the interfering device is affecting.

- Detected Time—The time at which the interference was detected.
- Severity—The severity index of the interfering device.
- Duty Cycle—The duty cycle (in percentage) of the interfering device.
- RSSI (dBm)—The Received Signal Strength Indicator of the interfering device.

**Figure 6-54** Rogue Client Details

Rogue client details includes the following:

- State
- Associated rogue access point
- Detecting access points
- First seen
- Last seen
- Last located

## Floor View Navigation

The main Floor View navigation pane (Figure 6-55) provides access to multiple map functions.

**Figure 6-55** Floor View Navigation Pane

This navigation pane includes the following functionality:

- **Zoom In/Zoom Out**—Click the magnifying glass icon with the plus sign (+) to enlarge the map view. Click the magnifying glass icon with the minus sign (-) to decrease the size of the map view.
- **Map Size**—Use the map size drop-down list to manually select the map view size (ranging from 50% to 800%).
- **Show Grid**—Click to show or hide the grid that displays distance in feet on the map.
- **RSSI Legend**—Hover your mouse cursor over the RSSI Legend icon to display the RSSI color scheme (ranging from red/-35 dBm to dark blue/-90 dBm).
- **Add Access Points**—Click to open the Add Access Points page. See the [“Adding Access Points to a Floor Area” section on page 6-34](#) for more information.
- **Remove Access Points**—Click to open the Remove Access Points page. Select the access points that you want to remove and click **OK**.
- **Position Access Points**—Click to open the Position Access Points page. See [“Placing Access Points” section on page 6-40](#) for more information.
- **Add Chokepoints**—Click to open the Add Chokepoints page. Refer to the *Cisco Context-Aware Services Configuration Guide* for more information.
- **Add WiFi TDOA Receivers**—Click to open the Add Wi-Fi TDOA Receivers page. Refer to the *Cisco Context-Aware Services Configuration Guide* for more information.
- **Auto Refresh**—From the drop-down list, choose the length of time between each system refresh.
- **Refresh from Network**—Click to initiate an immediate refresh of the current data.
- **Planning Mode**—Click to open the Planning Mode window. See the [“Using Planning Mode” section on page 6-89](#) for more information.
- **Map Editor**—Click to open the Map Editor.

**Full Screen**—Click to increase the size of the map to full screen. Once there, click **Exit Full Screen** to return to the normal view.

## Understanding RF Heatmap Calculation

A radio frequency heat map is a graphical representation of the strength of the RF signals. Because WLANs are very dynamic and nondeterministic in nature, administrators can never be certain of the coverage at a particular moment. To help combat this challenge, NCS provides a map of your floor plan along with visual cues as to the WiFi coverage of the floor. These maps are called heatmaps because they are similar to the colored maps used to show varying levels of heat in oceanography or geographical sciences. Color is used to show the various levels of signal strength. The different shades in the "heatmap" reflect differing signal strengths.

This color visualization is extremely useful. At one glance, you can see the current state of coverage (without having to walk around measuring it), the signal strength, and any gaps or "holes" in the WLAN. Because floor plans and heat maps are very intuitive, this system greatly enhances the speed and ease with which you support your organization and troubleshoot specific problems.

The RF heatmap calculation is based on an internal grid. Depending on the exact positioning of an obstacle in that grid, the RF heatmap, within a few feet or meters of the obstacle, may or may not account for the obstacle attenuation.

In detail, grid squares partially affected by an obstacle crossing the grid square may or may not incorporate the obstacle attenuation according to the geometry of the access point, obstacle, and grid.

For example, consider a wall crossing one grid square. The midpoint of the grid square is behind the wall from the AP, so the whole grid square is colored with attenuation, including (unfortunately) the top left corner that is actually in front of the wall (see [Figure 6-56](#)).

**Figure 6-56** Access Point/Grid Example One (Actual Attenuation)

[Figure 6-57](#) displays how the attenuation would ideally appear in this situation.

**Figure 6-57** Access Point/Grid Example One (Ideal Attenuation)

The midpoint of the grid square is on the same side of the wall as the AP, so the whole grid square is not colored with attenuation, including (unfortunately) the bottom right corner that is actually behind the wall from the AP (see [Figure 6-58](#)).

**Figure 6-58** Access Point/Grid Example Two (Actual Attenuation)

[Figure 6-59](#) displays how the attenuation would ideally appear in this situation.

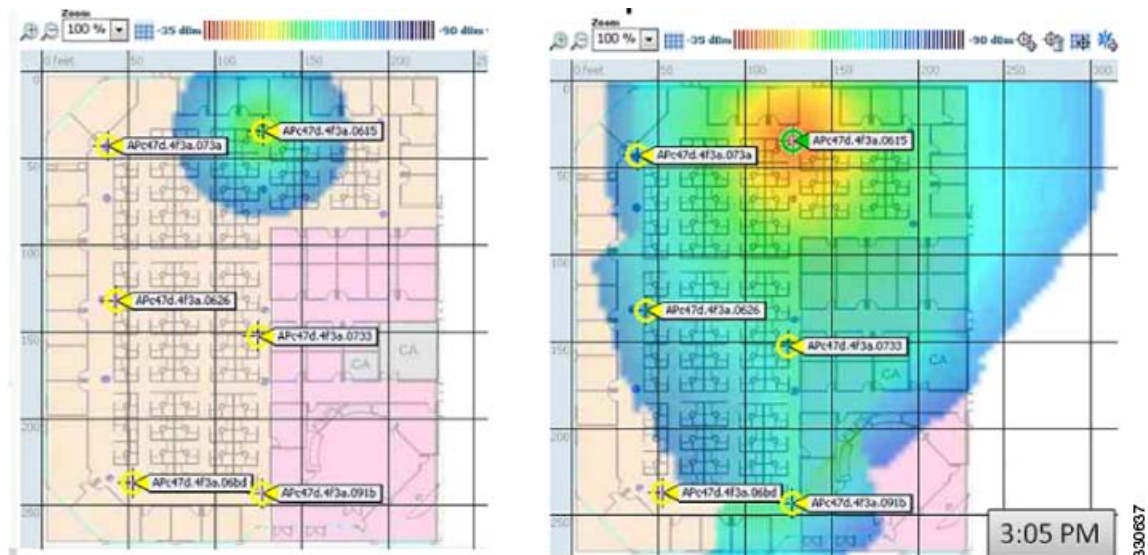

Figure 6-59 Access Point/Grid Example Two (Ideal Attenuation)

### Dynamic Heatmap Calculation

The RF heatmap calculation can be static or dynamic. By default it is dynamic, to configure it to be static, disable the dynamic heatmap option in the map properties page. The NCS server maintains the current list of all APs RSSI strength for all APs. The neighbor AP RSSI strength is used to modify the RF heatmaps for all APs. The main purpose of the dynamic heatmap feature is to recompute the RF heatmaps due to obstacles. Figure 6-60 shows the difference between static and dynamic heatmaps.

Figure 6-60 Static Vs Dynamic Heatmap Calculation

## Monitoring Google Earth Maps

Within Monitor > Google Earth Maps, you can create an outdoor location, import a file, view Google Earth maps, and specify Google Earth settings.

This chapter contains the following sections:

- [Creating an Outdoor Location Using Google Earth](#), page 6-112
- [Importing a File into NCS](#), page 6-116
- [Viewing Google Earth Maps](#), page 6-117
- [Adding Google Earth Location Launch Points to Access Point Pages](#), page 6-117
- [Google Earth Settings](#), page 6-118

## Creating an Outdoor Location Using Google Earth

To group the access points together into outdoor locations, use the Latitude/Longitude geographical coordinates for each access point. These coordinates are provided in two ways:

- Importing a KML (Google Keyhole Markup Language) File
- Importing a CSV File (Spreadsheet format with comma-separated values)

This section contains the following topics:

- [Understanding Geographical Coordinates for Google Earth](#), page 6-112
- [Creating and Importing Coordinates in Google Earth \(KML File\)](#), page 6-113
- [Creating and Importing Coordinates as a CSV File](#), page 6-115

## Understanding Geographical Coordinates for Google Earth

The following geographical information is required for each access point:

**Note**

---

Adding an AP to Google Earth map without having the AP associated on a standard map, you will not see any heatmap when you view the AP in Google Earth.

---

- Longitude (East or West)—Angular distance in degrees relative to Prime Meridian. Values west of Meridian range from –180 to 0 degrees. Values east of Meridian range from 0 to 180 degrees. The default is 0.

Coordinates in degrees, minutes, seconds, direction:

- Degrees (–180 to 180)
- Minutes (0 to 59)
- Seconds (00.00 to 59.99)
- Direction—East or West (E, W)

Decimal format (converted from degrees, minutes, and seconds):

- Longitude can range from –179.59.59.99 W to 179.59.59.99 E

- Latitude (North or South)—Angular distance in degrees relative to the Equator. Values south of the Equator range from –90 to 0 degrees. Values north of the Equator range from 0 to 90 degrees. The default is 0.

Coordinates in degrees, minutes, seconds, direction:

- Degrees (–90 to 90)
- Minutes (0 to 59)
- Seconds (00.00 to 59.99)

- Direction—North or South (N, S)

Decimal format (converted from degrees, minutes, and seconds):

- Latitude can range from –89.59.59.99 S to 89.59.59.99 N
- Altitude—Height or distance of the access point from the earth’s surface in meters. If not provided, value defaults to 0. Values range from 0 to 99999.
- Tilt—Values range from 0 to 90 degrees (cannot be negative). A tilt value of 0 degrees indicates viewing from directly above the access point. A tilt value of 90 degrees indicates viewing along the horizon. Values range from 0 to 90. The default azimuth angle is 0.
- Range—Distance in meters from the point specified by longitude and latitude to the point where the access point is being viewed (the Look At position) (camera range above sea level). Values range from 0 to 999999.
- Heading—Compass direction in degrees. The default is 0 (North). Values range from 0 to ±180 degrees.
- Altitude Mode—Indicates how the <altitude> specified for the Look At point is interpreted.
  - Clamped to ground—Ignores the <altitude> specification and places the Look At position on the ground. This is the default.
  - Relative to ground—Interprets the <altitude> as a value in meters above the ground.
  - Absolute—Interprets the <altitude> as a value in meters above sea level.
- Extend to ground—Indicates whether or not the access point is attached to a mast.

## Creating and Importing Coordinates in Google Earth (KML File)

The geographical coordinates can be created in Google Earth and imported. Either a folder or individual placemarks can be created. Creating a folder helps group all the Placemarks into a single folder and allows you to save the folder as a single KML (a.k.a. XML) file. If individual Placemarks are created, each Placemark must be individually saved.

Follow these steps to create a folder in Google Earth:

- 
- Step 1** Launch Google Earth.
  - Step 2** In the Places page on the left sidebar menu, choose **My Places** or **Temporary Places**.
  - Step 3** Right-click **Temporary Places** and select **Add > Folder** from the drop-down lists.

---

**Note** By using a KML file, folders can be created hierarchically to any depth. For example, you can create folders and placemarks organized by country, city, state, zip. This is not applicable for CSV. In CSV there can be only one level of hierarchy.

---

- Step 4** Enter the following information (optional):
  - Name—Folder name
  - Description—Folder description
  - View—Includes latitude, longitude, range, heading, and tilt

**Note**

If the View coordinates (latitude, longitude, range, heading, and tilt) are specified, this information is used to “fly” or advance to the correct location when Google Earth is first loaded.

If no coordinates are specified, the latitude and longitude information is derived using the minimum and maximum latitude and longitude of all access points within this group or folder.

- Step 5** Click **OK** to save the folder. After the folder is created, it can be selected from the Places page to create Placemarks.

To create Placemarks, follow these steps:

- Step 1** Launch Google Earth.
- Step 2** In the Places page on the left sidebar, select **My Places** or **Temporary Places**.
- Step 3** Select the folder that you previously created.
- Step 4** Right-click your created folder and select **Add > Placemark** from the drop-down lists.
- Step 5** Configure the following parameters, if applicable:
- Name—The Placemark name must contain the name, MAC address, or IP address of the appropriate access point.

**Note**

The MAC address refers to base radio MAC not Ethernet MAC.

- Latitude—Provides the current coordinate for the folder if the placemark is created inside the folder or the coordinate for the placemark (if not created inside a folder). This parameter is automatically filled depending on where the yellow Placemark icon is located on the map. Use your mouse to move the Placemark to the correct location or enter the correct coordinate in the Latitude text box.
- Longitude—Provides the current coordinate for the folder if the placemark is created inside the folder or the coordinate for the placemark (if not created inside a folder). This parameter is automatically filled depending on where the yellow Placemark icon is located on the map. Use your mouse to move the Placemark to the correct location or enter the correct coordinate in the Longitude text box.
- Description (optional)—Parameter is ignored by NCS.
- Style, Color (optional)—Parameter is ignored by NCS.
- View—Allows you to configure the Latitude, Longitude, Range, Heading and Tilt coordinates. See the “[Understanding Geographical Coordinates for Google Earth](#)” section on page 6-112” for more information on these geographical coordinates.
  - Longitude and latitude are automatically filled depending on where the yellow Placemark icon is located on the map. Use your mouse to click and move the Placemark to the correct location.
  - All of the coordinates can be entered manually.
- Altitude—Enter the altitude in meters in the text box or use the Ground to Space slide bar to indicate the altitude.
  - Clamped to ground—Indicates that the Look At position is on the ground. This is the default.

- Relative to ground—Interprets the <altitude> as a value in meters above the ground.
- Absolute—Interprets the <altitude> as a value in meters above sea level.
- Extend to ground—For Relative to ground or Absolute settings, indicates whether or not the access point is attached to a mast.

**Step 6** When all coordinates are entered, click **Snapshot current view** or click **Reset** to return the coordinates to the original settings.

**Note** For more information regarding Google Earth, refer to the Google Earth online help.

**Step 7** Click **OK**.

**Step 8** Repeat these steps for all placemarks you want to add.

**Step 9** When all placemarks are created, save the folder as a .kmz file (KML Zip file) or as a .kml file.

**Note** A .kmz file should contain only one .kml file.

**Note** To save the folder, right-click the folder, select **Save as** from the drop-down list, navigate to the correct location on your computer, and click **Save**. Both .kmz and .kml files can be imported into NCS.

## Creating and Importing Coordinates as a CSV File

To create a CSV file to import into NCS, follow these steps:

**Step 1** Open a flat file and provide the necessary information as a comma-separated list. The [Table 6-15](#) lists the potential data, whether the data is optional or required, and the parameters of the data.

**Note** For more information regarding the geographical coordinates listed below, see the [“Understanding Geographical Coordinates for Google Earth”](#) section on page 6-112.

**Table 6-15** Potential Fields for the CSV File

|                   |                  |                              |
|-------------------|------------------|------------------------------|
| "FolderName"      | "Value Optional" | Max Length: 32               |
| "FolderState"     | "Value Optional" | Permitted Values: true/false |
| "FolderLongitude" | "Value Optional" | Range: 0 to ±180             |
| "FolderLatitude"  | "Value Optional" | Range: 0 to ±90              |
| "FolderAltitude"  | "Value Optional" | Range: 0 to 99999            |
| "FolderRange"     | "Value Optional" | Range: 0 to 99999            |
| "FolderTilt"      | "Value Optional" | Range: 0 to 90               |
| "FolderHeading"   | "Value Optional" | Range: 0 to ±180             |

**Table 6-15** Potential Fields for the CSV File (continued)

|                    |                  |                       |
|--------------------|------------------|-----------------------|
| "FolderName"       | "Value Optional" | Max Length: 32        |
| "FolderGeoAddress" | "Value Optional" | Max Length: 128       |
| "FolderGeoCity"    | "Value Optional" | Max Length: 64        |
| "FolderGeoState"   | "Value Optional" | Max Length: 40        |
| "FolderGeoZip"     | "Value Optional" | Max Length: 12        |
| "FolderGeoCountry" | "Value Optional" | Max Length: 64        |
| "AP_Name"          | "Value Required" | Max Length: 32        |
| "AP_Longitude"     | "Value Required" | Range: 0 to $\pm 180$ |
| "AP_Latitude"      | "Value Required" | Range: 0 to $\pm 90$  |

**Step 2** Save the .csv file. The file is now ready to import into NCS.

## Importing a File into NCS

To import a Google KML or a CSV into the Google Earth Maps feature of NCS, follow these steps:

- Step 1** Log in to NCS.
- Step 2** Choose **Monitor > Google Earth Maps**.
- Step 3** From the Select a command drop-down list, choose **Import Google KML** or **Import CSV**.
- Step 4** Click **Go**.
- Step 5** Use the Browse button to navigate to the .kml, .kmz, or .csv file on your computer.
- Step 6** When the file name path is displayed in the text box, click **Next**.

The input file is parsed and validated for the following:

- Access points specified in the uploaded file are validated (the specified access points must be available within NCS).
- Range validations are performed for tilt, heading, range, and other geographical coordinates fields. If longitude and latitude are provided, range validations are performed; if not, the value is defaulted to 0.

**Note** In KML, the longitude and latitude ranges can only be entered in decimal format. In CSV, different formats are supported (refer to the CSV sample under Google Maps > Import CSV).

**Note** If the input file does not validate for completeness, an error page appears. The uploaded information cannot be saved until all errors are corrected.

- Step 7** After the files pass all validation checks, review the file details and click **Save**.  
If the uploaded information was saved previously, the information is overwritten accordingly:

- If the folder was uploaded previously, the coordinates are updated for the folder.
  - If access points were uploaded previously, the coordinates are updated for the access points.
  - Existing access points in the folder are not removed.
  - New folders, as needed, are created and access points are placed accordingly.
- 

## Viewing Google Earth Maps

To view Google Earth maps, follow these steps:

- 
- Step 1** Log in to NCS.
- Step 2** Choose **Monitor > Google Earth Maps**. The Google Earth Maps page displays all folders and the number of access points included within each folder.
- Step 3** Click **Launch** for the map you want to view. Google Earth opens in a separate page and displays the location and its access points.

**Note** To use this feature, you must have Google Earth installed on your computer and configured to auto-launch when data is sent from the server. You can download Google Earth from Google's website: <http://www.google.com/earth/index.html>.

---

## Viewing Google Earth Map Details

To view details for a Google Earth Map folder, follow these steps:

- 
- Step 1** In the Google Earth Map page, click the folder name to open the details page for this folder. The Google Earth Details provide the access point names and MAC or IP addresses.

**Note** To delete an access point, select the applicable check box and click **Delete**. To delete the entire folder, select the check box next to **Folder Name** and click **Delete**. Deleting a folder also deletes all subfolders and access points inside the folder.

---

- Step 2** Click **Cancel** to close the details page.
- 

## Adding Google Earth Location Launch Points to Access Point Pages

You can expand the number of Google Earth Location launch points within Cisco NCS by adding it to the Access Point summary and detail pages.

Follow these steps to add a Google Earth Location launch point to the Access Point summary and details page:

- Step 1** Click **Monitor > Access Points** (see Figure 6-61).
- Step 2** At Access Point summary page, click the **Edit View** link next to page heading.

**Figure 6-61** Monitor > Access Points Page

| AP Name                                          | Ethernet MAC      | IP Address  | Radio       | Map Location | Controller | Client Count | Admin Status | AP Mode | Oper Status | Alarm Status |
|--------------------------------------------------|-------------------|-------------|-------------|--------------|------------|--------------|--------------|---------|-------------|--------------|
| <input type="checkbox"/> AP69ef1bd5c1cea         | 00:21:a0:d5:03:c4 | 9.1.98.102  | 802.11b/g   | Unassigned   | 9.1.98.40  | 0            | Enabled      | Sniffer | Down        |              |
| <input type="checkbox"/> AP69ef1bd5c1cea         | 00:21:a0:d5:03:c4 | 9.1.98.102  | 802.11a     | Unassigned   | 9.1.98.40  | 0            | Enabled      | Sniffer | Down        |              |
| <input type="checkbox"/> sfn-1240-0022-901b-1742 | 00:22:90:1b:17:42 | 9.1.98.100  | 802.11b/g   | Unassigned   | 9.1.98.40  | 0            | Enabled      | Local   | Up          |              |
| <input type="checkbox"/> sfn-1240-0022-901b-1742 | 00:22:90:1b:17:42 | 9.1.98.100  | 802.11a     | Unassigned   | 9.1.98.40  | 0            | Enabled      | Local   | Down        |              |
| <input type="checkbox"/> MAP_2                   | c4:7d:4f:3a:c5:d5 | 9.1.98.101  | 802.11b/g/n | Unassigned   | 9.1.98.40  | 0            | Enabled      | H-REAP  | Up          |              |
| <input type="checkbox"/> MAP_2                   | c4:7d:4f:3a:c5:d5 | 9.1.98.101  | 802.11a/n   | Unassigned   | 9.1.98.40  | 0            | Enabled      | H-REAP  | Up          |              |
| <input type="checkbox"/> Evrns_2                 | 00:01:3c:1f:a4:59 | 9.1.98.104  | 802.11b/g/n | Unassigned   | 9.1.98.40  | 1            | Enabled      | Local   | Up          |              |
| <input type="checkbox"/> Evrns_2                 | 00:01:3c:1f:a4:59 | 9.1.98.104  | 802.11a/n   | Unassigned   | 9.1.98.40  | 0            | Enabled      | Local   | Up          |              |
| <input type="checkbox"/> AP_1_2                  | 00:22:b0:1b:e2:b5 | 9.1.96.100  | 802.11b/g/n | Unassigned   | 9.1.96.40  | 0            | Enabled      | Local   | Down        |              |
| <input type="checkbox"/> AP_1_2                  | 00:22:b0:1b:e2:b5 | 9.1.96.100  | 802.11a/n   | Unassigned   | 9.1.96.40  | 0            | Enabled      | Local   | Down        |              |
| <input type="checkbox"/> sfn-1140-63d3           | 00:22:b0:1a:63:d3 | 9.1.122.100 | 802.11b/g/n | Unassigned   | 9.1.122.11 | 0            | Enabled      | Local   | Up          |              |
| <input type="checkbox"/> sfn-1140-63d3           | 00:22:b0:1a:63:d3 | 9.1.122.100 | 802.11a/n   | Unassigned   | 9.1.122.11 | 0            | Enabled      | Local   | Up          |              |
| <input type="checkbox"/> RB1130_002304b62e24     | 00:23:04:b6:2e:24 | 9.1.121.101 | 802.11b/g   | Unassigned   | 9.1.121.11 | 0            | Enabled      | Local   | Down        |              |
| <input type="checkbox"/> RB1130_002304b62e24     | 00:23:04:b6:2e:24 | 9.1.121.101 | 802.11a     | Unassigned   | 9.1.121.11 | 0            | Enabled      | Local   | Up          |              |

- Step 3** In the Edit View page, highlight **Google Earth Location** in the left-hand column. Click **Show**.  
The Google Earth Location column heading moves into the View Information column.

**Note** The View Information listings, top-to-bottom, reflect the left-to-right order of the columns as they appear on the Access Point summary page.

- Step 4** To change the display order of the columns, highlight the Google Earth Location entry and click the **Up** and **Down** buttons as needed. Click **Submit**.  
You are returned to the Access Points summary page, and a Google Earth launch link is in the display.

**Note** The launch link also appears on the general summary page of the Access Points details page (**Monitor > Access Points > AP Name**).

## Google Earth Settings

Access point related settings can be defined from the Google Earth Settings page. To configure access point settings for the Google Earth Maps feature, follow these steps:

- Step 1** Choose **Monitor > Google Earth Maps**.
- Step 2** Configure the following parameters:
- Refresh Settings—Select the **Refresh from Network** check box to enable this on-demand refresh. This option is applied only once and then disabled.

**Caution**

Because this refresh occurs directly from the network, it could take a long period of time to collect data according to the number of access points.

- **Layers**—Layer filters for access points, access point heat maps, and access point mesh information can be selected and saved. Select the check box to activate the applicable layer and click > to open the filter page.

**Note** These settings apply when Google Earth sends the request for the next refresh.

- **Access Points**—From the AP Filter drop-down list, choose to display channels, Tx power level, coverage holes, MAC addresses, names, controller IP, utilization, profiles, or clients.

**Note** If the access point layer is not checked, no data is returned, and an error message is returned to Google Earth as a Placemark without an icon.

- **AP Heatmap**—From the Protocol drop-down list, choose **802.11a/n**, **802.11b/g/n**, **802.11a/n & 802.11b/g/n**, or **None**. Select the cutoff from the RSSI Cutoff drop-down list (- 60 to - 90 dBm).

**Note** If the protocol chosen is both 802.11a/n and 802.11b/g/n, the heat maps are generated for both and overlaid on top of each other. The order cannot be defined. To prevent this overlay, you must turn off individual overlay in Google Earth or change it in the Google Earth Settings on NCS.

- **AP Mesh Info**—Choose **Link SNR**, **Packet Error Rate**, or **none** from the Link Label drop-down list. Choose **Link SNR** or **Packet Error Rate** from the Link Color drop-down list.

**Note** When the AP Mesh Info check box is chosen, Mesh Links are also automatically shown.

**Step 3** Click **Save Settings** to confirm these changes or **Cancel** to close the page without saving the changes.

## CHAPTER 7

# Managing NCS User Accounts

---

The Administration enables you to schedule tasks, administer accounts, and configure local and external authentication and authorization. Also, set logging options, configure mail servers, and data management related to configuring the data retain periods. Information is available about the types of NCS licenses and how to install a license.

Organizations need an easy and cost-effective method to manage and control wireless network segments using a single management platform. They need a solution that supports limiting an individual administrator to manage or control the wireless LAN.

This chapter describes the administrative tasks to perform with Cisco NCS. It contains the following sections:

- [Managing NCS User Accounts, page 7-1](#)
- [Viewing the Audit Trail, page 7-8](#)
- [Managing NCS Guest User Accounts, page 7-11](#)
- [Adding a New User, page 7-14](#)
- [Managing Lobby Ambassador Accounts, page 7-16](#)

## Managing NCS User Accounts

This section describes how to configure global e-mail parameters and manage Cisco NCS user accounts. It contains the following topics:

- [Adding NCS User Accounts, page 7-2](#)
- [Deleting NCS User Accounts, page 7-3](#)
- [Changing Passwords, page 7-4](#)
- [Monitoring Active Sessions, page 7-4](#)
- [Viewing or Editing User Account Information, page 7-5](#)
- [Viewing or Editing Group Information, page 7-7](#)
- [Viewing the Audit Trail, page 7-8](#)
- [Creating Guest User Accounts, page 7-9](#)
- [Logging in to the NCS User Interface as a Lobby Ambassador, page 7-10](#)

## Adding NCS User Accounts

This section describes how to configure a NCS user. The accounting portion of the AAA framework is not implemented at this time. Besides complete access, you can give administrative access with differentiated privileges to certain user groups. NCS supports external user authentication using these access restrictions and authenticates the users against the TACACS+ and RADIUS servers.

The username and password supplied by you at install time are always authenticated, but the steps you take here create additional superusers. If the password is lost or forgotten, you must run a utility to reset the password to another user-defined password.

To add a new user account to NCS, follow these steps:

**Step 1** Start NCS server by following the instructions in the “Starting the NCS Server” section on page 2-10.

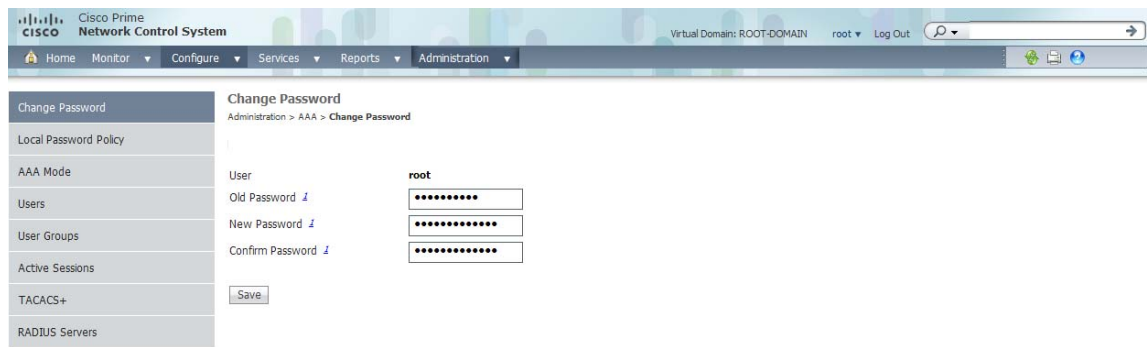

**Step 2** Log into the NCS user interface as *root*.

**Note** We recommend that you create a new superuser assigned to the SuperUsers group.

**Step 3** Choose **Administration > AAA**. The Change Password page appears (see Figure 7-1).

**Figure 7-1** Change Password Page

**Step 4** In the Old Password text box, enter the current password that you want to change.

**Step 5** Enter the username and password for the new NCS user account. You must enter the password twice.

**Note** These entries are case sensitive.

**Step 6** Click **User Groups** from the left sidebar menu. The All Groups page displays the following group names (see Figure 7-4).

**Note** Some usergroups cannot be combined with other usergroups. For instance, you cannot choose both lobby ambassador and monitor lite.

- System Monitoring—Allows users to monitor NCS operations.
- ConfigManagers—Allows users to monitor and configure NCS operations.

- Admin—Allows users to monitor and configure NCS operations and perform all system administration tasks.

**Note** If you choose admin account and log in as such on the controller, you can also see the guest users under Local Net Admin.

- SuperUsers—Allows users to monitor and configure NCS operations and perform all system administration tasks including administering NCS user accounts and passwords. Superusers tasks can be changed.
- Users Assistant—Allows only local net user administration. User assistants cannot configure or monitor controllers. They must access the Configure > Controller page to configure these local net features.

**Note** If you create a user assistant user, login as that user, and choose Monitor > Controller, you receive a permission denied message as expected behavior.

- Lobby Ambassador—Allows access for configuration and management of only Guest User user accounts.
- Monitor lite—Allows monitoring of assets location.
- Root—Allows users to monitor and configure NCS operations and perform all system administration tasks including changing any passwords. Only one user can be assigned to this group and is determined upon installation. It cannot be removed from the system, and no task changes can be made for this user.

**Step 7** Click the name of the user group to which you assigned the new user account. The Group Detail > *User Group* page shows a list of this group's permitted operations.

From this page you can also show an audit trail of login and logout patterns or export a task list.

**Step 8** Make any desired changes by selecting or unselecting the appropriate check boxes for task permissions and members.

**Note** Any changes you make will affect all members of this user group.

**Note** To view complete details in the Monitor > Client details page and to perform operations such as Radio Measurement, users in User Defined groups need permission for Monitor Clients, View Alerts & Events, Configure Controllers, and Client Location.

**Step 9** Click **Submit** to save your changes or **Cancel** to leave the settings unchanged.

## Deleting NCS User Accounts

To delete a NCS user account, follow these steps:

**Step 1** Start NCS server by following the instructions in the [“Starting the NCS Server”](#) section on page 2-10.

- Step 2** Log into the NCS user interface as a user assigned to the SuperUsers group.
- Step 3** Choose **Administration > AAA**.
- Step 4** Click **Users** from the left sidebar menu to display the Users page.
- Step 5** Select the check box to the left of the user account(s) to be deleted.
- Step 6** From the Select a command drop-down list, choose **Delete User(s)**, and click **Go**.
- When prompted, click **OK** to confirm your decision. The user account is deleted and can no longer be used.
- 

## Changing Passwords

To change the password for a NCS user account, follow these steps:

- Step 1** Start NCS server by following the instructions in the [“Starting the NCS Server”](#) section on page 2-10.
- Step 2** Log into the NCS user interface as a user assigned to the SuperUsers group.
- Step 3** Click **Administration > AAA** to display the Change Password page.
- Step 4** Enter your old password.
- Step 5** Enter the new password in both the New Password and Confirm New Password text boxes.
- Step 6** Click **Save** to save your changes. The password for this user account has been changed and can be used immediately.
- 

## Monitoring Active Sessions

To view a list of active users, follow the steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **Active Sessions**. The Active Sessions page appears.
- The user highlighted in red represents your current login. If a column heading is a hyperlink, click the heading to sort the list of active sessions in descending or ascending order along that column. The sort direction is toggled each time the hyperlink is clicked.
- The Active Sessions page has the following columns:
- Username— The logged in username.
  - IP/Host Name—The IP address or the hostname of the machine on which the browser is running. If the hostname of the user machine is not in DNS, the IP address is displayed.
  - Login Time—The time at which the user logged in to NCS. All times are based on the NCS server machine time.
  - Last Access Time—The time at which the user last accessed NCS. All times are based on the NCS server machine time.

**Note**

The time displayed in this column is usually a few seconds behind the current system time because Last Access Time is updated frequently by the updates to the alarm status pane.

- Login Method:
  - Regular: Sessions created for users who log into NCS directly through a browser.
- User Groups: The list of groups to which the user belongs.
- Audit trail icon: Link to page that displays the audit trail (previous login times) for that user.

## Viewing or Editing User Account Information

To see the group the user is assigned to or to adjust a password or group assignment for that user, follow these steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, choose **Users**.
- Step 3** Click a user in the User Name column. The User Detail : *User Group* page appears (see [Figure 7-2](#)).

**Figure 7-2 Detailed Users Page**

You can see which group is assigned to this user or change a password or group assignment.

## Setting the Lobby Ambassador Defaults

If you choose a Lobby Ambassador from the User Name column, a Lobby Ambassador Defaults tab appears (see [Figure 7-3](#)). All of the guest user accounts created by the lobby ambassador have these credentials by default. If the default values are not specified, the lobby ambassador must provide the required guest user credential fields.

**Note** If no default profile is chosen on this tab, the defaults do not get applied to this lobby ambassador. The lobby ambassador account does get created, and you can create users with any credentials you choose.

**Figure 7-3** Lobby Ambassador Default Tab

The screenshot shows the 'Add User' configuration page in Cisco Prime Network Control System. The 'Lobby Ambassador Defaults' tab is active. The configuration options are as follows:

- Profile: -Select A Profile-
- User Role: default
- Lifetime:  Limited  Unlimited, 8 hour(s)
- Apply To: Indoor Area
- Campus: C1
- Building: None
- Floor: All Floors
- Email Id: (empty field)
- Description: Wireless Network Guest Acc
- Disclaimer: Guests understand and acknowledge that we exercise no control over the nature, content or reliability of the information and/or data
- Defaults editable:  Enable
- Max User Creations Allowed:  Enable
- Hide Print Page Logo:  Enable
- Update Logo:  (empty) Browse...
- Print Page Header Text: Guest Account Details

A warning message at the bottom states: "Not selecting a profile will not configure defaults for this Lobby Ambassador. He/She will still be able to create Guest Accounts." Buttons for 'Save' and 'Cancel' are at the bottom left.

**Step 1** Use the Profile drop-down list to choose the guest user to connect to.

Wired-guest is an example of a profile that might be defined to indicate traffic that is originating from wired LAN ports. See the [“Configuring Wired Guest Access”](#) section on page 9-46.

**Step 2** Choose a user role to manage the amount of bandwidth allocated to specific users within the network. They are predefined by the administrator and are associated with the guests’ access (such as contractor, customer, partner, vendor, visitor, and so on).

**Step 3** Choose **Limited** or **Unlimited** at the Lifetime parameter.

- For the limited option, you choose the period of time that the guest user account is active using the hours and minutes drop-down lists. The default value for Limited is one day (8 hours).
  - When *unlimited* is chosen, no expiration date for the guest account exists.
- Step 4** Use the Apply to drop-down list to choose from the following options. What you choose determines what additional parameters appear.
- Indoor area—A campus, building, or floor.
  - Outdoor area—A campus or outdoor area.
  - Controller list—A list of controller(s) with the selected profile created.
  - Config Group—Those config group names configured on NCS.
- Step 5** Enter the e-mail ID of the host to whom the guest account credentials are sent.
- Step 6** Provide a brief description of the account.
- Step 7** If you want to supply disclaimer text, enter it.
- a. Select the **Defaults Editable** check box if you want to allow the lobby ambassador to override these configured defaults. This allows the Lobby Ambassadors to modify Guest User default settings while creating guest account from the Lobby Ambassador portal.

---

**Note** If no default profile is selected on this tab, the defaults are not applied to this Lobby Ambassador. However, the Lobby Ambassador account is created, and the Lobby Ambassador can create users with credentials as desired.

---

- Step 8** Select the **Max User Creations Allowed** check box to set limits on the number of guest users that can be created by the lobby ambassador in a given time period. The time period is defined in hours, days, or weeks.
- Step 9** Click the **Preview Current Logo** link to see what is currently being used as a logo, and then you can click to enable it or browse to another location to update the logo.
- Step 10** If you want additional page header text, you can enter it at the Print Page Header Text parameter.
- Step 11** Click **Submit**.

## Viewing or Editing Group Information

To see specific tasks the user is permitted to do within the defined group or make changes to the tasks, follow these steps:

- 
- Step 1** Choose **Administration > AAA**.
- Step 2** Choose **Users** from the left sidebar menu.
- Step 3** Click the group link in the **Member Of** column. The Group Detail: *User Group* page appears (see [Figure 7-4](#)).

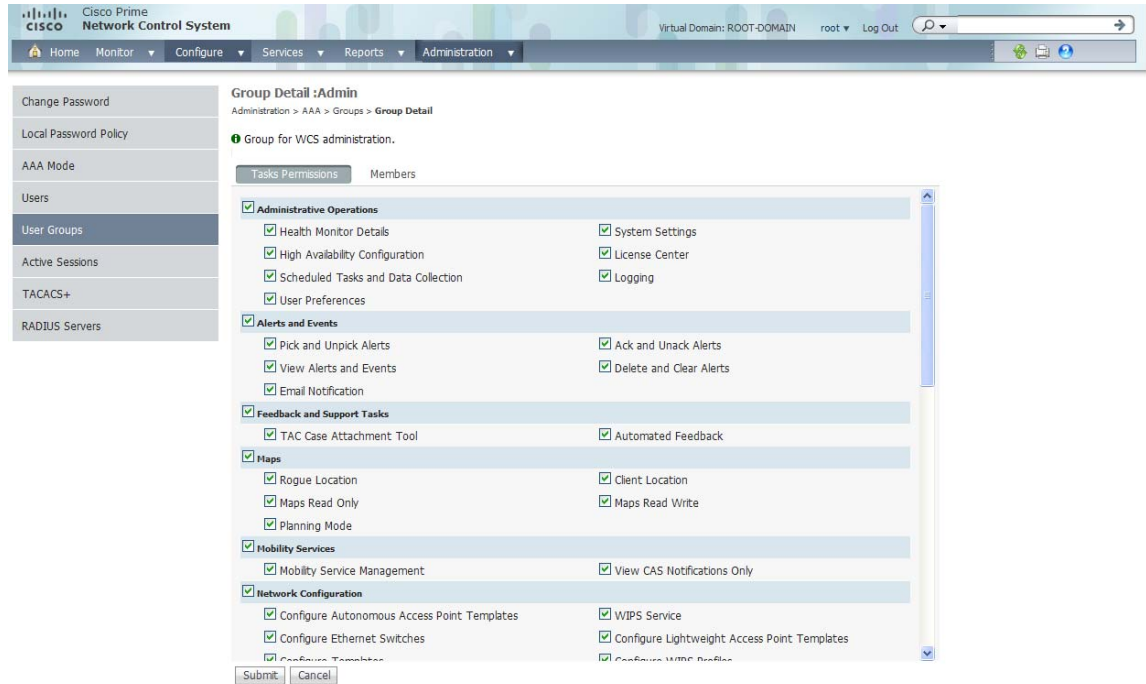

---

**Note** The detailed page varies based on what group you choose (see [Figure 7-4](#)).

---

Figure 7-4 Detailed Group Page

You can see the specific tasks the user is permitted to do within the defined group or make changes to the tasks.

## Editing the Guest User Credentials

Click the NCS username of the guest user whose credentials you want to edit. The Lobby Ambassador Default tab appears, and you can modify the credentials.

**Note** While editing, if the *Profile* selection is removed (changed to *Select a profile*), the defaults are removed for this Lobby Ambassador. The user must reconfigure the defaults to reinforce them.

## Viewing the Audit Trail

Click the  icon in the Users page to view the configuration changes performed by individual users. The Audit Trail page appears.

This page enables you to view the following data:

- User—User login name
- Operation—Type of operation audited
- Time—Time operation was audited
- Status—Success or failure
- Reason—Indicates any login failure reason, for example, invalid password.

- **Configuration Changes**—This field provides a Details link if there are any configuration changes. Click the Details link for more information on the configuration changes done by an individual user. The entries will list out the change of values for individual parameters between NCS and Controller. For more information on Audit Trail Details, see [“Audit Trail Details Page” section on page 7-9](#).

**Note** The audit trail entries could be logged for individual Controller changes. For example, If a template is applied on multiple Controllers, then there will be multiple audit entries for each Controller to which the template has been applied to.

## Audit Trail Details Page

The Configuration Changes column under the Audit Trail list page would contain a Details link if there are changes to the configuration. Click the Details link to view the Audit Trail Details for a specific User. The Audit Trail Details dialog box shows the attribute-level differences when a User changes the configuration from either the Templates or Configuration side.

[Table 7-1](#) describes the fields in the Audit Trail Details dialog box:

**Table 7-1 Parameters in the Audit Trail Details Page**

| Parameters            | Description                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NCS Username          | The Username who had triggered this audit trail.                                                                                                                                                                                                               |
| Object Name           | The name of the object that has triggered this audit trail.                                                                                                                                                                                                    |
| Operation Time        | The date and time at which the audit entry was made.                                                                                                                                                                                                           |
| Configuration Changes | Lists the attributes that have been changed as a result of a User action in NCS and Controller.<br>For example, the attributes could be: <ul style="list-style-type: none"> <li>• Quality of Service</li> <li>• Admin Status</li> <li>• MAC Filters</li> </ul> |

## Creating Guest User Accounts

You can use the Cisco Lobby Ambassador to create guest user accounts in NCS. A guest network provided by an enterprise allows access to the Internet for a guest without compromising the host. The web authentication is provided with or without a supplicant or client, so a guest needs to initiate a VPN tunnel to their desired destinations.

Both wired and wireless guest user access is supported. Wired guest access enables guest users to connect to the guest access network from a wired Ethernet connection designated and configured for guest access. Wired guest access ports might be available in a guest office or specific ports in a conference room. Like wireless guest user accounts, wired guest access ports are added to the network using the lobby ambassador feature.

The network administrator must first set up a lobby ambassador account. Guest user accounts are for visitors, temporary workers, and so on, who need network access. A lobby ambassador account has limited configuration privileges and only allows access to the screens used to configure and manage guest user accounts.

The lobby ambassador can create the following types of guest user accounts:

- A guest user account with a limited lifetime. After the specified time period, the guest user account automatically expires.
- A guest user account with an unlimited lifetime. This account never expires.
- A guest user account that is activated at a predefined time in the future. The lobby ambassador defines the beginning and end of the valid time period.

To create guest user accounts in NCS, follow these steps:

**Note**

A group that has the SuperUser/administrator privileges (by default) can create a lobby ambassador account. Multiple lobby ambassador accounts can be created by the administrator with varying profiles and permissions.

**Note**

A root group, which is created during installation, has only one assigned user, and no additional users can be assigned after installation. This root user cannot be changed. Also, unlike a super user, no task changes are allowed.

- 
- Step 1** Log into the NCS user interface as an administrator.
- Step 2** Choose **Administration > AAA**.
- Step 3** From the left sidebar menu, choose **Users**.
- Step 4** From the Select a command drop-down list, choose **Add User**, and click **Go**. The Users page appears.
- Step 5** Enter the username.
- Step 6** Enter the password. The minimum is six characters. Reenter and confirm the password.

**Note**

The password must include at least three of the following four types of elements: lowercase letters, uppercase letters, numbers, and special characters.

- Step 7** In the *Groups Assigned to this User* section, select the **LobbyAmbassador** check box to access the Lobby Ambassador Defaults tab.
- Step 8** Follow the steps in the [“Setting the Lobby Ambassador Defaults” section on page 7-6](#).
- 

## Logging in to the NCS User Interface as a Lobby Ambassador

When you log in as a lobby ambassador, you have access to the guest user template page in NCS. You can then configure guest user accounts (through templates).

To log into the NCS user interface through a web browser, follow these steps:

---

**Step 1** Launch Internet Explorer 7.0 or later on your computer.

**Note** Some NCS features may not function properly if you use a web browser other than Internet Explorer 7.0 or later on a Windows workstation.

---

**Step 2** In the browser's address line, enter **https://NCS-ip-address** (such as **https://209.165.200.224**), where *NCS-ip-address* is the IP address of the computer on which NCS is installed. Your administrator can provide this IP address.

**Step 3** When the NCS user interface displays the Login page, enter your username and password.

**Note** All entries are case sensitive.

---

**Note** The lobby ambassador can only define guest users templates.

---

**Step 4** Click **Submit** to log into NCS. The NCS user interface is now active and available for use. The Guest Users page is displayed. This page provides a summary of all created Guest Users.

To exit the NCS user interface, close the browser page or click **Logout** in the upper right corner of the page. Exiting a NCS user interface session does not shut down NCS on the server.

**Note** When a system administrator stops the NCS server during a NCS session, the session ends, and the web browser displays this message: "The page cannot be displayed." Your session does not reassociate to NCS when the server restarts. You must restart the NCS session.

---

## Managing NCS Guest User Accounts

NCS guest user accounts are managed with the use of templates. This section describes how to manage NCS user accounts. It contains the following topics:

- [Adding NCS Guest User Accounts](#) (see the "Configuring a Guest User Template" section on [page 11-56](#))
- [Scheduling NCS Guest User Accounts](#), [page 7-11](#)
- [Printing or E-mailing NCS Guest User Details](#), [page 7-13](#)
- [Saving Guest Accounts on a Device](#), [page 7-13](#)

## Scheduling NCS Guest User Accounts

A lobby ambassador is able to schedule automatic creation of a guest user account. The validity and recurrence of the account can be defined. The generation of a new password on every schedule is optional and is enabled by selecting a check box. For scheduled users, the password is automatically generated and is automatically sent by e-mail to the host of the guest. The e-mail address for the host is configured on the New User page. After clicking Save, the Guest User Details page displays the password. From this page, you can e-mail or printer the account credentials.

To schedule a recurring guest user account in NCS, follow these steps:

---

**Step 1** Log in to the NCS user interface as lobby ambassador.

**Step 2** Choose **Schedule Guest User** from the Guest User page.

---

**Note** You can also schedule guest users from the Configure > Controller Template Launch Pad > Security > Guest User option.

---

**Step 3** On the Guest Users > Scheduling page, enter the guest username. The maximum is 24 characters.

**Step 4** Select the check box to generate a username and password on every schedule. If this is enabled, a different password is supplied for each day (up to the number of days chosen). If this is disabled (unselected), one password is supplied for a span of days. The generation of a new password on every schedule is optional.

**Step 5** Select a Profile ID from the drop-down list. This is the SSID to which this guest user applies and must be a WLAN that has Layer 3 authentication policy configured. Your administrator can advise which Profile ID to use.

**Step 6** Enter a description of the guest user account.

**Step 7** Choose **limited** or **unlimited**.

- **Limited:** From the drop-down list, choose days, hours, or minutes for the lifetime of this guest user account. The maximum is 35 weeks.
  - Start time: Date and time when the guest user account begins.
  - End time: Date and time when the guest user account expires.
- **Unlimited:** This user account never expires.
- **Days of the week:** Select the check box for the days of the week that apply to this guest user account.

**Step 8** Choose **Apply To** to restrict a guest user to a confined area by selecting a campus, building, or floor so that when applied, only those controllers and associated access points are available. You can use AP grouping to enforce access point level restrictions that determine which SSIDs to broadcast. Those access points are then assigned to the respective floors. You can also restrict the guest user to specific listed controllers or a configuration group, which is a group of controllers that has been preconfigured by the administrator.

From the drop-down lists, choose one of the following:

- **Controller List:** select the check box for the controller(s) to which the guest user account is associated.
- **Indoor Area:** choose the applicable campus, building, and floor.
- **Outdoor Area:** choose the applicable campus and outdoor area.
- **Config group:** choose the configuration group to which the guest user account belongs.

**Step 9** Enter the e-mail address to send the guest user account credentials. Each time the scheduled time comes up, the guest user account credentials are e-mailed to the specified e-mail address.

**Step 10** Review the disclaimer information. Use the scroll bar to move up and down.

**Step 11** Click **Save** to save your changes or **Cancel** to leave the settings unchanged.

---

## Printing or E-mailing NCS Guest User Details

The lobby ambassador can print or e-mail the guest user account details to the host or person who welcomes guests.

The e-mail and print copy shows the following details:

- Username: Guest user account name.
- Password: Password for the guest user account.
- Start time: Data and time when the guest user account begins.
- End time: Date and time when the guest user account expires.
- Profile ID: Profile assigned to the guest user. Your administrator can advise which Profile ID to use.
- Disclaimer: Disclaimer information for the guest user.

When creating the guest user account and applying the account to a list of controllers, area, or configuration group, a link is provided to e-mail or print the guest user account details. You can also print guest user account details from the Guest Users List page.

To print guest user details from the Guest Users List page, follow these steps:

- 
- Step 1** Log into the NCS user interface as lobby ambassador.
- Step 2** On the Guest User page, select the check box next to User Name, choose **Print/E-mail User Details** from the Select a command drop-down list, and click **Go**.
- If printing, click **Print** and from the print page, select a printer, and click **Print** or **Cancel**.
  - If e-mailing, click **E-mail** and from the e-mail page, enter the subject text and the recipient's e-mail address. Click **Send** or **Cancel**.

---

**Note** You can also print or email user details from the Configure > Controller Template Launch Pad > Security > Guest User option.

---

## Saving Guest Accounts on a Device

Select the **Save Guest Accounts on Device** check box to save guest accounts to a WLC flash so that they are maintained across WLC reboots.

---

**Note** In the Configure > Controller Template Launch Pad > Security > Guest page, you choose **Save Guest Accounts on device** from the Select a command drop-down list.

---

## Editing the Guest User Credentials

Click the NCS username of the guest user whose credentials you want to edit. The Lobby Ambassador Default tab appears, and you can modify the credentials.

While editing, if the *Profile* selection is removed (changed to *Select a profile*), the defaults are removed for this Lobby Ambassador. The user must reconfigure the defaults to reinforce them.

# Adding a New User

The Add User page allows the administrator to set up a new user login including username, password, groups assigned to the user, and virtual domains for the user.

## Note

You can only assign virtual domains to a newly created user which you own. By assigning virtual domains to a user, the user is restricted to information applicable to those virtual domains.

This section contains the following topics:

- [Adding User Names, Passwords, and Groups, page 7-14](#)
- [Assigning a Virtual Domain, page 7-15](#)

## Adding User Names, Passwords, and Groups

To add a new user, follow these steps:

- Step 1** Choose **Administration > AAA**.
- Step 2** From the left sidebar menu, select **Users**.
- Step 3** From the Select a command drop-down list, choose **Add User**.
- Step 4** Click **Go**. The Users page appears (see [Figure 7-5](#)).

**Figure 7-5** Users Page

291103

- Step 5** Enter a new **Username**.
- Step 6** Enter and confirm a password for this account.
- Step 7** Select the check box(es) of the groups to which this user will be assigned.

## Note

If the user belongs to Lobby Ambassador, Monitor Lite, Northbound API, or Users Assistant group, the user cannot belong to any other group.

- **Admin**—Allows users to monitor and configure NCS operations and perform all system administration tasks.

- ConfigManagers—Allows users to monitor and configure NCS operations.
- System Monitoring—Allows users to monitor NCS operations.
- Users Assistant—Allows local net user administration only.
- Lobby Ambassador—Allows guest access for configuration and management only of user accounts. If Lobby Ambassador is selected, a Lobby Ambassador Defaults tab appears.
- Monitor Lite—Allows monitoring of assets location.
- North Bound API User—A user group used by the NCS Web Service consumers. That is, any North Bound APIs.

---

**Note** If you are creating a North Bound API user from TACACS or RADIUS, the default user domain should be *root*.

---

---

**Note** North Bound API Users cannot be assigned a Virtual Domain. When a North Bound API group is selected, the Virtual Domains tab is not available.

---

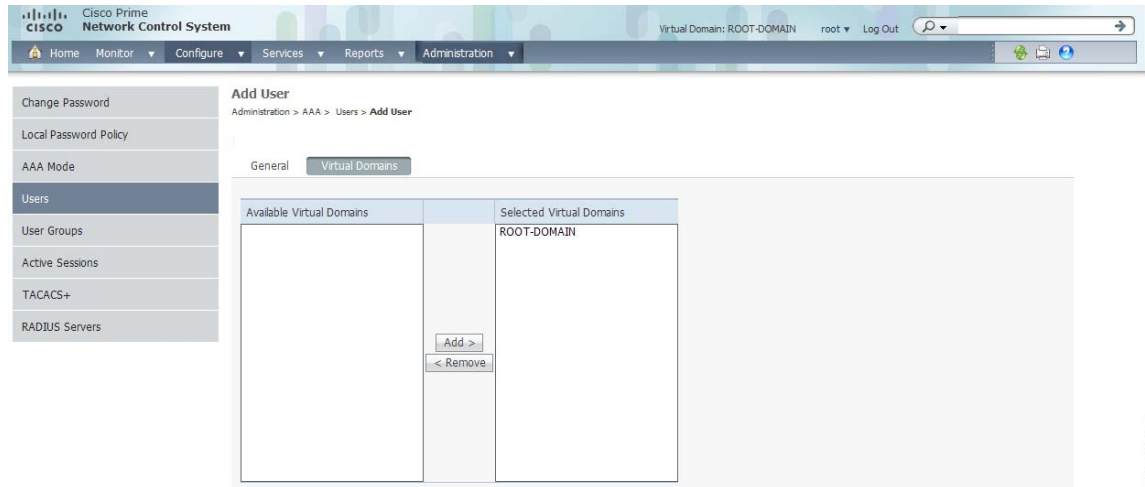

- SuperUsers—Allows users to monitor and configure NCS operations and perform all system administration tasks including administering NCS user accounts and passwords. Superuser tasks can be changed.
- Root—This group is only assignable to 'root' user and that assignment cannot be changed.
- User Defined.

## Assigning a Virtual Domain

To assign a virtual domain to this user, follow these steps:

- 
- Step 1** Click the **Virtual Domains** tab. This tab displays all virtual domains available and assigned to this user (see [Figure 7-6](#)).

Figure 7-6 Users Virtual Domains Tab

291104

**Note** The Virtual Domains tab enables the administrator to assign virtual domains for each user. By assigning virtual domains to a user, the user is restricted to information applicable to those virtual domains.

**Note** North Bound API Users cannot be assigned a Virtual Domain. When a North Bound API group is selected, the Virtual Domains tab is not available.

**Step 2** Click to highlight the virtual domain in the Available Virtual Domains list that you want to assign to this user.

**Note** You can select more than one virtual domain by holding down the Shift or Control key.

**Step 3** Click **Add >**. The virtual domain moves from the Available Virtual Domains to the Selected Virtual Domains list.

To remove a virtual domain from the Selected Virtual Domains list, click to highlight the domain in the Selected Virtual Domains list, and click **Remove**. The virtual domain moves from the Selected Virtual Domains to the Available Virtual Domains list.

**Step 4** Click **Submit** to save the changes or **Cancel** to close the page without adding or editing the current user.

## Managing Lobby Ambassador Accounts

You can use the Cisco Lobby Ambassador to create guest user accounts in NCS. A guest network provided by an enterprise allows access to the Internet for a guest without compromising the host. The web authentication is provided with or without a supplicant or client, so a guest needs to initiate a VPN tunnel to their desired destinations.

Both wired and wireless guest user access is supported. Wired guest access enables guest users to connect to the guest access network from a wired Ethernet connection designated and configured for guest access. Wired guest access ports might be available in a guest office or specific ports in a conference room. Like wireless guest user accounts, wired guest access ports are added to the network using the lobby ambassador feature.

The network administrator must first set up a lobby ambassador account. Guest user accounts are for visitors, temporary workers, and so on, who need network access. A lobby ambassador account has limited configuration privileges and only allows access to the pages used to configure and manage guest user accounts.

The lobby ambassador can create the following types of guest user accounts:

- A guest user account with a limited lifetime. After the specified time period, the guest user account automatically expires.
- A guest user account with an unlimited lifetime. This account never expires.
- A guest user account that is activated at a predefined time in the future. The lobby ambassador defines the beginning and end of the valid time period.

This section contains the following topics:

- [Creating a Lobby Ambassador Account, page 7-17](#)
- [Editing a Lobby Ambassador Account, page 7-18](#)
- [Logging in to the NCS User Interface as a Lobby Ambassador, page 7-19](#)
- [Logging the Lobby Ambassador Activities, page 7-19](#)

## Creating a Lobby Ambassador Account

**Note**

A group that has the SuperUser/administrator privileges (by default) can create a lobby ambassador account.

To create a lobby ambassador account in NCS, follow these steps:

- Step 1** Log into the NCS user interface as an administrator.
- Step 2** Choose **Administration > AAA**.
- Step 3** From the left sidebar menu, click **Users**.
- Step 4** From the Select a command drop-down list, choose **Add User**.
- Step 5** Click **Go**.
- Step 6** Enter the username.
- Step 7** Enter the password. Reenter to confirm the password. Password requirements include the following:
  - The password must have a minimum of eight characters.
  - The password must include at least three of the following elements: lowercase letters, uppercase letters, numbers, or special characters.
- Step 8** In the Groups Assigned to this User section, select the LobbyAmbassador check box to access the Lobby Ambassador Defaults tab.

The Lobby Ambassador Defaults tab has the following parameters:

- Profile—The default profile to which the guest users would connect.
- Lifetime—Limited or Unlimited.

---

**Note** By default, the lifetime is limited to eight hours.

---

- Apply to—From the drop-down list, choose one of the following:
  - Indoor Area—Campus, Building, and Floor.
  - Outdoor Area—Campus, Outdoor Area.
  - Controller List—List of controller(s) on which the selected profile is created.
  - Config Groups—Config group names configured on NCS.
- Email ID—The email ID of the host to whom the guest account credentials are sent.
- Description—A brief description of this account.
- Disclaimer—The default disclaimer text.
- Defaults Editable—Select this check box if you want to allow the lobby ambassador to override these configured defaults. This allows the lobby ambassador to modify these Guest User Account default settings while creating Guest Accounts from the Lobby Ambassador portal.

---

**Note** If no default profile is selected on this tab, the defaults are not applied to this Lobby Ambassador. However, the Lobby Ambassador account *is* created and the Lobby Ambassador can create users with credentials as desired.

---

- Max User Creation Allowed—Select this check box to set limits on the number of guest users that can be created by the Lobby Ambassador in a given time period. The time period is defined in hours, days, or weeks.
  - Click **Submit**. The name of the new lobby ambassador account is listed and the account can be used immediately.
- 

## Editing a Lobby Ambassador Account

The Lobby Ambassador default credentials can be edited from the username link on the NCS user list page.

To edit the Lobby Ambassador default credentials, follow these steps:

- 
- Step 1** Log into the NCS user interface as an administrator.
  - Step 2** Choose **Administration > AAA**.
  - Step 3** From the left sidebar menu, click **Users**.
  - Step 4** Click the applicable Lobby Ambassador account from the User Name column.
  - Step 5** From the Lobby Ambassador Defaults page, edit the credentials as necessary.

**Note** While editing, if the Profile selection is removed (changed to Select a profile), the defaults are removed for this Lobby Ambassador. The user must reconfigure the defaults to reinforce them.

**Step 6** Click **Submit**.

## Logging in to the NCS User Interface as a Lobby Ambassador

When you log in as a lobby ambassador, you have access to the guest user template page in NCS. You can then configure guest user accounts (through templates).

To log into the NCS user interface through a web browser, follow these steps:

**Step 1** Launch Internet Explorer 7.0 or later on your computer.

**Note** Some NCS features may not function properly if you use a web browser other than Internet Explorer 7.0 or later on a Windows workstation.

**Step 2** In the browser address line, enter **https://NCS-ip-address** (such as https://1.1.1.1), where *NCS-ip-address* is the IP address of the computer on which NCS is installed. Your administrator can provide this IP address.

**Step 3** When the NCS user interface displays the Login window, enter your username and password.

**Note** All entries are case sensitive.

**Note** The lobby ambassador can only define guest users templates.

**Step 4** Click **Submit** to log into NCS. The NCS user interface is now active and available for use. The Guest Users page is displayed. This page provides a summary of all created Guest Users.

To exit the NCS user interface, close the browser window or click **Logout** in the upper right corner of the page. Exiting a NCS user interface session does not shut down NCS on the server.

**Note** When a system administrator stops the NCS server during a NCS session, the session ends, and the web browser displays this message: "The page cannot be displayed." Your session does not reassociate to NCS when the server restarts. You must restart the NCS session.

## Logging the Lobby Ambassador Activities

The following activities are logged for each lobby ambassador account:

- Lobby ambassador login—NCS logs the authentication operation results for all users.

- Guest user creation—When a lobby ambassador creates a guest user account, NCS logs the guest username.
- Guest user deletion—When a lobby ambassador deletes the guest user account, NCS logs the deleted guest username.
- Account updates—NCS logs the details of any updates made to the guest user account. For example, increasing the life time.

To view the lobby ambassador activities, follow these steps:

---

**Note** You must have administrative permissions to open this window.

---

- Step 1** Log into the NCS user interface as an administrator.
- Step 2** Choose **Administration > AAA > Groups** from the left sidebar menu to display the All Groups page.
- Step 3** On the All Groups page, click the **Audit Trail** icon for the lobby ambassador account you want to view. The Audit Trail page for the lobby ambassador appears.

This page enables you to view a list of lobby ambassador activities over time.

- User—User login name
- Operation—Type of operation audited
- Time—Time operation was audited
- Status—Success or failure

- Step 4** To clear the audit trail, choose **Clear Audit Trail** from the Select a command drop-down list, and click **Go**.
-

## CHAPTER 8

# Configuring Mobility Groups

---

This chapter describes mobility groups and explains how to configure them on Cisco NCS. It contains the following sections:

- [Information About Mobility, page 8-1](#)
- [Symmetric Tunneling, page 8-5](#)
- [Overview of Mobility Groups, page 8-5](#)
- [Configuring Mobility Groups, page 8-8](#)
- [Mobility Anchors, page 8-12](#)
- [Configuring Multiple Country Codes, page 8-14](#)
- [Configuring Controller Config Groups, page 8-16](#)
- [Reporting Config Groups, page 8-22](#)
- [Downloading Software, page 8-23](#)

## Information About Mobility

Mobility, or roaming, is a wireless LAN client's ability to maintain its association seamlessly from one access point to another securely and with as little latency as possible. This section explains how mobility works when controllers are included in a wireless network.

When a wireless client associates and authenticates to an access point, the access point's controller places an entry for that client in its client database. This entry includes the client's MAC and IP addresses, security context and associations, quality of service (QoS) contexts, the WLANs, and the associated access point. The controller uses this information to forward frames and manage traffic to and from the wireless client. [Figure 8-1](#) illustrates a wireless client roaming from one access point to another when both access points are joined to the same controller.

Figure 8-1 Intra-Controller Roaming

When the wireless client moves its association from one access point to another, the controller simply updates the client database with the newly associated access point. If necessary, new security context and associations are established as well.

The process becomes more complicated, however, when a client roams from an access point joined to one controller to an access point joined to a different controller. The process also varies based on whether the controllers are operating on the same subnet. Figure 8-2 illustrates *inter-controller roaming*, which occurs when the controllers' wireless LAN interfaces are on the same IP subnet.

Figure 8-2 Inter-Controller Roaming

When the client associates to an access point joined to a new controller, the new controller exchanges mobility messages with the original controller, and the client database entry is moved to the new controller. New security context and associations are established if necessary, and the client database entry is updated for the new access point. This process remains invisible to the user.

**Note**

All clients configured with 802.1X/Wi-Fi Protected Access (WPA) security complete a full authentication in order to comply with the IEEE standard.

Figure 8-3 illustrates *inter-subnet roaming*, which occurs when the controllers' wireless LAN interfaces are on different IP subnets.

Figure 8-3 Inter-Subnet Roaming

*Inter-subnet roaming* is similar to inter-controller roaming in that the controllers exchange mobility messages on how the client roams. However, instead of moving the client database entry to the new controller, the original controller marks the client with an “Anchor” entry in its own client database. The database entry is copied to the new controller client database and marked with a “Foreign” entry in the new controller. The roam remains invisible to the wireless client, and the client maintains its original IP address.

After an inter-subnet roam, data flows in an asymmetric traffic path to and from the wireless client. Traffic from the client to the network is forwarded directly into the network by the foreign controller. Traffic to the client arrives at the anchor controller, which forwards the traffic to the foreign controller in an EtherIP tunnel. The foreign controller then forwards the data to the client. If a wireless client roams to a new foreign controller, the client database entry is moved from the original foreign controller to the new foreign controller, but the original anchor controller is always maintained. If the client moves back to the original controller, it becomes local again.

In inter-subnet roaming, WLANs on both anchor and foreign controllers need to have the same network access privileges and no source-based routing or source-based firewalls in place. Otherwise, the clients may have network connectivity problems after the handoff.

**Note**

Currently, multicast traffic cannot be passed during inter-subnet roaming. In other words, avoid designing an inter-subnet network for Spectralink phones that need to send multicast traffic while using push to talk.

**Note**

Both inter-controller roaming and inter-subnet roaming require the controllers to be in the same mobility group. See the next two sections for a description of mobility groups and instructions for configuring them.

# Symmetric Tunneling

With symmetric mobility tunneling, the controller provides inter-subnet mobility for clients roaming from one access point to another within a wireless LAN. The client traffic on the wired network is directly routed by the foreign controller. If a router has reverse path filtering (RPF) enabled (which provides additional checks on incoming packets), the communication is blocked. Symmetric mobility tunneling allows the client traffic to reach the controller designated as the anchor, even with RPF enabled. You enable or disable symmetric tunneling by choosing **Configure > Controller** and then **System > General** from the left sidebar menu.

---

**Note** All controllers in a mobility group should have the same symmetric tunneling mode.

---

---

**Note** For symmetric tunneling to take effect, a reboot is required.

---

With this guest tunneling N+1 redundancy feature, the time it takes for a client to join another access point following a controller failure is decreased because a failure is quickly identified, the clients are moved away from the problem controller, and the clients are anchored to another controller.

See the [“Configuring Controller Templates” section on page 11-4](#) for instructions on configuring this feature within a template.

# Overview of Mobility Groups

A set of controllers can be configured as a *mobility group* to allow seamless client roaming within a group of controllers. By creating a mobility group, you can enable multiple controllers in a network to dynamically share information and forward data traffic when inter-controller or inter-subnet roaming occurs. Controllers can share the context and state of client devices and controller loading information. With this information, the network can support inter-controller wireless LAN roaming and controller redundancy.

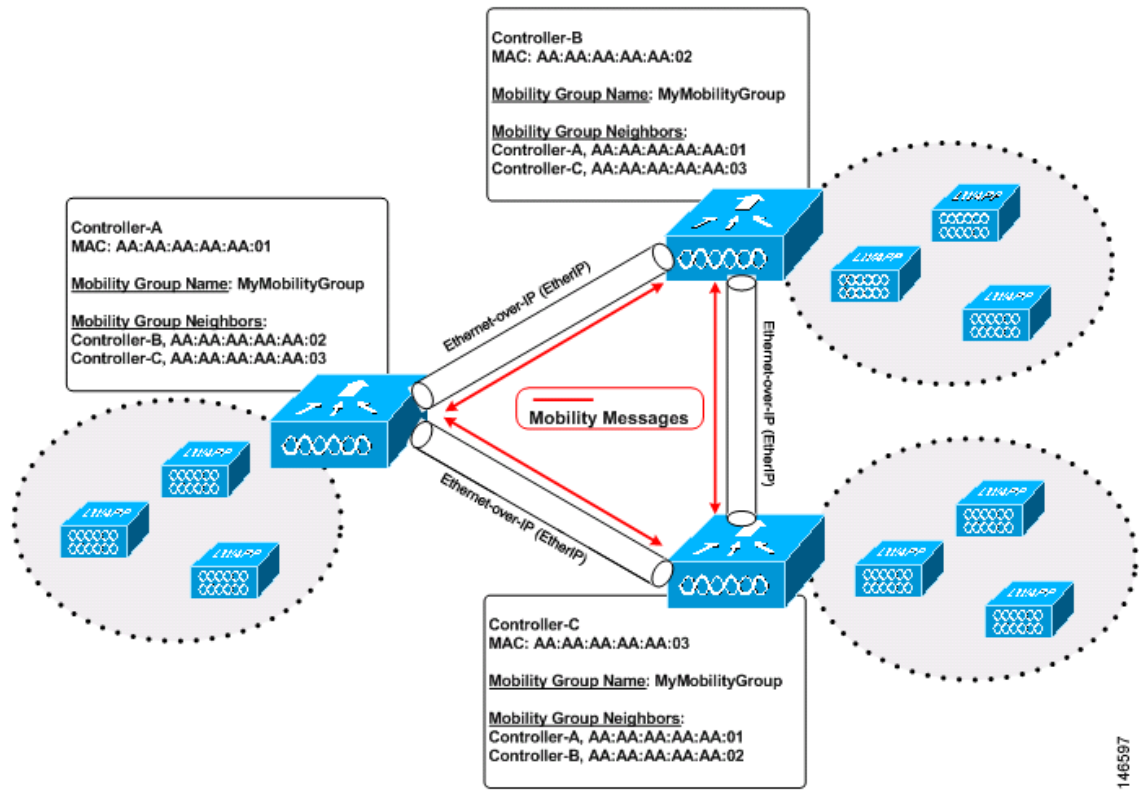

---

**Note** Clients do not roam across mobility groups.

---

[Figure 8-4](#) shows an example of a mobility group.

Figure 8-4 A Single Mobility Group

As shown in [Figure 8-4](#), each controller is configured with a list of the other members of the mobility group. Whenever a new client joins a controller, the controller sends out a unicast message to all of the controllers in the mobility group. The controller to which the client was previously connected passes on the status of the client. All mobility exchange traffic between controllers is carried over a CAPWAP tunnel.

Examples:

1. A 4404-100 controller supports up to 100 access points. Therefore, a mobility group consisting of 24 4404-100 controllers supports up to 2400 access points ( $24 * 100 = 2400$  access points).
2. A 4402-25 controller supports up to 25 access points, and a 4402-50 controller supports up to 50 access points. Therefore, a mobility group consisting of 12 4402-25 controllers and 12 4402-50 controllers supports up to 900 access points ( $12 * 25 + 12 * 50 = 300 + 600 = 900$  access points).

Mobility groups enable you to limit roaming between different floors, buildings, or campuses in the same enterprise by assigning different mobility group names to different controllers within the same wireless network. [Figure 8-5](#) shows the results of creating distinct mobility group names for two groups of controllers.

Figure 8-5 Two Mobility Groups

The controllers in the ABC mobility group recognize and communicate with each other through their access points and through their shared subnets. The controllers in the ABC mobility group do not recognize or communicate with the XYZ controllers, which are in a different mobility group. Likewise, the controllers in the XYZ mobility group do not recognize or communicate with the controllers in the ABC mobility group. This feature ensures mobility group isolation across the network.

**Note**

Clients may roam between access points in different mobility groups, provided they can detect them. However, their session information is not carried between controllers in different mobility groups.

## When to Include Controllers in a Mobility Group

If it is possible for a wireless client in your network to roam from an access point joined to one controller to an access point joined to another controller, both controllers should be in the same mobility group.

## Messaging among Mobility Groups

The controller provides inter-subnet mobility for clients by sending mobility messages to other member controllers. There can be up to 72 members in the list with up to 24 in the same mobility group. In NCS and controller software releases 5.0, two improvements have been made to mobility messaging, each of which is especially useful when sending messages to the full list of mobility members:

- Sending Mobile Announce messages within the same group first and then to other groups in the list  
The controller sends a Mobile Announce message to members in the mobility list each time a new client associates to it. In NCS and controller software releases prior to 5.0, the controller sends this message to all members in the list irrespective of the group to which they belong. However, in controller software release 5.0, the controller sends the message only to those members that are in the same group as the controller and then includes all of the other members while sending retries.
- Sending Mobile Announce messages using multicast instead of unicast  
In NCS and controller software releases prior to 5.0, the controller may be configured to use multicast to send the mobile announce messages, which requires sending a copy of the messages to every mobility member. This behavior is not efficient because many messages (such as Mobile Announce, PMK Update, AP List Update, and IDS Shun) are meant for all members in the group. In NCS and controller software releases 5.0, the controller uses multicast mode to send the Mobile Announce messages. This behavior allows the controller to send only one copy of the message to the network, which destines it to the multicast group containing all the mobility members. To derive the maximum benefit from multicast messaging, We recommend that it be enabled or disabled on all group members.

## Configuring Mobility Groups

This section provides instructions for configuring mobility groups.

### Note

You can also configure mobility groups using the controller. See the *Cisco Wireless LAN Controller Configuration Guide* for instructions.

## Prerequisites

Before you add controllers to a mobility group, you must verify that the following requirements have been met for all controllers that are to be included in the group:

- All controllers must be configured for the same LWAPP transport mode (Layer 2 or Layer 3).

### Note

You can verify and, if necessary, change the LWAPP transport mode on the System > General page.

- IP connectivity must exist between the management interfaces of all devices.

### Note

You can verify IP connectivity by pinging the controllers.

- All controllers must be configured with the same mobility group name.

### Note

For the Cisco WiSM, both controllers should be configured with the same mobility group name for seamless routing among 300 access points.

- All devices must be configured with the same virtual interface IP address.

**Note**

If all the controllers within a mobility group are not using the same virtual interface, inter-controller roaming may appear to work, but the hand-off does not complete, and the client loses connectivity for a period of time.

- You must have gathered the MAC address and IP address of every controller that is to be included in the mobility group. This information is necessary because you will be configuring all controllers with the MAC address and IP address of all the other mobility group members.

**Note**

You can find the MAC and IP addresses of the other controllers to be included in the mobility group on the [Configure > Controllers](#) page.

To add each WLC controller into mobility groups and configure them, follow these steps:

- Step 1** Choose [Configure > Controllers](#) (see [Figure 8-6](#)).

**Figure 8-6** *Configure > Controllers*

| IP Address | Controller Name | Type    | Location | Software Version | Mobility Group Name | Life Cycle State                   | Reachability Status | Audit Status  |
|------------|-----------------|---------|----------|------------------|---------------------|------------------------------------|---------------------|---------------|
| 9.1.192.50 | COMMON-5500-2   | 5500    |          | 7.0.116.0        | ram                 | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.96.40  | ATN2106         | WLC2106 |          | 7.0.116.0        | pdmn                | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.72.40  | RK4402          | 4400    |          | 7.0.116.0        | Ramesh              | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.120.11 | RB5500          | 5500    |          | 7.0.116.0        | ra                  | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.189.40 | COMMON-4400-3   | 4400    |          | 7.0.114.107      | ram                 | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.122.11 | RB2100          | WLC2106 |          | 7.0.116.0        | auto2100            | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.73.50  | RK5508          | 5500    |          | 7.0.116.0        | TEST_GROUP          | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.104.40 | SR4404          | 4400    |          | 7.0.116.0        | w                   | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.121.11 | RB4400          | 4400    |          | 7.0.116.0        | RamarB              | Device is managed and synchronized | Reachable           | Not Available |
| 9.1.105.40 | SR5508          | 5500    |          | 7.0.98.0         | test_group          | Device is managed and synchronized | Reachable           | Not Available |

This page shows the list of all the controllers you added in Step 1. The mobility group names and the IP address of each controller that is currently a member of the mobility group is listed.

- Step 2** Choose the first controller by clicking the WLC IP address. You will then access the controller templates interface for the controller you are managing.
- Step 3** Choose [System > Mobility Groups](#) from the left sidebar menu. The existing Mobility Group members are listed in the page (see [Figure 8-7](#)).

291110

Figure 8-7 Existing Mobility Groups

| Controller Name | Member MAC Address | Member IP Address | Multicast Address | Group Name |
|-----------------|--------------------|-------------------|-------------------|------------|
| COMMON-5500-2   | 68:ef:bd:8e:5c:00  | 9.1.192.50        | 0.0.0.0           | (Local)    |

- Step 4** You will see a list of available controllers. From the Select a command drop-down list in the upper right-hand corner, choose **Add Group Members** and then click **Go**.
- Step 5** If no controllers were found to add to the mobility group, you can add the members manually by clicking the “To add members manually to the Mobility Group [click here](#)” message. The Mobility Group Member page appears (see [Figure 8-8](#)).

Figure 8-8 Mobility Group Member Page

**Mobility Groups Details**  
 Configure > Controllers > 9.1.192.50 > System > Mobility Groups > Mobility Groups Details

\*\*Configuration not provisioned on the Device\*\*

Member MAC Address: 68:ef:bd:8e:5c:00

Member IP Address: 209.165.200.224

Multicast Address: 0.0.0.0

Group Name: Group1

Save Cancel

- Step 6** In the Member MAC Address text box, enter the MAC address of the controller to be added.
- Step 7** In the Member IP Address text box, enter the management interface IP address of the controller to be added.

**Note** If you are configuring the mobility group in a network where Network Address Translation (NAT) is enabled, enter the IP address sent to the controller from the NAT device rather than the controller’s management interface IP address. Otherwise, mobility will fail among controllers in the mobility group.

291111

291112

- Step 8** Enter the multicast group IP address to be used for multicast mobility messages in the Multicast Address text box. The local mobility member's group address must be the same as the local controller's group address.
- Step 9** In the Group Name text box, enter the name of the mobility group.
- Step 10** Click **Save**.
- Step 11** Repeat the above steps for the remaining WLC devices.

## Setting the Mobility Scalability Parameters

To set the mobility message parameters, follow these steps:

**Note** You must complete the steps in the “[Configuring Mobility Groups](#)” section on page 8-8 prior to setting the mobility scalability parameters.

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose an IP address of a controller whose software version is 5.0 or later.
- Step 3** Choose **System > Multicast** from the left sidebar menu. The Multicast page appears (see [Figure 8-9](#)).

**Figure 8-9 Multicast Page**

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is 'Configure > Controllers > 9.1.192.50 > System > Multicast'. The left sidebar shows the 'System' menu expanded to 'Multicast'. The main content area displays the following configuration parameters:

|                                  |                                     |
|----------------------------------|-------------------------------------|
| Ethernet Multicast Support       | Multicast                           |
| Multicast Group Address          | 209.165.200.224                     |
| Global Multicast Mode            | <input checked="" type="checkbox"/> |
| Multicast Mobility Mode          | Enable                              |
| Mobility Group Multicast Address | 209.165.200.225                     |

Buttons for 'Audit' and 'Save' are visible at the bottom of the configuration area.

- Step 4** At the Ethernet Multicast Support parameter, specify if you want to disable the ability for the controller to use multicast mode to send Mobile Announce messages to mobility members. Otherwise, you can choose Multicast or Unicast.
- Step 5** If you chose multicast in Step 4, you must enter the group IP address at the Multicast Group Address parameter to begin multicast mobility messaging. You must configure this IP address for the local mobility group, but it is optional for other groups within the mobility list. If you do not configure the IP address for other (non-local) groups, the controllers use unicast mode to send mobility messages to those members.
- Step 6** Select the **Enable Global Multicast Mode** check box to make the multicast mode available globally.
- Step 7** Select the **Enable IGMP Snooping** check box to enable IGMP snooping.

291113

**Step 8** Select **Enable** from the Multicast Mobility Mode drop-down list to change the IGMP snooping status or to set the IGMP timeout. When IGMP snooping is enabled, the controller gathers IGMP reports from the clients and then sends each access point a list of the clients listening to any multicast group. The access point then forwards the multicast packets only to those clients.

The timeout interval has a range of 3 to 300 and a default value of 60. When the timeout expires, the controller sends a query to all WLANs. Those clients which are listening in the multicast group then send a packet back to the controller.

**Step 9** If you enabled the Multicast Mobility Mode, enter the mobility group multicast address.

**Step 10** Select the **Multicast Direct** check box to enable videos to be streamed over a wireless network.

**Step 11** Specify the Session Banner information, which is the error information sent to the client if the client is denied or dropped from a Media Stream.

- a. State—Select the check box to activate the Session Banner. If not activated, the Session Banner is not sent to the client
- b. URL—A web address reported to the client
- c. Email—An email address reported to the client
- d. Phone—A telephone number reported to the client
- e. Note—A note reported to the client

**Note**

---

All Media Streams on a Controller share this configuration.

---

**Step 12** Click **Save**.

---

## Mobility Anchors

Mobility anchors are a subset of a mobility group specified as the anchor controllers for a WLAN. This feature can be used to restrict a WLAN to a single subnet, regardless of the client's entry point into the network. In this way, users can access a public or guest WLAN throughout an enterprise but still be restricted to a specific subnet. Guest WLAN can also be used to provide geographic load balancing because WLANs can represent a particular section of a building (such as a lobby, a restaurant, and so on).

When a client first associates to a controller of a mobility group that has been preconfigured as a mobility anchor for a WLAN, the client associates to the controller locally, and a local session is created for the client. Clients can be anchored only to preconfigured anchor controllers of the WLAN. For a given WLAN, you should configure the same set of anchor controllers on all controllers in the mobility group.

When a client first associates to a controller of a mobility group that has not been configured as a mobility anchor for a WLAN, the client associates to the controller locally, a local session is created for the client, and the controller is announced to the other controllers in the same mobility group. If the announcement is not answered, the controller contacts one of the anchor controllers configured for the WLAN and creates a foreign session for the client on the local switch. Packets from the client are encapsulated through a mobility tunnel using EtherIP and sent to the anchor controller, where they are decapsulated and delivered to the wired network. Packets to the client are received by the anchor controller and forwarded to the foreign controller through a mobility tunnel using EtherIP. The foreign controller decapsulates the packets and forwards them to the client.

**Note**

A 2000 series controller cannot be designated as an anchor for a WLAN. However, a WLAN created on a 2000 series controller can have a 4100 series controller or a 4400 series controller as its anchor.

**Note**

The L2TP Layer 3 security policies are unavailable for WLANs configured with a mobility anchor.

## Configuring Mobility Anchors

To create a new mobility anchor for a WLAN, follow these steps:

- Step 1** Click **Configure > Controllers**.
- Step 2** Choose a controller by clicking an IP address.
- Step 3** Choose **WLANs > WLAN Configuration** from the left sidebar menu.
- Step 4** Select the check box of the desired WLAN ID URL (see [Figure 8-10](#)).

**Figure 8-10** WLAN Page

| WLAN ID                    | Profile_Name | SSID | WLAN/Guest/Remote LAN | Security Policies      | Status  | Task List |
|----------------------------|--------------|------|-----------------------|------------------------|---------|-----------|
| <input type="checkbox"/> 1 | ram          | ram  | WLAN                  | [WPA2] [Auth( 802.1X)] | Enabled | N/A       |

- Step 5** After choosing a WLAN ID, a tabbed page appears (see [Figure 8-11](#)). Click the **Advanced** tab.

Figure 8-11 Advanced Page

The screenshot shows the 'New Controller Template' configuration page in the Cisco Prime Network Control System. The 'Advanced' tab is selected, displaying various configuration options. The left sidebar shows a navigation menu with 'WLAN Configuration' selected. The main content area is divided into several sections:

- General:** H-REAP Local Switching (checkbox), H-REAP Local Auth (checkbox), Diagnostic Channel (checkbox), Aronnet IE (checkbox), IPv6 (checkbox), Session Timeout (checkbox), Coverage Hole Detection (checkbox), Override Interface ACL (dropdown), Peer to Peer Blocking (dropdown), Client Exclusion (checkbox), Timeout Value (input), Media Session Snooping (checkbox), Passive Client (checkbox).
- DTIM Period:** A table with columns for network type and DTIM period (ms).
 

| Network             | DTIM Period (ms) |
|---------------------|------------------|
| 802.11a/n (1-255)   | 1                |
| 802.11b/g/n (1-255) | 1                |
- DHCP:** DHCP Server (checkbox), DHCP Address Assignment (checkbox).
- Management Frame Protection (MFP):** MFP Signature Generation (checkbox), MFP Client Protection (dropdown), MFP Version (input).
- Load Balancing and Band Select:** Client Load Balancing (checkbox), Client Band Select (checkbox).
- NAC:** NAC State (dropdown).

Buttons for 'Save' and 'Cancel' are located at the bottom of the configuration area.

291115

- Step 6** Click the **Mobility Anchors** link at the bottom of the page. The Mobility Anchors page appears.
- Step 7** Select the **IP address** check box of the controller to be designated a mobility anchor, and click **Save**.
- Step 8** Repeat [Step 6](#) and [Step 7](#) to set any other controllers as anchors for this WLAN.
- Step 9** Configure the same set of anchor controllers on every controller in the mobility group.

## Configuring Multiple Country Codes

You can configure one or more countries on a controller. After countries are configured on a controller, the corresponding 802.11a/n DCA channels are available for selection. At least one DCA channel must be selected for the 802.11a/n network. When the country codes are changed, the DCA channels are automatically changed in coordination.

**Note** 802.11a/n and 802.11b/n networks for controllers and access points must be disabled before configuring a country on a controller. To disable 802.11a/n or 802.11b/n networks, choose **Configure > Controllers**, select the desired controller you want to disable, choose **802.11a/n** or **802.11b/g/n** from the left sidebar menu, and then choose **Parameters**. The Network Status is the first check box.

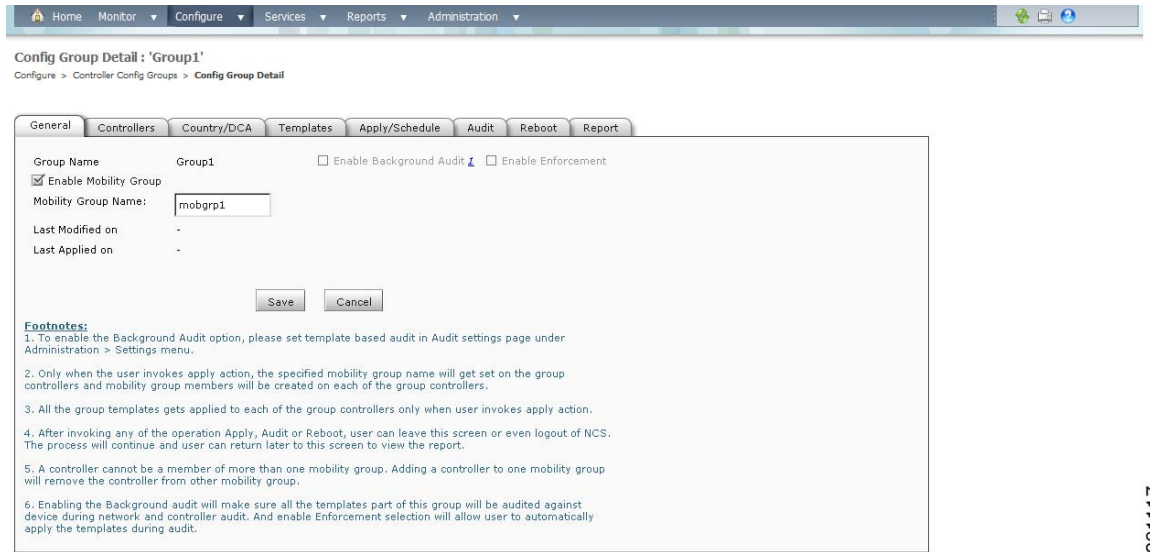

**Note** To configure multiple country codes outside of a mobility group, see the [“Configuring Security Parameters”](#) section on page 9-81.

To add multiple controllers that are defined in a configuration group and then set the DCA channels, follow these steps:

- Step 1** Choose **Configure > Controller Config Groups**.

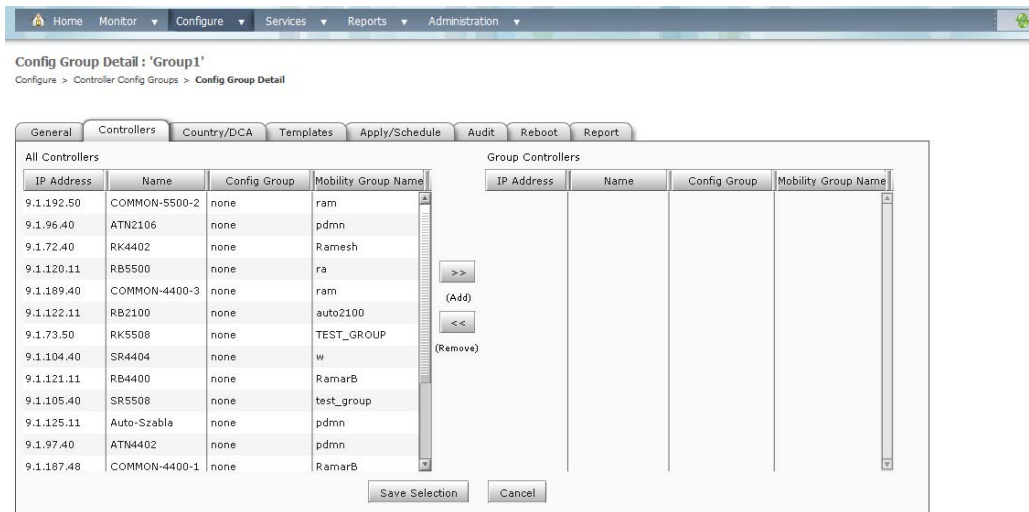

- Step 2** Choose **Add Config Groups** from the Select a command drop-down list, and click **Go**.
- Step 3** Create a config group by entering the group name and mobility group name.
- Step 4** Click **Save**. The Config Groups page appears (see [Figure 8-12](#)).

**Figure 8-12 Config Groups Page**

- Step 5** Click the **Controllers** tab. The Controllers page appears (see [Figure 8-13](#)).

**Figure 8-13 Controller Tab**

- Step 6** Highlight the controllers you want to add, and click the **Add** button. The controller is added to the Group Controllers page.
- Step 7** Click the **Country/DCA** tab. The Country/DCA page appears (see [Figure 8-14](#)). Dynamic Channel Allocation (DCA) automatically selects a reasonably good channel allocation amongst a set of managed devices connected to the controller.

291117

291118

Figure 8-14 Country/DCA Tab

The screenshot shows the 'Country/DCA' configuration page for a mobility group named 'Group1'. The page includes a navigation menu at the top with options like Home, Monitor, Configure, Services, Reports, and Administration. Below the navigation, the page title is 'Config Group Detail: 'Group1'' and the breadcrumb is 'Configure > Controller Config Groups > Config Group Detail'. The main content area has several tabs: General, Controllers, Country/DCA (selected), Templates, Apply/Schedule, Audit, Reboot, and Report. Under the 'Country/DCA' tab, there are several configuration options:
 

- 'Dynamic Channel Allocation (DCA) allows the selected radio channels to participate in auto-RF' with a checked 'Update Country/DCA' checkbox.
- 'DCA 802.11a Channel width' set to '20 MHz'.
- '802.11a Outdoor AP DCA' with a checked checkbox.
- Three list boxes: 'Select Country Codes (up to 20)', 'Select 802.11a DCA Channels', and 'Select 802.11b DCA Channels', each with a scroll bar and arrow buttons.
- 'Save Selection' and 'Cancel' buttons at the bottom.

291119

- Step 8** Select the **Update Countries/DCA** check box to display a list of countries from which to choose.
- Step 9** Those DCA channels that are currently configured on the controller for the same mobility group are displayed in the Select Country Codes page. The corresponding 802.11a/n and 802.11b/n allowable channels for the chosen country is displayed as well. You can add or delete any channels in the list by selecting or deselecting the channel and clicking **Save Selection**.

**Note** A minimum of 1 and a maximum of 20 countries can be configured for a controller.

## Configuring Controller Config Groups

By creating a config group, you can group controllers that should have the same mobility group name and similar configuration. You can assign templates to the group and push templates to all the controllers in a group. You can add, delete, or remove config groups, and download software, IDS signatures, or a customized web authentication page to controllers in the selected config groups. You can also save the current configuration to nonvolatile (flash) memory to controllers in selected config groups.

**Note** A controller cannot be a member of more than one mobility group. Adding a controller to one mobility group removes that controller from any other mobility group to which it is already a member.

For information about applying templates to either individual controllers or controllers in selected Config Groups, see the [“Using Templates” section on page 11-1](#).

By choosing Configure > Controller Config Groups, you can view a summary of all config groups in the Cisco NCS database. When you choose Add Config Groups from the Select a command drop-down list, the page displays a table with the following columns:

- Group Name: Name of the config group.

- Templates: Number of templates applied to config group.

## Adding New Group

To add a config group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**.
- Step 2** From the Select a command drop-down list, choose **Add Config Group**, and click **Go**. The Add New Group page appears.
- Step 3** Enter the new config group name. It must be unique across all groups. If Enable Background Audit is selected, the network and controller audits occur for this config group. If Enable Enforcement is selected, the templates are automatically applied during the audit if any discrepancies are found.

**Note** If the Enable Background Audit option is chosen, the network and controller audit is performed on this config group.

---

- Step 4** Other templates created in NCS can be assigned to a config group. The same WLAN template can be assigned to more than one config group. Choose from the following:
- Select and add later: Click to add template at a later time.
  - Copy templates from a controller: Click to copy templates from another controller. Choose a controller from a list of current controllers to copy its applied template to the new config group. Only the templates are copied.

**Note** The order of the templates is important when dealing with radio templates. For example, if the template list includes radio templates that require the radio network to be disabled prior to applying the radio parameters, the template to disable the radio network must be added to the template first.

---

- Step 5** Click **Save**. The Config Groups page appears (see [Figure 8-15](#)).

**Figure 8-15** *Config Groups Page*

291120

## Configuring Config Groups

To configure a config group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column. The Config Group page shown in [Figure 8-15](#) appears.
- Step 2** Click the **General** tab. The following options for the config group appear:
- Group Name: Name of the config group
    - Enable Background Audit—If selected, all the templates that are part of this group are audited against the controller during network and controller audits.
    - Enable Enforcement—If selected, the templates are automatically applied during the audit if any discrepancies are found.
-  **Note** The audit and enforcement of the config group template happens when the selected audit mode is *Template based audit*.
- 
- Enable Mobility Group—If selected, the mobility group name is pushed to all controllers in the group.
- Mobility Group Name: Mobility Group Name that is pushed to all controllers in the group. The Mobility Group Name can also be modified here.
-  **Note** A controller can be part of multiple config groups.
- 
- Last Modified On: Date and time config group was last modified.
  - Last Applied On: Date and time last changes were applied.
- Step 3** You must click the **Apply/Schedule** tab to distribute the specified mobility group name to the group controllers and to create mobility group members on each of the group controllers.
- Step 4** Click **Save**.
- 

## Adding or Removing Controllers from a Config Group

To add or remove controllers from a config group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column.
- Step 2** Click the **Controllers** tab. The columns in the table display the IP address of the controller, the config group name the controller belongs to, and the controller's mobility group name.
- Step 3** Click to highlight the row of the controller you want to add to the group.
- Step 4** Click **Add**.

---

**Note** If you want to remove a controller from the group, highlight the controller in the Group Controllers box and click **Remove**.

---

**Step 5** You must click the **Apply/Schedule** tab, and click **Apply** to add or remove the controllers to the config groups.

**Step 6** Click **Save Selection**.

---

## Adding or Removing Templates from the Config Group

To add or remove templates from the config group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column.
  - Step 2** Click the **Templates** tab. The Remaining Templates table displays the item number of all available templates, the template name, and the type and use of the template.
  - Step 3** Click to highlight the row of the template you want to add to the group.
  - Step 4** Click **Add** to move the highlighted template to the Group Templates column.

---

**Note** If you want to remove a template from the group, highlight the template in the Remaining Templates box, and click the **Remove** button.

---

- Step 5** You must click the **Apply/Schedule** tab and click **Apply** to add or remove the templates to the config groups.
- Step 6** Click **Save Selection**.

## Applying or Scheduling Config Groups

---

**Note** The scheduling function allows you to schedule a start day and time for provisioning.

---

To apply the mobility groups, mobility members, and templates to all the controllers in a config group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**, and click a group name in the Group Name column.
  - Step 2** Click the **Apply/Schedule** tab to access this page.
  - Step 3** Click **Apply** to start the provisioning of mobility groups, mobility members, and templates to all the controllers in the config group. After you apply, you can leave this page or log out of Cisco NCS. The process continues, and you can return later to this page to view a report.

---

**Note** Do not perform any other config group functions during the apply provisioning.

---

A report is generated and appears in the Recent Apply Report page. It shows which mobility group, mobility member, or template were successfully applied to each of the controllers.

---

**Note** If you want to print the report as shown on the page, you must choose landscape page orientation.

---

- Step 4** Enter a starting date in the text box or use the calendar icon to choose a start date.
- Step 5** Choose the starting time using the hours and minutes drop-down lists.

**Step 6** Click **Schedule** to start the provisioning at the scheduled time.

## Auditing Config Groups

The Config Groups Audit page allows you to verify if the controller's configuration complies with the group templates and mobility group. During the audit, you can leave this screen or logout of Cisco NCS. The process continues, and you can return to this page later to view a report.

**Note** Do not perform any other config group functions during the audit verification.

To perform a config group audit, follow these steps:

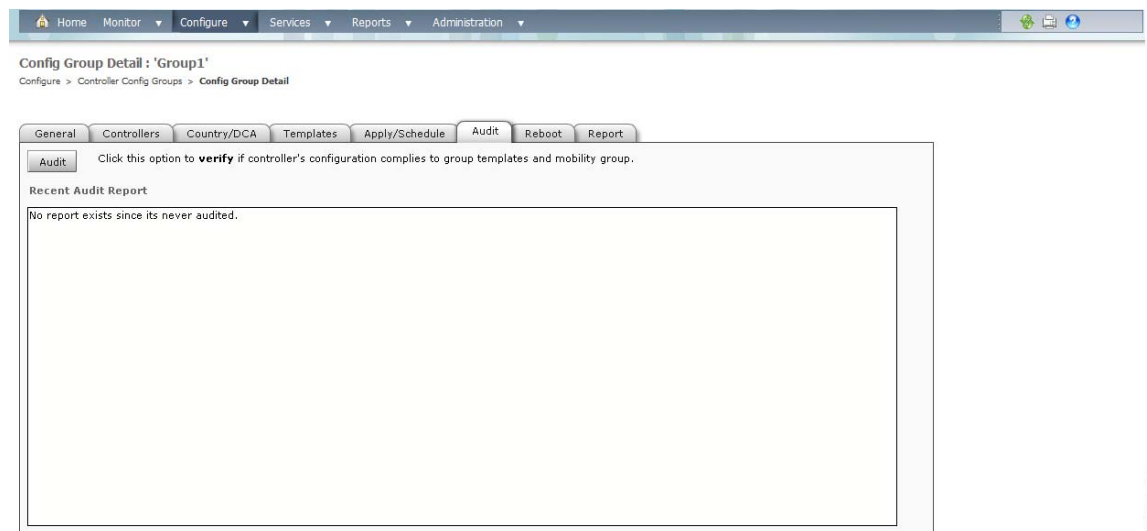

- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column.
- Step 2** Click the **Audit** tab to access this page.
- Step 3** Click to highlight a controller from the Controllers tab, choose **>> (Add)**, and **Save Selection**.
- Step 4** Click to highlight a template from the Templates tab, choose **>> (Add)**, and **Save Selection**.
- Step 5** Click **Audit** to begin the auditing process (see [Figure 8-16](#)).

A report is generated and the current configuration on each controller is compared with that in the config group templates. The report displays the audit status, the number of templates in sync, and the number of templates out of sync.

**Note** This audit does not enforce the NCS configuration to the device. It only identifies the discrepancies.

**Figure 8-16** *Config Groups Audit Tab*

001101

- Step 6** Click **Details** to view the Controller Audit Report details.
- Step 7** Double-click a line item to open the Attribute Differences page. This page displays the attribute, its value in NCS, and its value in the controller.

**Note** Click **Retain NCS Value** to push all attributes in the Attribute Differences page to the device.

- Step 8** Click **Close** to return to the Controller Audit Report page.

## Rebooting Config Groups

To reboot a config group, follow these steps:

- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column.
- Step 2** Click the **Reboot** tab.
- Step 3** Select the **Cascade Reboot** check box if you want to reboot one controller at a time, waiting for that controller to come up before rebooting the next controller.
- Step 4** Click **Reboot** to reboot all controllers in the config group at the same time. During the reboot, you can leave this page or logout of Cisco NCS. The process continues, and you can return later to this page and view a report.

The Recent Reboot Report page shows when each controller was rebooted and what the controller status is after the reboot. If NCS is unable to reboot the controller, a failure is shown.

**Note** If you want to print the report as shown on the page, you must choose landscape page orientation.

## Reporting Config Groups

To display all recently applied reports under a specified group name, follow these steps:

- Step 1** Choose **Configure > Controller Config Groups**, and click a group name under the Group Name column.
- Step 2** Click the **Report** tab. The Recent Apply Report page displays all recently applied reports including the apply status, the date and time the apply was initiated, and the number of templates. The following information is provided for each individual IP address:
- Apply Status—Indicates success, partial success, failure, or not initiated.
  - Successful Templates—Indicates the number of successful templates associated with the applicable IP address.
  - Failures—Indicates the number of failures with the provisioning of mobility group, mobility members, and templates to the applicable controller.

- Details—Click Details to view the individual failures and associated error messages.
- Step 3** If you want to view the scheduled task reports, click the **click here** link at the bottom of the page. You are then redirected to the Configure > Scheduled Configuration Tasks > Config Group menu where you can view reports of the scheduled config groups.
- 

## Downloading Software

To download software to all controllers in the selected groups after you have a config group established, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**.
- Step 2** Select the check box to choose one or more config groups names on the Config Groups page.
- Step 3** Choose **Download Software** from the Select a command drop-down list, and click **Go**.
- Step 4** The Download Software to Controller page appears. The IP address of the controller to receive the bundle and the current status are displayed. Choose **local machine** from the File is Located On parameter.
- Step 5** Enter the maximum number of times the controller should attempt to download the signature file in the Maximum Retries parameter.
- Step 6** Enter the maximum amount of time in seconds before the controller times out while attempting to download the signature file in the Timeout parameter.
- Step 7** The signature files are uploaded to the c:\tftp directory. Specify the local file name in that directory or use the Browse button to navigate to it. The controller uses this local file name as a base name and then adds \_custom.sgi as a suffix.
- If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name is populated for you and retried.
- Step 8** Click **OK**.
- 

## Downloading IDS Signatures

To download Intrusion Detection System (IDS) signature files from your config group to a local TFTP server, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**.
- Step 2** Select the check box to choose one or more config groups on the Config Groups page.
- Step 3** Choose **Download IDS Signatures** from the Select a command drop-down list, and click **Go**.
- Step 4** The Download IDS Signatures to Controller page appears. The IP address of the controller to receive the bundle and the current status are displayed. Choose **local machine** from the File is Located On parameter.
- Step 5** Enter the maximum number of times the controller should attempt to download the signature file in the Maximum Retries parameter.

- Step 6** Enter the maximum amount of time in seconds before the controller times out while attempting to download the signature file in the Timeout parameter.
- Step 7** The signature files are uploaded to the c:\tftp directory. Specify the local file name in that directory or use the Browse button to navigate to it. The controller uses this local file name as a base name and then adds \_custom.sgi as a suffix.
- If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the Server File Name is populated for you and retried.
- Step 8** Click **OK**.
- 

## Downloading Customized WebAuth

To download customized web authentication, follow these steps:

---

- Step 1** Choose **Configure > Controller Config** Groups.
- Step 2** Select the check box to choose one or more config groups on the Config Groups page.
- Step 3** Choose **Download Customized WebAuth** from the Select a command drop-down list, and click **Go**.
- Step 4** The Download Customized Web Auth Bundle to Controller page appears. The IP address of the controller to receive the bundle and the current status are displayed.
- Step 5** Choose **local machine** from the File is Located On parameter.

## CHAPTER 9

# Configuring Devices

---

This chapter describes how to configure devices in the NCS database. It contains the following sections:

- [Configuring Controllers, page 9-1](#)
- [Configuring Existing Controllers, page 9-23](#)
- [Configuring Access Points, page 9-151](#)
- [Configuring Switches, page 9-190](#)
- [Configuring Spectrum Experts, page 9-200](#)
- [Configuring Chokepoints, page 9-204](#)
- [Configuring WiFi TDOA Receivers, page 9-207](#)
- [Configuring Scheduled Configuration Tasks, page 9-211](#)
- [Configuring wIPS Profiles, page 9-220](#)
- [Configuring ACS View Servers, page 9-229](#)
- [Configuring TFTP Servers, page 9-230](#)
- [Interactive Graphs, page 9-230](#)

## Configuring Controllers

This section describes how to configure controllers in the NCS database.

Choose **Configure > Controllers** to access the following:

- A summary of all controllers in the NCS database.
- The ability to add, remove, and reboot selected controllers.
- The ability to download software from the NCS server to selected controllers.
- The ability to save the current configuration to nonvolatile (Flash) memory on selected controllers.
- The ability to view audit reports for selected controllers.

The controllers data table contains the following columns:

- Check box—Select the applicable controller.
- IP Address—Local network IP address of the controller .
  - Click the title to sort the list items.

- Click a list item to display parameters for that IP address. See the “[Viewing Controllers Properties, page 9-23](#)”.
- Click the icon to the right of the IP address to launch the controller Web user interface in a new browser window.
- Device Name—Indicates the name of the controller. Click the **Controller Name** link to sort the list by controller name.
- Device Type—Click to sort by type. Based on the series, device types are grouped. For example:
  - WLC2100—21xx Series Wireless LAN Controllers
  - 2500—25xx Series Wireless LAN Controllers
  - 4400—44xx Series Wireless LAN Controllers
  - 5500—55xx Series Wireless LAN Controllers
  - 7500—75xx Series Wireless LAN Controllers
  - WiSM—WiSM (slot number, port number)
  - WiSM2—WiSM2 (slot number, port number)
- Location—Indicates the location of the controller.
- Software Version—The operating system release.version.dot.maintenance number of the code currently running on the controller.
- Mobility Group Name—Name of the mobility or WPS group.
- Reachability Status—Reachable or not reachable.

---

**Note** Reachability status is updated based on the last execution information of the Device Status background task. For updating the current status, choose **Administration > Background Tasks**, and choose **Execute Now** from the Select a command drop-down list.

---

- Audit Status
  - Not Available—No audit occurred on this switch.
  - Identical—No configuration differences were discovered.
  - Mismatch—Configuration differences were discovered.

Click the **Audit Status** link to access the audit report. In the Audit Report page, choose **Audit Now** from the Select a command drop-down list to run a new audit for this controller. See the “[Understanding the Controller Audit Report, page 9-3](#)” for more information on audit reports.

---

**Note** Audit status is updated based on the last execution information of either the Configuration Sync background task or the Audit Now option located in the Controllers page. To get the current status, either choose **Administration > Background Tasks** and choose **Execute Now** or **Audit Now** from the Select a command drop-down list.

---

---

**Note** Use the Search feature to search for a specific controller. See the “[Using the Search Feature](#)” section on [page 2-33](#) for more information.

---

This section contains the following topics:

- [Understanding the Controller Audit Report, page 9-3](#)
- [Adding Controllers, page 9-4](#)
- [Bulk Update of Controller Credentials, page 9-7](#)
- [Removing Controllers from NCS, page 9-8](#)
- [Rebooting Controllers, page 9-8](#)
- [Downloading Software to Controllers, page 9-9](#)
- [Downloading Software to Controllers, page 9-9](#)
- [Downloading IDS Signatures, page 9-14](#)
- [Downloading a Customized WebAuthentication Bundle to a Controller, page 9-15](#)
- [Downloading a Vendor Device Certificate, page 9-16](#)
- [Downloading a Vendor CA Certificate, page 9-17](#)
- [Saving the Configuration to Flash, page 9-18](#)
- [Refreshing the Configuration from the Controller, page 9-18](#)
- [Discovering Templates from the Controller, page 9-19](#)
- [Updating Credentials in NCS, page 9-19](#)
- [Viewing Templates Applied to a Controller, page 9-20](#)
- [Using the Audit Now Feature, page 9-20](#)
- [Viewing the Latest Network Audit Report, page 9-22](#)

## Understanding the Controller Audit Report

The Controller Audit Report displays the following information depending on the type of audit selected in **Administration > Settings > Audit** and on which parameters the audit is performed:

- Applied template discrepancies (Template Based Audit only)
- Config group template discrepancies (Template Based Audit only)
- Total enforcements for config groups with background audit enabled (Template Based Audit only)
  - If the total enforcement count is greater than zero, this number appears as a link. Click the link to view a list of the enforcements made from NCS.
- Failed for config groups with background audit enabled (Template Based Audit only)
  - If the failed enforcement count is greater than zero, this number appears as a link. Click the link to view the failures returned from the device.
- Other NCS discrepancies

---

**Note**

The controller audit report indicates if the audit was performed on all parameters or on a selected set of parameters.

---

---

**Note**

See the [“Configuring an Audit”](#) section on page 15-74 for more in depth information on the two types of audits and how to manage specific parameters for the audit.

---

A current Controller Audit Report can be accessed in the **Configure > Controllers** page by clicking a value in the Audit Status column.

You can audit a controller by choosing **Audit Now** from the Select a command drop-down list in the **Configure > Controllers** page (See the “Using the Audit Now Feature” section on page 9-20 for more information) or by clicking **Audit Now** in the Controller Audit Report.

## Adding Controllers

You can add controllers one at a time or in batches.

To add controllers, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** From the Select a command drop-down list, choose **Add Controllers**, and click **Go**. The Add Controller page appears (see Figure 9-1).

**Figure 9-1** Add Controller Page

The screenshot shows the 'Add Controllers' page in the Cisco Prime Network Control System. The page has a navigation bar at the top with 'Home', 'Monitor', 'Configure', 'Services', 'Reports', and 'Administration'. Below the navigation bar, the page title is 'Add Controllers' and the breadcrumb is 'Configure > Controllers > Add Controllers'. The page is divided into three sections: 'General Parameters', 'SNMP Parameters', and 'Telnet/SSH Parameters'. In the 'General Parameters' section, 'Add Format Type' is set to 'Device Info', 'IP Addresses' is '209,165,200,224', and 'Wism Auto Add' is unchecked. In the 'SNMP Parameters' section, 'Version' is 'v2c', 'Retries' is '2', 'SNMP Timeout' is '10', and 'Community' is empty. In the 'Telnet/SSH Parameters' section, 'Protocol' is 'Telnet', 'Username' is 'admin', 'Password' and 'Confirm Password' are masked with dots, and 'Telnet Timeout' is '60'. There are 'Add' and 'Cancel' buttons at the bottom.

- Step 3** Choose one of the following:

If you want to add one controller or use commas to separate multiple controllers, leave the Add Format Type drop-down list at Device Info.

If you want to add multiple controllers by importing a CSV file, choose **File** from the Add Format Type drop-down list. The CSV file allows you to generate your own import file and add the devices you want.

**Note** When a controller is removed from the system, the associated access points are not removed automatically and therefore remain in the system. These disassociated access points must be removed manually.

**Note** If you are adding a controller into NCS across a GRE link using IPsec or a lower MTU link with multiple fragments, you may need to adjust the Maximum VarBinds per Get PDU and Maximum VarBinds per Set PDU. If it is set too high, the controller may fail to be added into NCS. To adjust the Maximum VarBinds per Get PDU or Maximum VarBinds per Set PDU, do the following: Stop NCS, choose Administration > Settings > SNMP Settings, and edit the Maximum VarBinds per Get PDU and Maximum VarBinds per Set PDU values to 50 or lower.

**Note** If you reduce the Maximum VarBinds per Get PDU or Maximum VarBinds per Set PDU value, applying the configurations to the device might fail.

**Step 4** If you chose Device Info, enter the IP address of the controller you want to add. If you want to add multiple controllers, use a comma between the string of IP addresses.

**Note** If a partial byte boundary is used and the IP address appears to be broadcast (without regard to the partial byte boundary), there is a limitation on adding the controllers into NCS. For example, 10.0.2.255/23 cannot be added but 10.0.2.254/23 can.

If you chose File, click **Browse** to find the location of the CSV file you want to import.

The first row of the CSV file is used to describe the columns included. The first row of the CSV file is used to describe the columns included. The IP Address column is mandatory. The following example shows a sample CSV file.

```
ip_address, network_mask, snmp_version, snmp_community, snmpv3_user_name, snmpv3_auth_type, snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password, snmp_retries, snmp_timeout, protocol, telnet_username, telnet_password, enable_password, telnet_timeout
209.165.200.225, 255.255.255.224, v2, public, , , , , 3, 10, telnet, cisco, cisco, cisco, 60
209.165.200.226, 255.255.255.224, v2, public, , , , , 3, 10, , cisco, cisco, cisco, 60
209.165.200.227, 255.255.255.224, v2, public, , , , , 3, 10, telnet, cisco, cisco, cisco, 60
```

The CSV files can contain the following fields:

- ip\_address
- network\_mask
- snmp\_version
- snmp\_community
- snmpv3\_user\_name
- snmpv3\_auth\_type
- snmpv3\_auth\_password
- snmpv3\_privacy\_type
- snmpv3\_privacy\_password
- snmp\_retries

- snmp\_timeout
- protocol
- telnet\_username
- telnet\_password
- enable\_password
- telnet\_timeout

**Step 5** Select the **Verify Telnet/SSH Credentials** check box if you want this controller to verify Telnet/SSH credentials. You may want to leave this unselected (or disabled) because of the substantial time it takes for discovery of the devices.

**Step 6** Use the Version drop-down list to choose v1, v2, or v3.

**Step 7** In the Retries parameter, enter the number of times that attempts are made to discover the controller.

**Step 8** Provide the client session timeout value in seconds. This determines the maximum amount of time allowed for a client before it is forced to reauthenticate.

**Step 9** In the Community parameter, enter either public or private (for v1 and v2 only).

---

**Note** If you go back and later change the community mode, you must perform a refresh config for that controller.

---

**Step 10** Choose None, HMAC-SHA, or HMAC-MD5 (for v3 only) for the authorization type.

**Step 11** Enter the authorization password (for v3 only).

**Step 12** Enter None, CBC-DES, or CFB-AES-128 (for v3 only) for the privacy type.

**Step 13** Enter the privacy password (for v3 only).

**Step 14** Enter the Telnet credentials information for the controller. If you chose the File option and added multiple controllers, the information will apply to all specified controllers. If you added controllers from a CSV file, the username and password information is obtained from the CSV file.

---

**Note** The Telnet/SSH username must have sufficient privileges to execute commands in CLI templates.

---

The default username and password is admin.

**Step 15** Enter the retries and timeout values. The default retries number is 3, and the default retry timeout is 1 minute.

**Step 16** Click **OK**.

---

**Note** If you fail to add a device to NCS, and if the error message ‘Sparse table not supported’ occurs, verify that NCS and WLC versions are compatible and retry. For information on compatible versions, see [http://www.cisco.com/en/US/docs/wireless/controller/4400/tech\\_notes/Wireless\\_Software\\_Compatibility\\_Matrix.html](http://www.cisco.com/en/US/docs/wireless/controller/4400/tech_notes/Wireless_Software_Compatibility_Matrix.html).

---

**Note** When a controller is added to the NCS, the NCS acts as a TRAP receiver and the following traps are enabled on the controller: 802.11 Disassociation, 802.11 Deauthentication, and 802.11 Authenticated.

**Note** To update the credentials of multiple controllers in a bulk, choose Bulk Update Controllers from the Select a command drop-down list. The Bulk Update Controllers page appears. You can choose a CSV file. The CSV file contains a list of controllers to be updated, one controller per line. Each line is a comma separated list of controller attributes. The first line describes the attributes included. The IP address attribute is mandatory. For details, see the NCS Configuration Guide.

## Bulk Update of Controller Credentials

You can update multiple controllers credentials by importing a CSV file.

To update controller(s) information in a bulk, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box(es) of the applicable controller(s).
  - Step 3** From the Select a command drop-down list, choose **Bulk Update Controller**. The Bulk Update Controller page appears.
  - Step 4** Click **Choose File** to select a CSV file, and then find the location of the CSV file you want to import.
  - Step 5** Click **Update and Sync**.
- 

### Sample CSV File for the Bulk Update of Controller Credentials

The first row of the CSV file is used to describe the columns included. The IP Address column is mandatory. The following example shows a sample CSV file.

```
ip_address,network_mask,snmp_version,snmp_community,snmpv3_user_name,snmpv3_auth_type,snmp
v3_auth_password,snmpv3_privacy_type,snmpv3_privacy_password,snmp_retries,snmp_timeout,pro
tocol,telnet_username,telnet_password,enable_password,telnet_timeout
209.165.200.225,255.255.255.224,v2,public,,,,,3,10,telnet,cisco,cisco,cisco,60
209.165.200.226,255.255.255.224,v2,public,,,,,3,10,,cisco,cisco,cisco,60
209.165.200.227,255.255.255.224,v2,public,,,,,3,10,telnet,cisco,cisco,cisco,60
```

The CSV files can contain the following fields:

- ip\_address
- network\_mask
- snmp\_version
- snmp\_community
- snmpv3\_user\_name

- snmpv3\_auth\_type
- snmpv3\_auth\_password
- snmpv3\_privacy\_type
- snmpv3\_privacy\_password
- snmp\_retries
- snmp\_timeout
- protocol
- telnet\_username
- telnet\_password
- enable\_password
- telnet\_timeout

## Removing Controllers from NCS

To remove a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box(es) of the applicable controller(s).
  - Step 3** From the Select a command drop-down list, choose **Remove Controllers**.
  - Step 4** Click **Go**.
  - Step 5** Click **OK** in the pop-up dialog box to confirm the deletion.

**Note**

---

When a controller is removed from the system, the associated access points are not removed automatically and, therefore, remain in the system. These disassociated access points must be removed manually.

---

## Rebooting Controllers

To reboot a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box(es) of the applicable controller(s).
  - Step 3** From the Select a command drop-down list, choose **Reboot Controllers**.
  - Step 4** Click **Go**. The Reboot Controllers page appears (see [Figure 9-2](#)).

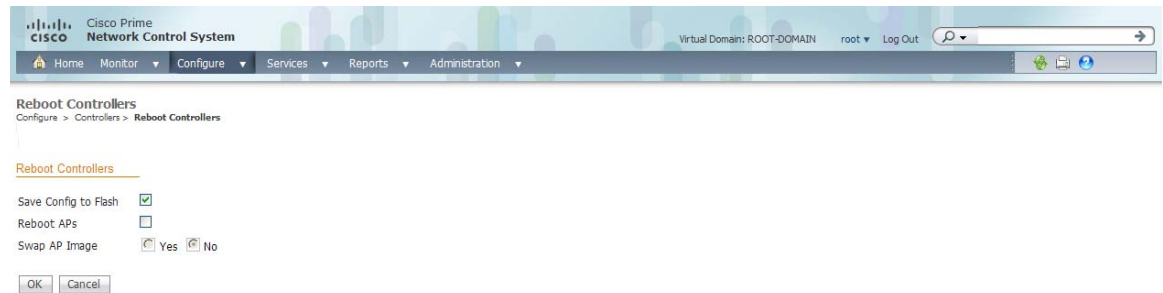

**Note**

---

Save the current controller configuration prior to rebooting.

---

Figure 9-2 Reboot Controllers Page

- Step 5** Select the Reboot Controller options that must be applied.
- **Save Config to Flash**—Data is saved to the controller in non-volatile RAM (NVRAM) and is preserved in the event of a power cycle. If the controller is rebooted, all applied changes are lost unless the configuration has been saved.
  - **Reboot APs**—Select the check box to enable a reboot of the access point after making any other updates.
  - **Swap AP Image**—Indicates whether or not to reboot controllers and APs by swapping AP images. This could be either Yes or No.

**Note** Options are disabled unless the Reboot APs check box is selected

- Step 6** Click **OK** to reboot the Controller with optional configuration selected.

## Downloading Software to Controllers

Both File Transfer Protocol (FTP) and Trivial File Transfer Protocol (TFTP) are supported for uploading and downloading files to and from NCS. In previous software releases, only TFTP was supported.

This section contains the following topics:

- [Download Software \(FTP\), page 9-9](#)
- [Download Software \(TFTP\), page 9-11](#)
- [Configure IPAddr Upload Configuration/Logs from Controller, page 9-13](#)

### Download Software (FTP)

To download software to a controller, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Select the check box(es) of the applicable controller(s).
- Step 3** From the Select a command drop-down list, choose **Download Software (FTP)**.
- Step 4** Click **Go**.

**Note** Software can also be downloaded by choosing **Configure > Controllers > IPaddr > System > Commands > Upload/Download Commands > Download Software**.

The IP address of the controller and its current status appears in the **Download Software to Controller** page.

**Step 5** Select the download type.

**Note** The pre-download option is displayed only when all selected controllers are using the version 7.0.x.x or later.

- Now—Executes the download software operation immediately. If you select this option, proceed with Step 7.

**Note** After the download is successful, reboot the controllers to enable the new software.

- Scheduled—Specify the scheduled download options.
  - Schedule download to controller—Select this check box to schedule download software to controller.
  - Pre-download software to APs—Select this check box to schedule the pre-download software to APs. The APs download the image and then reboot when the controller reboots.

**Note** To see Image Predownload status per AP, enable the task in the Administration > Background Task > AP Image Predownload Task page, and run an AP Image Predownload report from the Report Launch Pad.

**Step 6** If you selected the Scheduled option under Download type, enter the Schedule Details.

- Task Name—Enter a Scheduled Task Name to identify this scheduled software download task.
- Reboot Type—Indicates whether the reboot type is manual, automatic, or scheduled.

**Note** Reboot Type Automatic can be set when the only Download software to controller option is selected.

- Download date/time—Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date. Choose the time from the hours and minutes drop-down lists.
- Reboot date/time—This option appears only if you select the reboot type as “Scheduled”. Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date to reboot the controller. Choose the time from the hours and minutes drop-down lists.

**Note** Schedule enough time (at least 30mins) between Download and Reboot so that all APs can complete the software pre-download.

**Note** If any one of the AP is in pre-download progress state at the time of scheduled reboot, the controller will not reboot. In such a case, wait for the pre-download to finish for all the APs and reboot the controller manually.

- Notification (Optional)—Enter the e-mail address of recipient to send notifications via e-mail.

**Note** To receive email notifications, configure the NCS mail server in the **Administration > Settings > Mail Server Configuration** page.

**Step 7** Enter the FTP credentials including username, password, and port.

**Step 8** In the File is located on parameter, click either the **Local machine** or **FTP Server**.

**Note** If you choose FTP Server, choose **Default Server** or **New** from the Server Name drop-down list.

**Note** The software files are uploaded to the FTP directory specified during the install.

**Step 9** Specify the local file name or click **Browse** to navigate to the appropriate file.

**Note** If you chose FTP Server previously, specify the server filename.

**Step 10** Click **Download**.

**Note** If the transfer times out for some reason, you can choose the FTP server option in the **File is located** on parameter; the server filename is populated and retried.

## Download Software (TFTP)

To download software to a controller, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** Select the check box(es) of the applicable controller(s).

**Step 3** In the Select a command drop-down list, choose **Download Software (TFTP)**.

**Step 4** Click **Go**.

**Note** Software can also be downloaded from **Configure > Controllers > IPaddr > System > Commands > Upload/Download Commands > Download Software**.

The IP address of the controller and its current status are displayed in the Download Software to Controller page.

**Step 5** Select the download type.

**Note** The pre-download option is displayed only when all selected controllers are using the version 7.0.x.x or later.

- **Now**—Executes the download software operation immediately. If you select this option, proceed with Step 7.

**Note** After the download is successful, reboot the controllers to enable the new software.

- **Scheduled**—Specify the scheduled download options.
  - **Download software to controller**—Select this option to schedule download software to controller.
  - **Pre-download software to APs**—Select this option to schedule the pre-download software to APs. The APs download the image and then reboot when the controller reboots.

**Note** To see Image Predownload status per AP, enable the task in the Administration > Background Task > AP Image Predownload Task page, and run an AP Image Predownload report from the Report Launch Pad.

**Step 6** If you selected the Scheduled option under Download type, enter the Schedule Detail.

- **Task Name**—Enter a Scheduled Task Name to identify this scheduled software download task.
- **Reboot Type**—Indicates whether the reboot type is manual, automatic, or scheduled.

**Note** Reboot Type **Automatic** can be set when only Download software to controller option is selected.

- **Download date/time**—Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date. Choose the time from the hours and minutes drop-down lists.
- **Reboot date/time**—This option appears only if you select the reboot type as “Scheduled”. Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date to reboot the controller. Choose the time from the hours and minutes drop-down lists.

**Note** Schedule enough time (at least 30 minutes) between Download and Reboot so that all APs can complete the software pre-download.

**Note** If any one of the AP is in pre-download progress state at the time of scheduled reboot, the controller will not reboot. In such a case, wait for the pre-download to finish for all the APs and reboot the controller manually.

- **Notification (Optional)**—Enter the e-mail address of recipient to send notifications via e-mail.

**Note** To receive email notifications, configure the NCS mail server in the Administration > Settings > Mail Server Configuration page.

**Step 7** From the File is located on parameter, choose **Local machine** or **TFTP server**.

**Note** If you choose TFTP server, select the Default Server or add a New server using the Server Name drop-down list.

**Step 8** From the Maximum Retries parameter, enter the maximum number of tries the controller should attempt to download the software.

**Step 9** In the Timeout parameter, enter the maximum amount of time (in seconds) before the controller times out while attempting to download the software.

**Note** The software files are uploaded to the TFTP directory specified during the install.

**Step 10** Specify the local file name or click **Browse** to navigate to the appropriate file.

**Note** If you selected TFTP server previously, specify the Server File Name.

**Step 11** Click **Download**.

**Tip** If the transfer times out for some reason, you can choose the TFTP server option in the File is located on parameter; the Server File Name is populated and retried.

## Configure *IPaddr* Upload Configuration/Logs from Controller

To upload files from the controller, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click an IP address under the IP address column.

**Step 3** From the left sidebar menu, choose **System > Commands**.

**Step 4** Select the **FTP** or **TFTP** radio button.

**Note** Both File Transfer Protocol (FTP) and Trivial Transfer Protocol (TFTP) are supported for uploading and downloading files to and from NCS. In previous software releases, only TFTP was supported.

**Step 5** From the Upload/Download Commands drop-down list, choose **Upload File from Controller**.

**Step 6** Click **Go** to access this page.

- FTP Credentials Information—Enter the FTP username, password, and port if you selected the FTP radio button previously.
- TFTP or FTP Server Information:
  - Server Name—From the drop-down list, choose **Default Server** or **New**.
  - IP Address—IP address of the controller. This is automatically populated if the default server is selected.
  - File Type—Select from configuration, event log, message log, trap log, crash file, signature files, or PAC.
  - Enter the Upload to File from /(root)/NCS-tftp/ or /(root)/NCS-ftp/ filename.
  - Select whether or not Cisco NCS saves before backing up the configuration.

---

**Note** The Cisco NCS uses an integral TFTP and FTP server. This means that third-party TFTP and FTP servers cannot run on the same workstation as the Cisco NCS, because the Cisco NCS and the third-party servers use the same communication port.

---

- Step 7** Click **OK**. The selected file will be uploaded to your TFTP or FTP server and named what you entered in the File Name text box.
- 

## Downloading IDS Signatures

To download Intrusion Detection System (IDS) signature files to a controller, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Select the check box(es) of the applicable controller(s).
- Step 3** From the Select a command drop-down list, choose **Download IDS Signatures**.
- Step 4** Click **Go**.

---

**Note** IDS signature files can also be downloaded from **Configure > Controllers > IPAddr > System > Commands > Upload/Download Commands > Download IDS Signatures**.

---

In the Download IDS Signatures to Controller page, the controller IP address and its current status appears.

- Step 5** Copy the signature file (\*.sig) to the default directory on your TFTP server.
- Step 6** In the File is located on parameter, select the **Local machine** radio button.

---

**Note** If you know the filename and path relative to the server root directory, you can also select the **TFTP server** radio button.

---

- Step 7** In the Maximum Retries text box, enter the maximum number of tries the controller should attempt to download the signature file.

- Step 8** In the Timeout text box, enter the maximum amount of time (in seconds) before the controller times out while attempting to download the signature file.

**Note** The signature files are uploaded to the c:\tftp directory.

- Step 9** Specify the local file name or click **Browse** to navigate to the appropriate file. The controller uses this local file name as a base name and adds *\_custom.sgi* as a suffix.

**Note** If you chose TFTP server previously, specify the server file name.

- Step 10** Click **Download**.

**Tip** If the transfer times out for some reason, you can choose the TFTP server option in the File is located on parameter; the server file name is populated and retried.

**Note** The local machine option initiates a two-step operation. First, the local file is copied from the administrator workstation to NCS own built-in TFTP server. Then the controller retrieves that file. For later operations, the file is already in the NCS server TFTP directory, and the downloaded web page now automatically populates the filename.

## Downloading a Customized WebAuthentication Bundle to a Controller

To download customized web authentication bundle to a controller, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Select the check box(es) of the applicable controller(s).
- Step 3** From the Select a command drop-down list, choose **Download Customized WebAuth**.
- Step 4** Click **Go**.

**Note** A customized web authentication bundle can also be downloaded from Configure > Controllers > IPAddr > System > Commands > Upload/Download Commands > Download Customized Web Auth.

In the Download Customized WebAuth bundle to Controller page, the controller IP address and its current status appears.

- Step 5** Select the **Local machine** radio button in the File is located on parameter.

**Note** If you know the file name and path relative to the server root directory, you can also select the **TFTP server** radio button.

---

**Note** For a local machine download, either .zip or .tar file options exists but the NCS does the conversion of .zip to .tar automatically. If you choose a TFTP server download, only .tar files are specified.

---

**Step 6** In the Maximum Retries text box, enter the maximum number of tries the controller should attempt to download the file.

**Step 7** In the Timeout text box, enter the maximum amount of time (in seconds) before the controller times out while attempting to download the file.

---

**Note** The NCS Server Files In parameter specifies where the NCS server files are located.

---

**Step 8** Specify the local file name or click **Browse** to navigate to the appropriate file. The controller uses this local file name as a base name and adds *\_custom.sgi* as a suffix.

**Step 9** Click **Download**.

---

**Tip** If the transfer times out for some reason, you can select the **TFTP server** radio button in the File is located on parameter; the server file name is populated and retried.

---

**Step 10** The local machine option initiates a two-step operation. First, the local file is copied from the administrator workstation to NCS own built-in TFTP server. Then the controller retrieves that file. For later operations, the file is already in the NCS server TFTP directory, and the downloaded web page now automatically populates the filename.

**Step 11** After completing the download, you are directed to a new page and are able to authenticate.

---

## Downloading a Vendor Device Certificate

Each wireless device (controller, access point, and client) has its own device certificate. If you wish to use your own vendor-specific device certificate, it must be downloaded to the controller.

To download a vendor device certificate to a controller, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

**Step 2** You can download the certificate in one of two ways:

- a. Select the check box(es) of the applicable controller(s).
- b. From the Select a command drop-down list, choose **Download Vendor Device Certificate**.
- c. Click **Go**.

-or-

- a. Click the IP address of the desired controller.
- b. Choose **System > Commands** from the left sidebar menu.
- c. From the Upload/Download Commands drop-down list, choose **Download Vendor Device Certificate**.

d. Click **Go**.

**Step 3** In the Certificate Password text box, enter the password used to protect the certificate.

**Step 4** Re-enter the password in the Confirm Password text box.

**Step 5** In the File is located on parameter, select the **Local machine** or **TFTP server** radio button.

**Note** If the certificate is located on the TFTP server, enter the Server File Name. If it is located on the local machine, enter the local file name by clicking **Browse**.

**Step 6** Enter the TFTP server name in the Server Name parameter. The default is the NCS server.

**Step 7** Enter the server IP address.

**Step 8** In the Maximum Retries text box, enter the maximum number of times that the TFTP server attempts to download the certificate.

**Step 9** In the Timeout text box, enter the amount of time (in seconds) that the TFTP server attempts to download the certificate.

**Step 10** In the Local File Name text box, enter the directory path of the certificate.

**Step 11** In the Server File Name text box, enter the name of the certificate.

**Step 12** Click **Download**.

## Downloading a Vendor CA Certificate

Controllers and access points have a certificate authority (CA) certificate that is used to sign and validate device certificates. The controller is shipped with a Cisco-installed CA certificate. This certificate may be used by EAP-TLS and EAP-FAST (when not using PACs) to authenticate wireless clients during local EAP authentication. However, if you wish to use your own vendor-specific CA certificate, it must be downloaded to the controller.

To download a vendor CA certificate to the controller, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** You can download the certificate in one of two ways:

- a. Select the check box(es) of the applicable controller(s).
- b. From the Select a command drop-down list, choose **Download Vendor CA Certificate**.
- c. Click **Go**.

-or-

- a. Click the IP address of the desired controller.
- b. Choose **System > Commands** from the left sidebar menu.
- c. From the Upload/Download Commands drop-down list, choose **Download Vendor CA Certificate**.
- d. Click **Go**.

**Step 3** In the File is located on parameter, Select the **Local machine** or **TFTP server** radio button.

---

**Note** If the certificate is located on the TFTP server, enter the server file name. If it is located on the local machine, enter the local file name by clicking the **Browse** button.

---

- Step 4** Enter the TFTP server name in the Server Name text box. The default is the NCS server.
  - Step 5** Enter the server IP address.
  - Step 6** In the Maximum Retries text box, enter the maximum number of times that the TFTP server attempts to download the certificate.
  - Step 7** In the Timeout text box, enter the amount of time (in seconds) that the TFTP server attempts to download the certificate.
  - Step 8** In the Local File Name text box, enter the directory path of the certificate.
  - Step 9** In the Server File Name text box, enter the name of the certificate.
  - Step 10** Click **OK**.
- 

## Saving the Configuration to Flash

To save the configuration to flash memory, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box(es) for the applicable controller(s).
  - Step 3** From the Select a command drop-down list, choose **Save Config to Flash**.
  - Step 4** Click **Go**.
- 

## Refreshing the Configuration from the Controller

To refresh the configuration from the controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box(es) for the applicable controller(s).
  - Step 3** From the Select a command drop-down list, choose **Refresh Config from Controller**.
  - Step 4** Click **Go**.
  - Step 5** At the **Configuration Change** prompt, select the **Retain** or **Delete** radio button.
  - Step 6** Click **Go**.
-

## Discovering Templates from the Controller

Prior to software release 5.1, templates were detected when a controller was detected, and every configuration found on NCS for a controller had an associated template. Now templates are not automatically detected with controller discovery, and you can specify which NCS configurations you want to have associated templates.

---

**Note** The templates that are discovered do not retrieve management or local user passwords.

---

The following rules apply for template discovery:

- Template Discovery discovers templates that are not found in NCS.
- Existing templates are not discovered.

To discover current templates, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box of the controller for which you want to discover templates.
  - Step 3** From the Select a command drop-down list, choose **Discover Templates from Controller**.
  - Step 4** Click **Go**. The Discover Templates page displays the number of discovered templates, each template type and each template name.

---

**Note** You can choose the **Enabling this option will create association between discovered templates and the device listed above check box** so that discovered templates will be associated to the configuration on the device and will be shown as applied on that controller.

---

---

**Note** Template discovery refreshes configuration from the controller prior to discovering templates. Click **OK** in the warning dialog box to continue with the discovery.

---

## Updating Credentials in NCS

To update SNMP/Telnet credential details in NCS for multiple controllers, there is no configuration available. To perform this mass update, you need to go to each device and update the SNMP and Telnet credentials.

To update the SNMP/Telnet credentials, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box for each controller to which you want to update SNMP/Telnet credentials.
  - Step 3** From the **Select a command** drop-down list, choose **Update Credentials in NCS**. The Update Credentials in NCS page appears.
  - Step 4** Select the **SNMP Parameters** check box and specify the following parameters:

---

**Note** SNMP write access parameters are needed for modifying controller configuration. With read-only access parameters, configuration can only be displayed.

---

- Version—Choose from v1, v2, or v3.
- Retries—Indicates the number of controller discovery attempts.
- Timeout—Indicate the amount of time (in seconds) allowed before the process time outs. The valid range is 2 to 90 seconds. The default is 2 seconds.
- Community—Public or Private.
- Verify SNMP Credentials—Select this check box to verify SNMP credentials.

**Step 5** Select the **Telnet/SSH Parameters** check box and specify the following parameters:

- User Name—Enter the user name.
  - Password/Confirm Password—Enter and confirm the password.
  - Timeout—Indicate the amount of time (in seconds) allowed before the process time outs. The valid range is 2 to 90 seconds. The default is 60 seconds.
- 

## Viewing Templates Applied to a Controller

You can view all templates currently applied to a specific controller.

---

**Note** Only templates applied in this partition are displayed.

---

To view applied templates, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Select the check box for the applicable controller.
  - Step 3** From the Select a command drop-down list, choose **Templates Applied to a Controller**.
  - Step 4** Click **Go**. The Templates Applied to a Controller page displays each applied template name, template type, the date the template was last saved, and the date the template was last applied.

---

**Note** Click the template name link to view the template details. See “Using Templates” for more information.

---

## Using the Audit Now Feature

You can audit a controller by choosing **Audit Now** from the Select a command drop-down list in the Configure > Controllers page or by choosing **Audit Now** directly from the Select a command drop-down list.

**Note**

A current Controller Audit Report can be accessed in the Configure > Controllers page by clicking a value in the Audit Status column.

To audit a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Select the check box for the applicable controller.
- Step 3** From the Select a command drop-down list, choose **Audit Now**.
- Step 4** Click **Go**.
- Step 5** Click **OK** in the pop-up dialog box if you want to remove the template associations from configuration objects in the database as well as template associations for this controller from associated config groups (Template based audit only).

The Audit Report displays:

- Device Name
- Time of Audit
- Audit Status
- Applied and Config Group Template Discrepancies information including:
  - Template type (template name)
  - Template application method
  - Audit status (For example, mismatch, identical)
  - Template attribute
  - Value in NCS
  - Value in Controller
- Other NCS Discrepancies including:
  - Configuration type (name)
  - Audit Status (For example, mismatch, identical)
  - Attribute
  - Value in NCS
  - Value in Controller
- Total enforcements for config groups with background audit enabled—If discrepancies are found during the audit in regards to the config groups enabled for background audit and if the enforcement is enabled, this section lists the enforcements made during the controller audit. Choose Config Groups > General for more information on enabling the background audit.
- Failed Enforcements for Config Groups with background audit enabled—Click the link to view a list of failure details (including the reason for the failure) returned by the device. See “[Config Groups > General](#)” for more information on enabling the background audit (ConfigAuditSet).
- Restore NCS Values to Controller or Refresh Config from Controller—If there are config differences found as a result of the audit, you can either click **Restore NCS Values to controller** or **Refresh Config from controller** to bring the NCS configuration in sync with the controller.
  - Choose **Restore NCS Values to Controller** to push the discrepancies to the device.

- Choose **Refresh config from controller** to pick up the device for this configuration from the device.

**Note** Templates are not refreshed as a result of clicking Refresh Config from Controller.

## Viewing the Latest Network Audit Report

The Network Audit Report shows the time of the audit, the IP address of the selected controller, and the synchronization status.

**Note** This method shows the report from the network audit task and not an on-demand audit per controller.

To view the latest network audit report for the selected controllers, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Select the check box for the applicable controller.
- Step 3** From the Select a command drop-down list, choose **View Latest Network Configuration Audit Report**.
- Step 4** Click **Go**.

The Audit Summary displays the time of the audit, the IP address of the selected controller, and the audit status. The Audit Details display the config differences, if applicable.

**Note** Use the General and Schedule tabs to revise Audit Report parameters. See [“Configuration Audit Report”](#) section for more information.

### Command Buttons

- **Save**—Click to save changes made to the current parameters.
- **Save and Run**—Click to save the changes to the current parameters and run the report.
- **Run Now**—Click to run the audit report based on existing parameters.
- **Export Now**—Click to export the report results. The supported export formats is PDF and CSV.
- **Cancel**—Click to cancel any changes made to the existing parameters.

**Note** From the All Controllers page, click the Audit Status column value to view the latest audit details page for the selected controller. This method has similar information as the Network Audit report on the Reports menu, but this report is interactive and per controller.

**Note**

To run an on-demand audit report, choose which controller you want to run the report on and choose **Audit Now** from the Select a command drop-down list. If you run an on-demand audit report and configuration differences are detected, you are given the option to retain the existing controller or NCS values.

## Configuring Existing Controllers

This section contains the following topics:

- [Viewing Controllers Properties, page 9-23](#)
- [Configuring Controller System Parameters, page 9-25](#)
- [Configuring Controller WLANs, page 9-64](#)
- [Configuring Hybrid REAP Parameters, page 9-79](#)
- [Configuring Security Parameters, page 9-81](#)
- [Configuring Cisco Access Points, page 9-110](#)
- [Configuring 802.11 Parameters, page 9-112](#)
- [Configuring 802.11a/n Parameters, page 9-117](#)
- [Configuring 802.11b/g/n Parameters, page 9-129](#)
- [Configuring Mesh Parameters, page 9-139](#)
- [Configuring Port Parameters, page 9-142](#)
- [Configuring Controllers Management Parameters, page 9-143](#)
- [Configuring Location Configurations, page 9-149](#)

## Viewing Controllers Properties

To view the properties for current controllers, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Properties > Settings**. The following parameters appear:
- General Parameters:
    - Name—Name assigned to the controller.
    - Type—Controller type.
    - Restore on Cold Start Trap—Select to enable a restore on a cold start trap.
    - Auto Refresh on Save Config Trap—Select to enable an automatic refresh on a Save Config trap.
    - Trap Destination Port—Read-only.
    - Software Version—Read-only.
    - Location—Location of the controller.

- Contact—The contact person for this controller.
- Most Recent Backup—The date and time of the most recent backup.
- Save Before Backup—Select to enable a save before backup.
- SNMP Parameters:

---

**Note** SNMP write access parameters are needed for modifying controller configuration. With read-only access parameters, configuration can only be displayed.

---

- Version—Choose from v1, v2, or v3.
- Retries—Indicates the number of controller discovery attempts.
- Timeout (seconds)—Client Session timeout. Sets the maximum amount of time allowed a client before it is forced to reauthenticate.
- Community—Public or Private.
- Access Mode—Read Write

---

**Note** Community settings only apply to v1 and v2.

---

- User Name—Enter a username.
- Auth. Type—Choose an authentication type from the drop-down list or choose **None**.
- Auth. Password—Enter an authentication password.
- Privacy Type—Choose a privacy type from the drop-down list or choose **None**.
- Privacy Password—Enter a privacy password.

---

**Note** User Name, Auth. Type, Auth. Password, Privacy Type, and Privacy Password only display for v3.

---

- Telnet/SSH Parameters:
  - User Name—Enter the user name. (Default username is admin.)

---

**Note** The Telnet/SSH username must have sufficient privileges to execute commands in CLI templates.

---

- Password/Confirm Password—Enter and confirm the password. (Default password is admin.)
- Retries—Indicate the number of allowed retry attempts. The default is three.
- Timeout—Indicate the amount of time (in seconds) allowed before the process time outs. The default is 60 seconds.

---

**Note** Default values are used if the Telnet/SSH parameters are left blank.

---

- Step 4** If you made changes to this controller properties, click **OK** to confirm the changes, **Reset** to return to the previous or default settings, or **Cancel** to return to the **Configure > Controllers** page without making any changes to these settings.
- 

## Configuring Controller System Parameters

This section describes how to configure the controller system parameters and includes the following topics:

- [Managing General System Properties for Controllers, page 9-25](#)
- [Configuring Controller System Commands, page 9-31](#)
- [Configuring Controller System Interfaces, page 9-38](#)
- [Configuring Controller System Interface Groups, page 9-41](#)
- [Configuring Controller Network Routes, page 9-49](#)
- [Configuring Controller Spanning Tree Protocol Parameters, page 9-50](#)
- [Configuring Controller Mobility Groups, page 9-50](#)
- [Configuring Controller Network Time Protocol, page 9-53](#)
- [Configuring Controller QoS Profiles, page 9-56](#)
- [Configuring Controller DHCP Scopes, page 9-56](#)
- [Configuring Controller User Roles, page 9-57](#)
- [Configuring a Global Access Point Password, page 9-59](#)
- [Configuring AP 802.1X Supplicant Credentials](#)
- [Configuring Controller DHCP, page 9-61](#)
- [Configuring Controller Multicast Mode, page 9-62](#)
- [Configuring Access Point Timer Settings, page 9-63](#)

## Managing General System Properties for Controllers

To view the general system parameters for a current controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > General**. The following parameters appear:
- 802.3x Flow Control Mode—Disable or enable. See the [“802.3x Flow Control” section on page 9-29](#) for more information.
  - 802.3 Bridging—Disable or enable. See the [“Configuring 802.3 Bridging” section on page 9-29](#) for more information.
  - Web Radius Authentication—Choose PAP, CHAP, or MD5-CHAP.
    - PAP—Password Authentication Protocol. Authentication method where user information (username and password) is transmitted in clear text.

- CHAP—Challenge Handshake Authentication Protocol. Authentication method where user information is encrypted for transmission.
- MD5-CHAP—Message Digest 5 Challenge Handshake Authentication Protocol. With MD5, passwords are hashed using the Message Digest 5 algorithm.
- AP Primary Discovery Timeout—Enter a value between 30 and 3600 seconds.

The access point maintains a list of backup controllers and periodically sends primary discovery requests to each entry in the list. When configured, the primary discovery request timer specifies the amount of time that a controller has to respond to the discovery request of the access point before the access point assumes that the controller cannot be joined and waits for a discovery response from the next controller in the list.

- CAPWAP Transport Mode—Layer 3 or Layer 2. See the “[Lightweight Access Point Protocol Transport Mode, page 9-29](#)” for more information.
- Current LWAPP Operating Mode—Automatically populated.
- Broadcast Forwarding—Disable or enable.
- LAG Mode—Choose **Disable** if you want to disable LAG.

Link aggregation (LAG) is a partial implementation of the 802.3ad port aggregation standard. It bundles all of the controller distribution system ports into a single 802.3ad port channel, thereby reducing the number of IP addresses needed to configure the ports on your controller. When LAG is enabled, the system dynamically manages port redundancy and load balances access points transparently to the user.

---

**Note** LAG is disabled by default on the Cisco 5500 and 4400 series controllers but enabled by default on the Cisco WiSM and the controller in the Catalyst 3750G Integrated Wireless LAN Controller Switch.

---

See the “[Link Aggregation](#)” section on [page 9-31](#) for more information.

- Ethernet Multicast Support
  - Disable—Select to disable multicast support on the controller.
  - Unicast—Select if the controller, upon receiving a multicast packet, forwards the packets to all the associated access points.

---

**Note** H-REAP supports only unicast mode.

---

- Multicast—Select to enable multicast support on the controller.
- Aggressive Load Balancing—Disable or enable. See the “[Aggressive Load Balancing](#)” section on [page 9-30](#)” for more information on load balancing.
- Peer to Peer Blocking Mode
  - Disable—Same-subnet clients communicate through the controller.
  - Enable—Same-subnet clients communicate through a higher-level router.
- Over Air Provision AP Mode—Disable or enable.

Over-the-air provisioning (OTAP) is supported by Cisco 5500 and 4400 series controllers. If this feature is enabled on the controller, all associated access points transmit wireless CAPWAP or LWAPP neighbor messages, and new access points receive the controller IP address from these messages. This feature is disabled by default and should remain disabled when all access points are installed.

---

**Note** Disabling OTAP on the controller does not disable it on the access point. OTAP cannot be disabled on the access point.

---

---

**Note** You can find additional information about OTAP at this URL:  
[http://www.ciscosystems.com/en/US/products/ps6366/products\\_tech\\_note09186a008093d74a.shtml](http://www.ciscosystems.com/en/US/products/ps6366/products_tech_note09186a008093d74a.shtml)

---

- AP Fallback—Disable or enable.

---

**Note** Enabling AP Fallback causes an access point which lost a primary controller connection to automatically return to service when the primary controller returns.

---

- AP Failover Priority—Disable or enable.

---

**Note** To configure failover priority settings for access points, you must first enable the AP Failover Priority feature. See the “[AP Failover Priority](#)” section on page 9-28 for more information.

---

- AppleTalk Bridging—Disable or enable.
- Fast SSID change—Disable or enable.

When fast SSID changing is enabled, the controller allows clients to move between SSIDs. When the client sends a new association for a different SSID, the client entry in the controller connection table is cleared before the client is added to the new SSID. When fast SSID changing is disabled, the controller enforces a delay before clients are allowed to move to a new SSID.

---

**Note** If enabled, the client connects instantly to the controller between SSIDs without having appreciable loss of connectivity.

---

- Master Controller Mode—Disable or enable.

---

**Note** Because the master controller is normally not used in a deployed network, the master controller setting is automatically disabled upon reboot or OS code upgrade.

---

- Wireless Management—Disable or enable. See the “[Wireless Management](#)” section on page 9-31 for more information.
- Symmetric Tunneling Mode

- ACL Counters—Disable or enable. The number of hits are displayed in the ACL Rule page. See the “[Configuring Access Control Lists](#)” section on page 9-98 or the “[Configure IPaddr > Access Control List > listname Rules](#)” section on page 9-98 for more information.
- Multicast Mobility Mode—Disable or enable. See the “[Setting the Mobility Scalability Parameters](#)” section on page 9-52” for more information.
- Default Mobility Domain Name—Enter domain name.
- Mobility Anchor Group Keep Alive Interval—Enter the amount of delay time allowed between tries for a client attempting to join another access point. See the “[Mobility Anchor Group Keep Alive Interval](#)” section on page 9-31” for more information.

---

**Tip** When you hover your mouse cursor over the parameter text box, the valid range for that field appears.

---

- Mobility Anchor Group Keep Alive Retries—Enter number of allowable retries.

---

**Tip** When you hover your mouse cursor over the parameter text box, the valid range for that field appears.

---

- RF Network Name—Enter network name.
  - User Idle Timeout (seconds)—Enter timeout in seconds.
  - ARP Timeout (seconds)—Enter timeout in seconds.
- 

## AP Failover Priority

When a controller fails, the backup controller configured for the access point suddenly receives a number of Discovery and Join requests. If the controller becomes overloaded, it may reject some of the access points.

By assigning failover priority to an access point, you have some control over which access points are rejected. When the backup controller is overloaded, join requests of access points configured with a higher priority levels take precedence over lower-priority access points.

To configure failover priority settings for access points, you must first enable the AP Failover Priority feature.

To enable the AP Failover Priority feature, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > General**.
  - Step 4** From the AP Failover Priority drop-down, select **Enabled**.
- 

To configure an access point failover priority, follow these steps:

- 
- Step 1** Choose **Configure > Access Points > <AP Name>**.

- Step 2** From the AP Failover Priority drop-down list, choose the applicable priority (**Low, Medium, High, Critical**).

---

**Note** The default priority is Low.

---

## Configuring 802.3 Bridging

The controller supports 802.3 frames and applications that use them, such as those typically used for cash registers and cash register servers. However, to make these applications work with the controller, the 802.3 frames must be bridged on the controller.

Support for raw 802.3 frames allows the controller to bridge non-IP frames for applications not running over IP. Only this raw 802.3 frame format is currently supported.

To configure 802.3 bridging using NCS release 4.1 or later, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** Choose **System > General** to access the General page.
- Step 4** From the 802.3 Bridging drop-down list, choose **Enable** to enable 802.3 bridging on your controller or **Disable** to disable this feature. The default value is Disable.
- Step 5** Click **Save** to confirm your changes.
- 

## 802.3x Flow Control

Flow control is a technique for ensuring that a transmitting entity, such as a modem, does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

By default, flow control is disabled. You can only enable a Cisco switch to receive PAUSE frames but not to send them.

## Lightweight Access Point Protocol Transport Mode

Lightweight Access Point Protocol transport mode indicates the communications layer between controllers and access points. Selections are Layer 2 or Layer 3.

To convert a Cisco Unified Wireless Network Solution from Layer 3 to Layer 2 lightweight access point transport mode using the NCS user interface, follow these steps:

---

**Note** Cisco IOS-based lightweight access points do not support Layer 2 lightweight access point mode. These access points can only be run with Layer 3.

---

---

**Note** This procedure causes your access points to go offline until the controller reboots and the associated access points reassociate to the controller.

---

---

**Step 1** Make sure that all controllers and access points are on the same subnet.

**Note** You must configure the controllers and associated access points to operate in Layer 2 mode before completing the conversion.

---

**Step 2** Log into the NCS user interface. Then follow these steps to change the lightweight access point transport mode from Layer 3 to Layer 2:

- a. Choose **Configure > Controllers**.
- b. Click the IP address of the applicable controller.
- c. Choose **System > General** to access the General page.
- d. Change lightweight access point transport mode to Layer2 and click **Save**.
- e. If NCS displays the following message, click **OK**:  
Please reboot the system for the CAPWAP Mode change to take effect.

**Step 3** To restart NCS, follow these steps:

- a. Choose **System > Commands**.
- b. From the Administrative Commands drop-down list, choose **Save Config To Flash**, and click **Go** to save the changed configuration to the controller.
- c. Click **OK** to continue.
- d. From the Administrative Commands drop-down list, choose **Reboot**, and click **Go** to reboot the controller.
- e. Click **OK** to confirm the save and reboot.

**Step 4** After the controller reboots, follow these steps to verify that the CAPWAP transport mode is now Layer 2:

- a. Choose **Configure > Controllers**.
- b. Click the IP address of the applicable controller.
- c. Verify that the current CAPWAP transport mode is Layer2 from the general drop-down list.

You have completed the CAPWAP transport mode conversion from Layer 3 to Layer 2. The operating system software now controls all communications between controllers and access points on the same subnet.

---

## Aggressive Load Balancing

In routing, load balancing refers to the capability of a router to distribute traffic over all its network ports that are the same distance from the destination address. Good load-balancing algorithms use both line speed and reliability information. Load balancing increases the use of network segments, thus increasing effective network bandwidth.

Aggressive load balancing actively balances the load between the mobile clients and their associated access points.

## Link Aggregation

Link aggregation allows you to reduce the number of IP addresses needed to configure the ports on your controller by grouping all the physical ports and creating a link aggregation group (LAG). In a 4402 model, two ports are combined to form a LAG whereas in a 4404 model, all four ports are combined to form a LAG.

If LAG is enabled on a controller, the following configuration changes occur:

- Any dynamic interfaces that you have created are deleted. This is done to prevent configuration inconsistencies in the interface database.
- Interfaces cannot be created with the “Dynamic AP Manager” flag set.

---

**Note** You cannot create more than one LAG on a controller.

---

The advantages of creating a LAG include:

- Assurance that, if one of the links goes down, the traffic is moved to the other links in the LAG. As long as one of the physical ports is working, the system remains functional.
- No need to configure separate backup ports for each interface.
- Multiple AP-manager interfaces are not required because only one logical port is visible to the application.

---

**Note** When you make changes to the LAG configuration, the controller has to be rebooted for the changes to take effect.

---

---

**Tip** When you hover your mouse over the parameter text box, the valid range for that field appears.

---

## Wireless Management

Because of IPSec operation, management via wireless is only available to operators logging in across WPA, Static WEP, or VPN Pass Through WLANs. Wireless management is not available to clients attempting to log in via an IPSec WLAN.

## Mobility Anchor Group Keep Alive Interval

Indicate the delay between tries for clients attempting to join another access point. This decreases the time it takes for a client to join another access point following a controller failure because the failure is quickly identified, the clients are moved away from the problem controller, and the clients are anchored to another controller.

---

**Tip** When you hover your mouse over the parameter text box, the valid range for that field appears.

---

## Configuring Controller System Commands

To view the System Command parameters for current controllers, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Commands**. The following parameters appear:
- Administrative
    - Reboot—This command enables you to confirm the restart of your controller after saving your configuration changes. Open and confirm a new session and log into the controller to avoid losing a system connection.
    - Save Config to Flash—Data is saved to the controller in non-volatile RAM (NVRAM) and is preserved in the event of a power cycle. If the controller is rebooted, all applied changes are lost unless the configuration has been saved.
    - Reset to Factory Default—Choose this command to return the controller to its original settings. See the [“Restoring Factory Defaults”](#) section on page 9-33 for more information.
    - Ping From Controller—Send a ping to a network element. This pop-up dialog box allows you to tell the controller to send a ping request to a specified IP address. This is useful for determining if there is connectivity between the controller and a particular IP station. If you click **OK**, three pings are sent and the results of the ping are displayed in the pop-up. If a reply to the ping is not received, it will show No Reply Received from IP xxx.xxx.xxx.xxx, otherwise it shows Reply received from IP xxx.xxx.xxx.xxx: (send count =3, receive count = n).
  - Configuration
    - Audit Config—See the [“Viewing the Latest Network Audit Report”](#) section on page 9-22.
    - Refresh Config From Controller—See the [“Refreshing the Configuration from the Controller”](#) section on page 9-18.
    - Restore Config To Controller—Choose this command to restore the configuration from the NCS database to the controller.
    - Set System Time—See the [“Setting Controller Time and Date”](#) section on page 9-34.
  - Upload/Download Commands
    - Upload File from Controller—See the [“Uploading Configuration/Logs from Controllers”](#) section on page 9-34.
    - Download Config—See the [“Downloading Configurations to Controllers”](#) section on page 9-35.
    - Download Software—Choose this command to download software to the selected controller or all controllers in the selected groups after you have a configuration group established. See the [“Downloading Software to a Controller”](#) section on page 9-35.
    - Download Web Auth Cert—Choose this command to access the Download Web Auth Certificate to Controller page. See the [“Downloading a Web Admin Certificate to a Controller”](#) section on page 9-36.
    - Download Web Admin Cert—Choose this command to access the Download Web Admin Certificate to Controller page. See the [“Downloading a Web Admin Certificate to a Controller”](#) section on page 9-36.
- 
-  **Note** Select the **FTP** or **TFTP** radio button. Both File Transfer Protocol (FTP) and Trivial Transfer Protocol (TFTP) are supported for uploading and downloading files to and from NCS. In previous software releases, only TFTP was supported.
-

- Download IDS Signatures—Choose this command to download customized signatures to the standard signature file currently on the controller. See the “[Downloading Signature Files](#)” section on page 9-106 for more information.
  - Download Customized Web Auth—Choose this command to download a customized Web authentication page to the controller. A customized web page is created to establish a username and password for user web access. See the “[Downloading a Customized WebAuthentication Bundle to a Controller](#)” section on page 9-15.
  - Download Vendor Device Certificate—Choose this command to download your own vendor-specific device certificate to the controller to replace the current wireless device certificate. See the “[Downloading a Vendor Device Certificate](#)” section on page 9-16.
  - Download Vendor CA Certificate—Choose this command to download your own vendor-specific certificate authority (CA) to the controller to replace the current CA. See the “[Downloading a Vendor CA Certificate](#)” section on page 9-17.
- RRM Commands
    - RRM 802.11a/n Reset—Resets Remote Radio Management for 802.11a/n Cisco Radios.
    - 802.11b/g/n Reset—Resets Remote Radio Management for 802.11b/g/n Cisco Radios.
    - 802.11a/n Channel Update—Updates access point dynamic channel algorithm for 802.11a/n Cisco Radios.
    - 802.11b/g/n Channel Update—Updates access point dynamic channel algorithm for 802.11b/g/n Cisco Radios.
    - 802.11a/n Power Update—Updates access point dynamic transmit power algorithm for 802.11a/n Cisco Radios.
    - 802.11b/g/n Power Update—Updates access point dynamic transmit power algorithm for 802.11b/g/n Cisco Radios.
- 

## Restoring Factory Defaults

Choose **Configure > Controllers**, and click an IP address in the IP Address column. From the left sidebar menu, choose **System > Commands**, and from the Administrative Commands drop-down list, choose **Reset to Factory Default**, and click **Go** to access this page.

This command enables you to reset the controller configuration to the factory default. This overwrites all applied and saved configuration parameters. You are prompted for confirmation to re-initialize your controller.

All configuration data files are deleted, and upon reboot, the controller is restored to its original non-configured state. This will remove all IP configuration, and you will need a serial connection to restore its base configuration.

### Note

After confirming configuration removal, you must reboot the controller and select the “Reboot Without Saving” option.

---

## Setting Controller Time and Date

Choose **Configure > Controllers**, and click an IP address under the IP Address column. From the left sidebar menu, choose **System > Commands**, and from the Configuration Commands drop-down list choose **Set System Time**, and click **Go** to access this page.

Use this command to manually set the current time and date on the controller. To use a Network Time Server to set or refresh the current time, see the “[Configuring an NTP Server Template](#)” section on [page 11-10](#) page. The following parameters appear:

- Current Time—Shows the time currently being used by the system.
- Month/Day/Year—Choose the month/day/year from the drop-down list.
- Hour/Minutes/Seconds—Choose the hour/minutes/seconds from the drop-down list.
- Delta (hours)—Enter the positive or negative hour offset from GMT (Greenwich Mean Time).
- Delta (minutes)—Enter the positive or negative minute offset from GMT.
- Daylight Savings—Select to enable Daylight Savings Time.

### Command Buttons

- Set Date and Time
- Set Time Zone
- Cancel

## Uploading Configuration/Logs from Controllers

To upload files from the controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an IP address in the IP Address column.
  - Step 3** From the left sidebar menu, choose **System > Commands**.
  - Step 4** From the Upload/Download Commands drop-down list, choose **Upload File from Controller**.
  - Step 5** Click **Go** to access this page.

Use this command to upload files from your controller to a local TFTP (Trivial File Transfer Protocol) server. The following parameter appears:

- IP Address—IP address of the controller.
  - Status—Upload NOT\_INITIATED, or other state.
  - Enter the TFTP server name, or New and the new TFTP server name.
  - Verify and/or enter the IP Address of the TFTP server.
  - Select the file type—Configuration file, Event Log, Message Log, Trap Log, Crash File.
  - Enter the Upload to File from /(root)/NCS-tftp/ filename.
  - Choose whether or not Cisco NCS saves before backing up the configuration.
- Step 6** Click **OK**. The selected file will be uploaded to your TFTP server and named what you entered in the File Name text box.

**Note**

The Cisco NCS uses an integral TFTP server. This means that third-party TFTP servers cannot run on the same workstation as the Cisco NCS, because the Cisco NCS and the third-party TFTP servers use the same communication port.

## Downloading Configurations to Controllers

To download configuration files, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an IP address in the IP Address column.
- Step 3** From the left sidebar menu, choose **System > Commands**.
- Step 4** From the Upload/Download Commands drop-down list, choose **Download Config**.
- Step 5** Click **Go** to access this page.

Use this command to download and install a configuration file to your controller from a local TFTP (Trivial File Transfer Protocol) server. The following parameters appear:

**Note**

The Cisco NCS uses an integral TFTP server. This means that third-party TFTP servers cannot run on the same workstation as the Cisco NCS, because the Cisco NCS and the third-party TFTP servers use the same communication port.

- IP Address—IP address of the controller.
- Status—Status of the certificate, for example, NOT\_INITIATED.

### TFTP Servers

- Server Name—Choose Default Server or New from the drop-down list. When you choose New, type in the IP address.
- Server Address—IP address of the server.
- Maximum Retries—How many times to retry if the download fails.
- Timeout—How long to allow between retries.
- File Name—Enter or choose the filename to download by clicking the Browse button.

## Downloading Software to a Controller

To download software, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an IP address in the IP Address column.
- Step 3** From the left sidebar menu, choose **System > Commands**.
- Step 4** From the Upload/Download Commands drop-down list, choose **Download Software**.

**Step 5** Click **Go** to access this page.

Use this command to download and install a new Operating System software to your controller from a local TFTP (Trivial File Transfer Protocol) server.

**Note**

The Cisco NCS uses an integral TFTP server. This means that third-party TFTP servers cannot run on the same workstation as the Cisco NCS, because the Cisco NCS and the third-party TFTP servers use the same communication port.

- IP Address—IP address of the controller to receive the software.
- Current Software Version—The software version currently running on the controller.
- Status—Status of the software, for example, NOT\_INITIATED.
- TFTP Server on Cisco NCS System—Select the check box enable the built-in Cisco NCS TFTP server.
- Server IP Address—When you have disabled the built-in Cisco NCS TFTP server, IP Address of the TFTP server to send the software to the controller.
- Maximum Retries—Maximum number of unsuccessful attempts before the download is abandoned.
- Timeout—Maximum number of seconds before the download is abandoned.
- File Name—Enter or select the filename to download using the Browse button.

## Downloading a Web Admin Certificate to a Controller

To download a Web Admin Certificate, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click an IP address in the IP Address column.

**Step 3** From the left sidebar menu, choose **System > Commands**.

**Step 4** From the Upload/Download Commands drop-down list, choose **Download WEB Admin Cert**.

**Step 5** Click **Go** to access this page.

This page enables you to download a web administration certificate to the controller. The following parameters appear:

**Caution**

Each certificate has a variable-length embedded RSA Key. The RSA key length varies from 512 bits, which is relatively insecure, to thousands of bits, which is very secure. When you are obtaining a new certificate from a certificate authority (such as the Microsoft CA), Make sure the RSA key embedded in the certificate is at least 768 Bits.

- IP Address—IP address of the controller to receive the certificate.
- Status—Status of the certificate, for example, NOT\_INITIATED.

### TFTP Servers

- Server Name—Use the drop-down list to choose the Default Server or New. When you select New, type in the IP address.
- Server Address—IP address of the server.

- Maximum Retries—Maximum number of times each download operation can be attempted.
- Timeout (seconds)—The amount of time allowed for each download operation.
- File Name—File name of the certificate.
- Password—Password to access the certificate.

## Downloading IDS Signatures

To download a IDS Signature, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an IP address in the IP Address column.
  - Step 3** From the left sidebar menu, choose **System > Commands**.
  - Step 4** From the Upload/Download Commands drop-down list, choose **Download IDS Signatures**.
  - Step 5** Click **Go** to access this page.

Use this command to download IDS (Intrusion Detection System) signature files from your controller to a local TFTP (Trivial File Transfer Protocol) server. The following parameters appear:

- IP Address—IP address of the controller.
- Status—Download NOT\_INITIATED, TRANSFER\_SUCCESSFUL or other state.

## Downloading a Customized Web Auth Bundle to a Controller

To download a customized Web authentication page to the controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**
  - Step 2** Click an IP address in the IP Address column.
  - Step 3** From the left sidebar menu, choose **System > Commands**.
  - Step 4** From the Upload/Download Commands drop-down list, choose **Download Customized Web Auth**.

The following parameters appear:

- IP Address—IP address of the controller to receive the bundle.
- Status—State of download: NOT\_INITIATED, TRANSFER\_SUCCESSFUL, TRANSFER\_FAILED, NOT\_RESPONDING.

---

Before downloading the customized Web authentication bundle, follow these steps:

- 
- Step 1** Click the indicated link to download the example login.tar bundle file from the server.  
The link is the highlighted word “here” near the bottom of the page.
  - Step 2** Edit the login.html file and save it as a .tar or .zip file.
  - Step 3** Download the .tar or .zip file to the controller.

The file contains the pages and image files required for the Web authentication display.

**Note** The controller accepts a .tar or .zip file of up to 1 MB in size. The 1 MB limit includes the total size of uncompressed files in the bundle.

## TFTP Servers

To set up one or more TFTP servers, configure the following parameters:

- File is located on—Choose **Local machine** or **TFTP server**. The default is local machine (NCS internal server).
- Server Name—Use the drop-down list to choose one of the following:
  - New—Set up a new server. Enter the server name and IP address in the text boxes provided.
  - Default Server—server name (editable) IP address (read-only) are automatically added.
- Server IP Address—IP address of the server.
- Maximum Retries—Maximum number of unsuccessful attempts before the download is abandoned.
- Timeout—Maximum number of seconds before the download is abandoned.
- NCS Server Files In—C:\tftp or other specified file directory on the local machine.
- Local File Name—Filename of the Web authentication bundle on the local machine. Click **Browse** to locate the file.
- Server File Name—Filename on a remote TFTP server.

When completed, these fields and settings are repopulated in the page and do not need to be entered again.

## Command Buttons

- OK—The file is downloaded from the local machine or TFTP server with the name shown in the File Name text box.
- Cancel

## Configuring Controller System Interfaces

This section describes how to configure controller system interfaces and includes the following topics:

- [Adding an Interface, page 9-39](#)
- [Viewing Current Interface Details, page 9-40](#)
- [Deleting a Dynamic Interface, page 9-41](#)
- [NAC Integration, page 9-43](#)
- [Configuring Wired Guest Access, page 9-46](#)

To view existing interfaces, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Interfaces**. The following parameters appear:

- Check box—Select the dynamic interface for deletion. Choose **Delete Dynamic Interfaces** from the Select a command drop-down list.
  - Interface Name—User-defined name for this interface (For example, Management, Service-Port, Virtual).
  - VLAN Identifier—VLAN identifier between 0 (untagged) and 4096, or N/A.
  - Quarantine—Select the check box if the interface has a quarantine VLAN ID configured on it.
  - IP Address—IP address of this interface.
  - Interface Type—Static (Management, AP-Manager, Service-Port, and Virtual interfaces) or Dynamic (operator-defined interfaces).
  - AP Management Status—Displays the status of AP Management interfaces. The parameters include Enabled, Disabled, and N/A.
- 

## Adding an Interface

To add an interface, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Interfaces**.
  - Step 4** From the Select a command drop-down list, choose **Add Interface**.
  - Step 5** Enter the necessary parameters:
    - Interface Name—User-defined name for this interface (Management, Service-Port, Virtual, and VLAN n).
    - Wired Interface—Select the check box to mark the interface as wired.
    - Interface Address
      - VLAN Identifier—1 through 4096, or 0 = untagged.
      - Quarantine—Enable/disable to quarantine a VLAN. Select the check box to enable.
      - IP Address—IP address of the interface.
      - Gateway—Gateway address of the interface.
    - Physical Information
      - Port Number—The port that is used by the interface.
      - Primary Port Number (active)—The port that is currently used by the interface.
      - Secondary Port Number—The port that is used by the interface when the primary port is down.

**Note** Primary and secondary port numbers are only present in Cisco 4400 Series Wireless LAN Controllers.

---

---

**Note** The secondary port is used when the primary port shuts down. When the primary port is reactivated, the Cisco 4400 Series Wireless LAN Controller transfers the interfaces back to the primary port.

---

- AP Management—Select to enable access point management.
  - DHCP Information
    - Primary DHCP Server—IP address of the primary DHCP server.
    - Secondary DHCP Server—IP address of the secondary DHCP server.
  - Access Control List—User-defined ACL name (or none).
- 

## Viewing Current Interface Details

To view details for a current interface, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Interfaces**.
  - Step 4** Select the Interface Name for the applicable interface. The Interface Details page opens.
  - Step 5** View or edit the following interface parameters:

---

**Note** Changing the Interface parameters causes the WLANs to be temporarily disabled and thus may result in loss of connectivity for some clients.

---

- Interface Address
  - VLAN Identifier—1 through 4096, or 0 = untagged.
  - Guest LAN
  - Quarantine—Enable/disable to quarantine a VLAN. Select the check box to enable.
  - IP Address—IP address of the interface.
  - Gateway—Gateway address of the interface.
- Physical Information
  - Primary Port Number (active)—The port that is currently used by the interface.
  - Secondary Port Number—The port that is used by the interface when the primary port is down.

---

**Note** Primary and secondary port numbers are only present in Cisco 4400 Series Wireless LAN Controllers.

---

**Note**

The secondary port is used when the primary port shuts down. When the primary port is reactivated, the Cisco 4400 Series Wireless LAN Controller transfers the interfaces back to the primary port.

- AP Management—Select to enable access point management.
- DHCP Information
  - Primary DHCP Server—IP address of the primary DHCP server.
  - Secondary DHCP Server—IP address of the secondary DHCP server.
- Access Control List
  - ACL Name—User-defined name of the access control list (or none).

**Step 6** Click **Save** to confirm any changes made. Click **Audit** to audit the device values.

## Deleting a Dynamic Interface

To delete a dynamic interface, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Interfaces**.
- Step 4** Select the check box of the dynamic interface that you want to delete.
- Step 5** From the Select a command drop-down list, choose **Delete Dynamic Interfaces**.
- Step 6** Click **OK** to confirm the deletion.

**Note**

The dynamic interface cannot be deleted if it is been assigned to interface group.

## Configuring Controller System Interface Groups

This section describes how to configure controller system interface groups and introduces the following topics:

- [Adding an Interface Group, page 9-41](#)
- [Deleting an Interface Group, page 9-42](#)
- [Viewing Interface Groups, page 9-43](#)

### Adding an Interface Group

To add an interface group, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Interface Groups**.
- Step 4** From the Select a command drop-down list, choose **Add Interface Group**.
- Step 5** Enter the necessary parameters:
- Name—User-defined name for this interface group (group1, group2).
  - Interface Group Type—Select/deselect to quarantine a VLAN.
  - Description—(Optional) Description for the Interface group.
- Step 6** Click **Add**.
- The Interface dialog box appears.
- Step 7** Select the interfaces that you want to add to the group and click **OK**.
- To remove an Interface from the Interface group, from the Interface Group page, select the Interface and click **Remove**.
- Step 8** Once you are done with adding the interfaces, in the Interface Group page, click any of these buttons:
- **Save** to confirm any changes made.
  - **Audit** to audit the device values.
  - **Cancel** to discard the changes.

**Note**

- The number of interfaces that could be added to an interface group depends upon the type of the controller.
  - Guest LAN interfaces cannot be part of interface groups.
  - An Interface group name must be different from the Interface name.
- 

## Deleting an Interface Group

To delete an interface group, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Interface Groups**.
- Step 4** Select the check box of the interface group that you want to delete.
- Step 5** From the Select a command drop-down list, choose **Delete Interface Group**, and click **Go**.
- Step 6** Click **OK** to confirm the deletion.

**Note**

- The Interface Group cannot be deleted if it has been assigned to WLAN(s).
- The Interface Group cannot be deleted if it has been assigned to AP Group(s).
- The Interface Group cannot be deleted if it has been assigned to Foreign Controller Mapping for the WLAN(s).

- The Interface Group Template cannot be deleted if it has been assigned to WLAN Template(s).
  - The Interface Group Template cannot be deleted if it has been assigned to AP Group Template(s).
  - You cannot enable/disable quarantine for an interface if it has been assigned to an interface group.
- 

## Viewing Interface Groups

To view existing interface groups, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Interface Groups**. The following parameters appear:
    - Name—User-defined name for the interface group (For example, group1, group2).
    - Description—(Optional) Description for the Interface Group.
    - Interfaces—Count of the number of interfaces belonging to the group.
  - Step 4** Click the Interface group name link.

The Interface Groups Details page appears with the Interface group details as well as the details of the Interfaces that form part of that particular Interface group.

---

## NAC Integration

The Cisco NAC appliance, also known as Cisco Clean Access (CCA), is a network admission control (NAC) product that allows network administrators to authenticate, authorize, evaluate, and remediate wired, wireless, and remote users and their machines prior to allowing users onto the network. It identifies whether machines are compliant with security policies and repairs vulnerabilities before permitting access to the network. The NAC appliance is available in two modes: in-band and out-of-band. Customers can deploy both modes if desired, each geared toward certain types of access (in-band for supporting wireless users and out-of-band for supporting wired users, for example).

For more information on NAC Out-of-Band Integration, see the applicable section in the *Cisco Network Control System Configuration Guide*.

- [Guidelines for Using SNMP NAC, page 9-43](#)
- [Configuring NAC Out-of-Band Integration \(SNMP NAC\), page 9-44](#)

### Guidelines for Using SNMP NAC

Follow these guidelines when using SNMP NAC out-of-band integration:

- The NAC appliance supports up to 3500 users, and the controller supports up to 5000 users. Therefore, multiple NAC appliances might need to be deployed.
- Because the NAC appliance supports static VLAN mapping, you must configure a unique quarantine VLAN for each interface configured on the controller. For example, you might configure a quarantine VLAN of 110 on controller 1 and a quarantine VLAN of 120 on controller 2. However,

if two WLANs or guest LANs use the same distribution system interface, they must use the same quarantine VLAN, provided they have one NAC appliance deployed in the network. The NAC appliance supports unique quarantine-to-access VLAN mapping.

- For posture reassessment based on session expiry, you must configure the session timeout on both the NAC appliance and the WLAN, making sure that the session expiry on the WLAN is greater than that on the NAC appliance.
- When a session timeout is configured on an open WLAN, the timing out of clients in the Quarantine state is determined by the timer on the NAC appliance. Once the session timeout expires for WLANs using web authentication, clients deauthenticate from the controller and must perform posture validation again.
- NAC out-of-band integration is supported only on WLANs configured for hybrid-REAP central switching. It is not supported for use on WLANs configured for hybrid-REAP local switching.
- If you want to enable NAC on an access point group VLAN, you must first enable NAC on the WLAN. Then you can enable or disable NAC on the access point group VLAN. If you ever decide to disable NAC on the WLAN, be sure to disable it on the access point group VLAN as well.
- NAC out-of-band integration is not supported for use with the WLAN AAA override feature.
- All Layer 2 and Layer 3 authentication occurs in the quarantine VLAN. To use external web authentication, you must configure the NAC appliance to allow HTTP traffic to and from external web servers and to allow the redirect URL in the quarantine VLAN.

**Note** See the Cisco NAC appliance configuration guides for configuration instructions: [http://www.cisco.com/en/US/products/ps6128/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/ps6128/products_installation_and_configuration_guides_list.html).

## Guidelines for Using RADIUS NAC

Follow these guidelines when using RADIUS NAC:

- RADIUS NAC is available only for WLAN with 802.1x/WPA/WPA2 Layer 2 security.
- RADIUS NAC cannot be enabled when HREAP local switching is enabled.
- AAA override should be enabled to configure RADIUS NAC.

## Configuring NAC Out-of-Band Integration (SNMP NAC)

To configure SNMP NAC out-of-band integration, follow these steps:

- Step 1** To configure the quarantine VLAN for a dynamic interface, follow these steps:
- Choose **Configure > Controller**.
  - Choose which controller you are configuring for out-of-band integration by clicking it in the IP Address column.
  - Choose **System > Interfaces** from the left sidebar menu.
  - Choose **Add Interface** from the Select a command drop-down list.
  - In the Interface Name text box, enter a name for this interface, such as “quarantine.”
  - In the VLAN Identifier text box, enter a non-zero value for the access VLAN ID, such as “10.”
  - Select the **Quarantine** check box if the interface has a quarantine VLAN ID configured on it.

**Note**

We recommend that you configure unique quarantine VLANs throughout your network. If multiple controllers are configured in the same mobility group and access interfaces on all controllers are in the same subnet, it is mandatory to have the same quarantine VLAN if there is only one NAC appliance in the network. If multiple controllers are configured in the same mobility group and access interfaces on all controllers are in different subnets, it is mandatory to have different quarantine VLANs if there is only one NAC appliance in the network.

- h. Configure any remaining fields for this interface, such as the IP address, netmask, and default gateway.
- i. Enter an IP address for the primary and secondary DHCP server.
- j. Click **Save**. You are now ready to create a NAC-enabled WLAN or Guest LAN.

**Step 2** To configure NAC out-of-band support on a WLAN or guest LAN, follow these steps:

- a. Choose **WLANs > WLAN** from the left sidebar menu.
- b. Choose **Add a WLAN** from the Select a command drop-down list and click **Go**.
- c. If you have a template established that you want to apply to this controller, choose the guest LAN template name from the drop-down list. Otherwise, click the **click here** link to create a new template. For more information on setting up the template, see the “[Configuring Wired Guest Access](#)” section on page 9-46 section.
- d. Click the **Advanced** tab.
- e. To configure SNMP NAC support for this WLAN or guest LAN, select **SNMP NAC** from the NAC Stage drop-down list. To disable SNMP NAC support, select **None** from the NAC Stage drop-down list, which is the default value.
- f. Click **Apply** to commit your changes.

**Step 3** To configure NAC out-of-band support for a specific AP group, follow these steps:

- a. Choose **WLANs > AP Groups VLAN** from the left sidebar menu to open the AP Groups page.

**Note**

AP Groups (for 5.2 and later controllers) is referred to as **AP Group VLANs** for controllers prior to 5.2.

- b. Click the name of the desired AP group.
- c. From the Interface Name drop-down list, choose the quarantine enabled interface.
- d. To configure SNMP NAC support for this AP group, select **SNMP NAC** from the Nac State drop-down list. To disable NAC out-of-band support, select **None** from the Nac State drop-down list, which is the default value.
- e. Click **Apply** to commit your changes.

**Step 4** To see the current state of the client (either Quarantine or Access), follow these steps:

- a. Choose **Monitor > Clients** to open the Clients. Perform a search for Clients.
- b. Click the MAC address of the desired client to open the Clients > Detail page. The NAC state appears as access, invalid, or quarantine in the Security Information section.

## Configuring Wired Guest Access

Wired Guest Access enables guest users to connect to the guest access network from a wired Ethernet connection designated and configured for guest access. Wired guest access ports might be available in a guest office or specific ports in a conference room.

Like wireless guest user accounts, wired guest access ports are added to the network using the Lobby Ambassador feature. See the [“Configuring a Guest Account” section on page 15-82](#).

Wired Guest Access can be configured in a standalone configuration or in a dual controller configuration employing an anchor and foreign controller. This latter configuration is used to further isolate wired guest access traffic but is not required for deployment of wired guest access.

Wired Guest Access ports initially terminate on a Layer 2 access switch or switch port which is configured with VLAN interfaces for wired guest access traffic.

The wired guest traffic is then trunked from the access switch to a wireless LAN controller. This controller is configured with an interface that is mapped to a wired guest access VLAN on the access switch.

If two controllers are being used, the controller (foreign) that receives the wired guest traffic from the switch then forwards the wired guest traffic to an anchor controller that is also configured for wired guest access. After successful hand off of the wired guest traffic to the anchor controller, a bidirectional Ethernet over IP (EoIP) tunnel is established between the foreign and anchor controllers to handle this traffic.

**Note**

Although wired guest access is managed by anchor and foreign anchors when two controllers are deployed, mobility is not supported for wired guest access clients. In this case, DHCP and web authentication for the client are handled by the anchor controller.

**Note**

You can specify how much bandwidth a wired guest user is allocated in the network by configuring and assigning a role and bandwidth contract. For details on configuring these features, see the [“Configuring a Guest Account” section on page 15-82](#).

To configure and enable wired guest user access on the network, follow these steps:

- Step 1** To configure a dynamic interface for wired guest user access, choose **Configure > Controllers** and after IP address, choose **System > Interfaces**.
- Step 2** Choose **Add Interface** from the Select a command drop-down list, and click **Go**.
- Step 3** Enter a name and VLAN ID for the new interface.
- Step 4** Select the **Guest LAN** check box.
- Step 5** Enter the primary and secondary port number.
- Step 6** Click **Save**. You are now ready to create a wired LAN for guest access.
- Step 7** To configure a wired LAN for guest user access, choose **WLANS > WLAN configuration** from the left sidebar menu.
- Step 8** Choose **Add a WLAN** from the Select a command drop-down list, and click **Go**.
- Step 9** If you have a template established that you want to apply to this controller, choose the guest LAN template name from the drop-down list. Otherwise, click the **click here** link to create a new template.

- Step 10** In the **WLAN > New Template general** page, enter a name in the Profile Name text box that identifies the guest LAN. Do not use any spaces in the name entered.
- Step 11** Select the **Enabled** check box for the WLAN Status parameter.
- Step 12** From the Ingress Interface drop-down list, choose the VLAN that you created in Step 3. This VLAN provides a path between the wired guest client and the controller by way of the Layer 2 access switch.
- Step 13** From the Egress Interface drop-down list, choose the name of the interface. This WLAN provides a path out of the controller for wired guest client traffic.

---

**Note** If you have only one controller in the configuration, choose **management** from the Egress Interface drop-down list.

---

- Step 14** Choose **Security > Layer 3** tab to modify the default security policy (web authentication) or to assign WLAN specific web authentication (login, logout, login failure) pages and the server source.
- To change the security policy to passthrough, select the **Web Policy** check box and select the **Passthrough** radio button. This option allows users to access the network without entering a username or password.  
  
An Email Input check box appears. Select this check box if you want users to be prompted for their email address when attempting to connect to the network.
  - To specify custom web authentication pages, unselect the Global WebAuth Configuration **Enabled** check box.  
  
When the Web Auth Type drop-down list appears, choose one of the following options to define the web login page for the wireless guest users:  
  
Default Internal—Displays the default web login page for the controller. This is the default value.  
  
Customized Web Auth—Displays custom web login, login failure, and logout pages. When the customized option is selected, three separate drop-down lists for login, login failure, and logout page selection appear. You do not need to define a customized page for all three of the options. Choose **None** from the appropriate drop-down list if you do not want to display a customized page for that option.  
  
These optional login, login failure, and logout pages are downloaded to the controller as webauth.tar files. For specifics on downloading custom pages, see the [“Downloading a Customized WebAuthentication Bundle to a Controller”](#) section on page 9-15.  
  
External—Redirects users to an external server for authentication. If you choose this option, you must also enter the URL of the external server in the URL text box.  
  
You can select specific RADIUS or LDAP servers to provide external authentication in the Security > AAA pane. To do so, continue with Step 17.

---

**Note** The RADIUS and LDAP external servers must be already configured to have selectable options in the Security > AAA pane. You can configure these servers on the RADIUS Authentication Servers, TACACS+ Authentication Servers page, and LDAP Servers page.

---

- Step 15** If you selected External as the Web Authentication Type in [Step 15](#), choose **Security > AAA** and choose up to three RADIUS and LDAP servers using the drop-down lists.
- Step 16** Click **Save**.

**Step 17** Repeat this process if a second (anchor) controller is being used in the network.

## Creating an Ingress Interface

To create an Ingress interface, follow these step:

- Step 1** Choose **Add Interface** from the Select a command drop-down list, and click **Go**.
- Step 2** Click an interface name. The Interfaces Details : New Config page appears (see [Figure 9-3](#)).

**Figure 9-3** Interfaces Details : New Config Page

The screenshot shows the Cisco Prime Network Control System interface for configuring a new interface. The breadcrumb trail is: Configure > Controllers > 9.1.192.50 > System > Interfaces > Interfaces Details. A warning message states: "Changing the Interface parameters causes the WLANs to be temporarily disabled and thus may result in loss of connectivity for some clients." The configuration sections are as follows:

- General:** Interface Name: management; MAC Address: 68:ef:bd:8e:5c:00
- Interface Address:** VLAN Identifier: 192; Quarantine: ; IP Address: 209.165.200.224; Netmask: 255.255.255.0; Gateway: 209.165.200.225
- Physical Information:** Primary Port Number (active): 1; Secondary Port Number: 0; AP Management:  Enable
- DHCP Information:** Primary DHCP Server: 209.165.200.227; Secondary DHCP Server: 0.0.0.0
- Access Control List:** ACL Name: none

Buttons at the bottom: Audit, Save, Cancel.

- Step 3** In the Interface Name text box, enter a name for this interface, such as guestinterface.
- Step 4** Enter a VLAN identifier for the new interface.
- Step 5** Select the **Guest LAN** check box.
- Step 6** Enter the primary and secondary port numbers.
- Step 7** Click **Save**.

## Creating an Egress Interface

To create an Egress interface, follow these steps:

- Step 1** Choose **Add Interface** from the Select a command drop-down list, and click **Go**.

- Step 2** Click an interface name. The Interfaces Details : New Config page appears (see [Figure 9-3](#)).
- Step 3** In the Interface Name text box, enter a name for this interface, such as quarantine.
- Step 4** In the VLAN Identifier text box, enter a non-zero value for the access VLAN ID, such as 10.
- Step 5** Select the **Quarantine** check box and enter a non-zero value for the quarantine VLAN ID, such as 110.

**Note** You can have NAC-support enabled on the WLAN or guest WLAN template Advanced tab for interfaces with Quarantine enabled.

- Step 6** Enter the IP address, netmask, and default gateway.
- Step 7** Enter the primary and secondary port numbers.
- Step 8** Provide an IP address for the primary and secondary DHCP server.
- Step 9** Configure any remaining fields for this interface, and click **Save**.
- You are now ready to create a wired LAN for guest access.

## Configuring Controller Network Routes

The Network Route page enables you to add a route to the controller service port. This route allows you to direct all Service Port traffic to the designated management IP address.

- [Viewing Existing Network Routes, page 9-49](#)
- [Adding a Network Route, page 9-49](#)

## Viewing Existing Network Routes

To view existing network routes, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Network Route**. The following parameters appear:
- IP Address—The IP address of the network route.
  - IP Netmask—Network mask of the route.
  - Gateway IP Address—Gateway IP address of the network route.

## Adding a Network Route

To add a network route, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Network Route**.

- Step 4** From the Select a command drop-down list, choose **Add Network Route**.
  - Step 5** Click **Go**.
  - Step 6** Enter the IP address, IP Netmask, and Gateway IP address information.
  - Step 7** Click **Save**.
- 

## Configuring Controller Spanning Tree Protocol Parameters

Spanning Tree Protocol (STP) is a link management protocol that provides path redundancy while preventing undesirable loops in the network.

To view or manage current STP parameters, follow these steps:

- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Spanning Tree Protocol**. The Spanning Tree Protocol page displays the following parameters:
    - Protocol Spec—The current protocol specification.
    - Admin Status—Check this check box to enable.
    - Priority—The numerical priority number of the ideal switch.
    - Maximum Age (seconds)—The amount of time (in seconds) before the received protocol information recorded for a port is discarded.
    - Hello Time (seconds)—Determines how often (in seconds) the switch broadcasts its hello message to other switches.
    - Forward Delay (seconds)—The time spent (in seconds) by a port in the learning/listening states of the switches.
- 

## Configuring Controller Mobility Groups

By creating a mobility group, you can enable multiple network controllers to dynamically share information and forward data traffic when inter-controller or inter-subnet roaming occurs. Controllers can share the context and state of client devices and controller loading information. With this information, the network can support inter-controller wireless LAN roaming and controller redundancy.

### Note

If it is possible for a wireless client in your network to roam from an access point joined to one controller to an access point joined to another controller, both controllers should be in the same mobility group.

- [Messaging Among Mobility Groups, page 9-51](#)
- [Mobility Group Prerequisites, page 9-51](#)
- [Viewing Current Mobility Group Members, page 9-51](#)
- [Adding Mobility Group Members from a List of Controllers, page 9-51](#)
- [Manually Adding Mobility Group Members, page 9-52](#)

- [Setting the Mobility Scalability Parameters, page 9-52](#)

## Messaging Among Mobility Groups

The controller provides inter-subnet mobility for clients by sending mobility messages to other member controllers:

- There can be up to 72 members in the list with up to 24 in the same mobility group.
- The controller sends a Mobile Announce message to members in the mobility list each time a new client associates to it.
- In NCS and controller software release 5.0, the controller uses multicast mode to send the Mobile Announce messages. This allows the controller to send only one copy of the message to the network, which delivers it to the multicast group containing all the mobility members.

**Note**

For more information regarding mobility groups, see the *Cisco Network Control System Configuration Guide*.

## Mobility Group Prerequisites

Before you add controllers to a mobility group, you must verify that the following requirements have been met for all controllers that are to be included in the group:

- All controllers must be configured for the same CAPWAP transport mode (Layer 2 or Layer 3).
- IP connectivity must exist between the management interfaces of all devices.
- All controllers must be configured with the same mobility group name.
- All devices must be configured with the same virtual interface IP address.
- Availability of MAC and IP addresses of each controller to be included in the mobility group (to configure the controllers with the MAC address and IP address of all the other mobility group members).

## Viewing Current Mobility Group Members

To view current mobility group members, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Mobility Groups**.

**Note**

To delete a group member, select a check box for the applicable group member, choose **Delete Group Members**, and click **Go**.

## Adding Mobility Group Members from a List of Controllers

To add a mobility group member from a list of existing controllers, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > Mobility Groups**.
  - Step 4** From the Select a command drop-down list, choose **Add Group Members**.
  - Step 5** Click **Go**.
  - Step 6** Select the check box(es) for the controller to be added to the mobility group.
  - Step 7** Click **Save**.
- 

### Manually Adding Mobility Group Members

If no controllers were found to add to the mobility group, you can add members manually. To manually add members to the mobility group, follow these steps:

- 
- Step 1** Click the **click here** link from the Mobility Group Member details page.
  - Step 2** In the Member MAC Address text box, enter the MAC address of the controller to be added.
  - Step 3** In the Member IP Address text box, enter the management interface IP address of the controller to be added.

**Note** If you are configuring the mobility group in a network where Network Address Translation (NAT) is enabled, enter the IP address sent to the controller from the NAT device rather than the controller management interface IP address. Otherwise, mobility fails among controllers in the mobility group.

- 
- Step 4** Enter the multicast group IP address to be used for multicast mobility messages in the Multicast Address text box. The local mobility member group address must be the same as the local controller group address.
  - Step 5** In the Group Name text box, enter the name of the mobility group.
  - Step 6** Click **Save**.
  - Step 7** Repeat the Steps 1 through 6 for the remaining WLC devices.
- 

### Setting the Mobility Scalability Parameters

**Note** Mobility Groups must be configured prior to setting the mobility scalability parameters.

To set the mobility message parameters, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Choose an IP address of a controller whose software version is 5.0 or later.
  - Step 3** From the left sidebar menu, choose **System > General**.

- Step 4** At the Multicast Mobility Mode parameter, specify if you want to enable or disable the ability for the controller to use multicast mode to send Mobile Announce messages to mobility members.
- Step 5** If you enabled multicast messaging by setting multicast mobility mode to enabled, you must enter the group IP address at the Mobility Group Multicast-address parameter to begin multicast mobility messaging. You must configure this IP address for the local mobility group but it is optional for other groups within the mobility list. If you do not configure the IP address for other (non-local) groups, the controllers use unicast mode to send mobility messages to those members.
- Step 6** Click **Save**.
- 

## Configuring Controller Network Time Protocol

To add a new NTP Server, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > Network Time Protocol**.
- Step 4** From the Select a command drop-down list, choose **Add NTP Server**.
- Step 5** Click **Go**.
- Step 6** From the Select a template to apply to this controller drop-down list, select the applicable template to apply to this controller.
- 

### Command Buttons

- Apply
- Cancel

To create a New Template for NTP Servers, use the **click here** link to access the template creation page (Configure NTP Servers > New Template).

NTP general parameters include:

- Template Name—Enter the new NTP Template name.

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

- Server Address—Enter the NTP server IP address.
- No. of Controllers Applied To—Number of controllers to which this template is applied (read-only).

## Background Scanning on 1510s in Mesh Networks

Background scanning allows Cisco Aironet 1510 Access Points to actively and continuously monitor neighboring channels for more optimal paths and parents. Because the access points are searching on neighboring channels as well as the current channel, the list of optimal alternate paths and parents is greater.

Identifying this information prior to the loss of a parent results in a faster transfer and the best link possible for the access points. Additionally, access points might switch to a new channel if a link on that channel is found to be better than the current channel in terms of fewer hops, stronger signal-to-noise ratio (SNR), and so on.

Background scanning on other channels and data collection from neighbors on those channels are performed on the primary backhaul between two access points:

The primary backhaul for 1510s operate on the 802.11a link.

Background scanning is enabled on a global basis on the access point's associated controller.

**Note**

Latency might increase for voice calls when they are switched to a new channel.

**Note**

In the EMEA regulatory domain, locating neighbors on other channels might take longer given DFS requirements.

## Background Scanning Scenarios

A few scenarios are provided below to better illustrate how background scanning operates.

In [Figure 9-4](#), when the mesh access point (MAP1) initially comes up, it is aware of both root access points (RAP1 and RAP2) as possible parents. It chooses RAP2 as its parent because the route through RAP2 is better in terms of hops, SNR, and so on. After the link is established, background scanning (once enabled) continuously monitors all channels in search of a more optimal path and parent. RAP2 continues to act as parent for MAP1 and communicates on channel 2 until either the link goes down or a more optimal path is located on another channel.

**Figure 9-4** Mesh Access Point (MAP1) Selects a Parent

In [Figure 9-5](#), the link between MAP1 and RAP2 is lost. Data from ongoing background scanning identifies RAP1 and channel 1 as the next best parent and communication path for MAP1 so that link is established immediately without the need for additional scanning after the link to RAP2 goes down.

**Figure 9-5** Background Scanning Identifies a New Parent

### Enabling Background Scanning

To enable background scanning on an AP1510 RAP or MAP, follow these steps:

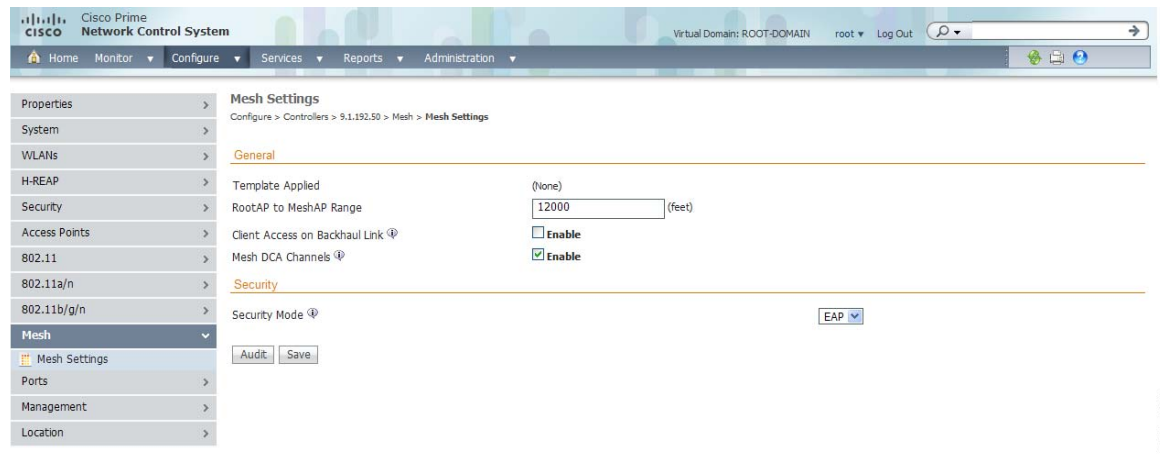

**Step 1** Click **Configure > Controllers**.

**Note** You can also enable this on the Controllers template. See the “[Configuring Mesh Templates](#)” section on page 11-114.

**Step 2** Choose **Mesh > Mesh Settings** from the left sidebar menu. The Mesh Settings page appears (see [Figure 9-6](#)).

**Figure 9-6** Mesh Settings Page

**Step 3** Select the **Background Scanning** check box to enable background scanning or unselect it to disable the feature. The default value is disabled.

**Step 4** Click **Save**.

---

## Configuring Controller QoS Profiles

To make modifications to the quality of service profiles, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click the IP address of the applicable controller.

**Step 3** From the left sidebar menu, choose **System > QoS Profiles**. The following parameters appear:

- Bronze—For Background
- Gold—For Video Applications
- Platinum—For Voice Applications
- Silver—For Best Effort

**Step 4** Click the applicable profile to view or edit profile parameters.

**Step 5** Set the following values in the Per-User Bandwidth Contracts section (all have a default of 0 or Off):

- Average Data Rate—The average data rate for non-UDP traffic.
- Burst Data Rate—The peak data rate for non-UDP traffic.
- Average Real-time Rate—The average data rate for UDP traffic.
- Burst Real-time Rate—The peak data rate for UDP traffic.

**Step 6** Set the following values for the Over-the-Air QoS section:

- Maximum QoS RF Usage Per AP (%)—The maximum air bandwidth available to clients. The default is 100%.
- QoS Queue Depth—The depth of queue for a class of client. The packets with a greater value are dropped at the access point.

**Step 7** Set the following values in the Wired QoS Protocol section:

- Wired QoS Protocol—Choose **802.1P** to activate 802.1P priority tags or **None** to deactivate 802.1P priority tags.

**Step 8** Click **Save**.

---

## Configuring Controller DHCP Scopes

- [Viewing Current DHCP Scopes, page 9-56](#)
- [Adding a New DHCP Scope, page 9-57](#)

### Viewing Current DHCP Scopes

To view current DHCP (Dynamic Host Configuration Protocol) scopes, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > DHCP Scopes**.

The following DHCP Scopes information appears:

- Pool Address
  - Lease Time
  - Status
- 

## Adding a New DHCP Scope

To add a new DHCP Scope, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **System > DHCP Scopes**.
- Step 4** From the Select a command drop-down list, choose **Add DHCP Scope**.
- Step 5** Enter the following information:
- Scope Name
  - Lease Time (in seconds)
  - Network
  - Netmask
  - Pool Start Address
  - Pool End Address
  - DNS Domain Name
  - Status
  - Router Addresses—Enter which IP addresses are already in use and should therefore be excluded. For example, you should enter the IP address of your company router. In doing so, this IP address will be blocked from use by another client.
  - DNS Servers—Enter the IP address of the DNS server(s). Each DNS server must be able to update a client DNS entry to match the IP address assigned by this DHCP scope.
  - NetBios Servers—Enter the IP address of the Microsoft Network Basic Input Output System (NetBIOS) name server(s), such as a Windows Internet Naming Service (WINS) server.
- Step 6** Click **Save**.
- 

## Configuring Controller User Roles

- [Viewing Current Local Net User Roles, page 9-58](#)
- [Adding a New Local Net User Role, page 9-58](#)

## Viewing Current Local Net User Roles

To view current local net user roles, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > User Roles**.

The following Local Net User Role parameters appear:

- Template Name

---

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

- Role Name
- Average Data Rate—The average data rate for non-UDP traffic.
- Burst Data Rate—The peak data rate for non-UDP traffic.
- Average Real-time Rate—The average data rate for UDP traffic.
- Burst Real-time Rate—The peak data rate for UDP traffic.

- Step 4** Click a Template Name to view the User Role details.
- 

## Adding a New Local Net User Role

To add a new local net user role, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > User Roles**.
  - Step 4** From the Select a command drop-down list, choose **Add User Role**.
  - Step 5** Select a template from the Select a template to apply to this controller drop-down list.
  - Step 6** Click **Apply**.

---

**Note** To create a new template for local net user roles, click the **click here** link to access the template creation page. See the [“Configuring User Roles Controller Templates”](#) section on page 11-11 for more information about User Role templates.

---

## Configuring a Global Access Point Password

The AP Username Password page enables you to set a global password that all access points inherit as they join a controller. When you are adding an access point, you can also choose to accept this global username and password or override it on a per-access point basis. See the “[Configuring AP Configuration Templates](#)” section on page 11-127 to view where the global password is displayed and how it can be overridden on a per-access point basis.

Also in controller software release 5.0, after an access point joins the controller, the access point enables console port security and you are prompted for your username and password whenever you log into the access point console port. When you log in, you are in non-privileged mode and you must enter the enable password in order to use the privileged mode.

To establish a global username and password, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an IP address of a controller with a version of 5.0 or later.
- Step 3** From the left sidebar menu, choose **System > AP Username Password**.
- Step 4** Enter the username and password that you want to be inherited by all access points that join the controller.
-  **Note** For Cisco IOS access points, you must also enter and confirm an enable password.
- 
- Step 5** Click **Save**.
- 

## Configuring Global CDP

Cisco Discovery Protocol (CDP) is a device-discovery protocol that runs on all Cisco network equipment. Each device sends identifying messages to a multicast address, and each device monitors the messages sent by other devices.

---

**Note** CDP is enabled on the bridge's Ethernet and radio ports by default.

---

---

**Note** Global Interface CDP Configuration will be applied to only the APs with CDP enabled at AP level.

---

To configure a Global CDP, perform the following steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the IP address of the desired controller.
- Step 3** From the left sidebar menu, choose **System > Global CDP Configuration** from the left sidebar menu. The Global CDP Configuration page appears.
- Step 4** In the Global CDP portion of the page, specify the following parameters:
- CDP on controller—Choose enable or disable CDP on the controller.

---

**Note** This configuration cannot be applied on WISM2 controllers.

---

- Global CDP on APs—Choose to enable or disable CDP on the access points.
- Refresh-time Interval (seconds)—At the Refresh Time Interval parameter, enter the time in seconds at which CDP messages are generated. The default is 60.
- Holdtime (seconds)—Enter the time in seconds before the CDP neighbor entry expires. The default is 180.
- CDP Advertisement Version—Enter which version of the CDP protocol to use. The default is v1.

**Step 5** In the CDP for Ethernet Interfaces portion of the page, select the slots of Ethernet interfaces for which you want to enable CDP.

---

**Note** CDP for Ethernet Interfaces fields are supported for controller version 7.0.110.2 onwards.

---

**Step 6** In the CDP for Radio Interfaces portion of the page, select the slots of Radio interfaces for which you want to enable CDP.

---

**Note** CDP for Radio Interfaces fields are supported for controller version 7.0.110.2 onwards.

---

**Step 7** Click **Save**.

---

## Configuring AP 802.1X Supplicant Credentials

You can configure 802.1X authentication between lightweight access points and the switch. The access point acts as an 802.1X supplicant and is authenticated by the switch using EAP-FAST with anonymous PAC provisioning. You can set global authentication settings that all access points inherit as they join the controller. This includes all access points that are currently joined to the controller and any that join in the future.

If desired, you can override the global authentication settings and assign unique authentication settings for a specific access point. See the [“Configuring Access Point Details”](#) section on page 9-164 for more information.

To enable global supplicant credentials, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the IP address of the desired controller.
- Step 3** From the left sidebar menu, choose **System > AP 802.1X Supplicant Credentials**.
- Step 4** Select the **Global Supplicant Credentials** check box.
- Step 5** Enter the supplicant username.
- Step 6** Enter and confirm the applicable password.
- Step 7** Click **Save**.

**Note** Once saved, you can click **Audit** to perform an audit on this controller. See the “[Understanding the Controller Audit Report](#)” section on page 9-3 or the “[Configuring an Audit](#)” section on page 15-74 for more information.

## Configuring Controller DHCP

To configure DHCP (Dynamic Host Configuration Protocol) information for a controller, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the IP address of the desired controller.
- Step 3** From the left sidebar menu, choose **System > DHCP**.
- Step 4** Add or modify the following parameters:

- DHCP Option 82 Remote Id Field Format—Select AP-MAC or AP-MAC-SSID from the drop-down list.

**Note** To set format for RemoteID field in DHCP option 82: If ‘Ap-Mac’ is selected, then set the RemoteID format as <AP-Mac>. If ‘Ap-Mac-ssid’ is selected, then set the RemoteID format as <AP-Mac>:<SSID>.

- DHCP Proxy—Select the check box to enable DHCP by proxy.

**Note** When DHCP proxy is enabled on the controller, the controller unicasts DHCP requests from the client to the configured servers. Consequently, at least one DHCP server must be configured on either the interface associated with the WLAN or the WLAN itself.

- Step 5** Enter the DHCP Timeout in seconds after which the DHCP request will time out. The default setting is 5. Allowed values range from 5 to 120 seconds.

**Note** DHCP Timeout is applicable from the controller version 7.0.114.74 onwards.

- Step 6** Click **Save**.

**Note** Once saved, you can click **Audit** to perform an audit on this controller. See the “[Understanding the Controller Audit Report](#)” section on page 9-3 or the “[Configuring an Audit](#)” section on page 15-74 for more information.

## Configuring Controller Multicast Mode

NCS provides an option to configure IGMP (Internet Group Management Protocol) snooping and timeout values on the controller.

To configure multicast mode and IGMP snooping for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the desired controller.
  - Step 3** From the left sidebar menu, choose **System > Multicast**.
  - Step 4** Choose **Disable**, **Unicast**, or **Multicast** from the Ethernet Multicast Support drop-down list.

---

**Note** IGMP Snooping and timeout can be set only if Ethernet Multicast mode is Enabled.

---

- Step 5** If Multicast is selected, enter the multicast group IP address.
- Step 6** Select the Enable Global Multicast Mode check box to make the multicast mode available globally.
- Step 7** Select to enable IGMP Snooping.
- Step 8** Choose **Enable** from the Multicast Mobility Mode drop-down list to change the IGMP snooping status or to set the IGMP timeout. When IGMP snooping is enabled, the controller gathers IGMP reports from the clients and then sends each access point a list of the clients listening to any multicast group. The access point then forwards the multicast packets only to those clients.

The timeout interval has a range of 3 to 300 and a default value of 60. When the timeout expires, the controller sends a query to all WLANs. Those clients which are listening in the multicast group then send a packet back to the controller.

- Step 9** If you enabled the Multicast Mobility Mode, enter the mobility group multicast address.
- Step 10** Select the Multicast Direct feature check box to enable videos to be streamed over a wireless network.
- Step 11** Specify the Session Banner information, which is the error information sent to the client if the client is denied or dropped from a Media Stream.
  - a.** State—Select the check box to activate the Session Banner. If not activated, the Session Banner is not sent to the client.
  - b.** URL—A web address reported to the client
  - c.** Email—An email address reported to the client
  - d.** Phone—A telephone number reported to the client
  - e.** Note—A note reported to the client

---

**Note** All Media Streams on a Controller share this configuration.

---

- Step 12** Click **Save**.

**Note**

Once saved, you can click **Audit** to perform an audit on this controller. See the “[Understanding the Controller Audit Report](#)” section on page 9-3 or the “[Configuring an Audit](#)” section on page 15-74 for more information.

## Configuring Access Point Timer Settings

Advanced timer configuration for HREAP and local mode is available for the controller on NCS.

**Note**

This feature is only supported on Release 6.0 controllers and later.

- [Configuring Advanced Timers](#), page 9-63
- [Access Point Timer Settings for Local Mode](#), page 9-63
- [Access Point Timer Settings for HREAP Mode](#), page 9-63

## Configuring Advanced Timers

To configure the advanced timers, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the controller for which you want to set timer configuration.
- Step 3** From the left sidebar menu, choose **System > AP Timers**.
- Step 4** Select the applicable access point mode (Local mode or HREAP mode).
- Step 5** See the “[Access Point Timer Settings for Local Mode](#)” section on page 9-63 or the “[Access Point Timer Settings for HREAP Mode](#)” section on page 9-63 for more information on each mode configuration.

### Access Point Timer Settings for Local Mode

To reduce the failure detection time, you can configure the fast heartbeat interval (between the controller and the access point) with a smaller timeout value. When the fast heartbeat timer expires (at every heartbeat interval), the access point determines if any data packets have been received from the controller within the last interval. If no packets have been received, the access point sends a fast echo request to the controller. You can then enter a value between 10 and 15 seconds.

### Access Point Timer Settings for HREAP Mode

Once selected, you can configure the HREAP timeout value. Select the **AP Primary Discovery Timeout** check box to enable the timeout value. Enter a value between 30 and 3600 seconds.

**Note**

5500 series controllers accept access point fast heartbeat timer values in the range of 10-15. All other controller models support a range of 1-10.

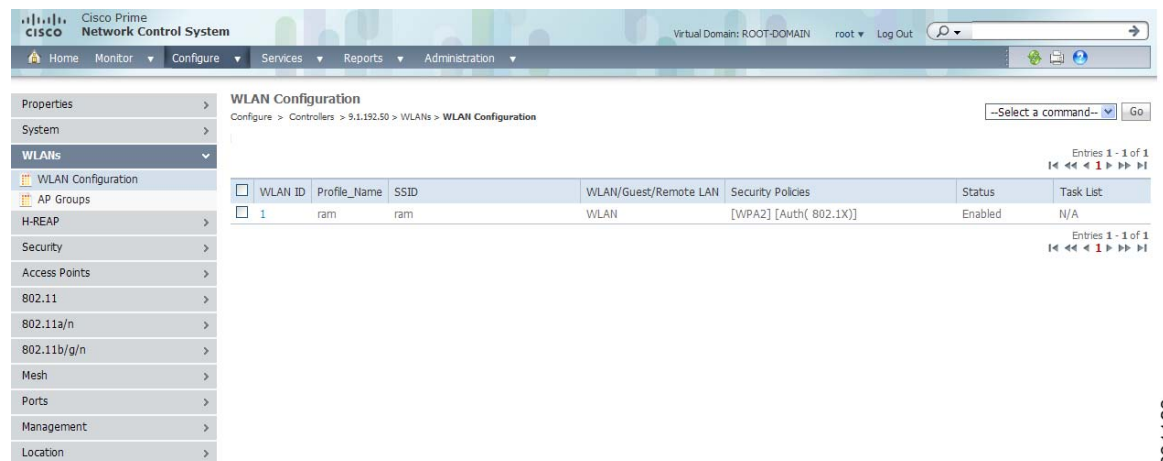

## Configuring Controller WLANs

Since controllers can support 512 WLAN configurations, NCS provides an effective way to enable or disable multiple WLANs at a specified time for a given controller.

To view a summary of the wireless local access networks (WLANs) that you have configured on your network, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **WLANs > WLAN Configuration**. The Configure WLAN Summary page appears (see [Figure 9-7](#)). This WLAN Configuration page contains the values found in [Table 9-1](#).

**Figure 9-7** WLAN Configuration Summary Page

**Table 9-1** WLAN Configuration Summary Page

| Parameter         | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| Check box         | Select the WLAN for deletion. Click <b>Delete WLANs</b> from the Select a command drop-down list.   |
| WLAN ID           | Identification number of the WLAN.                                                                  |
| Profile Name      | User-defined profile name specified when creating the WLAN template. Profile Name is the WLAN name. |
| SSID              | Service Set Identifier being broadcast by.                                                          |
| WLAN/Guest LAN    | Specifies if it is a WLAN or guest LAN.                                                             |
| Security Policies | Security policies enabled on the WLAN.                                                              |

**Table 9-1** WLAN Configuration Summary Page (continued)

| Parameter | Description                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| Status    | Status of the WLAN is either enabled or disabled.                                                                              |
| Task List | If a task is scheduled in Configure > Scheduled Configuration Tasks, you have a link to view the scheduled configuration task. |

## Viewing WLAN Details

To view WLAN details, choose **WLANs**. The WLAN Details page appears (see [Figure 9-8](#)).

**Figure 9-8** WLAN Details Page

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controllers > 9.1.192.50 > WLANs > WLANs > WLANs Details. The page title is "WLANs Details : Add From Template". There are "Apply" and "Cancel" buttons. Below the buttons, there are tabs for "General", "Security", "QoS", and "Advanced". The "General" tab is selected and shows the following configuration details:

- Template Name: wlan1
- Wired LAN:
- Profile Name: new
- SSID: 12
- Status:  Enable
- Security Policies: None (Modifications done under security tab will appear after save operation.)
- Radio Policy: All
- Interface:  Interface  Interface Group: management
- Multicast VLAN:  Enable
- BroadCast SSID:  Enable

Use the tabs (General, Security, QoS, and Advanced) to view or edit parameters for the WLAN.

- [General Tab, page 9-65](#)
- [Security Tab, page 9-66](#)
- [QoS Tab, page 9-70](#)
- [Advanced Tab, page 9-70](#)

## General Tab

The General tab includes the following information:

### Note

Depending on the WLAN template used for this controller, these parameters may or may not be available.

- Guest LAN—Indicates whether or not this WLAN is a Guest LAN.
- Profile Name
- SSID
- Status—Select the Enabled check box to enable this WLAN.

**Note** To configure a start time for the WLAN status to be enabled, select the **Schedule Status** check box. Select the hours and minutes from the drop-down lists. Click the calendar icon to select the applicable date.

- Schedule Status
- Security Policies—Identifies the security policies set using the Security tab (includes security policies such as None, 802.1X, Static WEP, Static WEP-802.1X, WPA+WPA2, and CKIP). Changes to the security policies appear in this section after the page is saved.
- Radio Policy—Choose from the drop-down list.
  - All, 802.11a only, 802.11g only, 802.11b/g only, 802.11a/g only.
- Interface/Interface Group—Select from the drop-down list.
- Broadcast SSID—Select the check box to enable.
- Egress Interface—Select the name of the applicable interface. This WLAN provides a path out of the controller for wired guest client traffic.

**Note** If you only have one controller in the configuration, choose **Management** from the Egress Interface drop-down list.

- Ingress Interface—Select the applicable VLAN from the drop-down list. This interface provides a path between the wired guest client and the controller by way of the Layer 2 access switch.

## Security Tab

The Security tab includes three additional tabs: Layer 2, Layer 3, and AAA Servers.

### Layer 2 Security

Use the Layer 2 Security drop-down list to choose between None, 802.1x, Static WEP, Cranite, Static WEP-802.1x, WPA1+WPA2, and CKIP. These parameters are described in the [Table 9-2](#).

MAC Filtering—Select the check box if you want to filter clients by MAC address.

**Table 9-2** Layer 2 Security Options

| Parameter | Description                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| None      | No Layer 2 security selected.                                                                                                  |
| 802.1x    | 802.11 Data Encryption: <ul style="list-style-type: none"> <li>• Type—WEP</li> <li>• Key Size—40, 104, or 128 bits.</li> </ul> |

**Table 9-2 Layer 2 Security Options (continued)**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static WEP        | 802.11 Data Encryption: <ul style="list-style-type: none"> <li>• Type</li> <li>• Key Size—not set, 40, 104, or 128 bits.</li> <li>• Key Index—1 to 4.</li> <li>• Encryption Key</li> <li>• Encryption Key Format—ASCII or HEX.</li> <li>• Allowed Shared Key Authentication—Select the check box to enable.</li> </ul>                                                                                                                                                                                                                                                                                  |
| Cranite           | Configure the WLAN to use the FIPS140-2 compliant Cranite Wireless Wall Software Suite, which uses AES encryption and VPN tunnels to encrypt and verify all data frames carried by the Cisco Wireless LAN Solution.                                                                                                                                                                                                                                                                                                                                                                                     |
| Static WEP-802.1X | Use this setting to enable both Static WEP and 802.1X policies. If this option is selected, static WEP and 802.1X parameters are displayed at the bottom of the page. <p>Static WEP encryption parameters:</p> <ul style="list-style-type: none"> <li>• 802.11 Data Encryption               <ul style="list-style-type: none"> <li>– Type</li> <li>– Key Size—not set, 40, 104, or 128 bits.</li> <li>– Key Index—1 to 4.</li> <li>– Encryption Key</li> <li>– Encryption Key Format—ASCII or HEX.</li> </ul> </li> <li>• Allowed Shared Key Authentication—Select the check box to enable.</li> </ul> |
|                   | 802.1X parameters: <ul style="list-style-type: none"> <li>• 802.11 Data Encryption               <ul style="list-style-type: none"> <li>– Type</li> <li>– Key Size—40, 104, or 128 bits.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                         |

Table 9-2 Layer 2 Security Options (continued)

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WPA+WPA2  | <p>Use this setting to enable WPA, WPA2, or both. WPA enables Wi-Fi Protected Access with TKIP-MIC Data Encryption or AES. When WPA+WPA2 is selected, you can use Cisco's Centralized Key Management (CCKM) authentication key management, which allows fast exchange when a client roams from one access point to another.</p> <p>When WPA+WPA2 is selected as the Layer 2 security policy and Pre-Shared Key is enabled, neither CCKM or 802.1X can be enabled; although, both CCKM and 802.1X can be enabled at the same time.</p> <p>WPA+WPA2 parameters:</p> <ul style="list-style-type: none"> <li>• WPA1—Select the check box to enable.</li> <li>• WPA2—Select the check box to enable.</li> </ul> <p>Authentication Key Management:</p> <ul style="list-style-type: none"> <li>• 802.1X—Select the check box to enable.</li> <li>• CCKM—Select the check box to enable.</li> <li>• PSK—Select the check box to enable.</li> </ul> |
| CKIP      | <p>Cisco Key Integrity Protocol. A Cisco access point advertises support for CKIP in beacon and probe response packets. CKIP can be configured only when Aironet IE is enabled on the WAN.</p> <p><b>Note</b> CKIP is not supported on 10xx access points.</p> <p>CKIP parameters:</p> <ul style="list-style-type: none"> <li>• 802.11 Data Encryption <ul style="list-style-type: none"> <li>– Type</li> <li>– Key Size—not set, 40, 104, or 128 bits.</li> <li>– Key Index—1 to 4.</li> <li>– Encryption Key</li> <li>– Encryption Key Format—ASCII or HEX.</li> </ul> </li> <li>• MMH Mode—Select the check box to enable.</li> <li>• Key Permutation—Select the check box to enable.</li> </ul>                                                                                                                                                                                                                                        |

## Layer 3 Security

Use the Layer 3 Security drop-down list to choose between None, VPN Pass Through, and IPsec (Internet Protocol Security). The page parameters change according to the selection you make.

**Note** Depending on the type of WLAN, the Layer 3 parameters may or may not be available.

**Note** If you choose VPN pass through, you must enter the VPN gateway address.

**Note** IPsec is a suite of protocols for securing IP communications by authenticating and/or encrypting each IP packet in a data stream. IPsec also includes protocols for establishing cryptographic keys.

Web Policy—Select the check box to specify policies such as authentication, pass through, or conditional web redirect. This section also allows you to enable guest users to view customized login pages.

**Note** If you choose Pass Through, the Email Input check box appears. Select this check box if you want users to be prompted for their email addresses when attempting to connect to the network.

To allow guest users to view customized login pages, follow these steps:

- 
- Step 1** Unselect the **Global WebAuth Configuration** check box.
- Step 2** Select **Web Auth Type** from the drop-down list on the Security > Layer 3 tab.
- Default Internal—The guest user receives the default login page.
  - Customized WebAuth—Customized login pages can be downloaded from the Upload/Download Commands page. See the [“Downloading a Customized Web Authentication Page”](#) section on page 11-66 for more information.
    - Select **Web Auth Login Page**, **Web Auth Login Failure Page**, or **Web Auth Logout Page** from the drop-down lists.
    - Select **None** from any of the drop-down lists if you do not want to display a customized page for that option.
  - External—The guest user is redirected to an external login page. Enter the login page URL in the External Web Auth URL text box.

**Note** If External is selected, you can select up to three RADIUS and LDAP servers from the Security > AAA page. See the [“AAA Servers”](#) section on page 9-70 for more information.

---

## AAA Servers

Select RADIUS and LDAP servers to override use of default servers on the current WLAN.

- RADIUS Servers—Use the drop-down lists to choose authentication and accounting servers. With this selection, the default RADIUS server for the specified WLAN overrides the RADIUS server that is configured for the network. If all three RADIUS servers are configured for a particular WLAN, server 1 has the highest priority, and so on.
- LDAP Servers—If no LDAP servers are chosen from the drop-down lists, NCS uses the default LDAP server order from the database.
- Local EAP Authorization—Allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that want to maintain connectivity to wireless clients when the back-end system becomes disrupted or the external authentication server fails.

Select the check box to enable if you have an EAP profile configured. Select the profile from the drop-down list.

- Allow AAA Override—When enabled, if a client has conflicting AAA and controller WLAN authentication parameters, client authentication is performed by the AAA server.

As part of this authentication, the operating system moves clients from the default Cisco WLAN solution to a VLAN returned by the AAA server and predefined in the controller interface configuration (only when configured for MAC filtering, 802.1X, or WPA operation).

In all cases, the operating system also uses QoS and ACL provided by the AAA server as long as they are predefined in the controller interface configuration. (This VLAN switching by AAA override is also referred to as *identity networking*.)

When AAA override is disabled, all client authentication defaults to the controller authentication parameter settings, and authentication is only performed by the AAA server if the controller WLANs do not contain any client-specific authentication parameters.

## QoS Tab

- Quality of service (QoS)—From the drop-down list, select Platinum (voice), Gold (video), Silver (best effort), or Bronze (background).
  - Services such as VoIP should be set to gold. Non-discriminating services such as text messaging can be set to bronze.
- WMM Parameters
  - WMM Policy—Choose Disabled, Allowed (to allow clients to communicate with the WLAN), or Required (to make it mandatory for clients to have WMM enabled for communication).
  - 7920 AP CAC—Select the check box to enable support on Cisco 7920 phones.
  - 7920 Client CAC—Select the check box to enable WLAN support for older versions of the software on 7920 phones. The CAC limit is set on the access point for newer versions of software.

## Advanced Tab

- H-REAP Local Switching—Select the check box to enable Hybrid REAP local switching. When enabled, the H-REAP access point handles client authentication and switches client packets locally. See the [“Configuring Hybrid REAP” section on page 12-4](#) for more information.

---

**Note** H-REAP local switching applies only to Cisco 1130/1240/1250 series access points. It is not supported with L2TP, PPTP, CRANITE, and FORTRESS authentications. It does not apply to WLAN IDs 9-16.

---

- Enable H-REAP local authentication by selecting the **H-REAP Local Auth** check box.

Local authentication is useful where you cannot maintain the criteria a remote office setup of minimum bandwidth of 128 kbps with the roundtrip latency no greater than 100 ms and the maximum transmission unit (MTU) no smaller than 500 bytes. In local switching, the authentication capabilities are present in the access point itself. Thus local authentication reduces the latency requirements of the branch office.

---

**Note** Local authentication can only be enabled on the WLAN of a HREAP AP that is in local switching mode.

---

Local authentication is not supported in the following scenarios:

- Guest Authentication cannot be performed on a HREAP local authentication enabled WLAN.
  - RRM information is not available at the controller for the hybrid REAP local authentication enabled WLAN.
  - Local radius is not supported.
  - Once the client has been authenticated, roaming will only be supported after the WLC and the other hybrid REAPs in the group are updated with the client information.
- Session Timeout (secs)—Set the maximum time a client session can continue before re-authentication.
  - Aironet IE—Select the check box to enable support for Aironet information elements (IEs) for this WLAN.
    - If Aironet IE support is enabled, the access point sends an Aironet IE 0x85 (which contains the access point name, load, number of associated clients, and so on) in the beacon and probe responses of this WLAN, and the controller sends Aironet IEs 0x85 and 0x95 (which contains the management IP address of the controller and the IP address of the access point) in the reassociation response if it receives Aironet IE 0x85 in the association request.
  - IPv6—Select the check box to enable IPv6.

---

**Note** Layer 3 security must be set to None for IPv6 to be enabled.

---

- Diagnostic Channel—Click to enable the diagnostics. When enabled, clients can connect to this WLAN for diagnostic purposes.

---

**Note** The results of the diagnostic tests are stored in the SNMP table, and NCS polls these tables to display the results.

---

- Override Interface ACL—Select a defined access control list (ACL) from the drop-down list. When the ACL is selected, the WLAN associates the ACL to the WLAN.

---

**Note** Selecting an ACL is optional, and the default is None.

---

For more information, see the [“Configuring an Access Control List Template”](#) section on page 11-69.

- Peer to Peer Blocking—From the drop-down list, select Disable, Drop, or Forward-Up Stream.
  - This option allows users to configure peer-to-peer blocking for individual clients rather than universally for all WLAN clients.
- Client Exclusion—Select the check box to enable automatic client exclusion. If it is enabled, set the timeout value in seconds for disabled client machines.
  - Client machines are excluded by MAC address, and their status can be observed.
  - A timeout setting of 0 indicates that administrative control is required in order to re-enable the client.

---

**Note** When session timeout is not set, the excluded client remains and will not time out from the excluded state. It does not imply that the exclusion feature is disabled.

---

- Media Session Snooping—Click to enable Media Session Snooping. This feature enables access points to detect the establishment, termination, and failure of voice calls and then report them to the controller and NCS. It can be enabled or disabled for each WLAN.

When media session snooping is enabled, the access point radios advertise this WLAN snoop for Session Initiation Protocol (SIP) voice packets. Any packets destined to or originating from port number 5060 are considered for further inspection. The access point tracks whether Wi-Fi Multimedia (WMM) and non-WMM clients are establishing a call, already on an active call, or in the process of ending a call and then notify the controller of any major call events.

- NAC State—From the **NAC State** drop-down list, choose **SNMP NAC** or **RADIUS NAC**. SIP errors that are discovered generate traps that appear on the client troubleshooting and alarms screens. The controller can integrate with the NAC appliance in out-of-band mode, where the NAC appliance remains in the data path only until clients have been analyzed and cleaned. Out-of-band mode reduces the traffic load on the NAC appliance and enables centralized NAC processing. See the [“NAC Integration”](#) section on page 9-43 for more information.
- Passive Client—If the check box is selected, it enables passive clients on your WLAN.

Passive clients are wireless devices like scales and printers that are configured with a static IP address. These clients do not transmit any IP information such as IP address, subnet mask, and gateway information during association with an access point. As a result, when passive clients are used, the controller will never know the IP address unless they use DHCP.

Wireless LAN controllers currently act as a proxy for ARP requests. On receiving an ARP request, the controller responds with an ARP response instead of passing the request directly to the client. This has two advantages:

- The upstream device that sends out the ARP request to the client cannot know where the client is located.
- Reserves power for battery-operated devices like mobile phones and printers as they do not need to respond to every ARP request.

Because the wireless controller does not have any IP-related information about passive clients, it cannot respond to any ARP requests. The current behavior does not allow the transfer of ARP requests to passive clients. Therefore, any application that tries to access a passive client will fail.

This feature enables ARP requests and responses to be exchanged between wired and wireless clients on a per-VLAN/WLAN basis. This feature enables the user to mark a desired WLAN for presence of proxy ARP thereby enabling the controller to pass the ARP requests until the client gets to RUN state.

**Note** This feature is supported only on the 5500 and 2100 series controllers.

- DTIM Period (in beacon intervals)—For 802.11a/n and 802.11b/g/n, specify the frequency of the DTIM packet sent in the wireless medium. This period can be configured for every WLAN (except guest WLAN) on all version 6.0 and above controllers.
- DHCP
  - DHCP Server—Select the check box to override the DHCP server, and enter the IP address of the DHCP server.

**Note** For some WLAN configurations, this setting is required.

- DHCP Addr. Assignment—If you select the Required check box, clients connected to this WLAN will get an IP address from the default DHCP server.
- Management Frame Protection (MFP)
  - MFP Signature Generation—If the check box is selected, it enables signature generation for the 802.11 management frames transmitted by an access point associated with this WLAN. With signature generation, changes to the transmitted management frames by an intruder are detected and reported.
  - MFP Client Protection—From the drop-down list, choose **Optional**, **Disabled**, or **Required** for individual WLAN configurations.
  - MFP Version—Displays the Management Frame Protection version.

**Note** Client-side MFP is available only for those WLANs configured to support CCXv5 (or later) clients. In addition, WPA1 must first be configured.

- Foreign Controller Mapping—Click this link to configure foreign controller mappings. This will take you to the Foreign Controller configuration page. In this configuration page, choose a foreign controller from the Foreign Controller drop-down list and choose an interface or interface group from the Interface/Interface Group drop-down list. After choosing the required options, click **Add** to complete the adding of a foreign controller.

## Adding a WLAN

To add a WLAN, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the appropriate controller.
- Step 3** From the left sidebar menu, choose **WLANs > WLAN Configuration**.

- Step 4** From the Select a command drop-down list, choose **Add a WLAN**.
- Step 5** Click **Go** to open the WLAN Details: Add from Template page (see [Figure 9-9](#)).

**Figure 9-9** WLAN Details: Add From Template Page

291130

- Step 6** Choose a template from the Select a template to apply to this controller drop-down list.
- Step 7** Click **Apply**.

**Note** To create a new template for WLANs, use the [click here](#) link in this page, or choose **Configure > Controller Template Launch Pad > WLANs > WLAN**.

## Deleting a WLAN

To delete a WLAN, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the appropriate controller.
- Step 3** From the left sidebar menu, choose **WLANs > WLAN Configuration**.
- Step 4** Select the check boxes of the WLANs that you want to delete.
- Step 5** From the Select a command drop-down list, choose **Delete a WLAN**.
- Step 6** Click **Go**.
- Step 7** Click **OK** to confirm the deletion.

## Managing WLAN Status Schedules

NCS enables you to change the status of more than one WLAN at a time on a given controller. You can select multiple WLANs and select the date and time for that status change to take place.

To schedule multiple WLANs for a status change, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the appropriate controller.
- Step 3** From the left sidebar menu, choose **WLANs > WLAN Configuration**.
- Step 4** Select the check boxes of the WLANs that you want to schedule for a status change.
- Step 5** From the Select a command drop-down list, choose **Schedule Status** to open the WLAN Schedule Task Detail page (see [Figure 9-10](#)).

**Figure 9-10** WLAN Schedule Task Detail Page

The screenshot shows the Cisco Prime Network Control System interface. The left sidebar menu is expanded to 'WLANs' > 'WLAN Configuration'. The main content area is titled 'WLAN Schedule Task Detail: New Task'. It shows a table of 'Selected WLAN(s)' with columns for Profile Name, SSID, and Admin Status. Below the table is a 'Schedule' section with fields for Schedule Task Name, Admin Status, Schedule Time (Hours, Minutes, Date), and Recurrence. The 'Submit' and 'Cancel' buttons are visible at the bottom of the form.

| Profile Name | SSID | Admin Status |
|--------------|------|--------------|
| ram          | ram  | Enabled      |

Schedule Task Name: task1  
Admin Status: Disabled  
Schedule Time: 0 (Hours) 0 (Minutes) 04/29/2011  
Recurrence:  No Recurrence  Daily  Weekly

The selected WLANs are listed at the top of the page.

- Step 6** Enter a Scheduled Task Name to identify this status change schedule.
- Step 7** Select the new Admin Status (Enabled or Disabled) from the drop-down list.
- Step 8** Select the schedule time using the hours and minutes drop-down lists.
- Step 9** Click the calendar icon to choose a schedule date or enter the date in the text box (MM/DD/YYYY).
- Step 10** Select the appropriate Recurrence radio button to determine the frequency of the status change (Daily, Weekly, or No Recurrence).
- Step 11** Click **Submit** to initiate the status change schedule.

### Note

For more information on the WLAN Configuration Scheduled Task results, see the [“Viewing WLAN Configuration Scheduled Task Results”](#) section on page 9-215.

## Mobility Anchors

Mobility anchors are one or more controllers defined as anchors for the WLAN. Clients (802.11 mobile stations such as a laptop) are always attached to one of the anchors.

This feature can be used to restrict a WLAN to a single subnet, regardless of the client's entry point into the network. In this way, users can access a public or guest WLAN throughout an enterprise but still be restricted to a specific subnet. Guest WLAN can also be used to provide geographical load balancing because WLANs can represent a particular section of a building (such as a lobby, restaurant, and so on).

When a client first associates to a controller of a mobility group that has been preconfigured as a mobility anchor for a WLAN, the client associates to the controller locally, and a local session is created for the client. Clients can be anchored only to preconfigured anchor controllers of the WLAN. For a given WLAN, you should configure the same set of anchor controllers on all controllers in the mobility group.

When a client first associates to a controller of a mobility group that has not been configured as a mobility anchor for a WLAN, the client associates to the controller locally, a local session is created for the client, and the controller is announced to the other controllers in the same mobility group. If the announcement is not answered, the controller contacts one of the anchor controllers configured for the WLAN and creates a foreign session for the client on the local switch. Packets from the client are encapsulated and delivered to the wired network. Packets to the client are received by the anchor controller and forwarded to the foreign controller through a mobility tunnel using EitherIP. The foreign controller decapsulates the packets and forwards them to the client.

**Note** A 2000 series controller cannot be designated as an anchor for a WLAN. However, a WLAN created on a 2000 series controllers can have a 4100 series controller or a 4400 series controller as its anchor.

**Note** The L2TP Layer 3 security policies are unavailable for WLANs configured with a mobility anchor.

To view the real time status of mobility anchors for a specific WLAN, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the appropriate controller.
- Step 3** From the left sidebar menu, choose **WLANs > WLAN Configuration**.
- Step 4** Click a WLAN ID to view the parameters for a specific WLAN.
- Step 5** Click the **Advanced** tab.
- Step 6** Click the **Mobility Anchors** link. [Table 9-3](#) describes the parameters that are displayed.

**Table 9-3** *Mobility Anchors*

| Parameter       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| Mobility Anchor | Anchor's IP address.                                            |
| Status          | Anchor's current status. For example, reachable or unreachable. |

## Configuring WLANs AP Groups

Site-specific VLANs or AP groups limit the broadcast domains to a minimum by segmenting a WLAN into different broadcast domains. Benefits of this include more effective management of load balancing and bandwidth allocation.

To open this page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click a controller IP address.
  - Step 3** From the left sidebar menu, choose **WLAN > AP Groups**.

This page displays a summary of the AP groups configured on your network. From here you can add, remove, or view details of an AP group. Click the AP group name on the Access Points tab to view or edit its access point(s). Click the **WLAN Profiles** tab to view, edit, add, or delete WLAN profiles.

---

## Adding Access Point Groups

To add a new access point group, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click a controller IP address.
  - Step 3** From the left sidebar menu, choose **WLAN > AP Groups**.

---

**Note** AP Groups (for 5.2 and later controllers) is referred to as AP Group VLANs for controllers prior to 5.2.

---

- Step 4** From the Select a command drop-down list, choose **Add AP Groups**.
- Step 5** Click **Go**.

In the AP Groups details page, you can add access points and WLAN profiles to this access point group.

- Step 6** Enter a name and group description for the access point group.

---

**Note** The group description is optional.

---

- Step 7** To add access points to the group, follow these steps:
  - a. Click the **Access Points** tab.
  - b. Click **Add**. The access point page displays parameters for available access points. Click the access point name to view or edit parameters for one of the available access points.
  - c. Select the check box(es) of the access point(s) you want to add.
  - d. Click **Select**.

**Step 8** To add a WLAN profile to this group, follow these steps:

- a. Click the **WLAN Profiles** tab.

**Note** Each access point is limited to sixteen WLAN profiles. Each access point broadcasts all WLAN profiles unless the WLAN override feature is enabled. The WLAN override feature allows you to disable any of the 16 WLAN profiles per access point.

**Note** The WLAN override feature applies only to older controllers that do not support the 512 WLAN feature (can support up to 512 WLAN profiles).

**Note** OfficeExtend access points are limited to fifteen WLAN profiles because one is reserved as the personal or local SSID for the OfficeExtend access point.

**Step 9** Enter a WLAN profile name or choose one from the WLAN Profile Name drop-down list.

**Step 10** Choose the interface or interface group from the Interface/Interface Group drop-down list.

**Note** For more information about configuring interfaces, see the [“Configuring Controller System Interfaces” section on page 9-38.](#)

**Step 11** Select the **NAC Override** check box, if applicable. NAC override is disabled by default.

**Step 12** When access points and WLAN profiles are added, click **Save**.

**Note** After saving, use the edit icon from the WLAN Profiles tab to edit WLAN profile information.

**Note** Changing the WLAN-interface mapping in an AP Group will remove the local VLAN mapping for HREAP APs in this group. These mappings will need to be reconfigured after applying this change.

## Deleting Access Point Groups

To delete an access point group, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click a controller IP address.

**Step 3** From the left sidebar menu, choose **WLAN > AP Groups**.

**Step 4** Select the check box(es) of the access point group(s) that you want to delete.

**Step 5** From the Select a command drop-down list, choose **Delete AP Groups**.

**Step 6** Click **OK** to confirm the deletion.

---

## Auditing Access Point Groups

You can audit the access point group to determine if the NCS and device values differ.

To audit an access point group, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click a controller IP address.
- Step 3** From the left sidebar menu, choose **WLAN > AP Groups**.
- Step 4** Click the name of the access point group that you want to audit.

**Note** Click **Audit** located at the bottom of the page.

---

## Configuring Hybrid REAP Parameters

Hybrid REAP enables customers to configure and control access points in a branch or remote office from the corporate office through a wide area network (WAN) link without deploying a controller in each office. There is no deployment restriction on the number of hybrid-REAP access points per location. The hybrid-REAP access points can switch client data traffic locally and perform client authentication locally when their connection to the controller is lost. When they are connected to the controller, they can also send traffic back to the controller.

- [Configuring H-REAP AP Groups, page 9-79](#)
- [Auditing an H-REAP Group, page 9-81](#)

## Configuring H-REAP AP Groups

To view a list of existing H-REAP AP groups, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **H-REAP > H-REAP AP Groups**. The H-REAP AP Groups page opens.
  - Group Name—The name of the H-REAP AP group. Click the group name to view its details.

**Note** Use the check box to select a group for deletion.

---

## Configuring a H-REAP AP Group

To configure a hybrid-REAP access point group, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **H-REAP > H-REAP AP Groups**.
  - Step 4** From the Select a command drop-down list, click **Add H-REAP AP Group** to open the H-REAP AP Group > Add From Template pane.
  - Step 5** Select a template from the Select a template to apply to this controller drop-down list.
  - Step 6** Click **Apply**.

**Note**

To make modifications to an existing H-REAP AP Group, click the existing group in the Group Name column of the H-REAP AP Group page.

To delete an existing group, select the check box of the group you want to remove, and choose **Delete H-REAP AP Group** from the Select a command drop-down list.

---

- Step 7** Configure the following H-REAP AP Group parameters:

- General tab

- Template Name—The name of the template applied to this controller.
- Primary Radius—From the drop-down list, choose the primary radius authentication server present on the controller.

**Note**

If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply.

---

**Note**

You must configure the RADIUS server configuration on the controller before you apply H-REAP RADIUS server configuration from NCS.

---

- Secondary Radius—From the drop-down list, choose the secondary radius authentication server present on the controller.

**Note**

If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply.

---

- H-REAP AP tab

- Ethernet MAC—Check this check box H-REAP AP to apply to the H-REAP group.

**Note**

An AP Ethernet MAC address cannot exist in more than one H-REAP group on the same controller. The controller will not allow you to set an AP Ethernet MAC in a hybrid-REAP group if it is already present in another H-REAP group.

---

- Add AP—Click to add an additional H-REAP AP (present in the NCS) to an existing H-REAP group.

**Step 8** If you want to enable local authentication for a hybrid-REAP group, click the **H-REAP Configuration** tab.

**Note** Make sure that the Primary RADIUS Server and Secondary RADIUS Server parameters are set to **None** on the General tab.

**Step 9** Select the **H-REAP Local Authentication Enable** check box to enable local authentication for this hybrid-REAP group. The default value is unselected.

**Step 10** To allow a hybrid-REAP access point to authenticate clients using LEAP, select the **LEAP** check box. Otherwise, to allow a hybrid-REAP access point to authenticate clients using EAP-FAST, select the **EAP-FAST** check box.

**Step 11** Perform one of the following, depending on how you want protected access credentials (PACs) to be provisioned:

- To use manual PAC provisioning, enter the key used to encrypt and decrypt PACs in the EAP=FAST Key text box. The key must be 32 hexadecimal characters.
- To allow PACs to be sent automatically to clients that do not have one during PAC provisioning, select the **Ignore Server Key** check box.

**Step 12** In the EAP-FAST Authority ID text box, enter the authority identifier of the EAP-FAST server. The identifier must be 32 hexadecimal characters.

**Step 13** In the EAP-FAST Authority Info text box, enter the authority identifier of the EAP-FAST server in text format. You can enter up to 32 hexadecimal characters.

**Step 14** In the EAP-FAST PAC Timeout text box, specify a PAC timeout value by entering the number of seconds for the PAC to remain visible in the edit text box. The valid range is 2 to 4095 seconds.

**Note** To see if an individual access point belongs to a hybrid-REAP group, click the **Users configured in the group** link. It advances you to the H-REAP AP Group page which shows the names of the groups and the access points that belong in it.

## Auditing an H-REAP Group

If the H-REAP configuration changes over a period of time either on NCS or the controller, you can audit the configuration. The changes are visible in subsequent pages. You can specify to refresh NCS or the controller to synchronize the configuration.

## Configuring Security Parameters

- [Configuring Controller File Encryption, page 9-82](#)
- [Configure Controllers > IPaddr > Security > AAA, page 9-82](#)
- [Configure Controllers > IPaddr > Security > Local EAP, page 9-93](#)
- [Configuring User Login Policies, page 9-97](#)

- [Managing Manually Disabled Clients](#), page 9-97
- [Configuring Access Control Lists](#), page 9-98
- [Configuring CPU Access Control Lists](#), page 9-99
- [Configuring the IDS Sensor List](#), page 9-100
- [Configuring CA Certificates](#), page 9-100
- [Configuring ID Certificates](#), page 9-101
- [Configure Controllers > IPAddr > Security > Web Auth Certificate](#), page 9-102
- [Configuring Wireless Protection Policies](#), page 9-102
- [Configuring Rogue Policies](#), page 9-103
- [Configuring Rogue AP Rules](#), page 9-104
- [Configuring Client Exclusion Policies](#), page 9-104
- [Configuring Controller Standard Signature Parameters](#), page 9-105
- [Configuring Custom Signatures](#), page 9-109
- [Configuring AP Authentication and MFP](#), page 9-109

## Configuring Controller File Encryption

To configure a controller file encryption, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > File Encryption**. File encryption ensures that data is encrypted when you upload or download the controller configuration file from a TFTP server.

File Encryption parameters include:

- **File Encryption**—If this option is enabled, the data in the controller configuration file is encrypted when it is uploaded or downloaded through the TFTP server.
- **Encryption Key**—A text string of exactly 16 characters.
- **Confirm Encryption Key**—Enter the encryption key.

## Configure Controllers > IPAddr > Security > AAA

This section describes how to configure controller security AAA parameters and contains the following topics:

- [Configuring AAA General Parameters](#), page 9-83
- [Configuring AAA RADIUS Auth Servers](#), page 9-83
- [Configuring AAA RADIUS Acct Servers](#), page 9-84
- [Configuring AAA RADIUS Fallback Parameters](#), page 9-85
- [Configuring AAA LDAP Servers](#), page 9-86
- [Configuring AAA TACACS+ Servers](#), page 9-87
- [Configuring AAA Local Net Users](#), page 9-88

- [Configuring AAA MAC Filtering, page 9-89](#)
- [Configuring AAA AP/MSE Authorization, page 9-90](#)
- [Configuring AAA Web Auth Configuration, page 9-91](#)
- [Configuring AAA Web Auth Configuration, page 9-91](#)

## Configuring AAA General Parameters

The General page allows you to configure the local database entries on a controller.

To configure the local database entries, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > General**.
  - Step 4** Enter the maximum number of allowed database entries. This amount becomes effective on the next reboot. The valid range is 512 - 2048.
- 

## Configuring AAA RADIUS Auth Servers

To view a summary of existing RADIUS authentication servers, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Auth Servers**. The following RADIUS Auth Servers parameters appear:
    - **Server Index**—Access priority number for the RADIUS server (display only). Click to go to **Configure IPaddr > RADIUS Authentication Server**.
    - **Server Address**—IP address of the RADIUS server (read-only).
    - **Port Number**—Controller port number (read-only).
    - **Admin Status**—Enable or Disable.
    - **Network User**—Enable or Disable.
    - **Management User**—Enable or Disable.
- 

## Adding an Authentication Server

To add an authentication server, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Auth Servers**.

- Step 4** From the Select a command drop-down list, choose **Add Auth Server** to open the Radius Authentication Server > Add From Template page.
- Step 5** Choose a template from the Select a template to apply to this controller drop-down list.
- Step 6** Click **Apply**.

**Note** To create a new template for Radius authentication servers, choose **Configure > Controller Templates > Security > RADIUS Auth Servers**.

## Configuring AAA RADIUS Acct Servers

To view a summary of existing RADIUS accounting servers, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Acct Servers**. RADIUS Acct Server parameters include the following:
- Server Index—Access priority number for the RADIUS server (read-only). Click to open the Radius Acct Servers Details page.

**Note** To edit or audit the current accounting server parameters, click the Server Index for the applicable accounting server.

- Server Address—IP address of the RADIUS server (read-only).
- Port Number—Controller port number (read-only).
- Admin Status—Enable or Disable.
- Network User—Enable or Disable.

### Command Buttons

- Save
- Audit

### Adding an Accounting Server

To add an accounting server, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Acct Servers**.

- Step 4** From the Select a command drop-down list, choose **Add Acct Server** to open the Radius Acct Servers Details > Add From Template page.
- Step 5** Choose a template from the Select a template to apply to this controller drop-down list.
- Step 6** From the drop-down list, choose a controller to apply to this template.
- Step 7** Click **Apply**.

**Note**

To create a new template for Radius accounting servers, choose **Configure > Controller Templates Launch Pad > Security > RADIUS Acct Servers**.

### Deleting an Accounting Server

To delete an accounting server, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Acct Servers**.
- Step 4** Select the check box(es) for the applicable accounting server(s).
- Step 5** From the Select a command drop-down list, choose **Delete Acct Server**.
- Step 6** Click **Go**.
- Step 7** Click **OK** in the pop-up dialog box to confirm the deletion.

### Configuring AAA RADIUS Fallback Parameters

To configure RADIUS fallback parameters, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > RADIUS Fallback**.
- Step 4** Add or modify the following parameters:
- RADIUS FallbackMode
  - Username
  - Time Interval
- Step 5** Click **Save**.

**Note**

Click **Audit** to check the present configuration status of NCS and the controller.

## Configuring AAA LDAP Servers

This page enables you to add and delete LDAP servers to this controller.

To access the LDAP Servers page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > LDAP Servers**.

This page displays LDAP servers currently used by this controller and contains the following parameters:

- Check box—Select the check box to choose an LDAP server for deletion.
- Server Index—A number assigned to identify the LDAP server.

---

**Note** Click the index number to go the LDAP server configuration page.

---

- Server Address—The LDAP server IP address.
- Port Number—The port number used to communicate with the LDAP server.
- Admin Status—Server template status.

Indicates if use of the LDAP server template is enabled o disabled.

---

**Note** If the title of a column is a link, click it to toggle between ascending and descending order.

---

---

**Note** NCS now supports LDAP configuration for both an anonymous or authenticated bind. For more information, see the [“Configuring New LDAP Bind Requests”](#) section on page 9-87.

---

### LDAP Servers Select a command Drop-Down List Options

#### Adding LDAP Server

To add a LDAP Server, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > LDAP Servers**.
  - Step 4** From the Select a command drop-down list, choose **Add LDAP Server**.
  - Step 5** Click **Go**.
-

## Deleting LDAP Servers

To delete the LDAP Server, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > LDAP Servers**.
  - Step 4** Select the check box(es) of the LDAP servers that you want to delete.
  - Step 5** From the Select a command drop-down list, choose **Delete LDAP Servers**.
  - Step 6** Click **Go**.
- 

## Configuring New LDAP Bind Requests

NCS now supports LDAP configuration for both an anonymous or authenticated bind. A bind is a socket opening that performs a lookup.

To configure LDAP bind requests, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
  - Step 2** From the left sidebar menu, choose **Security > AAA > LDAP Servers**.
  - Step 3** From the Bind Type drop-down list, choose **Authenticated** or **Anonymous**. If you choose **Authenticated**, you must enter a bind username and password as well.
  - Step 4** In the Server User Base DN text box, enter the distinguished name of the subtree in the LDAP server that contains a list of all the users.
  - Step 5** In the Server User Attribute text box, enter the attribute that contains the username in the LDAP server.
  - Step 6** In the Server User Type text box, enter the ObjectType attribute that identifies the user.
  - Step 7** In the Retransmit Timeout text box, enter the number of seconds between retransmissions. The valid range is 2 to 30 seconds, and the default value is 2 seconds.
  - Step 8** Select **Admin Status** check box if you want the LDAP server to have administrative privileges.
  - Step 9** Click **Save**.
- 

## Configuring AAA TACACS+ Servers

This page enables you to add and delete TACACS+ servers to this controller.

To access the TACACS+ Servers page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > TACACS+ Servers**.

This page displays TACACS+ servers currently used by this controller and contains the following parameters:

- Check box—Select the check box to choose a TACACS+ server for deletion.
- Server Type—The TACACS+ server type.
- Displays Accounting, Authorization, or Authentication.
- Server Index—A number assigned to identify the TACACS+ server and set its use priority.
- Click the index number to go the TACACS+ server configuration page.
- Server Address—The TACACS+ server IP address.
- Port Number—The port number used to communicate with the TACACS+ server.
- Admin Status—Server template status.

Indicates if use of the TACACS+ server template is enabled.

If the title of a column is a link, click it to toggle between ascending and descending order.

The Select a command drop-down list has the following options:

- Add TACACS+ Server—Choose this option, then click **Go** to add a TACACS+ server to the controller.
- Delete TACACS+ Servers—Choose this option, then click **Go** to delete all TACACS+ servers with a selected check box from the controller.

## Configuring AAA Local Net Users

This page provides a summary of the existing local network user controllers for clients who are allowed to access a specific WLAN. This is an administrative bypass of the RADIUS authentication process. Layer 3 Web Authentication must be enabled. The client information is passed to the RADIUS authentication server first, and if the client information does not match a RADIUS database entry, this local database is polled. Clients located in this database are granted access to network services if the RADIUS authentication fails or does not exist.

- [Adding a Local Net User, page 9-88](#)
- [Deleting a Local Net User, page 9-89](#)

To view existing local network users, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > Local Net Users**. The Local Net Users page displays the following local net user parameters:
  - Username—User-defined identification.
  - WLAN ID—Any WLAN ID, 1 through 16; 0 for all WLANs; 17 for third-party WLAN that this local net user is allowed to access.
  - Description—Optional user-defined description.

### Adding a Local Net User

To add a local net user, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > Local Net Users**.
- Step 4** From the Select a command drop-down list, choose **Add Local Net User** to open the **Local Net User > Add From Template** page.
- Step 5** Select a template from the Select a template to apply to this controller drop-down list.
- Step 6** Click **Apply**.

**Note** To create a new template for local net users, choose **Configure > Controller Templates > Security > Local Net Users**. See the [“Configuring a Local Network Users Template”](#) section on page 11-55 for more information.

---

### Deleting a Local Net User

To delete a local net user, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > Local Net Users**.
- Step 4** Select the check box(es) for the applicable local net user(s).
- Step 5** From the Select a command drop-down list, choose **Delete Local Net Users**.
- Step 6** Click **Go**.
- Step 7** Click **OK** in the dialog box to confirm the deletion.
- 

### Configuring AAA MAC Filtering

This page enables you to view MAC Filter parameter information.

**Note** You cannot use MAC address in the broadcast range.

---

To access the MAC Filtering page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > MAC Filtering**. The MAC Filtering page displays the following parameters:
- MAC Filter Parameters

- RADIUS Compatibility Mode—User-defined RADIUS server compatibility: Cisco ACS, FreeRADIUS, or Other.
  - MAC Delimiter—The MAC delimiters can be Colon (xx:xx:xx:xx:xx:xx), Hyphen (xx-xx-xx-xx-xx-xx), Single Hyphen (xxxxxx-xxxxxx), or No Delimiter (xxxxxxxxxxxx), as required by the RADIUS server.
  - MAC Filters
    - MAC Address—Client MAC address. Click to open Configure *IPaddr* > MAC Filter.
    - WLAN ID—1 through 16, 17 = Third-party AP WLAN, or 0 = all WLANs.
    - Interface—Displays the associated Interface Name.
    - Description—Displays an optional user-defined description.
- Step 4** From the Select a command drop-down list, choose **Add MAC Filters** to add a MAC Filter, **Delete MAC Filters** to delete the template(s), or **Edit MAC Filter Parameters** to edit the MAC Filters.
- Step 5** Click **Go**.
- 

## Configuring AAA AP/MSE Authorization

The AP/MSE Authorization page displays the access point policies and the list of authorized access points along with the type of certificate that an access point uses for authorization.

**Note** You cannot use MAC address in the broadcast range.

---

To access the AP/MSE Authorization page, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > AP/MSE Authorization**. The AP/MSE Authorization page displays the following parameters:

- AP Policies
  - Authorize APs—Enabled or Disabled.
  - Accept SSC-APs—Enabled or Disabled.
- AP/MSE Authorization
  - AP/MSE Base Radio MAC Address—The MAC address of the authorized access point.

**Note** Click the AP/MSE Base Radio MAC Address to view AP/MSE Authorization details.

---

- Type
- Certificate Type—MIC or SSC.
- Key Hash—The 40-hex long SHA1 key hash.

**Note**

The key hash is displayed only if the certificate type is SSC.

## Command Buttons

- Add AP/MSE Auth Entry—Select this command, and click **Go**. See the “[Configuring an Access Point or MSE Authorization Template](#)” section on page 11-59.
- Delete AP/MSE Auth Entries—Select one or more access points, select this command, and click **Go** to delete the selected access point from the AP authorization list.
- Edit AP Policies—Select this command, and click **Go**. See the “[Editing AP Policies](#)” section on page 9-91.

## Editing AP Policies

To edit AP/MSE Authorization access point policies, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > AP/MSE Authorization**.
- Step 4** In Edit AP Policies page, edit the following parameters, if necessary:
  - Authorize APs—Select the check box to enable access point authorization.
  - Accept SSC-APs—Select the check box to enable the acceptance of SSE access points.
- Step 5** Click **Save** to confirm the changes, **Audit** to perform an audit on these device values, or **Cancel** to close this page with no changes.

## Configuring AAA Web Auth Configuration

The Web Auth Configuration page enables the user to configure the Web auth configuration type. If the type is configured as customized, the user downloaded web auth replaces the controller-provided internal web auth page.

To access the Web Auth Configuration page, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > AAA > Web Auth Configuration**.
- Step 4** In the Web Authentication page, choose the Web Auth Type from the drop-down list. Web auth options include a default internal web page, a customized web authentication page, or an external web page.
- Step 5** Configure the web auth parameters depending on the type chosen:
  - Default Internal

- Logo Display—Enable or disable logo display.
  - Web Auth Page Title—Title displayed on web authentication page.
  - Web Auth Page Message—Message displayed on web authentication page.
  - Custom Redirect URL—URL where the user is redirected after a successful authentication. For example, if the value entered for this text box is <http://www.example.com>, the user would be directed to the company home page.
- Customized Web Auth

You have the option of downloading an example login page and customizing the page. If you are using a customized web authentication page, it is necessary to download the example login.tar bundle file from the server, edit the login.html file and save it as either a .tar or .zip file, then download the .tar or .zip file to the controller.

Click the preview image to download this sample login page as a TAR. After editing the HTML you may click [here](#) to redirect to the Download Web Auth page. See the “[Downloading a Customized WebAuthentication Bundle to a Controller](#)” section on page 9-15 for more information.

- External
  - External Redirect URL—Location of the login.html on an external server on the network.

If there are not any External Web Auth servers configured, you have the option of configuring one.

No external Web Auth server(s) configured. [Click here to configure External Web Auth Servers.](#)

**Note** To configure an External Web server template, see the “[Configuring an External Web Auth Server Template](#)” section on page 11-67.

## Command Buttons

- Save—Save the current settings to the controller.
- Audit—Check the present configuration status of NCS and the controller.

## Configuring AAA Password Policy

This page enables you to determine your password policy.

To make modifications to an existing password policy, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **Security > AAA > Password Policy**.
  - Step 4** Modify the password policy parameters as appropriate (see [Figure 9-11](#)).

Figure 9-11 Password Policy

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controllers > 5.1.152.50 > Security > AAA > Password Policies. The configuration page is titled 'Password Policies - Local Management User and AP'. It shows a 'Template Applied' field set to '(None)'. Below this, there are four password policy options, each with an 'Enable' checkbox:

- Password must contain characters from at least 3 different classes  Enable
- No character can be repeated more than 3 times consecutively  Enable
- Password cannot be the default words like cisco, admin  Enable
- Password cannot contain username or reverse of username  Enable

At the bottom of the configuration area, there are 'Audit' and 'Save' buttons. Below the configuration area, there are 'Footnotes':

1. Password must contain characters from at least three of the classes : upper case letters , lower case letters, digits, and special characters.
2. Password cannot be "cisco", "ocsic", "admin", "nimda" or any variant obtained by changing the capitalization of letters, or by substituting "1" "l" or "I" for i, or substituting "0" for "o", or substituting "5" for "s".

291132

**Step 5** Click **Save**.

**Note** If you disable password policy options, you will see a “Disabling the strong password check(s) will be a security risk as it allows weak passwords” message.

## Configure Controllers > IPAddr > Security > Local EAP

Local EAP is an authentication method that allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that want to maintain connectivity to wireless clients when the backend system becomes disrupted or the external authentication server goes down.

When you enable local EAP, the controller serves as the authentication server and the local user database, making it independent of an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP backend database to authenticate users.

## Configuring Local EAP General Parameters

This page allows you to specify a timeout value for local EAP. You can then add a template with this timeout value or make changes to an existing template.

**Note**

If any RADIUS servers are configured on the controller, the controller tries to authenticate the wireless clients using the RADIUS servers first. Local EAP is attempted only if no RADIUS servers are found, either because the RADIUS servers timed out or no RADIUS servers were configured. If four RADIUS servers are configured, the controller attempts to authenticate the client with the first RADIUS server, then the second RADIUS server, and then local EAP. If the client attempts to then reauthenticate manually, the controller tries the third RADIUS server, then the fourth RADIUS server, and then local EAP.

To specify a timeout value for local EAP, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Local EAP > General - Local EAP**.
- Step 4** Enter the Local Auth Active Timeout in the Local Auth Active Timeout text box (in seconds).

---

**Note** Local Auth Active Timeout refers to the timeout period during which Local EAP will always be used after all Radius servers are failed.

---

- Step 5** The following values should be adjusted if you are using EAP-FAST, manual password entry, one-time password, or 7920/7921 phones.

---

**Note** You must increase the 802.1x timeout values on the controller (default=2 seconds) for the client to obtain the PAC using automatic provisioning. We recommend the default timeout on the Cisco ACS server of 20 seconds.

---

- Local EAP Identify Request Timeout =1 (in seconds)
- Local EAP Identity Request Maximum Retries=20 (in seconds)
- Local EAP Dynamic Wep Key Index=0
- Local EAP Request Timeout=20 (in seconds)
- Local EAP Request Maximum Retries=2
- EAPOL-Key Timeout=1000 (in milli-seconds)
- EAPOL-Key Max Retries=2
- Max-Login Ignore Identity Response

---

**Note** Roaming fails if these values are not set the same across multiple controllers.

---

- Step 6** Click **Save**.
- 

## Command Buttons

- **Save**—Click to save the current template.
- **Apply to Controllers**—Click to apply the current template to controllers. In the Apply to Controllers page, choose the applicable controllers, and click **OK**.
- **Delete**—Click to delete the current template. If the template is currently applied to controllers, click **OK** to confirm that you want to remove the template from the selected controllers to which it is applied.
- **Cancel**—Click to cancel the current template creation or changes to the current template.

## Configuring Local EAP Profiles

This page allows you to apply a template for a local EAP profile or make modifications to an existing template.

**Note**

The LDAP backend database supports only these local EAP methods: EAP-TLS and EAP-FAST with certificates. LEAP and EAP-FAST with PACs are not supported for use with the LDAP backend database.

- [Viewing Existing Local EAP Profiles, page 9-95](#)
- [Adding a Local Net User, page 9-95](#)

## Viewing Existing Local EAP Profiles

To view existing local EAP profiles, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Local EAP > Local EAP Profiles**. The Local EAP Profiles page displays the following parameters:
- EAP Profile Name—User-defined identification.
  - LEAP—Authentication type that leverages Cisco Key Integrity Protocol (CKIP) and MMH message integrity check (MIC) for data protection. A username and password are used to perform mutual authentication with the RADIUS server through the access point.
  - EAP-FAST—Authentication type (Flexible Authentication via Secure Tunneling) that uses a three-phased tunnel authentication process to provide advanced 802.1x EAP mutual authentication. A username, password, and PAC (protected access credential) are used to perform mutual authentication with the RADIUS server through the access point.
  - TLS—Authentication type that uses a dynamic session-based WEP key derived from the client adapter and RADIUS server to encrypt data. It requires a client certificate for authentication.
  - PEAP—Protected Extensible Authentication Protocol.
- 

## Adding a Local Net User

To add a local EAP profile, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Local EAP > Local EAP Profile**.
- Step 4** From the **Select a command** drop-down list, choose **Add Local EAP Profile** to open the Local EAP Profile > Add From Template page.
- Step 5** Choose a template from the Select a template to apply to this controller drop-down list.
- Step 6** Click **Apply**.

**Note**

To create a new template for local EAP profiles, choose **Configure > Controller Templates > Security > Local EAP Profiles**.

## Configuring Local EAP General EAP-FAST Parameters

This authentication type (Flexible Authentication via Secure Tunneling) uses a three-phased tunnel authentication process to provide advanced 802.1x EAP mutual authentication. A username, password, and PAC are used to perform mutual authentication with the RADIUS server through the access point.

To set EAP-FAST Parameters, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Local EAP > EAP-FAST Parameters**.
- Step 4** Enter the following parameters:
  - Time to live for the PAC—The number of days for the PAC to remain viable. The valid range is 1 to 1000 days; the default setting is ten days.
  - Authority ID—The authority identifier of the local EAP-FAST server in hexadecimal characters. You can enter up to 32 hexadecimal characters but it must be an even number of characters.
  - Authority Info—The authority identifier of the local EAP-FAST server in text format.
  - Server Key—The key (in hexadecimal characters) used to encrypt and decrypt PACs.
  - Confirm Server Key—Verify the correct Server Key by re-typing it.
  - Anonymous Provision—Select the check box to enable anonymous provisioning.

**Note**

This feature allows PACs to be sent automatically to clients that do not have one during PAC provisioning. If this feature is disabled, PACs must be manually provisioned.

- Step 5** Click **Save**.

## Configuring Local EAP General Network Users Priority

To specify the order that LDAP and local databases use to retrieve user credential information, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Local EAP > Network Users Priority**.
- Step 4** Use the left and right pointing arrows to include or exclude network credentials in the right-most list.
- Step 5** Use the up and down buttons to determine the order credentials are attempted.

**Step 6** Click **Save**.

---

## Configuring User Login Policies

To configure the user login policies, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > User Login Policies**.
- Step 4** Enter the maximum number of concurrent logins allowed for a single username.
- Step 5** Click **Save**.
- 

## Managing Manually Disabled Clients

The Disabled Clients page enables you to view excluded (blacklisted) client information.

Clients who fail to authenticate three times when attempting to associate are automatically blocked, or excluded, from further association attempts for an operator-defined timeout. After the Excluded timeout, the client is allowed to retry authentication until it associates or fails authentication and is excluded again.

---

**Note** You cannot use MAC address in the broadcast range.

---

To access the Manually Disabled Clients page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the IP address of the applicable controller.
- Step 3** From the left sidebar menu, choose **Security > Manually Disabled Clients**. The Manually Disabled Clients page displays the following parameters:
- **MAC Address**—Disabled Client MAC addresses. Click a list item to edit the disabled client description.
  - **Description**—Optional description of disabled client.
- 

### Manually Disabled Clients Select a command Drop-Down List Options

- **Add Manually Disabled Client**—Select this command, and click **Go**. See the “[Configuring a Manually Disabled Client Template](#)” section on page 11-61.
- **Delete Manually Disabled Clients**—Select the applicable controller check box, select this command, and click **Go**.

## Configuring Access Control Lists

The Access Control Lists page displays access control lists (ACLs) available for this controller. It also enables you to add a new rule or edit an existing rule in an applied access control list.

To access the Access Control Lists page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the applicable IP address under the IP Address column.
  - Step 3** From the left sidebar menu, choose **Security > Access Control Lists**.
    - Check box—Use the check box to select one or more ACLs for deletion.
    - ACL Name—User-defined name of this template. Click an ACL item to view its parameters. See the [“Configure IPAddr > Access Control List > listname Rules”](#) section on page 9-98.
- 

### Configure *IPAddr* > Access Control List > *listname* Rules

This page displays current access control list (ACL) rules applied to this access control list.

To access the Access Control Lists Rules page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the applicable IP address under the IP address column.
  - Step 3** From the left sidebar menu, choose **Security > Access Control Lists**.
  - Step 4** Click an ACL name.
    - Check box—Select to delete access control list rules.
    - Seq#—The operator can define up to 64 Rules for each ACL. The Rules for each ACL are listed in contiguous sequence from 1 to 64. That is, if Rules 1 through 4 are already defined and you add Rule 29, it will be added as Rule 5.

**Note** If you add or change a Sequence number, operating system adjusts the other rule sequence numbers to retain the contiguous sequence. For instance, if you have Sequence numbers 1 through 7 defined and change number 7 to 5, operating system automatically reassigns Sequence 6 to 7 and Sequence 5 to 6.

---

- Action—Permit, Deny.
- Source IP/Mask—Source IP address and mask.
- Destination IP/Mask—Destination IP address and mask.
- Protocol—Protocol to use for this ACL:
  - Any—All protocols
  - TCP—Transmission Control Protocol
  - UDP—User Datagram Protocol
  - ICMP—Internet Control Message Protocol
  - ESP—IP Encapsulating Security Payload

- AH—Authentication Header
- GRE—Generic Routing Encapsulation
- IP—Internet Protocol
- Eth Over IP—Ethernet over Internet Protocol
- Other Port OSPF—Open Shortest Path First
- Other—Any other IANA protocol (<http://www.iana.org/>)

If TCP or UDP is selected, Source Port and Dest Port parameters appear:

- Source Port—Source Port. Can be Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other and Port Range.
  - Dest Port—Destination port. If TCP or UDP is selected, can be Any, HTTP, HTTPS, Telnet, RADIUS, DHCP Server, DHCP Client, DNS, L2TP, PPTP control, FTP control, SMTP, SNMP, LDAP, Kerberos, NetBIOS NS, NetBIOS DS, NetBIOS SS, MS Dir Server, Other and Port Range.
- DSCP (Differentiated Services Code Point)—Any, or 0 through 255.
  - Direction—Any, Inbound (from client) or Outbound (to client).

To add a new ACL rule, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > Access Control Lists**.
  - Step 4** Click an ACL Name.
  - Step 5** Click an applicable **Seq#**, or choose **Add New Rule** to access this page.
- 

## Configuring CPU Access Control Lists

Access control lists (ACL) can be applied to the controller CPU to control traffic to the CPU.

The Access Control Lists Rules page displays the name of the CPU access control list template applied to the chosen controller.

To access the Access Control Lists Rules page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click a controller IP address.
  - Step 3** From the left sidebar menu, choose **Security > CPU Access Control Lists**.
  - Step 4** Select the **Enable CPU ACL** check box to enable the CPU ACL.

If this check box is selected, the following parameters are available:

- ACL Name—Choose the ACL to use from the ACL Name drop-down list.
- CPU ACL Mode—Choose which data traffic direction this CPU ACL list controls.

The choices include: The wired side of the data traffic, the wireless side of the data traffic, or both wired and wireless.

---

## Configuring the IDS Sensor List

When the sensors identify an attack, they alert the controller to shun the offending client. When you add a new IDS (Intrusion Detection System) sensor, you register the controller with that IDS sensor so that the sensor can send shunned client reports to the controller. The controller also polls the sensor periodically.

To view IDS sensors, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > IDS Sensor Lists**.

The IDS Sensor page lists all IDS sensors that have been configured for this controller. Click an IP address to view details for a specific IDS sensor.

---

## Configuring CA Certificates

A CA certificate is a digital certificate issued by one certificate authority (CA) for another certification CA.

- [Importing a CA Certificate, page 9-100](#)
- [Pasting a CA Certificate Directly, page 9-100](#)

### Importing a CA Certificate

To import a CA certificate from a file, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > IP Sec Certificates > CA Certificate**.
  - Step 4** Click **Browse** to navigate to the applicable certificate file.
  - Step 5** Click **Open**.
  - Step 6** Click **Save**.
- 

### Pasting a CA Certificate Directly

To paste a CA certificate directly, follow these steps:

---

- Step 1** Copy the CA certificate to your computer clipboard.

- 
- Step 2** Choose **Configure > Controllers**.
  - Step 3** Click an applicable IP address.
  - Step 4** From the left sidebar menu, choose **Security > IP Sec Certificates > CA Certificate**.
  - Step 5** Select the **Paste** check box.
  - Step 6** Paste the certificate directly into the text box.
  - Step 7** Click **Save**.
- 

## Configuring ID Certificates

This page lists the existing network ID certificates by certificate name. An ID certificate can be used by web server operators to ensure secure server operation. This section contains the following topics:

- [Importing a ID Certificate, page 9-101](#)
- [Pasting an ID Certificate, page 9-101](#)

### Importing a ID Certificate

To import an ID certificate from a file, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > IP Sec Certificates > ID Certificate**.
  - Step 4** From the Select a command drop-down list, choose **Add Certificate**.
  - Step 5** Click **Go**.
  - Step 6** Enter the Name and Password.
  - Step 7** Click **Browse** to navigate to the applicable certificate file.
  - Step 8** Click **Open**.
  - Step 9** Click **Save**.
- 

### Pasting an ID Certificate

To paste an ID certificate directly, follow these steps:

- 
- Step 1** Copy the ID certificate to your computer clipboard.
  - Step 2** Choose **Configure > Controllers**.
  - Step 3** Click an applicable IP address.
  - Step 4** From the left sidebar menu, choose **Security > IP Sec Certificates > ID Certificate**.
  - Step 5** From the Select a command drop-down list, choose **Add Certificate**.
  - Step 6** Click **Go**.
  - Step 7** Enter the Name and Password.

- Step 8** Select the **Paste** check box.
- Step 9** Paste the certificate directly into the text box.
- Step 10** Click **Save**.

**Note** ID certificates are available only if the controller is running Cisco Unified Wireless Network Software Version 3.2 or higher.

**Note** To delete a certificate, select it, choose **Delete Certificates** from the Select a command drop-down list, and click **Go**.

## Configure Controllers > IPAddr > Security > Web Auth Certificate

This page enables you to download a web authorization certificate or regenerate the internally-generated web auth certificate.

To access the Web Auth Certificate page, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > Web Auth Certificate**.

### Caution

Each certificate has a variable-length embedded RSA Key. The RSA key can vary from 512 bits, which is relatively insecure, through thousands of bits, which is very secure. When you are obtaining a new certificate from a certificate authority (such as the Microsoft CA), make sure the RSA key embedded in the certificate is at least 768 Bits.

- Download Web Auth Certificate—Click to access the Download Web Auth Certificate to Controller page. See the [“Download Web Auth or Web Admin Certificate to Controller”](#) section on page 9-148 for additional information.

### Command Buttons

- Regenerate Cert—Regenerate the internally-generated web auth certificate.

## Configuring Wireless Protection Policies

This section describes the wireless protection policy configurations and introduces the following topics:

- [Configuring Rogue Policies, page 9-103](#)
- [Configuring Rogue AP Rules, page 9-104](#)
- [Configuring Client Exclusion Policies, page 9-104](#)
- [Configuring Controller Standard Signature Parameters, page 9-105](#)

- [Configuring Custom Signatures, page 9-109](#)
  - [Configuring AP Authentication and MFP, page 9-109](#)
- 

## Configuring Rogue Policies

This page enables you to set up policies for rogue access points.

To access the Rogue Policies page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Rogue Policies**. The following parameters appear:
- Rogue Location Discovery Protocol—RLDP determines whether or not the rogue is connected to the enterprise wired network. Choose one of the following from the drop-down list:
    - Disable—Disables RLDP on all access points. This is the default value.
    - All APs—Enables RLDP on all access points.
    - Monitor Mode APs—Enables RLDP only on access points in monitor mode.

**Note** Make sure that rogue detection is enabled on the desired access points. Rogue detection is enabled by default for all access points joined to a controller (except for OfficeExtend access points). However, in NCS software Release 6.0 or later, you can enable or disable rogue detection for individual access points by selecting or unselecting the **Rogue Detection** check box in the Access Point Details page. See the “[Configuring Access Points](#)” section on [page 9-151](#) for more information.

---

**Note** Rogue detection is disabled by default for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect a large number of rogue devices.

---

- Rogue APs
  - Expiration Timeout for Rogue AP and Rogue Client Entries (seconds)—Enter the number of seconds after which the rogue access point and client entries expire and are removed from the list.

The valid range is 240 to 3600 seconds and the default value is 1200 seconds.

**Note** If a rogue access point or client entry times out, it is removed from the controller only if its rogue state is Alert or Threat for any classification type.

---

- Rogue Clients
  - Validate rogue clients against AAA—Select the check box to use the AAA server or local database to validate if rogue clients are valid clients. The default value is unselected.

- Detect and report Adhoc networks—Select the check box to enable ad-hoc rogue detection and reporting. The default value is selected.

## Command Buttons

- Save—Save the changes made to the client exclusion policies and return to the previous page.
- Audit—Compare the NCS values with those used on the controller.

## Configuring Rogue AP Rules

This page enables you to view and edit current Rogue AP Rules.

To access the Rogue AP Rules page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Rogue AP Rules**. The Rogue AP Rules displays the Rogue AP Rules, the rule types (Malicious or Friendly), and the rule sequence.
  - Step 4** Click a Rogue AP Rule to view or edit its details. See the [“Configuring a Rogue AP Rules Template” section on page 11-78](#) for more information.
- 

## Configuring Client Exclusion Policies

This page enables you to set, enable, or disable the client exclusion policies applied to the controller.

To access the Client Exclusion Policies page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Client Exclusion Policies**. The following parameters appear:
    - Excessive 802.11a Association Failures—If enabled, clients are excluded on the sixth 802.11 association attempt, after five consecutive failures.
    - Excessive 802.11a Authentication Failures—If enabled, clients are excluded on the sixth 802.11 authentication attempt, after five consecutive failures.
    - Excessive 802.11x Authentication Failures—If enabled, clients are excluded on the fourth 802.1X authentication attempt, after three consecutive failures.
    - Excessive 802.11 Web Authentication Failures—If enabled, clients are excluded on the fourth web authentication attempt, after three consecutive failures.
    - IP Theft Or Reuse—If enabled, clients are excluded if the IP address is already assigned to another device.

- Step 4** Click **Save** to save the changes made to the client exclusion policies and return to the previous page or click **Audit** to compare the NCS values with those used on the controller.
- 

## Configuring IDS Signatures

You can configure *IDS* Signatures, or bit-pattern matching rules used to identify various types of attacks in incoming 802.11 packets, on the controller. When the signatures are enabled, the access points joined to the controller perform signature analysis on the received 802.11 data or management frames and report any discrepancies to the controller. If an attack is detected, an appropriate mitigation action is initiated.

Cisco supports 17 standard signatures on the controller as shown on the Standard Signatures and Custom Signatures pages. For more information on these IDS Signatures, see the *Cisco Network Control System Configuration Guide*.

- [Configuring Controller Standard Signature Parameters, page 9-105](#)
- [Configuring Custom Signatures, page 9-109](#)
- [Configuring AP Authentication and MFP, page 9-109](#)

## Configuring Controller Standard Signature Parameters

The Standard Signature Parameters page shows the list of Cisco-supplied signatures that are currently on the controller. This section contains the following topics:

- [Downloading Signature Files, page 9-106](#)
- [Uploading Signature Files, page 9-106](#)
- [Global Settings for Standard and Custom Signatures, page 9-107](#)

To access the Standard Signatures page, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Standard Signatures**. This page displays the following parameters:
- Precedence—The order in which the controller performs the signature checks.
  - Name—The type of attack the signature is trying to detect.
  - Frame Type—Management or data frame type on which the signature is looking for a security attack.
  - Action—What the controller is directed to do when the signature detects an attack. For example:
    - None—No action is taken.
    - Report—Report the detection.
  - State—Enabled or Disabled.
  - Description—A more detailed description of the type of attack the signature is trying to detect.
-

**Note**

---

Click a signature Name to view individual parameters and to enable or disable the signature.

---

## Downloading Signature Files

To download a signature file, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Standard Signatures** or **Security > Wireless Protection Policies > Custom Signatures**.
  - Step 4** From the **Select a command** drop-down list, choose **Download Signature Files**.

**Note**

---

This function can also be accessed by choosing **System > Commands > Upload/Download Commands > Download IDS Signatures**.

---

- Step 5** Click **Go**.
- Step 6** Copy the signature file (\*.sig) to the default directory on your TFTP server.
- Step 7** Choose **Local Machine** from the File is Located On. If you know the filename and path relative to the server root directory, you can also choose **TFTP server**.
- Step 8** Enter the maximum number of times the controller should attempt to download the signature file in the Maximum Retries.
- Step 9** Enter the maximum amount of time in seconds before the controller times out while attempting to download the signature file in the Timeout.
- Step 10** The signature files are uploaded to the c:\tftp directory. Specify the local file name in that directory or click the **Browse** button to navigate to it. A "revision" line in the signature file specifies whether the file is a Cisco-provided standard signature file or a site-tailored custom signature file (custom signature files must always have revision=custom).

**Note**

---

If the transfer times out for some reason, you can simply choose the TFTP server option in the File Is Located On parameter, and the server file name will be populated for you and retried. The local machine option initiates a two-step operation. First, the local file is copied from the administrator workstation to NCS own built-in TFTP server. Then the controller retrieves that file. For later operations, the file is already in the NCS server TFTP directory, and the downloaded web page now automatically populates the filename.

---

- Step 11** Click **OK**.
- 

## Uploading Signature Files

To upload a signature file from the controller, follow these steps:

- 
- Step 1** Obtain a signature file from Cisco (hereafter called a standard signature file). You can also create your own signature file (hereafter called a custom signature file) by following “[Downloading Signature Files](#)” section on page 9-106.
- Step 2** Make sure you have a Trivial File Transfer Protocol (TFTP) server available for the signature download. Keep these guidelines in mind when setting up a TFTP server:
- If you are downloading through the service port, the TFTP server must be on the same subnet as the service port because the service port cannot be routed.
  - If you are downloading through the distribution system network port, the TFTP server can be on the same or a different subnet because the distribution system port cannot be routed.
  - A third-party TFTP server cannot run on the same computer as the Cisco NCS because NCS built-in TFTP server and third-party TFTP server use the same communication port.
- Step 3** Choose **Configure > Controllers**.
- Step 4** Click an applicable IP address.
- Step 5** From the left sidebar menu, choose **Security > Wireless Protection Policies > Standard Signatures** or **Security > Wireless Protection Policies > Custom Signatures**.
- Step 6** From the Select a command drop-down list, choose **Upload Signature Files from controller**.
-  **Note** This function can also be accessed by choosing **Security > Custom Signatures > Select a command > Upload Signature Files from controller** or **System > Commands > Upload/Download Commands > Upload File from Controller**.
- 
- Step 7** Specify the TFTP server name being used for the transfer.
- Step 8** If the TFTP server is new, enter the TFTP IP address in the **Server IP Address** parameter.
- Step 9** Choose **Signature Files** from the File Type drop-down list.
- Step 10** The signature files are uploaded to the root directory which was configured for use by the TFTP server. You can change to a different directory at the Upload to File parameter (this parameter only shows if the Server Name is the default server). The controller uses this local file name as a base name and then adds `_std.sig` as a suffix for standard signature files and `_custom.sig` as a suffix for custom signature files.
- Step 11** Click **OK**.
- 

### Global Settings for Standard and Custom Signatures

This command enables all signatures that were individually selected as enabled. If this text box remains unselected, all files will be disabled, even those that were previously enabled. When the signatures are enabled, the access points joined to the controller perform signature analysis on the received 802.11 data or management frames and report any discrepancies to the controller.

To enable all standard and custom signatures currently on the controller, follow these steps:

- 
- Step 1** From the Select a command drop-down list, choose **Edit Signature Parameters**.
- Step 2** Click **Go**.
- Step 3** Select the **Enable Check for All Standard and Custom Signatures** check box.

**Step 4** Click **Save**.

---

To enable or disable an individual signature, follow these steps:

---

**Step 1** Click an applicable Name for the type of attack you want to enable or disable.

The Standard Signature parameters page shows the list of Cisco-supplied signatures that are currently on the controller. The Custom Signatures page shows the list of customer-supplied signatures that are currently on the controller. The following parameters are displayed in both the signature page and the detailed signature page:

- Precedence—The order, or precedence, in which the controller performs the signature checks.
- Name—The type of attack the signature is trying to detect.
- Description—A more detailed description of the type of attack that the signature is trying to detect.
- Frame Type—Management or data frame type on which the signature is looking for a security attack.
- Action—What the controller is directed to do when the signature detects an attack. One possibility is *None*, where no action is taken, and another is *Report*, to report the detection.
- Frequency—The signature frequency or the number of matching packets per interval that must be identified at the detecting access point level before an attack is detected. The range is 1 to 32,000 packets per interval and the default value is 50 packets per interval.
- Quiet Time—The length of time (in seconds) after which no attacks have been detected at the individual access point level, and the alarm can stop. This time appears only if the MAC information is all or both. The range is 60 to 32,000 seconds and the default value is 300 seconds.
- MAC Information—Whether the signature is to be tracked per network or per MAC address or both at the detecting access point level.
- MAC Frequency—The signature MAC frequency or the number of matching packets per interval that must be identified at the controller level before an attack is detected. The range is 1 to 32,000 packets per interval and the default value is 30 packets per interval.
- Interval—Enter the number of seconds that must elapse before the signature frequency threshold is reached within the configured interval. The range is 1 to 3600 seconds and the default value is 1 second.
- Enable—Select this check box to enable this signature to detect security attacks or unselect it to disable this signature.
- Signature Patterns—The pattern that is being used to detect a security attack.

**Step 2** From the Enable drop-down list, choose **Yes**. Because you are downloading a customized signature, you should enable the files named with the `_custom.sgi` and disable the standard signature with the same name but differing suffix. For example, if you are customizing broadcast probe flood, you want to disable broadcast probe flood in the standard signatures but enable it in custom signatures.

**Step 3** Click **Save**.

---

## Configuring Custom Signatures

The Custom Signature page shows the list of customer-supplied signatures that are currently on the controller.

- [Downloading Signature Files, page 9-106](#)
- [Uploading Signature Files, page 9-106](#)
- [Global Settings for Standard and Custom Signatures, page 9-107](#)

To access the Custom Signatures page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > Custom Signatures**. This page displays the following parameters:
- Precedence—The order in which the controller performs the signature checks.
  - Name—The type of attack the signature is trying to detect.
  - Frame Type—Management or data frame type on which the signature is looking for a security attack.
  - Action—What the controller is directed to do when the signature detects an attack. For example:
    - None—No action is taken.
    - Report—Report the detection.
  - State—Enabled or Disabled.
  - Description—A more detailed description of the type of attack the signature is trying to detect.
- 

**Note**

Click a signature Name to view individual parameters and to enable or disable the signature.

---

## Configuring AP Authentication and MFP

This page enables you to set the access point authentication policy.

To access the AP Authentication and MFP (Management Frame Protection) page, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Security > Wireless Protection Policies > AP Authentication and MFP**.
- RF Network Name—Not an editable text box. The RF Network Name entered in the general parameters page (See *Configure IPaddr > General*) is displayed here.
  - Protection Type—From the drop-down list, select one of the following authentication policies:
    - None—No access point authentication policy.
    - AP Authentication—Apply authentication policy.

- MFP—Apply Management Frame Protection. See the [“Monitoring Management Frame Protection” section on page 5-19](#) for more information.
  - Alarm Trigger Threshold—(Appears only when AP Authentication is selected as the Protection Type). Set the number of hits to be ignored from an alien access point before raising an alarm. The valid range is from 1 to 255. The default value is 255.
- 

### Command Buttons

- Save
- Audit

## Configuring Cisco Access Points

You can use the [Configure > Controllers](#) page to view and configure Cisco access points for a specific controller.

To access the Cisco APs page, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Access Points > Cisco APs**. The Cisco APs page opens and displays the following parameters:
  - AP Name—Click an access point name to view or configure access point details.
  - Base Radio MAC
  - Admin Status
  - AP Mode
  - Software Version
  - Primary Controller Name
- Step 4** Click an access point name to view or configure the access point details. The displayed information may vary depending on the access point type.

**Note** See the [“Configuring Access Points” section on page 9-151](#) for more detailed information.

---

### Command Buttons

- Save—Save the current settings.
- Audit—Discover the present status of this access point.

## Sniffer feature

When the sniffer feature is enabled on an access point, the access point functions as a sniffer and captures and forwards all the packets on a particular channel to a remote machine that runs AiroPeek. The packets contain information on timestamp, signal strength, packet size, and so on.

**Note**

The sniffer feature can be enabled only if you are running AiroPeek, which is a third-party network analyzer software that supports decoding of data packets. For more information on AiroPeek, see the following URL: [www.wildpackets.com/products/airopeek/overview](http://www.wildpackets.com/products/airopeek/overview)

### Prerequisites for Using the Sniffer Feature

Before using the sniffer feature, you must have completed the following:

- Configured an access point in sniffer mode at the remote site. For information on how to configure an access point in sniffer mode, see AP mode in Configuring an AP in Sniffer Mode Using the Web User Interface.
- Installed AiroPeek version 2.05 or later on a Windows XP machine.

**Note**

You must be a WildPackets Maintenance Member to download the following dll files. See the following URL:

[https://wpdn.wildpackets.com/view\\_submission.php?id=30](https://wpdn.wildpackets.com/view_submission.php?id=30)

- Copied the following dll files:
  - socket.dll file to the Plugins folder (Example: C:\ProgramFiles\WildPackets\AiroPeek\Plugins)
  - socketres.dll file to the PluginRes folder (Example:C:\ProgramFiles\WildPackets\AiroPeek\1033\PluginRes)

### Configuring AiroPeek on the Remote Machine

To configure AiroPeek on the remote machine, follow these steps:

- Step 1** Start the AiroPeek application and click **Options** on the Tools tab.
- Step 2** Click **Analysis Module** in the Options page.
- Step 3** Right-click inside the page and select **Disable All** option.
- Step 4** Find the Cisco remote module column and enable it. Click **OK** to save the changes.
- Step 5** Click **New capture** to bring up the capture option page.
- Step 6** Choose the remote Cisco adapter and from the list of adapter modules.
- Step 7** Expand it to locate the new remote adapter option. Double-click it to open a new page, enter a name in the text box provided and enter the controller management interface IP in the IP address column.
- Step 8** Click **OK**. The new adapter will be added to the remote Cisco adapter.
- Step 9** Select the new adapter for remote airopeek capture using the access point.
- Step 10** Click **start socket capture** in the capture page to start the remote capture process.

- Step 11** Go to the controller CLI, bring up an access point, and set it to sniffer mode by entering **config ap mode sniffer <ap-name>**.

The access point will reboot and come up in sniffer mode.

---

### Configuring an AP in Sniffer Mode Using the Web User Interface

To configure an AP in Sniffer Mode using the web user interface, follow these steps:

- Step 1** Choose **Configure > Access Points**, then click an item under AP Name list to navigate to this pane.
- Step 2** In General parameters, set the AP mode to Sniffer using the drop-down list, and click **Apply**.
- Step 3** Select a Protocol (802.11a/802.11b/g) under Radio Interfaces. This will open the configuration page.
- Step 4** Select the **Sniff** check box to bring up the Sniff parameters. Select the channel to be sniffed and enter the IP address of the server (The remote machine running AiroPeek).
- Step 5** Click **Save** to save the changes.
- 

## Configuring 802.11 Parameters

- [Configuring General Parameters for an 802.11 Controller, page 9-112](#)
- [Configuring Security Parameters, page 9-81](#)
- [Configuring Aggressive Load Balancing, page 9-113](#)
- [Configuring Band Selection, page 9-115](#)
- [Configuring 802.11 Media Parameters, page 9-116](#)

### Configuring General Parameters for an 802.11 Controller

This page enables you to edit country selection and timer information on a 802.11 controller. To access this page, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11 > General**. The page opens and displays the following parameters:

- Country
  - Country—Countries and the protocols allowed.

**Note** The maximum number of countries that you can select is 20.

---

- Selected Countries—Displays countries currently selected.
- Timers

- Authentication Response Timeout—Configures 802.11 authentication response timeout in seconds.
- 

## Setting Multiple Country Codes

To set multiple country support for a single controller(s) that is not part of a mobility group, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the controller for which you are adding countries.
- Step 3** Choose **802.11 > General** from the left sidebar menu.
- Step 4** Select the check box to choose which country you want to add. Access points are designed for use in many countries with varying regulatory requirements. You can configure a country code to ensure that it complies with your country regulations.

**Note** Access points may not operate properly if they are not designed for use in your country of operation. For example, an access point with part number AIR-AP1030-A-K9 (which is included in the Americas regulatory domain) cannot be used in Australia. Always be sure to purchase access points that match your country regulatory domain. For a complete list of country codes supported per product, see <http://www.cisco.com/warp/public/779/smbiz/wireless/approvals.html>.

---

- Step 5** Enter the time (in seconds) after which the authentication response will timeout.
  - Step 6** Click **Save**.
- 

## Configuring Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points.

**Note** Clients are load balanced between access points on the same controller. Load balancing does not occur between access points on different controllers.

---

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. This code indicates whether the access point can accept any more associations. If the access point is too busy, the client attempts to associate to a different access point in the area. The system determines if an access point is relatively more busy than its neighbor access points that are also accessible to the client.

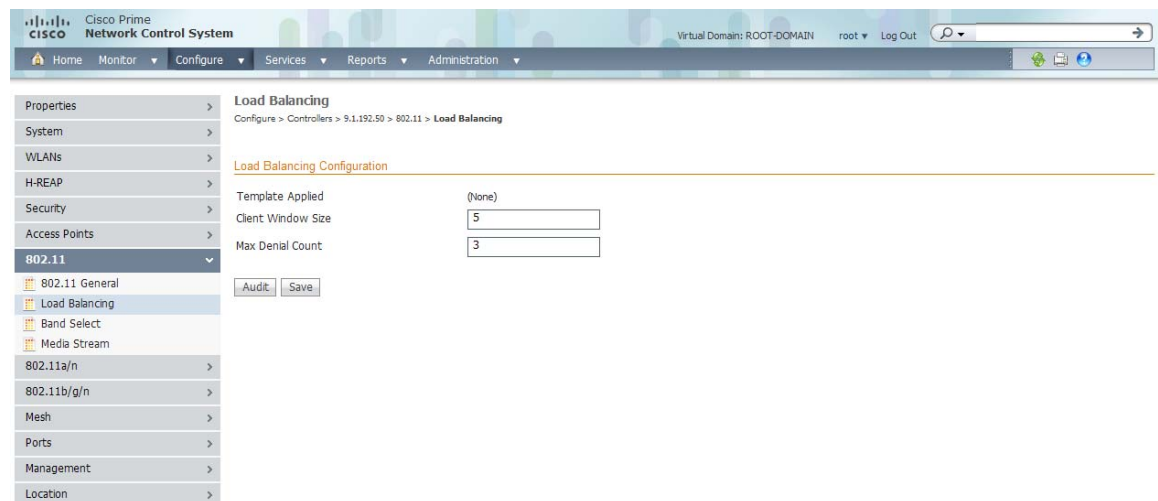

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

To configure aggressive load balancing, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Choose the controller that you need to configure.
- Step 3** Choose **802.11 > Load Balancing** from the left sidebar menu. The load balancing page appears (see [Figure 9-12](#)).

**Figure 9-12** Load Balancing

- Step 4** Enter a value between 1 and 20 for the client window size. The page size becomes part of the algorithm that determines whether an access point is too heavily loaded to accept more client associations:
 
$$\text{load-balancing page} + \text{client associations on AP with lightest load} = \text{load-balancing threshold}$$

In the group of access points accessible to a client device, each access point has a different number of client associations. The access point with the lowest number of clients has the lightest load. The client page size plus the number of clients on the access point with the lightest load forms the threshold. Access points with more client associations than this threshold is considered busy, and clients can associate only to access points with client counts lower than the threshold.
- Step 5** Enter a value between 0 and 10 for the max denial count. The denial count sets the maximum number of association denials during load balancing.
- Step 6** Click **Save**.
- Step 7** To enable or disable aggressive load balancing on specific WLANs, browse to the WLAN Configuration page, and click the **Advanced** tab. For instructions on using the WLAN Configuration page, see the [“Configuring Controller WLANs”](#) section on page 9-64.

## Configuring Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three non-overlapping channels. To combat these sources of interference and improve overall network performance, you can configure band selection on the controller.

Band selection works by regulating probe responses to clients. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels.

You can enable band selection globally on a controller, or you can enable or disable band selection for a particular WLAN, which is useful if you want to disable it for a select group of clients (such as time-sensitive voice clients).

**Note**

Band-selection-enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.

### Guidelines for Using Band Selection

Follow these guidelines when using band selection:

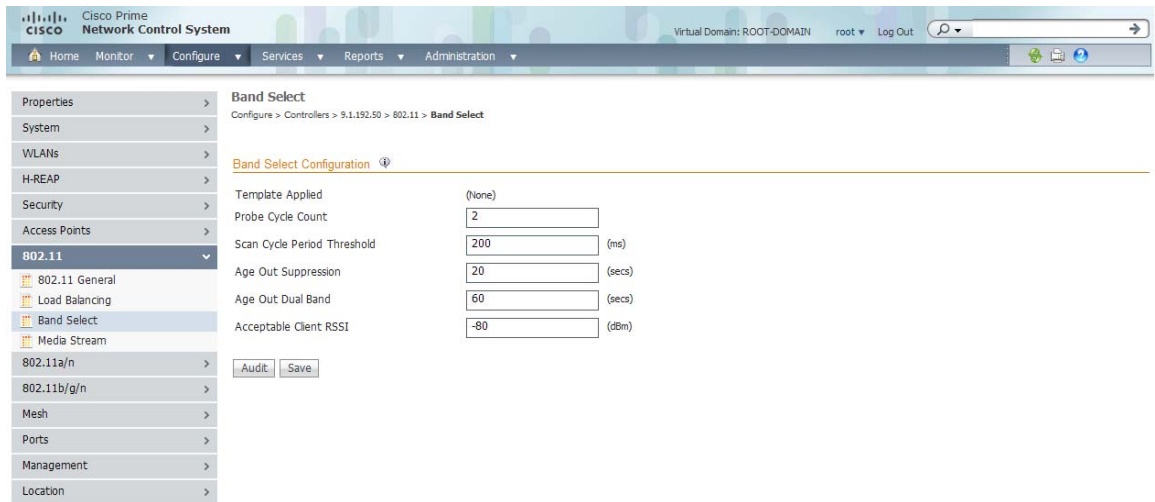

- Band selection can be used only with Cisco Aironet 1140 and 1250 series access points.
- Band selection operates only on access points that are connected to a controller. A hybrid-REAP access point without a controller connection does not perform band selection after a reboot.
- The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.
- You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.

### Configuration Steps

To configure band selection, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Choose the controller that you need to configure.
  - Step 3** Choose **802.11 > Band Select** from the left sidebar menu. The band select page appears (see [Figure 9-13](#)).

**Figure 9-13 Band Select**

- Step 4** Enter a value between 1 and 10 for the probe cycle count. The cycle count sets the number of suppression cycles for a new client. The default cycle count is 2.
- Step 5** Enter a value between 1 and 1000 milliseconds for the scan cycle period threshold. This setting determines the time threshold during which new probe requests from a client come from a new scanning cycle. The default cycle threshold is 200 milliseconds.
- Step 6** Enter a value between 10 and 200 seconds for the age out suppression parameter. Age-out suppression sets the expiration time for pruning previously known 802.11b/g clients. The default value is 20 seconds. After this time elapses, clients become new and are subject to probe response suppression.
- Step 7** Enter a value between 10 and 300 seconds for the age out dual band parameter. The age-out period sets the expiration time for pruning previously known dual-band clients. The default value is 60 seconds. After this time elapses, clients become new and are subject to probe response suppression.
- Step 8** Enter a value between -20 and -90 dBm for the acceptable client RSSI parameter. This parameter sets the minimum RSSI for a client to respond to a probe. The default value is -80 dBm.
- Step 9** Click **Save**.
- Step 10** To enable or disable band selection on specific WLANs, browse to the WLAN Configuration page and click the **Advanced** tab. For instructions on using the WLAN Configuration page, see the [“Configuring Controller WLANs”](#) section on page 9-64.

## Configuring 802.11 Media Parameters

To configure the media parameters for 802.11, follow these steps:

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click the applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11 > Media Stream**.
- Step 4** In the Media Stream Configuration section, specify the following parameters
  - Media Stream Name

- Multicast Destination Start IP—Start IP address of the media stream to be multicast
- Multicast Destination End IP—End IP address of the media stream to be multicast
- Maximum Expected Bandwidth—Maximum bandwidth that a media stream can use

**Step 5** In the Resource Reservation Control (RRC) Parameters group box, specify the following parameters:

- Average Packet Size—Average packet size that a media stream can use.
- RRC Periodical Update—Resource Reservation Control calculations that are updated periodically; if disabled, RRC calculations are done only once when a client joins a media stream.
- RRC Priority—Priority of RRC with the highest at 1 and the lowest at 8.
- Traffic Profile Violation—Appears if the stream is dropped or put in the best effort queue if the stream violates the QoS video profile.
- Policy—Appears if the media stream is admitted or denied.

**Step 6** Click **Save**.

---

## Configuring 802.11a/n Parameters

This section contains the following topics:

- [Configuring 802.11a/n General Parameters, page 9-117](#)
- [Configuring 802.11a/n 802.11h Parameters, page 9-127](#)
- [Configuring 802.11a/n RRM Intervals, page 9-119](#)
- [Configuring 802.11a/n RRM Transmit Power Control, page 9-120](#)
- [Configuring 802.11a/n RRM Dynamic Channel Allocation, page 9-121](#)
- [Configuring 802.11a/n RRM Radio Grouping, page 9-123](#)
- [Configuring 802.11a/n Media Parameters, page 9-123](#)
- [Configuring 802.11a/n EDCA Parameters, page 9-126](#)
- [Configuring 802.11a/n Roaming Parameters, page 9-126](#)
- [Configuring 802.11a/n 802.11h Parameters, page 9-127](#)
- [Configuring 802.11a/n High Throughput \(802.11n\) Parameters, page 9-128](#)
- [Configuring 802.11a/n CleanAir Parameters, page 9-128](#)

## Configuring 802.11a/n General Parameters

To view 802.11a/n parameters for a specific controller, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n Parameters** to view the following parameters:

- General
  - 802.11a/n Network Status—Select the check box to enable.

- Beacon Period—The amount of time between beacons. The valid range is from 100 to 600 milliseconds.
- DTIM Period—The number of beacon intervals that may elapse between transmission of beacon frames containing a traffic indicator message (TIM) element whose delivery count field is 0.
- Fragmentation Threshold (in bytes)—The size at which packets are fragmented. Use a low setting in areas where communication is poor or where there is a great deal of radio interference.
- Template Applied
- 802.11a/n Band Status
  - Low, Medium, and High Bands (read-only).
- 802.11a/n Power Status
  - Dynamic Assessment—Automatic, On Demand, or Disabled.
  - Current Tx Level—Range includes: 1 (maximum power allowed per country code setting), 2 (50% power), 3 (25% power), 4 (6.25 to 12.5% power), and 5 (0.195 to 6.25% power).

---

**Note** The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

---

- Control Interval—In seconds (read-only).
- Dynamic Treatment Power Control—Select the check box to enable.
- 802.11a/n Channel Status
  - Assignment Mode—Automatic, On Demand, or Disabled.
  - Update Interval—In seconds.
  - Avoid Foreign AP Interference—Enable to have RRM consider interference from foreign Cisco access points (those non-Cisco access points outside RF/mobility domain) when assigning channels.
  - Avoid Cisco AP load—Enable to have controllers consider the traffic bandwidth used by each access point when assigning channels to access points.
  - Avoid non 802.11 Noise—Enable to have access points avoid channels that have interference from non-access point sources, such as microwave ovens or Bluetooth devices. Disable this parameter to have RRM ignore this interference.
  - Signal Strength Contribution—Not configurable.
  - Avoid Persistent Non-WiFi interface
- Data Rates
  - Ranges between 6 Mbps and 54 Mbps—Supported, Mandatory, or Disabled.
- Noise/Interference/Rogue Monitoring Channels.
  - Channel List—All Channels, Country Channels, DCA Channels.

---

**Note** Dynamic Channel Allocation (DCA) automatically selects a reasonably good channel allocation from a set of managed devices connected to the controller.

---

- CCX Location Measurement—When enabled, it enhances the location accuracy of clients.
  - Mode—Select the check box to enable.

- Interval—In seconds.

**Note** The CCX Location Measurement Interval can be changed only when measurement mode is enabled.

## Command Buttons

- Save—Save the changes made.
- Audit—Compare the NCS values with those used on the controller.

## Configuring 802.11a/n RRM Thresholds

To configure a 802.11a/n RRM threshold controller, follow these steps:

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > RRM Thresholds**.

**Step 4** Make any necessary changes to Coverage Thresholds, Load Thresholds, Other Thresholds, and Noise/Interference/Rogue Monitoring Channels.

**Note** When the Coverage Thresholds Min SNR Level (dB) parameter is adjusted, the value of the Signal Strength (dB) automatically reflects this change. The Signal Strength (dB) parameter provides information regarding what the target range of coverage thresholds will be when adjusting the SNR value.

**Step 5** Click **Save**.

## Configuring 802.11a/n RRM Intervals

To configure 802.11a/n or 802.11b/g/n RRM intervals for an individual controller, follow these steps:

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > RRM Intervals** or **802.11b/g/n > RRM Intervals**.

**Note** The default for the following four RRM interval parameters is 300 seconds.

**Step 4** Enter at which interval you want strength measurements taken for each access point.

**Step 5** Enter at which interval you want noise and interference measurements taken for each access point.

**Step 6** Enter at which interval you want load measurements taken for each access point.

- Step 7** Enter at which interval you want coverage measurements taken for each access point.
- Step 8** Click **Save**.
- 

## Configuring 802.11a/n RRM Transmit Power Control

The controller dynamically controls access point transmit power based on real-time wireless LAN conditions. Normally, power can be kept low to gain extra capacity and reduce interference. The controller attempts to balance the access points' transmit power according to how the access points are seen by their third strongest neighbor.

The transmit power control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances TPC will seek to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from Coverage Hole Detection, explained below. Coverage hole detection is primarily concerned with clients, while TPC is tasked with providing enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

To configure 802.11a/n or 802.11b/g/n RRM TPC, follow these steps:

---

- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11a/n-RRM > TPC**.
- Step 4** Configure the following TPC parameters:
- **Template Applied**—The name of the template applied to this controller.
  - **Dynamic Assignment**—At the Dynamic Assignment drop-down list, choose one of three modes:
    - **Automatic** - The transmit power is periodically updated for all access points that permit this operation.
    - **On Demand** - Transmit power is updated when the Assign Now button is selected.
    - **Disabled** - No dynamic transmit power assignments occur, and values are set to their global default.
  - **Maximum Power Assignment**—Indicates the maximum power assigned.
    - Range: -10 to 30 dB
    - Default: 30 dB
  - **Minimum Power Assignment**—Indicates the minimum power assigned.
    - Range: -10 to 30 dB
    - Default: 30 dB
  - **Dynamic Tx Power Control**—Determine if you want to enable Dynamic Tx Power Control.
  - **Transmitted Power Threshold**—Enter a transmitted power threshold between -50 and -80.
  - **Control Interval**—In seconds (read-only).
- Step 5** Click **Save**.
-

## Configuring 802.11a/n RRM Dynamic Channel Allocation

The Radio Resource Management (RRM) Dynamic Channel Assignment (DCA) page allows you to choose the DCA channels as well as the channel width for this controller.

RRM DCA supports 802.11n 40-MHz channel width in the 5-GHz band. The higher bandwidth allows radios to achieve higher instantaneous data rates.

---

**Note** Choosing a larger bandwidth reduces the non-overlapping channels which could potentially reduce the overall network throughput for certain deployments.

---

To configure 802.11 a/n RRM DCA channels for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the appropriate controller.
  - Step 3** From the left sidebar menu, choose **802.11a/n > RRM DCA**. The 802.11a/n RRM DCA page appears (see [Figure 9-14](#)).

---

**Note** You can also configure the channel width on the access point page by choosing **Configure > Access Points**, and clicking the **802.11a/n** link in the Radio column. The Current RF Channel Assignment. is provided, and you can choose a Global assignment method or choose Custom to specify a channel.

---

Figure 9-14 802.11a/n RRM DCA Page

The screenshot displays the Cisco Prime Network Control System configuration interface for the 802.11a/n RRM DCA page. The left sidebar shows the navigation tree with '802.11a/n' selected. The main content area is divided into several sections:

- DCA**: Configuration for Dynamic Channel Assignment.
  - Assignment Mode: Automatic
  - Update Interval: 600 (secs)
  - Avoid Foreign AP Interference:  Enable
  - Avoid Cisco AP load:  Enable
  - Avoid non 802.11 Noise:  Enable
  - Avoid Persistent Non-WiFi Interference:  Enable
  - Signal Strength Contribution:  Enable
  - Outdoor AP DCA:  Enable
  - Channel Width: 20 MHz
- DCA List Channels**: A list of selected DCA channels: 36, 40, 44, 48, 52, 56, 60, 64, 149, 153, 157, 161.
- Event Driven RRM**:
  - Event Driven RRM:  Enable
  - Sensitivity Threshold: Medium

- Step 4** From the Channel Width drop-down list, choose **20 MHz** or **40 MHz**. Prior to software release 5.1, 40-MHz channels were only statically configurable. Only radios with 20-MHz channels were supported by DCA. With 40 MHz, radios can achieve higher instantaneous data rates; however, larger bandwidths reduce the number of non-overlapping channels so certain deployments could have reduced overall network throughput.

**Note** Be cautious about deploying a mix of 20-MHz and 40-MHz devices. The 40-MHz devices have slightly different channel access rules which may negatively impact the 20-MHz devices.

**Note** To view the channel width for an access point's radio, go to **Monitor > Access Points > name > Interfaces** tab. You can also view the channel width and antenna selections by choosing **Configure > Access Points** and clicking the desired radio in the Radio column.

- Step 5** Select the check boxes for the appropriate DCA channels. The selected channels are listed in the Selected DCA channels list.
- Step 6** Enable or disable event-driven radio resource management (RRM) using the following parameters. Event Driven RRM is used when a CleanAir-enabled access point detects a significant level of interference.

- Event Driven RRM—Enable or Disable spectrum event-driven RRM. By default, Event Driven RRM is enabled.
- Sensitivity Threshold—If Event Driven RRM is enabled, this field displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

**Step 7** Click **Save**.

---

## Configuring 802.11a/n RRM Radio Grouping

To configure 802.11a/n or 802.11b/g/n RRM Radio Grouping for an individual controller, follow these steps:

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > RRM > RF Grouping**.

**Step 4** Choose a grouping mode from the drop-down list. The following parameters appear:

- Automatic—Allows you to activate the automatic RRM Grouping Algorithm. This is the default mode.
- Off—Allows you to deactivate the automatic grouping.
- Leader—Allows you to assign members to the group.

**Step 5** Choose a group update interval (secs) from the drop-down list. When grouping is on, this interval (in seconds) represents the period with which the grouping algorithm is run by the Group Leader. Grouping algorithm will also run when the group contents changes and the automatic grouping is enabled. A dynamic grouping can be started upon request from the system administrator. Default value is 600 seconds.

**Step 6** In the Group Members group box, click **Add >**. The selected controller moves from the Available Controllers to the RF Group Members list.

**Note** The RF Group Members group box appears only when the grouping mode is set to Leader.

**Note** The maximum number of controllers that can be added to a RF Group is 20.

**Step 7** Click **Save**.

---

## Configuring 802.11a/n Media Parameters

To configure the media parameters for 802.11a/n, follow these steps:

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click the applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > Media Parameters**.

**Step 4** In the **Voice** tab, specify the following parameters:

- Admission Control (ACM)—Select the check box to enable admission control.

For end users to experience acceptable audio quality during a VoIP phone call, packets must be delivered from one endpoint to another with low latency and low packet loss. To maintain QoS under differing network loads, call admission control (CAC) is required. CAC on an access point allows it to maintain controlled QoS when the network is experiencing congestion and keep the maximum allowed number of calls to an acceptable quantity.

- CAC Method—If Admission Control (ACM) is enabled, specify the CAC method as either load-based or static.

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types from itself, from co-channel access points, and by co-located channel interference. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point periodically measures and updates the utilization of the RF channel, channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents over-subscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

- Maximum Bandwidth Allowed—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- Reserved Roaming Bandwidth—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- Expedited Bandwidth—Select the check box to enable expedited bandwidth as an extension of CAC for emergency calls.

You must have an expedited bandwidth that is CCXv5 compliant so that a TSPEC request is given higher priority.

- SIP CAC—Select the check box to enable SIP CAC.

SIP CAC should be used only for phones that support status code 17 and do not support TSPEC-based admission control.

- SIP Codec—Specify the codec name you want to use on this radio. The available options are G.711, G.729, and User Defined.
- SIP Call Bandwidth—Specify the bandwidth in kilobits per second that you want to assign per SIP call on the network. This parameter can be configured only when the SIP Codec selected is User Defined.
- SIP Sample Interval—Specify the sample interval in milliseconds that the codec must operate in.
- Max Voice Calls per Radio—Specify the maximum number of voice calls that can be made per Radio.
- Max Roaming Reserved Calls per Radio—Specify the maximum number roaming calls that can be reserved per Radio.

**Note** The Max Voice Calls per Radio and Max Roaming Reserved Calls per Radio options are available only if the CAC Method is specified as Static and SIP CAC is enabled.

- Metric Collection—Select the check box to enable metric collection.

Traffic stream metrics are a series of statistics about VoIP over your wireless LAN which inform you of the QoS of the wireless LAN. For the access point to collect measurement values, traffic stream metrics must be enabled. When this is enabled, the controller begins collecting statistical data every 90 seconds for the 802.11b/g interfaces from all associated access points. If you are using VoIP or video, this feature should be enabled.

**Step 5** On the **Video** tab, specify the following parameters:

- Admission Control (ACM)—Select the check box to enable admission control.
- Maximum Bandwidth Allowed—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- Reserved Roaming Bandwidth—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- Unicast Video Redirect—Select the **Unicast Video Redirect** check box to enable all non-media stream packets in video queue are redirected to the best effort queue. If disabled, all packets with video marking are kept in video queue.
- Client Minimum Phy Rate—Specify the physical data rate required for the client to join a media stream from the Client Minimum Phy Rate drop-down list.
- Multicast Direct Enable—Select the **Multicast Direct Enable** check box to set the Media Direct for any WLAN with Media Direct enabled on a WLAN on this radio.
- Maximum Number of Streams per Radio—Specify the maximum number of streams per Radio to be allowed.
- Maximum Number of Streams per Client—Specify the maximum number of streams per Client to be allowed.
- Best Effort QOS Admission—Select the Best Effort QOS Admission check box to redirect new client requests to the best effort queue. This happens only if all the video bandwidth has been used.

**Note** If disabled and maximum video bandwidth has been used, then any new client request is rejected.

**Step 6** In the **General** tab, specify the following parameter:

- Maximum Media Bandwidth (0 to 85%)—Specify the percentage of maximum of bandwidth allowed. This option is only available when CAC is enabled.

**Step 7** Click **Save**.

**Note** SIPs are available only on the following controllers: 4400, 5500 and on for the following access points: 1240, 1130, and 11n.

## Command Buttons

- Save—Save the changes made.

- Audit—Compare the NCS values with those used on the controller.

## Configuring 802.11a/n EDCA Parameters

The EDCA parameters (EDCA profile and Streaming MAC Enable settings) for 802.11a/n and 802.11b/g/n can be configured either by individual controller or through a controller template to improve voice QoS support.

To configure 802.11a/n or 802.11b/g/n EDCA parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11a/n > EDCA Parameters** or **802.11b/g/n > EDCA Parameters**.
- Step 4** Choose the EDCA Profile from the drop-down list.

**Note** Profiles include Wi-Fi Multimedia (WMM), Spectralink Voice Priority (SVP), Voice Optimized, and Voice & Video Optimized. WMM is the default EDCA profile.

**Note** You must shut down radio interface before configuring EDCA Parameters.

- Step 5** Select the **Enable Streaming MAC** check box to enable this feature.

**Note** Only enable Streaming MAC if all clients on the network are WMM compliant.

---

## Configuring 802.11a/n Roaming Parameters

To configure 802.11a/n or 802.11b/g/n EDCA parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11a/n > Roaming Parameters**.
- Step 4** From the Mode drop-down list, choose **Default values** or **Custom values**.
- Default values—The default values (read-only) are automatically displayed in the text boxes.
  - Custom values—Activates the text boxes to enable editing of the roaming parameters.
- Step 5** In the Minimum RSSI text box, enter a value for the minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.
- Range: -80 to -90 dBm
  - Default: -85 dBm

**Note** If the client average received signal power dips below this threshold, reliable communication is typically impossible; clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

**Step 6** In the Hysteresis text box, enter a value to indicate how strong the signal strength of a neighboring access point must for the client to roam to it.

This parameter is intended to reduce the amount of “ping ponging” between access points if the client is physically located on or near the border between two access points.

- Range: 2 to 4 dB
- Default: 3 dB

**Step 7** In the Adaptive Scan Threshold text box, enter the RSSI value, from a client associated access point, below which the client must be able to roam to a neighboring access point within the specified transition time.

This parameter provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when below the threshold.

- Range: -70 to -77 dB
- Default: -72 dB

**Step 8** In the Transition Time text box, enter the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client associated access point is below the scan threshold.

The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.

- Range: 1 to 10 seconds
- Default: 5 seconds

**Step 9** Click **Save**.

## Configuring 802.11a/n 802.11h Parameters

To configure 802.11h parameters for an individual controller, follow these steps:

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > 802.11h** or **802.11b/g/n > 802.11h**.

**Step 4** Select the **power constraint** check box to enable TPC.

**Step 5** Select the **channel announcement** check box to enable channel announcement. Channel announcement is a method in which the access point announces when it is switching to a new channel and the new channel number.

**Step 6** Click **Save**.

---

## Configuring 802.11a/n High Throughput (802.11n) Parameters

To configure 802.11a/n or 802.11b/g/n high throughput parameters, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > High Throughput** or **802.11b/g/n > High Throughput**.

**Step 4** Select the **802.11n Network Status Enabled** check box to enable high throughput.

**Step 5** In the MCS (Data Rate) Settings, choose which level of data rate you want supported. MCS is modulation coding schemes which are similar to 802.11a data rate. As a default, 20 MHz and short guarded interval is used.

**Note** When you select the Supported check box, the chosen numbers appear in the Selected MCS Indexes page.

---

**Step 6** Click **Save**.

---

## Configuring 802.11a/n CleanAir Parameters

To configure 802.11a/n CleanAir parameters, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > CleanAir** to view the following information.

- **CleanAir**—Select the check box to enable CleanAir functionality on the 802.11 a/n network, or unselect to disable CleanAir functionality. The default value is selected.
- **Reporting Configuration**—Use the parameters in this section to configure the interferer devices you want to include for your reports.
  - **Report**—Select the **report interferers** check box to enable CleanAir system to report and detect sources of interference, or unselect it to prevent the controller from reporting interferers. The default value is selected.
  - Make sure that any sources of interference that need to be detected and reported by the CleanAir system appear in the Interferences to Detect text box and any that do not need to be detected appear in the Interferers to Ignore text box. Use the > and < buttons to move interference sources between these two text boxes. By default, all interference sources are detected.
- **Alarm Configuration**—This section enables you to configure triggering of air quality alarms.
  - **Air Quality Alarm**—Select the **Air Quality Alarm** check box to enable the triggering of air quality alarms, or unselect the box to disable this feature. The default value is selected.

- Air Quality Alarm Threshold—If you selected the Air Quality Alarm check box, enter a value between 1 and 100 (inclusive) in the Air Quality Alarm Threshold text box to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.
- Interferers For Security Alarm—Select the **Interferers For Security Alarm** check box to trigger interferer alarms when the controller detects specified device types, or unselect it to disable this feature. The default value is selected.
- Make sure that any sources of interference that need to trigger interferer alarms appear in the Interferers Selected for Security Alarms text box and any that do not need to trigger interferer alarms appear in the Interferers Ignored for Security Alarms text box. Use the > and < buttons to move interference sources between these two boxes. By default, all interference sources trigger interferer alarms.
- Event Driven RRM—To trigger spectrum event-driven Radio Resource Management (RRM) to run when a CleanAir-enabled access point detects a significant level of interference, follow these steps:
  - Event Driven RRM—Displays the current status of spectrum event-driven RRM.
  - Sensitivity Threshold—If Event Driven RRM is enabled, this text box displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

### Command Buttons

- Save—Save the changes made.
  - Audit—Compare the NCS values with those used on the controller.
- 

## Configuring 802.11b/g/n Parameters

This section contains the following topics:

- [Configuring 802.11b/g/n General Parameters, page 9-130](#)
- [Configuring 802.11b/g/n RRM Thresholds, page 9-131](#)
- [Configuring 802.11b/g/n RRM Intervals, page 9-131](#)

## Configuring 802.11b/g/n General Parameters

To view 802.11b/g/n parameters for a specific controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11b/g/n Parameters** to view the following parameters:
- General
    - 802.11b/g Network Status—Select the check box to enable.
    - 802.11g Support—Select the check box to enable.
    - Beacon Period—In milliseconds.
    - DTIM Period—The number of beacon intervals that may elapse between transmission of beacon frames containing a traffic indicator message (TIM) element whose delivery count field is 0.
    - Fragmentation Threshold—In bytes.
    - Short Preamble—Select the check box to enable.
    - Template Applied
  - 802.11a/n Power Status
    - Dynamic Assessment—Automatic, On Demand, or Disabled.
    - Current Tx Level
    - Control Interval—In seconds (Read-only).
    - Dynamic Treatment Power Control—Select the check box to enable.
  - 802.11a/n Channel Status
    - Assignment Mode—Automatic, On Demand, or Disabled.
    - Update Interval—In seconds.
    - Avoid Foreign AP Interference—Select the check box to enable.
    - Avoid Cisco AP load—Select the check box to enable.
    - Avoid non 802.11 Noise—Select the check box to enable.
    - Signal Strength Contribution—Select the check box to enable.
  - Data Rates
    - Ranges between 1 Mbps and 54 Mbps—Supported, Mandatory, or Disabled.
  - Noise/Interference/Rogue Monitoring Channels
    - Channel List—All Channels, Country Channels, DCA Channels.
  - CCX Location Measurement
    - Mode—Select the check box to enable.
    - Interval—In seconds.

**Note** The CCX Location Measurement Interval can be changed only when measurement mode is enabled.

## Command Buttons

- Save—Save the changes made.
- Audit—Compare the NCS values with those used on the controller.

## Configuring 802.11b/g/n RRM Thresholds

To configure a 802.11b/g/n RRM threshold controller, follow these steps:

- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11b/g/n > RRM Thresholds**.
- Step 4** Make any necessary changes to Coverage Thresholds, Load Thresholds, Other Thresholds, and Noise/Interference/Rogue Monitoring Channels.

**Note** When the Coverage Thresholds Min SNR Level (dB) parameter is adjusted, the value of the Signal Strength (dB) automatically reflects this change. The Signal Strength (dB) parameter provides information regarding what the target range of coverage thresholds will be when adjusting the SNR value.

- Step 5** Click **Save**.

## Configuring 802.11b/g/n RRM Intervals

To configure 802.11a/n or 802.11b/g/n RRM intervals for an individual controller, follow these steps:

- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11a/n > RRM Intervals** or **802.11b/g/n > RRM Intervals**.

**Note** The default for the following four RRM interval parameters is 300 seconds.

- Step 4** Enter at which interval you want strength measurements taken for each access point.
- Step 5** Enter at which interval you want noise and interference measurements taken for each access point.
- Step 6** Enter at which interval you want load measurements taken for each access point.
- Step 7** Enter at which interval you want coverage measurements taken for each access point.

**Step 8** Click **Save**.

---

## Configuring 802.11b/g/n RRM Transmit Power Control

The controller dynamically controls access point transmit power based on real-time wireless LAN conditions. Normally, power can be kept low to gain extra capacity and reduce interference. The controller attempts to balance the access points' transmit power according to how the access points are seen by their third strongest neighbor.

The transmit power control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances TPC will seek to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from Coverage Hole Detection, explained below. Coverage hole detection is primarily concerned with clients, while TPC is tasked with providing enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

To configure 802.11b/g/n RRM TPC, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11b/g/n-RRM > TPC**.

**Step 4** Configure the following TPC parameters:

- **Template Applied**—The name of the template applied to this controller.
- **Dynamic Assignment**—At the Dynamic Assignment drop-down list, choose one of three modes:
  - **Automatic** - The transmit power is periodically updated for all access points that permit this operation.
  - **On Demand** - Transmit power is updated when the Assign Now button is selected.
  - **Disabled** - No dynamic transmit power assignments occur, and values are set to their global default.
- **Maximum Power Assignment**—Indicates the maximum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- **Minimum Power Assignment**—Indicates the minimum power assigned.
  - Range: -10 to 30 dB
  - Default: 30 dB
- **Dynamic Tx Power Control**—Determine if you want to enable Dynamic Tx Power Control.
- **Transmitted Power Threshold**—Enter a transmitted power threshold between -50 and -80.
- **Control Interval**—In seconds (read-only).

**Step 5** Click **Save**.

---

## Configuring 802.11b/g/n RRM DCA

To configure 802.11a/n or 802.11b/g/n RRM DCA channels for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11b/g/n-RRM > DCA**.
- Step 4** Select the check box(es) for the applicable DCA channel(s). The selected channels are listed in the Selected DCA channels text box.
- Step 5** Enable or disable event-driven Radio Resource Management (RRM). Event Driven RRM is used when a CleanAir-enabled access point detects a significant level of interference, follow these steps:
- Event Driven RRM—Enable or Disable spectrum event-driven RRM. By default, Event Driven RRM is enabled.
  - Sensitivity Threshold—If Event Driven RRM is enabled, this text box displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Assignment (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity
- Step 6** Click **Save**.
- 

## Configuring 802.11b/g/n RRM Radio Grouping

To configure 802.11a/n or 802.11b/g/n RRM Radio Grouping for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11b/g/n > RRM > RF Grouping**.
- Step 4** Choose a grouping mode from the drop-down list. The following parameters appear:
- Automatic—Allows you to activate the automatic RRM Grouping Algorithm. This is the default mode.
  - Off—Allows you to deactivate the automatic grouping.
  - Leader—Allows you to assign members to the group.
- Step 5** Choose a group update interval (secs) from the drop-down list. When grouping is on, this interval (in seconds) represents the period with which the grouping algorithm is run by the Group Leader. Grouping algorithm will also run when the group contents changes and the automatic grouping is enabled. A dynamic grouping can be started upon request from the system administrator. Default value is 600 seconds.
- Step 6** Under the Group Members group box, click **Add >**. The selected controller moves from the Available Controllers to the RF Group Members list.

---

**Note** The RF Group Members group box appears only when the grouping mode is set to Leader.

---

---

**Note** The maximum number of controllers that can be added to a RF Group is 20.

---

**Step 7** Click **Save**.

---

## Configuring 802.11b/g/n Media Parameters

To configure the media parameters for 802.11b/g/n, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click the applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11b/g/n > Media Parameters**.

**Step 4** In the Voice tab, specify the following parameters:

- **Admission Control (ACM)**—Select the check box to enable admission control.

For end users to experience acceptable audio quality during a VoIP phone call, packets must be delivered from one endpoint to another with low latency and low packet loss. To maintain QoS under differing network loads, Call Admission Control (CAC) is required. CAC on an access point allows it to maintain controlled QoS when the network is experiencing congestion and keep the maximum allowed number of calls to an acceptable quantity.

- **CAC Method**—If Admission Control (ACM) is enabled, specify the CAC method as either load-based or static.

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types from itself, from co-channel access points, and by co-located channel interference. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point periodically measures and updates the utilization of the RF channel, channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents over-subscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

- **Maximum Bandwidth Allowed**—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- **Reserved Roaming Bandwidth**—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- **Expedited Bandwidth**—Select the check box to enable expedited bandwidth as an extension of CAC for emergency calls.

You must have an expedited bandwidth that is CCXv5 compliant so that a TSPEC request is given higher priority.

- **SIP CAC**—Select the check box to enable SIP CAC.

SIP CAC should be used only for phones that support status code 17 and do not support TSPEC-based admission control.

- **SIP Codec**—Specify the codec name you want to use on this radio. The available options are G.711, G.729, and User Defined.
- **SIP Call Bandwidth**—Specify the bandwidth in kilobits per second that you want to assign per SIP call on the network. This parameter can be configured only when the SIP Codec selected is User Defined.
- **SIP Sample Interval**—Specify the sample interval in milliseconds that the codec must operate in.
- **Max Voice Calls per Radio**—Indicates the maximum number of voice calls that can be made per Radio.

---

**Note** You cannot set the value of Max Voice Calls per Radio. This is automatically calculated based on the selected CAC method, Max BW allowed, and Roaming Bandwidth.

---

- **Max Roaming Reserved Calls per Radio**—Indicates the maximum number roaming calls that can be reserved per Radio.

---

**Note** The Max Voice Calls per Radio and Max Roaming Reserved Calls per Radio options are available only if the CAC Method is specified as Static and SIP CAC is enabled.

---

- **Metric Collection**—Select the check box to enable metric collection.

Traffic stream metrics are a series of statistics about VoIP over your wireless LAN which inform you of the QoS of the wireless LAN. For the access point to collect measurement values, traffic stream metrics must be enabled. When this is enabled, the controller begins collecting statistical data every 90 seconds for the 802.11b/g interfaces from all associated access points. If you are using VoIP or video, this feature should be enabled.

**Step 5** In the **Video** tab, specify the following parameters:

- **Admission Control (ACM)**—Select the check box to enable admission control.
- **Maximum Bandwidth**—Specify the percentage of maximum bandwidth allowed. This option is only available when CAC is enabled.
- **Reserved Roaming Bandwidth**—Specify the percentage of reserved roaming bandwidth. This option is only available when CAC is enabled.
- **Unicast Video Redirect**—Select the **Unicast Video Redirect** check box to enable all non-media stream packets in video queue are redirected to the best effort queue. If disabled, all packets with video marking are kept in video queue.
- **Client Minimum Phy Rate**—Specify the physical data rate required for the client to join a media stream from the Client Minimum Phy Rate drop-down list.
- **Multicast Direct Enable**—Select the **Multicast Direct Enable** check box to set the Media Direct for any WLAN with Media Direct enabled on a WLAN on this radio.
- **Maximum Number of Streams per Radio**—Specify the maximum number of streams per Radio to be allowed.
- **Maximum Number of Streams per Client**—Specify the maximum number of streams per Client to be allowed.
- **Best Effort QOS Admission**—Select the **Best Effort QOS Admission** check box to redirect new client requests to the best effort queue. This happens only if all the video bandwidth has been used.

---

**Note** If disabled and maximum video bandwidth has been used, then any new client request is rejected.

---

**Step 6** In the **General** tab, specify the following parameter:

- **Maximum Media Bandwidth (0 to 85%)**—Specify the percentage of maximum of bandwidth allowed. This option is only available when CAC is enabled.

**Step 7** Click **Save**.

---

**Note** SIPs are available only on the following controllers: 4400, 5500 and on for the following access points: 1240, 1130, and 11n.

---

### Command Buttons

- **Save**—Save the changes made.
- **Audit**—Compare the NCS values with those used on the controller.

## Configuring 802.11b/g/n EDCA Parameters

The EDCA parameters (EDCA profile and Streaming MAC Enable settings) for 802.11a/n and 802.11b/g/n can be configured either by individual controller or through a controller template to improve voice QoS support.

To configure 802.11a/n or 802.11b/g/n EDCA parameters for an individual controller, follow these steps:

---

**Step 1** Choose **Configure > Controllers**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > EDCA Parameters** or **802.11b/g/n > EDCA Parameters**.

**Step 4** Choose the EDCA Profile from the drop-down list.

---

**Note** Profiles include Wi-Fi Multimedia (WMM), Spectralink Voice Priority (SVP), Voice Optimized, and Voice & Video Optimized. WMM is the default EDCA profile.

---

---

**Note** You must shut down radio interface before configuring EDCA Parameters.

---

**Step 5** Select the **Enable Streaming MAC** check box to enable this feature.

---

**Note** Only enable Streaming MAC if all clients on the network are WMM compliant.

---

## Configuring 802.11b/g/n Roaming Parameters

To configure 802.11a/n or 802.11b/g/n EDCA parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **802.11a/n > Roaming Parameters** or **802.11b/g/n > Roaming Parameters**.
- Step 4** From the Mode drop-down list, choose **Default values** or **Custom values**.
- Default values—The default values (read-only) are automatically displayed in the text boxes.
  - Custom values—Activates the text boxes to enable editing of the roaming parameters.
- Step 5** In the Minimum RSSI text box, enter a value for the minimum received signal strength indicator (RSSI) required for the client to associate to an access point.
- Range: -80 to -90 dBm
  - Default: -85 dBm

---

**Note** If the client average received signal power dips below this threshold, reliable communication is typically impossible; clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

---

- Step 6** In the Hysteresis text box, enter a value to indicate how strong the signal strength of a neighboring access point must be in order for the client to roam to it.
- This parameter is intended to reduce the amount of “ping ponging” between access points if the client is physically located on or near the border between two access points.
- Range: 2 to 4 dB
  - Default: 3 dB
- Step 7** In the Adaptive Scan Threshold text box, enter the RSSI value, from a client associated access point, below which the client must be able to roam to a neighboring access point within the specified transition time.
- This parameter provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when below the threshold.
- Range: -70 to -77 dB
  - Default: -72 dB
- Step 8** In the Transition Time text box, enter the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client associated access point is below the scan threshold.
- The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.
- Range: 1 to 10 seconds
  - Default: 5 seconds

**Step 9** Click **Save**.

---

## Configuring 802.11b/g/n High Throughput (802.11n) Parameters

To configure 802.11a/n or 802.11b/g/n high throughput parameters, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11a/n > High Throughput** or **802.11b/g/n > High Throughput**.

**Step 4** Select the **802.11n Network Status Enabled** check box to enable high throughput.

**Step 5** In the MCS (Data Rate) Settings, choose which level of data rate you want supported. MCS is modulation coding schemes which are similar to 802.11a data rate. As a default, 20 MHz and short guarded interval is used.

**Note** When you select the Supported check box, the chosen numbers appear in the Selected MCS Indexes page.

---

**Step 6** Click **Save**.

---

## Configuring 802.11b/g/n CleanAir Parameters

To configure 802.11b/g/n CleanAir parameters, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **802.11b/g/n > CleanAir** to view the following information.

- CleanAir—Select the check box to enable CleanAir functionality on the 802.11b/g/n network, or unselect to prevent the controller from detecting spectrum interference. The default value is selected.
- Reporting Configuration—Use the parameters in this section to configure the interferer devices you want to include for your reports.
  - Report—Select the **report interferers** check box to enable CleanAir system to report and detect sources of interference, or unselect it to prevent the controller from reporting interferers. The default value is selected.
  - Make sure that any sources of interference that need to be detected and reported by the CleanAir system appear in the Interferences to Detect text box and any that do not need to be detected appear in the Interferers to Ignore text box. Use the > and < buttons to move interference sources between these two text boxes. By default, all interference sources are detected.
- Alarm Configuration—This section enables you to configure triggering of air quality alarms.
  - Air Quality Alarm—Select the **Air Quality Alarm** check box to enable the triggering of air quality alarms, or unselect the text box to disable this feature. The default value is selected.

- Air Quality Alarm Threshold—If you selected the **Air Quality Alarm** check box, enter a value between 1 and 100 (inclusive) in the Air Quality Alarm Threshold text box to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.
- Interferers For Security Alarm—Select the **Interferers For Security Alarm** check box to trigger interferer alarms when the controller detects specified device types, or unselect it to disable this feature. The default value is selected.
- Make sure that any sources of interference that need to trigger interferer alarms appear in the Interferers Selected for Security Alarms text box and any that do not need to trigger interferer alarms appear in the Interferers Ignored for Security Alarms text box. Use the > and < buttons to move interference sources between these two text boxes. By default, all interference sources trigger interferer alarms.
- Event Driven RRM—To trigger spectrum event-driven Radio Resource Management (RRM) to run when a CleanAir-enabled access point detects a significant level of interference, use the following parameters:
  - Event Driven RRM—Displays the current status of spectrum event-driven RRM.
  - Sensitivity Threshold—If Event Driven RRM is enabled, this text box displays the threshold level at which event-driven RRM is triggered. It can have a value of either Low, Medium, or High. When the interference for the access point rises above the threshold level, RRM initiates a local Dynamic Channel Allocation (DCA) run and changes the channel of the affected access point radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

### Command Buttons

- Save—Save the changes made.
  - Audit—Compare the NCS values with those used on the controller.
- 

## Configuring Mesh Parameters

To configure Mesh parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Mesh > Mesh Settings**.
  - Step 4** View or edit the following mesh parameters:
    - RootAP to MeshAP Range (150 - 13200 ft)—By default, this value is 12,000 feet. You can enter a value between 150 and 132,000 feet. Enter the optimum distance (in feet) that should exist between the root access point and the mesh access point. This global parameter applies to all access points when they join the controller and all existing access points in the network.

- **Client Access on Backhaul Link**—Enabling this feature lets mesh access points associate with 802.11a wireless clients over the 802.11a backhaul. This client association is in addition to the existing communication on the 802.11a backhaul between the root and mesh access points. This feature is only applicable to access points with two radios. For more information, see the “[Client Access on 1524SB Dual Backhaul](#)” section on page 9-140.

---

**Note** Changing Backhaul Client Access reboots all mesh access points.

---

- **Mesh DCA Channels**—Enable or disable. This option is disabled by default. Enable this option to enable backhaul channel deselection on the Controller using the DCA channel list. Any change to the channels in the Controller DCA list is pushed to the associated access points. This option is only applicable for 1524SB mesh access points. For more information on this feature, see the “[Backhaul Channel Deselection Using NCS](#)” section on page 9-141.
- **Background Scanning**—Select the **Background Scanning** check box to enable background scanning or unselect it to disable the feature. The default value is disabled. Background scanning allows Cisco Aironet 1510 Access Points to actively and continuously monitor neighboring channels for more optimal paths and parents.
- **Security Mode**—Choose **EAP** (Extensible Authentication Protocol) or **PSK** (Pre-Shared Key) from the Security Mode drop-down list.

---

**Note** Changing Security reboots all mesh access points.

---

**Step 5** Click **Save**.

---

## Client Access on 1524SB Dual Backhaul

The 1524 Serial Backhaul (SB) access point consists of three radio slots. Radio in slot-0 operate in 2.4 GHz frequency band which is used for client access. Radios in slot-1 and slot-2 operate in 5.8 GHz band and are primarily used for backhaul. However, with the Universal Client Access feature, client access is also allowed over slot-1 and slot-2 radios.

The two 802.11a backhaul radios use the same MAC address. There may be instances where the same WLAN maps to the same BSSID in more than one slot.

By default, client access is disabled over both of the backhaul radios.

The following guidelines should be followed for enabling or disabling a radio slot:

- You can enable client access on slot-1 even if client access on slot-2 is disabled.
- You can enable client access on slot-2 only when client access on slot-1 is enabled.
- If you disable client access on slot-1 the client access on slot-2 is automatically disabled.
- All the Mesh Access Points reboot whenever the client access is enabled or disabled.

You can configure client access over backhaul radio from either one of the following:

- The Controller command-line interface (CLI)
- The Controller Graphical User Interface (GUI)
- The NCS GUI. For more information, see the “[Configuring Client Access using NCS - GUI](#)” section on page 9-141.

**Note**

The procedure for configuring client access using the CLI and GUI is documented in the *Controller Configuration Guide*.

### Configuring Client Access using NCS - GUI

To configure client access on the two backhaul radios, follow these steps:

- 
- Step 1** Choose **Configure > Controllers > Controller IP > Mesh > Mesh Settings**.
  - Step 2** Select the **Client Access on Backhaul Link** check box.
  - Step 3** Select the **Extended Backhaul Client Access** check box if you want to enable extended backhaul client access.
  - Step 4** Click **Save**.  
A warning message is displayed:  
Enabling client access on both backhaul slots will use same BSSIDs on both the slots.  
Changing Backhaul Client Access will reboot all Mesh APs.
  - Step 5** Click **OK**.  
The Universal Client access is configured on both the radios.
- 

### Backhaul Channel Deselection Using NCS

To configure backhaul channel deselection, follow these steps:

- 
- Step 1** You must first configure the Mesh DCA channels flag on the controllers. See the [“Configuring Mesh DCA Channel Flag on Controllers Using NCS”](#) section on page 9-141 for more information.
  - Step 2** Then change the channel list using config groups. See the [“Changing the Channel List Using Config Groups”](#) section on page 9-142 for more information.
- 

### Configuring Mesh DCA Channel Flag on Controllers Using NCS

You can configure the Mesh DCA Channel flag to push each channel change on one or more controllers to all the associated 1524SB access points. To configure this feature, follow these steps:

- 
- Step 1** Choose **Configure > Controllers > ip address of controller > Mesh > Mesh Settings** to configure this flag for a specific controller.  
Or  
**Configure > Controller Template Launch Pad > Mesh > Mesh Settings** to configure this flag for a list of controllers.  
The Mesh Settings page appears.
  - Step 2** From the general options select the **Mesh DCA Channels** option to enable channel selection. This option is unselected by default.

Now the channel changes in the controllers are pushed to the associated 1524SB access points.

---

## Changing the Channel List Using Config Groups

You can use controller config groups to configure backhaul channel deselection. You can create a config group and add the required controllers into the group and use the Country/DCA tab to select or deselect channels for the controllers in that group.

To configure backhaul channel deselection using config groups, follow these steps:

- 
- Step 1** Choose **Configure > Controller Config Groups**.
  - Step 2** Select a config group to view its config group details.
  - Step 3** From the Config Group detail page, click the **Country/DCA** tab.
  - Step 4** Select or unselect the channels for the config group.
- 

**Note** You can also configure backhaul channel deselection from controllers. For more information, see the Controller Online Help or *Controller User Guide*.

---

## Configuring Port Parameters

To configure Port parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
  - Step 2** Click an applicable IP address.
  - Step 3** From the left sidebar menu, choose **Ports > Port Settings**.
  - Step 4** Click the applicable Port Number to open the Port Settings Details page. The following parameters display:
    - General Parameters:
      - Port Number—Read-only.
      - Admin Status—Choose Enabled or Disabled from the drop-down list.
      - Physical Mode—Choose Auto Negotiate or Full Duplex 1 Gbps.
      - STP Mode—Choose 802.1D, Fast, or Off.
      - Mirror Mode—Choose Enabled or Disabled.
      - Link Traps—Choose Enabled or Disabled.
      - Power Over Ethernet
      - Multicast Application Mode—Select Enabled or Disabled.
    - Spanning Tree Protocol Parameters:
      - Priority—The numerical priority number of the ideal switch.

- Path Cost—A value (typically based on hop count, media bandwidth, or other measures) assigned by a network administrator and used to determine the most favorable through an internetwork environment (the lower the cost, the better the path).

**Step 5** Choose **Save** or **Audit** for General or Spanning Tree Protocol settings.

---

## Configuring Controllers Management Parameters

- [Configuring Trap Receivers, page 9-143](#)
- [Configuring Trap Control Parameters, page 9-144](#)
- [Configuring Telnet SSH Parameters, page 9-146](#)
- [Configuring a Syslog for an Individual Controller, page 9-147](#)
- [Configuring Multiple Syslog Servers, page 9-147](#)
- [Configuring WEB Admin, page 9-147](#)
- [Configuring Local Management Users, page 9-149](#)
- [Configuring Authentication Priority, page 9-149](#)

## Configuring Trap Receivers

This section contains the following topics:

- [Configuring Trap Receivers for an Individual Controller, page 9-143](#)
- [Adding a New Receiver, page 9-144](#)

### Configuring Trap Receivers for an Individual Controller

To configure trap receivers for an individual controller, follow these steps:

---

- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Trap Receivers**.
- Step 4** The following parameters are displayed for current trap receivers:
- Template Name—User-defined name of this template.
  - IP Address—The IP address of the server.
  - Admin Status—Status must be enabled for the SNMP traps to be sent to the receiver.
- Step 5** Click a receiver Name to access its details.
- Step 6** Select the **Admin Status** check box to enable the trap receiver. Deselect the check box to disable the trap receiver.
- Step 7** Click **Save**.
-

## Adding a New Receiver

To add a new receiver, follow these steps:

- 
- Step 1** From the Select a command drop-down list, choose **Add Receiver**.
- Step 2** Click **Go**.
- Step 3** From the Select a template to apply to this controller drop-down list, choose the applicable template to apply to this controller.

---

**Note** To create a new template for Trap Receivers, use the **click here** link to access the applicable template creation page.

---

- Step 4** Click **Apply**.
- 

## Configuring Trap Control Parameters

To configure trap control parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Trap Control**.

The applied template is identified (if applicable). See the [“Configuring Trap Control Templates” section on page 11-116](#) for more information.

The following traps can be enabled for this controller:

- Miscellaneous Traps
    - SNMP Authentication—The SNMPv2 entity has received a protocol message that is not properly authenticated.
- 
-  **Note** When a user who is configured in SNMP V3 mode tries to access the controller with an incorrect password, the authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.
- 
- Link (Port) Up/Down—Link changes status from up or down.
  - Multiple Users—Two users login with the same login ID.
  - Spanning Tree—Spanning Tree traps. See the STP specifications for descriptions of individual parameters.
  - Rogue AP—Whenever a rogue access point is detected this trap will be sent with its MAC Address; When a rogue access point that was detected earlier and it no longer exists this trap is sent.
  - Config Save—Notification sent when the controller configuration is modified.
- Client Related Traps

- 802.11 Association—The associate notification is sent when the client sends an association frame.
- 802.11 Disassociation—The disassociate notification is sent when the client sends a disassociation frame.
- 802.11 Deauthentication—The deauthenticate notification is sent when the client sends a deauthentication frame.
- 802.11 Failed Authentication—The authenticate failure notification is sent when the client sends an authentication frame with a status code other than 'successful'.
- 802.11 Failed Association—The associate failure notification is sent when the client sends an association frame with a status code other than 'successful'.
- Excluded—The associate failure notification is sent when a client is excluded.
- Cisco AP Traps
  - AP Register—Notification sent when an access point associates or disassociates with the controller.
  - AP Interface Up/Down—Notification sent when access point interface (802.11a or 802.11b/g) status goes up or down.
- Auto RF Profile Traps
  - Load Profile—Notification sent when Load Profile state changes between PASS and FAIL.
  - Noise Profile—Notification sent when Noise Profile state changes between PASS and FAIL.
  - Interference Profile—Notification sent when Interference Profile state changes between PASS and FAIL.
  - Coverage Profile—Notification sent when Coverage Profile state changes between PASS and FAIL.
- Auto RF Update Traps
  - Channel Update—Notification sent when access point dynamic channel algorithm is updated.
  - Tx Power Update—Notification sent when access point dynamic transmit power algorithm is updated.
- AAA Traps
  - User Auth Failure—This trap is to inform that a client RADIUS Authentication failure has occurred.
  - RADIUS Server No Response—This trap is to indicate that no RADIUS server(s) are responding to authentication requests sent by the RADIUS client.
- IP Security Traps
  - ESP Authentication Failure—IPSec packets with invalid hashes were found in an inbound ESP SA.
  - ESP Replay Failure—IPSec packets with invalid sequence numbers were found in an inbound ESP SA.
  - Invalid SPI—A packet with an unknown SPI was detected from the specified peer with the specified SPI using the specified protocol.
  - IKE Negotiation Failure—An attempt to negotiate a phase 1 IKE SA failed. The notification counts are also sent as part of the trap, along with the current value of the total negotiation error counters.

- IKE Suite Failure—An attempt to negotiate a phase 2 SA suite for the specified selector failed. The current total failure counts are passed as well as the notification type counts for the notify involved in the failure.
- Invalid Cookie—ISAKMP packets with invalid cookies were detected from the specified source, intended for the specified destination. The initiator and responder cookies are also sent with the trap.
- 802.11 Security Traps
  - WEP Decrypt Error—Notification sent when the controller detects a WEP decrypting error.
- WPS Traps
  - Rogue Auto Containment—Notification sent when a rogue access point is auto-contained.

**Step 4** After selecting the applicable parameters, click **Save**.

---

## Configuring Telnet SSH Parameters

To configure Telnet SSH (Secure Shell) parameters for an individual controller, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **Management > Telnet SSH**.

The applied template is identified (if applicable). See the [“Configuring Telnet SSH Templates” section on page 11-119](#) for more information.

The following parameters can be configured:

- Session Timeout—Indicates the number of minutes a Telnet session is allowed to remain inactive before being logged off. A zero means there will be no timeout. May be specified as a number from 0 to 160. The factory default is 5.
- Maximum Sessions—From the drop-down list choose a value from 0 to 5. This object indicates the number of simultaneous Telnet sessions allowed.

**Note** New Telnet sessions can be allowed or disallowed on the DS (network) port. New Telnet sessions are always allowed on the Service port.

---

- Allow New Telnet Sessions—Indicates that new Telnet sessions will not be allowed on the DS Port when set to no. The factory default value is no.

**Note** New Telnet sessions can be allowed or disallowed on the DS (network) port. New Telnet sessions are always allowed on the Service port.

---

- Allow New SSH Sessions—Indicates that new Secure Shell Telnet sessions will not be allowed when set to no. The factory default value is yes.

**Step 4** After configuring the applicable parameters, click **Save**.

---

## Configuring a Syslog for an Individual Controller

To enable a Syslog for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Syslog**.  
The applied template is identified (if applicable). See the [“Configuring Legacy Syslog Templates” section on page 11-120](#) for more information.
- **Syslog Enabled**—Select the check box to enable the syslog.
- Step 4** Click **Save**.
- 

## Configuring Multiple Syslog Servers

For version 5.0.148.0 controllers or later, you can configure multiple (up to three) syslog servers on the WLAN controller. With each message logged, the controller sends a copy of the message to each configured syslog host, provided the message has severity greater than or equal to the configured syslog filter severity level.

To enable syslogs for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Multiple Syslog**.  
The applied template is identified:  
Syslog Server Address—Indicates the server address of the applicable syslog.
- Step 4** Click **Save**.
- 

## Configuring WEB Admin

This section provides instructions for enabling the distribution system port as a web port (using HTTP) or as a secure web port (using HTTPS). You can protect communication with the GUI by enabling HTTPS. HTTPS protects HTTP browser sessions by using the Secure Sockets Layer (SSL) protocol. When you enable HTTPS, the controller generates its own local web administration SSL certificate and automatically applies it to the GUI. You also have the option of downloading an externally generated certificate.

To enable WEB admin parameters for an individual controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Web Admin**.  
The following parameters can be configured:

- Web Mode—Choose **Enable** or **Disable** from the drop-down list. When enabled, users can access the controller GUI using *http:ip-address*. The default is Disabled.

---

**Note** Web mode is not a secure connection.

---

- Secure Web Mode—Choose **Enable** or **Disable** from the drop-down list. When enabled, users can access the controller GUI using *https://ip-address*. The default is Enabled.

---

**Note** Secure web mode is a secure connection.

---

- Certificate Type
- Download Web Admin Certificate—Click to access the Download Web Admin Certificate to Controller page. See the “[Download Web Auth or Web Admin Certificate to Controller](#)” section on [page 9-148](#) for additional information.

---

**Note** The controller must be rebooted for the new Web Admin certificate to take effect.

---

## Command Buttons

- Save
- Audit
- Regenerate Cert

## Download Web Auth or Web Admin Certificate to Controller

To download a Web Auth or Web Admin Certificate to the controller, follow these steps:

---

**Step 1** Click the **Download Web Admin Certificate** or **Download Web Auth Certificate** link.

**Step 2** In the File is located on parameter, specify Local machine or TFTP server.

---

**Note** If the certificate is located on the TFTP server, enter the Server File Name. If it is located on the local machine, enter the Local File Name using the **Browse** button.

---

**Step 3** Enter the TFTP server name in the **Server Name** parameter. The default is the NCS server.

**Step 4** Enter the server IP address.

**Step 5** In the Maximum Retries text box, enter the maximum number of times that the TFTP server attempts to download the certificate.

**Step 6** In the Timeout text box, enter the amount of time (in seconds) that the TFTP server attempts to download the certificate.

**Step 7** In the Local File Name text box, enter the directory path of the certificate.

**Step 8** In the Server File Name text box, enter the name of the certificate.

- Step 9** Enter the password in the Password text box.
- Step 10** Click **OK**.
- 

## Configuring Local Management Users

This page lists the names and access privileges of the local management users. To access the Local Management Users page, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Local Management Users**.
- Step 4** Click a user name.
- User Name (read-only)—Name of the user.
  - Access Level (read-only)—Read Write or Read Only.
- 

## Configuring Authentication Priority

In this page, you can control the order in which authentication servers are used to authenticate a controller management users.

To access the Authentication Priority page, follow these steps:

---

- Step 1** Choose **Configure > Controllers**.
- Step 2** Click an applicable IP address.
- Step 3** From the left sidebar menu, choose **Management > Authentication Priority**.
- Step 4** The local database is searched first. Choose either RADIUS or TACACS+ for the next search. If authentication using the local database fails, the controller uses the next type of server.
- Step 5** Click **Save**.
- 

### Command Buttons

- **Save**—Save the changes made to the management user authentication order and return to the previous page.
- **Audit**—Compare the NCS values with those used on the controller.

## Configuring Location Configurations

In the Location Configuration page, you can configuration location parameters such as expiration times, notification interval, and other advanced configuration options.

You can set the following general and advanced parameters on the location template:

- General parameters—Enable RFID tag collection, set the location path loss for calibrating or normal (non-calibrating) clients, measurement notification for clients, tags, and rogue access points, set the RSSI expiry timeout value for clients, tags, and rogue access points.
- Advanced parameters—Set the RFID tag data timeout value and enable the location path loss configuration for calibrating client multi-band.

To configure location configurations for an individual controller, follow these steps:

---

**Step 1** Choose **Configure > Controller**.

**Step 2** Click an applicable IP address.

**Step 3** From the left sidebar menu, choose **Location Configuration > Location Configuration**.

The Location Configuration page displays two tabs: General and Advanced.

**Step 4** Add or modify the General parameters:

- RFID Tag Data Collection—Select the check box to enable the collection of data on tags.

Before the location server can collect asset tag data from controllers, you must enable the detection of active RFID tags using the CLI command **config rfid status enable** on the controllers.

- Location Path Loss Configuration

- Calibrating Client—Select the **Enabled** check box to enable calibration for the client. Controllers send regular S36 or S60 requests (depending on the client capability) by way of the access point to calibrate clients. Packets are transmitted on all channels. All access points gather RSSI data from the client at each location. These additional transmissions and channel changes might degrade contemporaneous voice or video traffic.

---

**Note** To use all radios (802.11a/b/g/n) available, you must enable multiband in the Advanced page.

---

- Normal Client—Select the **Enabled** check box to have a non-calibrating client. No S36 requests are transmitted to the client.

---

**Note** S36 and S60 are client drivers compatible with specific Cisco Compatible Extensions. S36 is compatible with CCXv2 or later. S60 is compatible with CCXv4 or later. For details, see [http://www.cisco.com/en/US/products/ps9806/products\\_qanda\\_item09186a0080af9513.shtml](http://www.cisco.com/en/US/products/ps9806/products_qanda_item09186a0080af9513.shtml)

---

- Measurement Notification Interval (in secs)
  - Tags, Clients, and Rogue APs/Clients—Allows you to set the NMSP measurement notification interval for clients, tags, and rogues. Specify how many seconds should elapse before notification of the found element (tags, clients, and rogue access points/clients).

Setting this value on the controller generates an out-of-sync notification which you can view on the Synchronize Servers page. When different measurement intervals exist between a controller and the mobility services engine, the largest interval setting of the two is adopted by the mobility services engine.

Once this controller is synchronized with the mobility services engine, the new value is set on the mobility services engine.

---

**Note** Synchronization to the mobility services engine is required if changes are made to measurement notification interval.

---

- RSS Expiry Timeout (in secs)
  - For Clients—Enter the number of seconds after which RSSI measurements for normal (non-calibrating) clients should be discarded.
  - For Calibrating Clients—Enter the number of seconds after which RSSI measurements for calibrating clients should be discarded.
  - For Tags—Enter the number of seconds after which RSSI measurements for tags should be discarded.
  - For Rogue APs—Enter the number of seconds after which RSSI measurements for rogue access points should be discarded.

**Step 5** Add or modify the Advanced parameters:

- RFID Tag Data Timeout (in secs)—Enter a value (in seconds) to set the RFID tag data timeout setting.
- Location Path Loss Configuration
  - Calibrating Client Multiband—Select the **Enabled** check box to send S36 and S60 packets (where applicable) on all channels. Calibrating clients must be enable in the general page.

---

**Note** To use all radios (802.11a/b/g/n) available, you must enable multiband.

---

**Step 6** Click **Save**.

---

### Command Buttons

- **Save**—Save the changes made to the management user authentication order and return to the previous page.
- **Audit**—Compare the NCS values with those used on the controller.uld be discarded.

## Configuring Access Points

This section describes how to configure access points in the Cisco NCS database. This section contains the following topics:

- [Setting AP Failover Priority, page 9-152](#)
- [Configuring Global Credentials for Access Points, page 9-152](#)
- [Configuring Ethernet Bridging and Ethernet VLAN Tagging, page 9-154](#)
- [Autonomous to Lightweight Migration Support, page 9-158](#)
- [Configuring Access Point Details, page 9-164](#)
- [Configuring CDP, page 9-184](#)
- [Configuring Access Point Radios for Tracking Optimized Monitor Mode, page 9-184](#)

- [Copying and Replacing Access Points](#), page 9-185
- [Removing Access Points](#), page 9-186
- [Scheduling Radio Status](#), page 9-186
- [Viewing Audit Status \(for Access Points\)](#), page 9-187
- [Filtering Alarms for Maintenance Mode Access Points](#), page 9-187
- [Searching Access Points](#), page 9-188
- [Viewing Mesh Link Details](#), page 9-189
- [Viewing or Editing Rogue Access Point Rules](#), page 9-190
- [Configuring Spectrum Experts](#), page 9-200
- [OfficeExtend Access Point](#), page 9-202
- [Configuring Link Latency Settings for Access Points](#), page 9-203

## Setting AP Failover Priority

When a controller fails, the backup controller configured for the access point suddenly receives a number of discovery and join requests. This may cause the controller to reach a saturation point and reject some of the access points.

By assigning priority to an access point, you have some control over which access points are rejected. In a failover situation when the backup controller is saturated, the higher priority access points are allowed to join the backup controller by disjoining the lower priority access points.

To configure priority settings for access points, you must first enable the AP Priority feature. To enable the AP Priority feature, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click the IP address of the applicable controller.
  - Step 3** From the left sidebar menu, choose **System > General**.
  - Step 4** From the AP Failover Priority drop-down list, choose **Enable**.

To configure an access point's priority, see the [“Configuring Access Point Details”](#) section on page 9-164.

---

## Configuring Global Credentials for Access Points

Cisco autonomous access points are shipped from the factory with *Cisco* as the default enable password. This password allows users to log into the non-privileged mode and execute show and debug commands, posing a security threat. The default enable password must be changed to prevent unauthorized access and to enable users to execute configuration commands from the access point's console port.

In NCS and controller software releases prior to 5.0, you can set the access point enable password only for access points that are currently connected to the controller. In NCS and controller software release 5.0, you can set a global username, password, and enable password that all access points inherit as they join a controller. This includes all access points that are currently joined to the controller and any that join in the future. When you are adding an access point, you can also choose to accept this global

username and password or override it on a per-access point basis and assign a unique username, password, and enable password. See the “[Configuring AP Configuration Templates](#)” section on [page 11-127](#) to see where the global password is displayed and how it can be overridden on a per-access point basis.

Also in controller software release 5.0, after an access point joins the controller, the access point enables console port security, and you are prompted for your username and password whenever you log into the access point’s console port. When you log in, you are in non-privileged mode, and you must enter the enable password in order to use the privileged mode.

**Note**

These controller software release 5.0 features are supported on all access points that have been converted to lightweight mode, except the 1100 series. VxWorks access points are not supported.

The global credentials that you configure on the controller are retained across controller and access point reboots. They are overwritten only if the access point joins a new controller that is configured with a global username and password. If the new controller is not configured with global credentials, the access point retains the global username and password configured for the first controller.

**Note**

You need to keep careful track of the credentials used by the access points. Otherwise, you might not be able to log into an access point’s console port. If necessary, you can clear the access point configuration to return the access point username and password to the default setting.

To establish a global username and password, follow these steps:

- Step 1** Choose **Configure > Controllers** or **Configure > Access Points**.
- Step 2** Choose an IP address of a controller with software release 5.0 or later or choose an access point associated with software release 5.0 or later.
- Step 3** Choose **System > AP Username Password** from the left sidebar menu. The AP Username Password page appears (see [Figure 9-15](#)).

**Figure 9-15** AP Username Password Page

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb path is 'Configure > Controllers > 9.1.192.50 > System > AP Username Password'. The configuration page includes the following fields:

- Template Applied: (None)
- AP Username: user1
- AP Password: [masked]
- Confirm AP Password: [masked]
- Enable Password: [masked]
- Confirm Enable Password: [masked]

A 'Save' button is located at the bottom of the configuration area.

- Step 4** In the AP Username text box, enter the username that is to be inherited by all access points that join the controller.

- Step 5** In the AP Password text box, enter the password that is to be inherited by all access points that join the controller. Re-enter in the Confirm AP Password text box.
- Step 6** For Cisco autonomous access points, you must also enter and confirm an enable password. In the AP Enable Password text box, enter the enable password that is to be inherited by all access points that join the controller. Re-enter in the Confirm Enable Password text box.
- Step 7** Click **Save**.

## Configuring Ethernet Bridging and Ethernet VLAN Tagging

Ethernet bridging is used in two mesh network scenarios:

1. Point-to-point and point-to-multipoint bridging between MAPs (untagged packets). A typical trunking application might be bridging traffic between buildings within a campus (see [Figure 9-16](#)).

**Note** You do not need to configure VLAN tagging to use Ethernet bridging for point-to-point and point-to-multipoint bridging deployments.

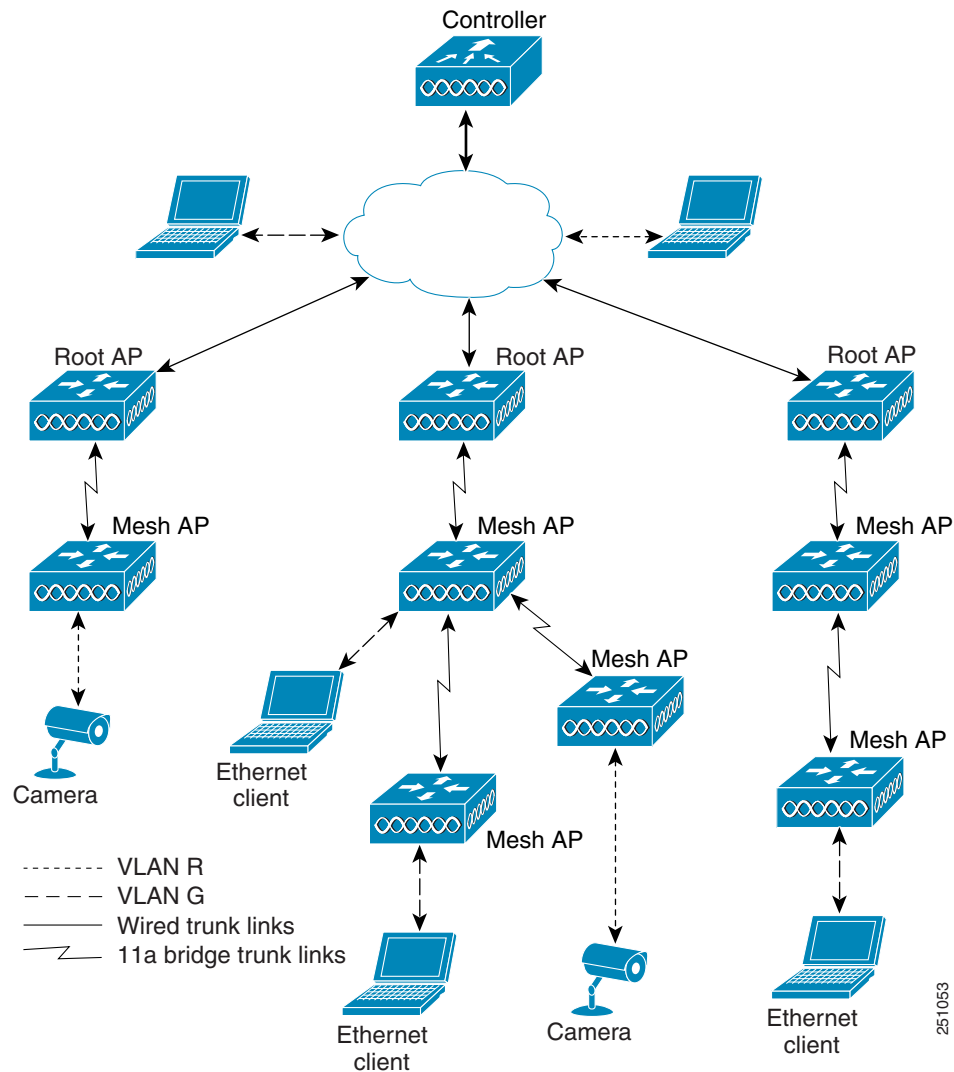

**Figure 9-16** Point-to-Multipoint Bridging

2. Ethernet VLAN tagging allows specific application traffic to be segmented within a wireless mesh network and then forwarded (bridged) to a wired LAN (access mode) or bridged to another wireless mesh network (trunk mode).

A typical public safety access application using Ethernet VLAN tagging is placement of video surveillance cameras at various outdoor locations within a city. Each of these video cameras has a wired connection to a MAP. The video of all these cameras is then streamed across the wireless backhaul to a central command station on a wired network (see [Figure 9-17](#)).

Figure 9-17 Ethernet VLAN Tagging

## Ethernet VLAN Tagging Guidelines

- For security reasons, the Ethernet port on a mesh access point (RAP and MAP) is disabled by default. It is enabled by configuring Ethernet Bridging on the mesh access point port.
- You must enable Ethernet bridging on all the access points in the mesh network to allow Ethernet VLAN Tagging to operate.
- You must set VLAN Mode as non-VLAN transparent (global mesh parameter). See the [“Configuring Ethernet Bridging and Ethernet VLAN Tagging”](#) section on page 9-154.
  - VLAN transparent is enabled by default. To set as non-VLAN transparent, you must unselect the VLAN transparent option in the Global Mesh Parameters page.
- VLAN configuration on a mesh access point is only applied if all the uplink mesh access points are able to support that VLAN.

- If uplink access points are not able to support the VLAN, then the configuration is stored rather than applied.
- VLAN tagging can only be configured on Ethernet interfaces.
  - On 152x mesh access points, use three of the four ports as *secondary Ethernet interfaces: port 0-PoE in, port 1-PoE out, and port 3- fiber*. You cannot configure *Port 2 - cable* as a secondary Ethernet interface.
  - In Ethernet VLAN tagging, *port 0-PoE in* on the RAP connects the trunk port of the switch of the wired network. *Port 1-PoE out* on the MAP connects external devices such as video cameras.
- Backhaul interfaces (802.11a radios) act as *primary Ethernet interfaces*. Backhauls function as trunks in the network and carry all VLAN traffic between the wireless and wired network. You are not required to configure the primary Ethernet interface.
- You must configure the switch port in the wired network that is attached to the RAP (*port 0-PoE in*) to accept tagged packets on its trunk port. The RAP forwards all tagged packets received from the mesh network to the wired network.
- Configuration to support VLAN tagging on the 802.11a backhaul Ethernet interface is not required within the mesh network.
  - This includes the RAP uplink Ethernet port. The required configuration happens automatically using a registration mechanism.
  - Any configuration changes to an 802.11a Ethernet link acting as a backhaul are ignored, and a warning results. When the Ethernet link no longer functions as a backhaul, the modified configuration is applied.
- You cannot configure VLANs on port-02-cable modem port of a 152x access point. Configure VLANs on ports 0 (PoE-in), 1 (PoE-out), and 3 (fiber).
- If bridging between two MAPs, enter the distance (mesh range) between the two access points that are bridging. (Not applicable to applications in which you are forwarding traffic connected to the MAP to the RAP, access mode.)
- Each sector supports up to 16 VLANs; therefore, the cumulative number of VLANs supported by a RAP's children (MAPs) cannot exceed 16.
- Ethernet ports on access points function as *normal*, *access*, or *trunk* ports in an Ethernet tagging deployment.
  - Normal mode—In this mode, the Ethernet interface is VLAN-transparent by default and does not accept or send any tagged packets. Tagged frames from clients are dropped. Untagged frames are forwarded to the native VLAN on the RAP trunk port.
  - Access mode—In this mode only untagged packets are accepted. You must tag all packets with a user-configured VLAN called access-VLAN. For this mode to take effect, the global VLAN mode should be non-VLAN transparent.
 

Use this option for applications in which information is collected from devices connected to the MAP such as cameras or PCs and then forwarded to the RAP. The RAP then applies tags and forwards traffic to a switch on the wired network.
  - Trunk mode—This mode requires the user to configure a native VLAN and an allowed VLAN list (no defaults). In this mode, both tagged and untagged packets are accepted. You can accept untagged packets and tag them with the user-specified native VLAN. You can accept tagged packets if they are tagged with a VLAN in the allowed VLAN list. For this mode to take effect, the global VLAN mode should be non-VLAN transparent.
 

Use this option for bridging applications such as forwarding traffic between two MAPs resident on separate buildings within a campus.

- The switch port connected to the RAP must be a trunk.
  - The trunk port on the switch and the RAP trunk port must match.
- A configured VLAN on a MAP Ethernet port cannot function as a Management VLAN.
- The RAP must always connect to the native VLAN (ID 1) on a switch.
  - The RAP's primary Ethernet interface is by default the native VLAN of 1.

## Enabling Ethernet Bridging and VLAN Tagging

To enable Ethernet Bridging and VLAN tagging on a RAP or MAP, follow these steps:

- Step 1** Choose **Configure > Access Points**.
- Step 2** Click the name of the mesh access point for which you want to enable Ethernet bridging. A configuration page for the access point appears.
- Step 3** In the Bridging Information section, choose the appropriate backhaul rate from the Data Rate drop-down list. The default value is 24 Mbps for the 802.11a backhaul interface.
- Step 4** In the Bridging Information section, choose **Enable** from the Ethernet Bridging drop-down list.
- Step 5** Click the appropriate Ethernet interface link (such as FastEthernet or gigabitEthernet1). (See [Figure 9-18](#).)

**Figure 9-18** *Configure > Access Points > AP Name Page*

| AP Name                                          | Ethernet MAC      | IP Address  | Radio            | Map Location | Controller     | AP Type | Oper Status | Alarm Status | Audit Status |

| <input type="checkbox"/> Fenway_RAP              | 58:bc:27:c5:64:00 | 9.6.139.105 | 802.11b/g/n      | Cl > B1 > F5 | 10.104.173.178 | CAPWAP  | Up          | ●            | Identical    |
| <input type="checkbox"/> Fenway_RAP              | 58:bc:27:c5:64:00 | 9.6.139.105 | 802.11a/n        | Cl > B1 > F5 | 10.104.173.178 | CAPWAP  | Up          | ●            | Identical    |

- Step 6** Within the Ethernet interface page, perform one of the following:

**Note** The configuration options vary for each of the VLAN modes (normal, access, and trunk).

- If you are configuring a MAP and RAP normal ports and chose FastEthernet0, choose **Normal** from the VLAN Mode drop-down list.

In this mode, the Ethernet interface is VLAN-transparent by default and does not accept or send any tagged packets. Tagged frames from clients are dropped. Untagged frames are forwarded to the native VLAN on the RAP trunk port.

- b. If you are configuring a MAP access port and chose **gigabitEthernet1** (port 1-PoE out),
1. Choose **Access** from the VLAN Mode drop-down list.
  2. Enter a VLAN ID. The VLAN ID can be any value between 1 and 4095.
  3. Click **Save**.

**Note** VLAN ID 1 is not reserved as the default VLAN.

**Note** A maximum of 16 VLANs in total are supported across all of a RAP's subordinate MAPs.

- c. If you are configuring a RAP or MAP trunk port and chose **gigabitEthernet0** (or **FastEthernet0**) (port 0-PoE in),
1. Choose **trunk** from the VLAN Mode drop-down list.
  2. Enter a native VLAN ID for *incoming* traffic. The native VLAN ID can be any value between 1 and 4095. Do not assign any value assigned to a user-VLAN (access).
  3. Enter a trunk VLAN ID for *outgoing* traffic, and click **Add**.

The added trunk appears in the summary column of allowed VLAN IDs.

If forwarding *untagged* packets, do not change the default trunk VLAN ID value of zero (such as MAP-to-MAP bridging, campus environment).

If forwarding *tagged* packets, enter a VLAN ID (1 to 4095) that is not already assigned (such as RAP to switch on wired network).

**Note** To remove a VLAN from the list, click **Delete**.

4. Click **Save**.

**Note** At least one mesh access point must be set to RootAP in the mesh network.

## Autonomous to Lightweight Migration Support

The autonomous to lightweight migration support feature provides a common application (NCS) from which you can perform basic monitoring of autonomous access points along with current lightweight access points. The following autonomous access points are supported:

- Cisco Aironet 1130 Access Point
- Cisco Aironet 1200 Access Point
- Cisco Aironet 1240 Access Point
- Cisco Aironet 1310 Bridge
- Cisco Aironet 1410 Bridge

You may also choose to convert autonomous access points to lightweight. Once an access point is converted to lightweight, the previous status or configuration of the access point is not retained.

From NCS, the following functions are available when managing autonomous access points:

- [Adding Autonomous Access Points to NCS, page 9-159](#)
- [Viewing Autonomous Access Points in NCS, page 9-163](#)
- Adding and viewing autonomous access points from the Monitor > Maps page (see the “[Monitoring Maps](#)” section on page 6-1 for more information)
- Monitoring associated alarms
- Performing an autonomous access point background task
  - Checks the status of autonomous access points managed by NCS.
  - Generates a critical alarm when an unreachable autonomous access point is detected.
- Running reports on autonomous access points
  - See Reports > Inventory Reports and Reports > Client Reports > Client Count for more information
- [Supporting Autonomous Access Points in Work Group Bridge \(WGB\) mode, page 9-164](#)
- [Migrating a Autonomous Access Point to a Lightweight Access Point, page 11-139](#)

## Adding Autonomous Access Points to NCS

From NCS, the following methods are available for adding autonomous access points:

- [Adding Autonomous Access Points by Device Information, page 9-159](#) (IP addresses and credentials).
- [Adding Autonomous Access Points by CSV File, page 9-160.](#)
- [Removing Autonomous Access Points, page 9-162](#)

### Adding Autonomous Access Points by Device Information

Autonomous access points can be added to NCS by device information using comma-separated IP addresses and credentials.

To add autonomous access points using device information, follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
  - Step 2** From the Select a command drop-down list, choose **Add Autonomous APs**.
  - Step 3** Click **Go**.
  - Step 4** Select **Device Info** from the Add Format Type drop-down list.
  - Step 5** Enter comma-separated IP addresses of autonomous access points.
  - Step 6** Enter the SNMP Parameters parameters:
    - Version—Choose from v1, v2, or v3.
    - Retries—Indicates the number of controller discovery attempts.
    - Timeout—Indicate the amount of time (in seconds) allowed before the process time outs. The valid range is 2 to 90 seconds. The default is 10 seconds.
    - Community—Public or Private.

**Step 7** Enter the Telnet/SSH Parameters:

**Note** Default values are used if the Telnet/SSH parameters are left blank.

- Protocol—Select the protocol you want to use (either Telenet or SSH).
- User Name—Enter the user name. (Default username is admin.)

**Note** The Telnet/SSH username must have sufficient privileges to execute commands in CLI templates.

- Password/Confirm Password—Enter and confirm the password. (Default password is admin.)
- Enable Password/Confirm Password—Enter and confirm an enable password.
- Telnet Timeout—Indicate the amount of time (in seconds) allowed before the process time outs. The default is 60 seconds.

**Note** Cisco autonomous access points are shipped from the factory with *Cisco* as the default enable password. This password allows users to log into the non-privileged mode and execute show and debug commands, posing a security threat. The default enable password must be changed to prevent unauthorized access and to enable users to execute configuration commands from the access point's console port.

**Step 8** Click **Add**.

**Note** After the AP is added and its inventory collection is completed, it will appear in Access Point list page (Configure > Access Points). If it is not found in the Access Points list, choose Configure > Unknown Device page to check the status. For details, see the [“Configuring Unknown Devices” section on page 9-199](#).

**Note** Autonomous access points are not counted towards the total device count for your license.

## Adding Autonomous Access Points by CSV File

Autonomous access points can be added to NCS using a CSV file exported from WLSE.

To add autonomous access points using a CSV file, follow these steps:

- Step 1** Choose **Configure > Access Points**.
- Step 2** From the Select a command drop-down list, choose **Add Autonomous APs**.
- Step 3** Click **Go**.
- Step 4** Select **File** from the Add Format Type drop-down list.
- Step 5** Enter or browse to the applicable CSV file.

The sample CSV files for V2 devices are as follows:

```
ip_address, network_mask, snmp_version, snmp_community, snmpv3_user_name,
snmpv3_auth_type, snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password,
snmp_retries, snmp_timeout, telnet_username, telnet_password, telnet_retries, telnet_timeout
209.165.200.224,255.255.255.224,v2,public,,,,,3,4
209.165.201.0,255.255.255.0,v2,public,,,,,3,4,Cisco,Cisco,2,10
```

---

**Note** The SNMP, telnet, or SSH credentials are mandatory.

---

The sample CSV files for V3 devices are as follows:

```
ip_address, network_mask, snmp_version, snmpv3_user_name, snmpv3_auth_type,
snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password, snmp_retries,
snmp_timeout, telnet_username, telnet_password, telnet_retries, telnet_timeout
209.165.200.224,255.255.255.224,v3,default,HMAC-MD5,default,None,,3,4
209.165.201.0,255.255.255.224,v3,default1,HMAC-MD5,default1,DES,default1,3,4,Cisco,Cisco,2
,10
```

The CSV files can contain the following fields:

- ip\_address
- network\_mask
- snmp\_version
- snmp\_community
- snmpv3\_user\_name
- snmpv3\_auth\_type
- snmpv3\_auth\_password
- snmpv3\_privacy\_type
- snmpv3\_privacy\_password
- snmp\_retries
- snmp\_timeout
- telnet\_username
- telnet\_password
- enable\_password
- telnet\_retries
- telnet\_timeout

**Step 6** Click **OK**.

---

## Bulk Update of Autonomous Access Points

You can update multiple autonomous access points credentials by importing a CSV file.

To update autonomous access point(s) information in a bulk, follow these steps:

---

**Step 1** Choose **Configure > Access Points**.

**Step 2** Select the check box(es) of the applicable controller(s).

**Step 3** From the Select a command drop-down list, choose **Bulk Update APs**. The Bulk Update Autonomous Access Points page appears.

- Step 4** Click **Choose File** to select a CSV file, and then find the location of the CSV file you want to import.
- Step 5** Click **Update and Sync**.

### Sample CSV File for the Bulk Update of Autonomous Access Points

The sample CSV files for V2 devices are as follows:

```
ip_address, network_mask, snmp_version, snmp_community, snmpv3_user_name,
snmpv3_auth_type, snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password,
snmp_retries, snmp_timeout, telnet_username, telnet_password, telnet_retries, telnet_timeout
209.165.200.224,255.255.255.224,v2,public,,,,,3,4
209.165.201.0,255.255.255.0,v2,public,,,,,3,4,Cisco,Cisco,2,10
```

**Note** The SNMP, telnet, or SSH credentials are mandatory.

The sample CSV files for V3 devices are as follows:

```
ip_address, network_mask, snmp_version, snmpv3_user_name, snmpv3_auth_type,
snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password, snmp_retries,
snmp_timeout, telnet_username, telnet_password, telnet_retries, telnet_timeout
209.165.200.224,255.255.255.224,v3,default,HMAC-MD5,default,None,,3,4
209.165.201.0,255.255.255.224,v3,default1,HMAC-MD5,default1,DES,default1,3,4,Cisco,Cisco,2
,10
```

The CSV files can contain the following fields:

- ip\_address
- network\_mask
- snmp\_version
- snmp\_community
- snmpv3\_user\_name
- snmpv3\_auth\_type
- snmpv3\_auth\_password
- snmpv3\_privacy\_type
- snmpv3\_privacy\_password
- snmp\_retries
- snmp\_timeout
- telnet\_username
- telnet\_password
- enable\_password
- telnet\_retries
- telnet\_timeout

### Removing Autonomous Access Points

To remove an autonomous access point from NCS, follow these steps:

- Step 1** Select the check boxes of the access points you want to remove.

**Step 2** Select **Remove APs** from the Select a command drop-down list.

---

## Viewing Autonomous Access Points in NCS

Once added, the autonomous access points can be viewed on the **Monitor > Access Points** page.

Click the autonomous access point to view more detailed information such as the following:

- Operational status of the access points
- Key attributes including radio information, channel, power, and number of clients on the radio
- CDP neighbored information

The autonomous access points can also be viewed in Monitor > Maps.

They can be added to a floor area by choosing **Monitor Maps > floor area** and selecting **Add Access Points** from the Select a command drop-down list.

## Downloading Images to Autonomous Access Points (TFTP)

Lightweight access point images are bundled with controller images and managed by the controller. Autonomous access point images must be handled by a NMS system such as WLSE, CiscoWorks, or NCS.

To download images to autonomous access points (using TFTP), follow these steps:

---

**Step 1** Choose **Configure > Access Points**.

**Step 2** Select the check box of the autonomous access point to which you want to download an image. The AP Type column displays whether the access point is autonomous or lightweight.

**Step 3** From the Select a command drop-down list, choose **Download Autonomous AP Image (TFTP)**. The Download images to Autonomous APs page appears.

**Step 4** Specify the following parameters:

- File is located on—Choose **Local machine** or **TFTP server**.
- Server Name—Select the Default Server or add a New server using the Server Name drop-down list.
- IP address—Specify the TFTP server IP address. This is automatically populated if the default server is selected.
- NCS Server Files In—Specify where the NCS server files are located. This is automatically populated if the default server is selected.
- Server File Name—Specify the Server File Name.

**Step 5** Click **Download**.

**Tip** Some TFTP servers may not support files larger than 32 MB

---

## Downloading Images to Autonomous Access Points (FTP)

To download images to autonomous access points (using FTP), follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
  - Step 2** Select the check box of the autonomous access point to which you want to download an image. The AP Type column displays whether the access point is autonomous or lightweight.
  - Step 3** From the Select a command drop-down list, choose **Download Autonomous AP Image (FTP)**. The Download images to Autonomous APs page appears.
  - Step 4** Enter the FTP credentials including username and password.
  - Step 5** Specify the following parameters:
    - File is located on—Choose **Local machine** or **FTP server**.
    - Server Name—Select the Default Server or add a New server using the Server Name drop-down list.
    - IP address—Specify the FTP server IP address. This is automatically populated if the default server is selected.
    - NCS Server Files In—Specify where the NCS server files are located. This is automatically populated if the default server is selected.
    - Server File Name—Specify the Server File Name.
  - Step 6** Click **Download**.
- 

## Supporting Autonomous Access Points in Work Group Bridge (WGB) mode

Workgroup Bridge (WGB) mode is a special mode where an autonomous access point functions as a wireless client and connects to a lightweight access point. The WGB and its wired clients are listed as client in NCS if the AP mode is set to Bridge, and the access point is bridge capable.

To view a list of all NCS clients that are WGBs, choose **Monitor > Clients**. From the Show drop-down list, choose **WGB Clients**, and click **Go**. The Clients (detected as WGBs) page appears. Click a User to view detailed information regarding a specific WGB and its wired clients.

**Note**

---

The NCS provides WGB client information for the autonomous access point whether or not it is managed by the NCS. If the WGB access point is also managed by the NCS, NCS provides basic monitoring functions for the access point similar to other autonomous access points.

---

## Configuring Access Point Details

Choose **Configure > Access Points** to see a summary of all access points in the Cisco NCS database. The summary information includes the following:

- Ethernet MAC
- IP Address
- Radio
- Map Location

- AP Type
- Controller
- Operation Status
- Alarm Status
- Audit Status

---

**Note** If you hover your mouse cursor over the Audit Status value, the time of the last audit is displayed.

---

---

**Note** You cannot configure the Cisco 600 Series Access Points from the this page. It can be configured from the AP Configuration Templates page only. For details on configuring AP Configuration Templates, see [“Configuring AP Configuration Templates” section on page 11-127](#).

---

---

**Step 1** Click the link under AP Name to see detailed information about that access point name. The Access Point Detail page appears (see [Figure 9-19](#)).

Figure 9-19 Detailed Access Point Information

Access Point Detail : atn-1130-001c.58dc.b44e

Configure > Access Points > Access Point Detail

**General**

AP Name: atn-1130-001c.58dc.b44e [Requirements](#)

Ethernet MAC: 00:1c:58:dc:b4:4e

Base Radio MAC: 00:1c:f9:04:e0:50

Country Code: US

IP Address: 9.1.97.103

| Interface 0 | 0       | Disabled  |

**Radio Interfaces**

| Protocol  | Admin Status | Channel Number | Power Level | Antenna Diversity | Antenna Type |
|-----------|--------------|----------------|-------------|-------------------|--------------|
| 802.11b/g | Enabled      | 6*             | 8           | Enabled           | Internal     |

**Hardware Reset**

Perform a hardware reset on this AP

Reset AP Now

**Set to Factory Defaults**

Clear configuration on this AP and reset it to factory defaults

Clear Config

**Note** The operating system software automatically detects and adds an access point to the Cisco NCS database as it associates with existing controllers in the Cisco NCS database.

**Note** Access point parameters may vary depending on the access point type.

Some of the parameters on the page are automatically populated.

- The General portion displays the Ethernet MAC, the Base Radio MAC, IP Address, and status.
- The Versions portion of the page displays the software and boot version.

- The Inventory Information portion displays the model, AP type, AP certificate type, serial number, and REAP mode support.
- The Ethernet Interfaces portion provides information such as interface name, slot ID, admin status, and CDP state.
- The Radio Interfaces portion provides the current status of the 802.11a/n and 802.11b/g/n radios such as admin status, channel number, power level, antenna mode, antenna diversity, and antenna type.

To set the configurable parameters, follow these steps:

---

**Note** Changing access point parameters causes the access point to be temporarily disabled and this may cause some clients to lose connectivity.

---

**Step 2** Enter the name assigned to the access point.

**Step 3** Use the drop-down list to choose a country code to establish multiple country support. Access points are designed for use in many countries with varying regulatory requirements. You can configure a country code to ensure that the access point complies with your country's regulations. Consider the following when setting the country code:

- You can configure up to 20 countries per controller.
- Because only one auto-RF engine and one list of available channels exist, configuring multiple countries limits the channels available to auto-RF in the common channels. A common channel is one that is legal in each and every configured country.
- When you configure access points for multiple countries, the auto-RF channels are limited to the highest power level available in every configured country. A particular access point may be set to exceed these limitations (or you may manually set the levels in excess of these limitations), but auto-RF does not automatically choose a non-common channel or raise the power level beyond that available in all countries.

---

**Note** Access points may not operate properly if they are not designed for use in your country of operation. For example, an (-A) access point with part number AIR-AP1030-A-K9 (which is included in the Americas regulatory domain) cannot be used in Europe (-E). Always be sure to purchase access points that match your country's regulatory domain. For a complete list of country codes supported per product, see this location:

[http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product\\_data\\_sheet0900aecd80537b6a\\_ps430\\_Products\\_Data\\_Sheet.html](http://www.cisco.com/en/US/prod/collateral/wireless/ps5679/ps5861/product_data_sheet0900aecd80537b6a_ps430_Products_Data_Sheet.html)

---

**Step 4** If you want to enable the access point for administrative purposes, select the **Enable** check box.

**Step 5** If you click **Enable** at the AP Static IP check box, a static IP address is always assigned to the access point rather than getting an IP address dynamically upon reboot.

**Step 6** Choose the role of the access point from the AP Mode drop-down list. No reboot is required after the mode is changed *except* when monitor mode is selected. You are notified of the reboot when you click **Save**. The available modes are as follows:

- **Local**—This is the normal operation of the access point and the default AP Mode choice. With this mode, data clients are serviced while configured channels are scanned for noise and rogues. The access point goes off-channel for 50 ms and listens for rogues. It cycles through each channel for the period specified under the Auto RF configuration.

- H-REAP—Choose **HREAP** from the AP Mode drop-down list to enable Hybrid REAP for up to six access points. The H-REAP access points can switch client data traffic locally and perform client authentication locally when their connection to the controller is lost.

---

**Note** To configure Local or HREAP access points for Cisco Adaptive wIPS feature, choose Local or HREAP, and select the **Enhanced wIPS Engine Enabled** check box.

---

- Monitor—This is radio receive only mode and allows the access point to scan all configured channels every 12 seconds. Only deauthentication packets are sent in the air with an access point configured this way. A monitor mode access point detects rogues, but it cannot connect to a suspicious rogue as a client to prepare for the sending of RLDP packets.

---

**Note** You can expand the monitor mode for tags to include location calculation by enabling the tracking optimized monitor mode (TOMM) feature. When TOMM is enabled, you can specify which four channels within the 2.4 GHz band (802.11b/g radio) of an access point to use to monitor tags. This allows you to focus channel scans on only those channels for which tags are traditionally found (such as channels 1, 6, and 11) in your network. To enable TOMM, you must also make additional edits on the 802.11b/g radio of the access point. See the “[Configuring Access Point Radios for Tracking Optimized Monitor Mode](#)” section on [page 9-184](#) for configuration details.

---

---

**Note** You cannot enable both TOMM and wIPS at the same time. TOMM can be enabled only when wIPS is disabled.

---

---

**Note** To configure access points for Cisco Adaptive wIPS feature, choose **Monitor** and select the **Enhanced wIPS Engine Enabled** check box, and select **wIPS** from the Monitor Mode Optimization drop-down list.

---

- Rogue Detector—In this mode, the access point radio is turned off, and the access point listens to wired traffic only. The controllers that operate in this mode monitor the rogue access points. The controller sends all the rogue access point and client MAC address lists to the rogue detector, and the rogue detector forwards this information to the WLC. The MAC address list is compared to what the WLC access points expected. If the MAC addresses match, you can determine which rogue access points are connected on the wired network.
- Sniffer—Operating in sniffer mode, the access point captures and forwards all the packets on a particular channel to a remote machine that runs AiroPeek. These packets contain information such as timestamp, signal strength, packet size, and so on. This feature can only be enabled if you run AiroPeek, which is a third-party network analyzer software that supports the decoding of data packets. For more information on AiroPeek, see [www.wildpackets.com](http://www.wildpackets.com).
- Bridge—Bridge mode is a special mode where an autonomous access point functions as a wireless client and connects to a lightweight access point. The bridge and its wired clients are listed as client in NCS if the AP mode is set to Bridge, and the access point is bridge capable.
- SE-Connect—This mode allows a CleanAir-enabled access point to be used extensively for interference detection on all monitored channels. All other functions such as IDS scanning and Wi-Fi are suspended.

---

**Note** This option is displayed only if the access point is CleanAir-capable.

---

---

**Note** Changing the AP mode reboots the access point.

---

- Step 7** Disable any access point radios.
- Step 8** From the AP Failover Priority drop-down list, choose Low, Medium, High, or Critical to indicate the access point's failover priority. The default priority is low. See the [“Setting AP Failover Priority” section on page 9-152](#) for more information.
- Step 9** In the Primary, Secondary, and Tertiary Controller fields, you can define the order in which controllers are accessed.
- Step 10** The AP Group Name drop-down shows all access point group names that have been defined using WLANs > AP Group VLANs, and you can specify whether this access point is tied to any group.

---

**Note** An access point group name to 31 characters for WLC versions earlier than 4.2.132.0 and 5.0.159.0.

---

- Step 11** Enter a description of the physical location where the access point was placed.
- Step 12** In the Stats Collection Period parameter, enter the time in which the access point sends .11 statistics to the controller. The valid range is 0 to 65535 seconds. A value of 0 means statistics should not be sent.
- Step 13** Choose **Enable** for Mirror Mode if you want to duplicate (to another port) all of the traffic originating from or terminating at a single client device or access point. Mirror mode is useful in diagnosing specific network problems but should only be enabled on an unused port since any connections to this port become unresponsive.
- Step 14** You can globally configure MFP on a controller. When you do, management frame protection and validation are enabled by default for each joined access point, and access point authentication is automatically disabled. After MFP is globally enabled on a controller, you can disable and re-enable it for individual WLANs and access points.

If you click to enable MFP Frame Validation, three main functions are performed:

- Management frame protection—When management frame protection is enabled, the access point protects the management frames it transmits by adding a message integrity check information element (MIC IE) to each frame. Any attempt to copy, alter, or replay the frame invalidates the MIC, causing those receiving access points which were configured to detect MFP frames to report the discrepancy.
- Management frame validation—When management frame validation is enabled, the access point validates every management frame it receives from other access points in the network. When the originator is configured to transmit MFP frames, the access point ensures that the MIC IE is present and matches the content of the management frame. If it receives any frame that does not contain a valid MIC IE, it reports the discrepancy to the network management system. In order to report this discrepancy, the access point must have been configured to transmit MFP frames. Likewise, for the timestamps to operate properly, all controllers must be Network Transfer Protocol (NTP) synchronized.
- Event reporting—The access point notifies the controller when it detects an anomaly, and the controller aggregates the received anomaly events and reports the results through SNMP traps to alert the network manager.

- Step 15** Select the **Cisco Discovery Protocol** check box if you want to enable it. CDP is a device discovery protocol that runs on all Cisco-manufactured equipment, such as routers, bridges, and communication servers. Each device sends periodic messages to a multicast address and listens to the messages that others send in order to learn about neighboring devices. When the device boots, it sends a CDP packet specifying whether the device is inline power enabled so that the requested power can be supplied.

**Note** Changing access point parameters temporarily disables an access point and might result in loss of connectivity to some clients.

- Step 16** Select the check box to enable rogue detection. See the “[Rogue Access Point Location, Tagging, and Containment](#)” section on page 3-13 for more information on rogue detection.

**Note** Rogue detection is disabled automatically for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect a large number of rogue devices. For more information regarding OfficeExtend access points, see the *Cisco Wireless LAN Controller Configuration Guide*.

- Step 17** Select the **Encryption** check box to enable encryption.

**Note** Enabling or disabling encryption functionality causes the access point to reboot, which then causes clients to lose connectivity.

**Note** DTLS data encryption is enabled automatically for OfficeExtend access points to maintain security, but disabled by default for all other access points.

**Note** Cisco 5500 controllers can be loaded with one of the two types of images, AS\_5500\_LDPE\_x\_x\_x\_x.aes or AS\_5500\_x\_x\_x\_x.aes. For the 5500 controller loaded with former image, you need to have DTLS License to show encryption.

**Note** For WiSM2 and 2500 controllers, it is mandatory to have DTLS license to show encryption.

- Step 18** If rogue detection is enabled, the access point radio is turned off, and the access point listens to wired traffic only. The controllers that operate in this mode monitor the rogue access points. The controller sends all the rogue access point and client MAC address lists to the rogue detector, and the rogue detector forwards this information to the WLC. The MAC address list is compared to what the WLC access points expected. If the MAC addresses match, you can determine which rogue access points are connected on the wired network.

- Step 19** Select the **SSH Access** check box to enable SSH access.

- Step 20** Select the **Telnet Access** check box to enable Telnet access.

**Note** An OfficeExtend access point may be connected directly to the WAN which could allow external access if the default password is used by the access point. Therefore, Telnet and SSH access are disabled automatically for OfficeExtend access points.

- Step 21** If you want to override credentials for this access point, select the **Override Global Username Password** check box. You can then enter a new supplicant AP username, AP password, and Enable password that you want to assign for this access point.

**Note** On the System > AP Username Password page, you can set global credentials for all access points to inherit as they join a controller. These established credentials appear in the lower right of the AP Parameters tab page.

The information that you enter is retained across controller and access point reboots and if the access point joins a new controller.

- Step 22** Select the **Enable Link Latency** check box to enable link latency for this access point or unselect it to prevent the access point from sending the round-trip time to the controller after every echo response is received. See the “[Configuring Link Latency Settings for Access Points](#)” section on page 9-203 for more information on link latency.
- Step 23** You can now manipulate power injector settings through NCS without having to go directly to the controllers. In the Power Over Ethernet Settings section, select the check box to enable pre-standard or power injector state.

Pre-standard is chosen if the access point is powered by a high power Cisco switch; otherwise, it is disabled. If power injector state is selected, power injector options appear. The possible values are installed or override. If you choose override, you can either enter a MAC address or leave it empty so that it is supplied by WLC.

**Note** To determine which source of power is running NCS, go to **Monitor > Access Points**, click **Edit View**, and then choose and move POE Status to the View Information box. After you click **Submit**, the POE status appears in the last column. If the device is powered by an injector, the POE status appears as Not Applicable.

- Step 24** Select the **Enable** check box to enable the following H-REAP configurations:

**Note** H-REAP settings cannot be changed when the access point is enabled.

- OfficeExtend AP—The default is Enabled.

**Note** Unselecting the check box simply disables OfficeExtend mode for this access point. It does not undo all of the configuration settings on the access point, but it does put the access point at risk since it becomes remotely deployed. If you want to clear the access point’s configuration and return it to factory default settings, click **Clear Config** at the bottom of the access point details page. If you want to clear only the access point’s personal SSID, click **Reset Personal SSID** at the bottom of the access point details page.

When you select Enabled for the OfficeExtend AP, a warning message provides the following information:

- Configuration changes that automatically occur. Encryption and Link Latency are enabled. Rogue Detection, SSH Access, and Telnet Access are disabled.
- A reminder to configure at least one primary, secondary, and tertiary controller (including name and IP address).

**Note** Typically, an access point first looks for the primary controller to join. After that, the controller tries the secondary and then the tertiary controller. If none of these controllers are configured, the access point switches to a default discovery mode in an attempt to join whatever controller it may find.

An OfficeExtend access point searches only for a primary, secondary, or tertiary controller to join. It does not look any further for a configured controller. Because of this, it is important that you configure at least one primary, secondary, or tertiary controller name and IP address.

- A warning the enabling encryption causes the access point to reboot and causes clients to lose connectivity.
- Least Latency Controller Join—When enabled, the access point switches from a priority order search (primary, secondary, and then tertiary controller) to a search for the controller with the best latency measurement (least latency). The controller with the least latency provides the best performance.

**Note** The access point only performs this search once when it initially joins the controller. It does not recalculate the primary, secondary, and tertiary controllers' latency measurements once joined to see if the measurements have changed.

- Enable VLAN—When selected, enter the Native VLAN identifier.

When Enable VLAN is selected, NCS displays locally switched VLANs.

**Step 25** Select the role of the mesh access point from the Role drop-down list. The default setting is MAP.

**Note** An access point in a mesh network functions as either a root access point (RAP) or mesh access point (MAP).

**Step 26** Enter the name of the bridge group to which the access point belongs. The name can have up to 10 characters.

**Note** Bridge groups are used to logically group the mesh access points to avoid two networks on the same channel from communicating with each other.

**Note** For mesh access points to communicate, they must have the same bridge group name.

**Note** For configurations with multiple RAPs, make sure that all RAPs have the same bridge group name to allow failover from one RAP to another.

**Note** For configurations where separate sectors are required, make sure that each RAP and its associated MAPs have separate bridge group names.

The Type parameter appears whether the mesh access point is an indoor or outdoor access point, and the Backhaul Interface parameter displays the access point radio that is being used as the backhaul for the access point.

- Step 27** Select the data rate for the backhaul interface from the drop-down list. Data rates available are dictated by the backhaul interface. The default rate is 18 Mbps.

**Note** This data rate is shared between the mesh access points and is fixed for the whole mesh network.

**Note** Do NOT change the data rate for a deployed mesh networking solution.

- Step 28** Choose **Enable** from the Ethernet Bridging drop-down list to enable Ethernet bridging for the mesh access point.
- Step 29** Click **Save** to save the configuration.
- Step 30** Re-enable the access point radios.
- Step 31** If you need to reset this access point, click **Reset AP Now**.
- Step 32** Click **Reset Personal SSID** to reset the OfficeExtend access point personal SSID to the factory default.
- Step 33** If you need to clear the access point configuration and reset all values to the factory default, click **Clear Config**.

## Configuring an Ethernet Interface

**Note** The 152x mesh access points are configured on any one of these four ports: port 0-PoE in, port 1-PoE out, Port 2 - cable, and port 3- fiber. Other APs (such as 1130,1140,1240,1250) are configured on Port 2 - cable.

To configure an Ethernet interface, follow these steps:

- Step 1** Choose Configure > Access Points.
- Step 2** Click the link under AP Name to see detailed information about that access point name. The Access Point Detail page appears.

**Note** The Access Point Details page displays the list of Ethernet interfaces.

- Step 3** Click the link under Interface to see detailed information about that interface. The Ethernet Interface page appears.

This page displays the following parameters:

- AP Name—The name of the access point.
- Slot Id—Indicates the slot number.
- Admin Status—Indicates the administration state of the access point.
- CDP State—Select the CDP State check box to enable the CDP state.

**Step 4** Click **Save**.

---

## Importing AP Configuration

To import a current access point configuration file, follow these steps:

---

**Step 1** Choose **Configure > Access Points**.

**Step 2** From the **Select a command** drop-down list, choose **Import AP Config**.

A pop-up alert box appears stating All Unified AP(s) are imported from CSV file only. Unified AP(s) from Excel and XML file are not imported.

**Step 3** Click **OK** to close the pop-up alert box.

**Step 4** Click **Go**.

**Step 5** Enter the CSV file path in the text box or use the Browse button to navigate to the CSV file on your computer.

The first row of the CSV file is used to describe the columns included. The AP Ethernet Mac Address column is mandatory. The parameters on the page will be used for columns not defined in the CSV file.

Sample File Header:

```
ethernetMac,apName,location,primaryController,secondaryController,tertiaryController
00:1c:58:74:8c:22, ap-1, sjc-14-a, controller-4404-1, controller-4404-2, controller-4404-3
```

- ethernetMac—Access point ethernet MacAddress
- apName—Access point name
- location—Access point location
- primaryController—Primary Controller
- secondaryController—Secondary Controller
- tertiaryController—Tertiary Controller

The CSV file can contain following fields:

- AP Ethernet MacAddress—Mandatory
- AP Name—Optional
- Location—Optional
- Primary Controller—Optional
- Secondary Controller—Optional
- Tertiary Controller—Optional

---

**Note** Optional fields can remain empty. The AP Config Import ignores empty optional field values. However, if primaryMwar and secondaryMwar entries are empty then a unified access point update is not complete.

---

**Step 6** When the appropriate CSV file path appears in the Select CSV File text box, click **OK**.

---

## Exporting AP Configuration

To export current access point configuration files, follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
- Step 2** From the **Select a command** drop-down list, choose **Export AP Config**.  
A pop-up alert box appears stating All Unified AP(s) are exported to CSV/EXCEL/XML file.
- Step 3** Click **OK** to close the pop-up alert box.
- Step 4** Click **Go** to view the current AP configurations including:
- apName
  - ethernetMac
  - location
  - primaryController
  - secondaryController
  - tertiaryController
- Step 5** Select the file option (CSV, Excel, XML) to export the access point configurations.
- Step 6** In the File Download window, click **Save** to save the file.
- 

## Configuring Access Points 802.11n Antenna

NCS provides the ability to enable or disable the use of specific antennas. All antennas are enabled by default.

**Note**

At least one transmitting and one receiving antenna must be enabled. You cannot disable all transmitting or all receiving antennas at once.

---

If you choose **Configure > Access Points** and select an **802.11n** item from the Radio column, the following page appears (see [Figure 9-20](#)).

Figure 9-20 Access Point &gt; 802.11a/n

Cisco Prime Network Control System  
Virtual Domain: ROOT-DOMAIN root Log Out

Home Monitor Configure Services Reports Administration

Radio Detail: 802.11a/n  
Configure > Access Points > atn-1250-c47d.4f39.3234 > Radio Detail

AP is running on Low Power. Please disable one radio and reset the AP to get full power on the other radio.

|                       |                                     |                                  |                                                                         |

|                       |                                     | Antenna C                        | <input checked="" type="checkbox"/>                                     |

**Performance Profile**  
To view/edit Performance Profile parameters for this AP Interface click here

Save

The following 11n Parameters display and can be modified:

**Note**

Changing any of the parameters causes the radio to be temporarily disabled and thus may result in loss of connectivity for some clients.

## General

- AP Name—The operator-defined name of the access point.
- AP Base Radio MAC—MAC address of the access point's base radio.
- Admin Status—Select the box to enable the administration state of the access point.
- CDP State—Select the CDP State check box to enable CDP.
- Controller—IP address of the controller. Click the controller's IP address for more details.
- Site Config ID—Site identification number.
- CleanAir Capable—Displays if the access point is CleanAir capable.
- CleanAir—Select the check box to enable CleanAir.

## Antenna

- Antenna Type—Indicates an external or internal antenna.
- Antenna Diversity—Select Right, Left, or Enabled.

**Note**

Antenna diversity refers to the Cisco Aironet access point feature where an access point samples the radio signal from two integrated antenna ports and choose the preferred antenna. This diversity option is designed to create robustness in areas with multi-path distortion.

For external antenna, select one of the following:

- Enabled—Use this setting to enable diversity on both the left and right connectors of the access point.
- Left—Use this setting if your access point has removable antennas and you install a high-gain antenna on the access point's left connector.
- Right—Use this setting if your access point has removable antennas and you install a high-gain antenna on the access point's right connector.

For internal antennas, select one of the following:

- Enabled—Use this setting to enable diversity on both Side A and Side B.
- Side A—Use this setting to enable diversity on Side A (front antenna) only.
- Side B—Use this setting to enable diversity on Side B (rear antenna) only.
- External Antenna—Select the external antenna or Other from the drop-down list.
- Antenna Gain—Enter the desired antenna gain in the text box.

**Note**

The peak gain of the dBi of the antenna for directional antennas and the average gain in dBi for omni-directional antennas connected to the wireless network adapter. The gain is in multiples of 0.5 dBm. An integer value 4 means  $4 \times 0.5 = 2$  dBm of gain.

- Current Gain (dBm)—Indicates the current gain in dBm.

Table 9-4 lists the antenna names, gain, and descriptions.

**Table 9-4** Antenna Names, Gain, and Descriptions

| Antenna Name       | Gain (dBi) | Description                                                                     |
|--------------------|------------|---------------------------------------------------------------------------------|
| AIR-ANT1000        | 0.00       | AP 1000 Integrated antenna                                                      |
| CUSH-S5157WP       | 3.00       | 5.15-5.87 GHz diversity wideband panel antenna (side gain and back attenuation) |
| KODIAK-DIRECTIONAL | 8.00       | Integrated Kodiak directional antenna                                           |
| KODIAK-OMNI        | 5.00       | Kodiak omni antenna                                                             |
| AIR-ANT1728        | 5.20       | Omni ceiling mount antenna                                                      |
| AIR-ANT1729        | 6.00       | Patch wall mount antenna                                                        |

|          | 802.11b/g  | AIR-ANTM2050D-R                                                                                                                                                                                                                                                                                                                                                                                         |

## WLAN Override

The following 802.11a WLAN Override parameter appears:

- WLAN Override—Choose **Enable** or **Disable** from the drop-down list.

**Note** When you enable WLAN Override, operating system displays a table showing all current Cisco WLAN Solution WLANs. In the table, select WLANs to enable WLAN operation, and deselect WLANs to disallow WLAN operation for this 802.11a Cisco Radio.

**Note**

WLAN override does not apply to access points that support the 512 WLAN feature.

## Performance Profile

Click the URL to view or edit performance profile parameters for this access point interface.

- ClientLink—Enable or disable client link for the access point radios per interface. This feature is only supported for legacy (orthogonal frequency-division multiplexing) OFDM rates. The interface must support ClientLink, and OFDM rates must be enabled. Also, two or more antennas must be enabled for transmission, and all three antennas must be enabled for reception.

**Note** The maximum number of clients supported is 15. If the antenna configuration restricts operation to a single transmit antenna or OFDM rates are disabled, ClientLink cannot be used.

## RF Channel Assignment

The following 802.11a RF Channel Assignment parameters appear:

- Current Channel—Channel number of the access point.
- Assignment Method—Select one of the following:
  - Global—Use this setting if your access point’s channel is set globally by the controller.
  - Custom—Use this setting if your access point’s channel is set locally. Select a channel from the drop-down list.  
For example, if you select 2(17 dBm) as the custom power, 2 corresponds to the Power Level and 17 is the Absolute Power (dBm).
- Channel width—Select the channel width from the drop-down list. The selections include 20, above 40, and below 40.

RF Channel assignment supports 802.11n 40 MHz channel width in the 5-GHz band. 40-MHz channelization allows radios to achieve higher instantaneous data rates.

**Note** Selecting a larger bandwidth reduces the non-overlapping channels which could potentially reduce the overall network throughput for certain deployments.

## Tx Power Level Assignment

- Current Tx Power Level—Indicates the current transmit power level.
- Assignment Method—Select one of the following:
  - Global—Use this setting if your access point’s power level is set globally by the controller.
  - Custom—Use this setting if your access point’s power level is set locally. Choose a power level from the drop-down list.

## 11n Antenna Selection

NCS provides the ability to enable or disable the use of specific antennas. All antennas are enabled by default.

**Note** At least one transmitting and one receiving antenna must be enabled. You cannot disable all transmitting or all receiving antennas at once.

The following 11n Antenna Selection parameters appear:

- Transmit Antenna—Select the check box beside Antenna A or Antenna B to enable it.
- Receive Antenna—Select the check box beside Antenna A, B, or C to enable it.

## 11n Parameters

The following 11n parameter appears:

- 11n Supported—Indicates whether or not 802.11n radios are supported.

## Configuring CDP

Cisco Discovery Protocol (CDP) is a device-discovery protocol that runs on all Cisco network equipment. Each device sends identifying messages to a multicast address, and each device monitors the messages sent by other devices.

**Note** CDP is enabled on the bridge's Ethernet and radio ports by default.

## Configuring CDP on Access Point

To configure CDP on Radio or Ethernet interfaces, follow these steps:

- Step 1** Choose **Configure > Access Points**.
- Step 2** Choose an access point associated with software release 5.0 or later.
- Step 3** Click the slots of radio or an ethernet interfaces for which you want to enable CDP.
- Step 4** Select the **CDP State** check box to enable CDP on the interface.
- Step 5** Click **Save**.

## Configuring Access Point Radios for Tracking Optimized Monitor Mode

To optimize monitoring and location calculation of tags, you can enable tracking optimized monitor mode (TOMM) on up to four channels within the 2.4-GHz band (802.11b/g radio) of an access point. This allows you to focus channel scans only on those channels on which tags are usually programmed to operate (such as channels 1, 6, and 11).

After enabling Monitor Mode at the access point level, you must then enable TOMM and assign monitoring channels on the 802.11b/g radio of the access point.

**Note** For details on enabling Monitor Mode on an access point, see [Step 6](#) in the “[Configuring Access Point Details](#)” section on page 9-164.

To set enable TOMM and assign monitoring channels on the access point radio, follow these steps:

- Step 1** After enabling Monitor Mode at the access point level, choose **Configure > Access Points**.
- Step 2** In the Access Points page, click the **802.11 b/g Radio** link for the appropriate access point.
- Step 3** In the General portion, disable **Admin Status** by unselecting the check box. This disables the radio.

**Step 4** Select the **TOMM** check box. This check box only appears for Monitor Mode APs. drop-down lists for each of the four configurable channels display.

**Step 5** Select the four channels on which you want the access point to monitor tags.

**Note** You can configure fewer than four channels for monitoring. To eliminate a monitoring channel, select **None** from the channel drop-down list.

**Step 6** Click **Save**. Channel selection is saved.

**Step 7** In the Radio parameters page, re-enable the radio by selecting the **Admin Status** check box.

**Step 8** Click **Save**. The access point is now configured as a TOMM access point.

The AP Mode displays as Monitor/TOMM on the Monitor > Access Points page.

## Copying and Replacing Access Points

The Copy and Replace AP feature is useful if you need to remove an access point from the network and replace it with a new access point. All of the access point information, such as AP mode, name, and map location needs to be copied from the old access point to the new access point.

To access the **Copy and Replace AP** function, follow these steps:

**Step 1** Choose **Configure > Access Points**.

**Step 2** Select the check box for the applicable access point.

**Step 3** From the Select a command drop-down list, choose **Copy and Replace AP**.

**Step 4** Click **Go**.

The old access point needs to be removed from the network first. This access point then becomes unassociated to any controller. When you plug in the new access point, it is associated with the controller and NCS refreshes the information. At that point, select the old unassociated access point and choose to copy and replace the configuration to the new access point.

**Note** If a different access point type is used to replace an older access point, only the configuration parameters that apply will be copied.

- Check box
- MAC Address
- Name—Name of the access point.
- Controller IP Address—IP address of controller to which the access point is associated.
- Map Location—Map location of the access point.
- Copy Location information

### Command Buttons

- Copy to AP

- Cancel

## Removing Access Points

To remove access points that are not associated, follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
  - Step 2** From the Select a command drop-down list, choose **Remove APs**.
  - Step 3** Click **Go**.
  - Step 4** Click **OK** to confirm the removal.
- 

## Scheduling and Viewing Radio Status

- [Scheduling Radio Status, page 9-186](#)
- [Viewing Scheduled Tasks, page 9-186](#)

### Scheduling Radio Status

To schedule a radio status change (enable or disable), follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
  - Step 2** Select the check box for the applicable access point(s).
  - Step 3** From the Select a command drop-down list, choose **Schedule Radio Status**.
  - Step 4** Click **Go**.
  - Step 5** Choose **Enable** or **Disable** from the Admin Status drop-down list.
  - Step 6** Use the Hours and Minutes drop-down lists to determine the scheduled time.
  - Step 7** Click the calendar icon to select the scheduled date for the status change.
  - Step 8** If the scheduled task is recurring, choose **Daily** or **Weekly**, as applicable. If the scheduled task is a one-time event, choose **No Recurrence**.
  - Step 9** Choose **Save** to confirm the scheduled task.
- 

### Viewing Scheduled Tasks

To view currently scheduled radio status tasks, follow these steps:

- 
- Step 1** Choose **Configure > Access Points**.
  - Step 2** Select the check box for the applicable access point(s).
  - Step 3** From the Select a command drop-down list, choose **View Scheduled Radio Task(s)**.

**Step 4** Click **Go**.

The Scheduled Task(s) information includes:

- Scheduled Task(s)—Choose the task to view its access points and access point radios.
- Scheduled Radio adminStatus—Indicates the status change (Enable or Disable).
- Schedule Time—Indicates the time the schedule task occurs.
- Execution status—Indicates whether or not the task is scheduled.
- Recurrence—Indicates Daily or Weekly if the scheduled task is recurring.
- Next Execution—Indicates the time and date of the next task occurrence.
- Last Execution—Indicates the time and date of the last task occurrence.
- Unschedule—Click **Unschedule** to cancel the scheduled task. Click **OK** to confirm the cancellation.

## Viewing Audit Status (for Access Points)

An Audit Status column on the **Configure > Access Points** page shows an audit status for each of the access points. You can also view the audit report for the selected access points. The report shows the time of the audit, the IP address of the selected access point, and the synchronization status.

To view the audit status, follow these steps:

---

**Step 1** Choose **Configure > Access Points**.**Step 2** Click the **Audit Status** column value to go to the latest audit details page for the selected access point. This report is interactive and per access point.

---

**Note** If you hover over the Audit Status column value, the time of the last audit is displayed.

---

To run an access point on-demand audit report, select the desired access point for which you want to run the report and choose **Audit Now** from the Select a command drop-down list. In versions prior to 4.1, the audit only spanned the parameters present on the AP Details and AP Interface Details page. In release 4.1, this audit report covers complete access point level auditing. The audit results are stored in the database so that you can view the latest audit reports without having to run another audit.

---

**Note** The audit can only be run on an access point that is associated to a controller.

---

## Filtering Alarms for Maintenance Mode Access Points

The NCS uses critical alarms to track if the managed access points are down. The Controller sends three different alarms when:

- Access point is down
- Radio A of the access point is down

- Radio B/G of the access point is down

In Release 7.0.172.0 and later, these 3 alarms are clubbed into one alarm.

When an access point is under technical maintenance, the critical alarms need to be deprioritized. You can deprioritize the severity of an alarm of an access point using the **Configure > Access Points** page. When you move an access point to maintenance state, the alarm status for that access point appears in black color.

This section consists of the following topics:

- [Placing an Access Point in Maintenance State, page 9-188](#)
- [Removing an Access Point from Maintenance State, page 9-188](#)

## Placing an Access Point in Maintenance State

To move an access point to the maintenance state, follow these steps:

---

**Step 1** Choose **NCS > Configure > Access Points**.

The Access Points page appears.

**Step 2** From the drop-down list available in the right side, choose **Place in Maintenance State** and click **Go**.

The access point is moved to maintenance state.

Once the access point is moved to maintenance state, the access point down alarms would be processed with lower severity instead of critical.

---

## Removing an Access Point from Maintenance State

To remove an access point from the maintenance state, follow these steps:

---

**Step 1** Choose **NCS > Configure > Access Points**.

The Access Points page appears.

From the drop-down list available in the right side, choose **Remove from Maintenance State** and click **Go**.

The access point is removed from the maintenance state.

---

## Searching Access Points

Use the search options in the uppermost right corner of the page to create and save custom searches:

- **New Search:** Enter an IP address, name, SSID, or MAC, and click Search.
- **Saved Searches:** Click **Saved Search** to choose a category, a saved custom search, or choose other criteria for a search from the drop-down lists.
- **Advanced Search:** An advanced search allows you to search for a device based on a variety of categories and filters.

See the [“Using the Search Feature” section on page 2-33](#) for further information.

After you click **Go**, the access point search results appear (see [Table 9-5](#)).

**Table 9-5** Access Point Search Results

| Parameter          | Options                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address         | IP address of the access point.                                                                                                                                                                         |
| Ethernet MAC       | MAC address of the access point.                                                                                                                                                                        |
| AP Name            | Name assigned to the access point. Click the access point name item to display details.                                                                                                                 |
| Radio              | Protocol of the access point is either 802.11a/n or 802.11b/g/n.                                                                                                                                        |
| Map Location       | Campus, building, and floor location.                                                                                                                                                                   |
| Controller         | IP address of the controller.                                                                                                                                                                           |
| AP Type            | Access point radio frequency type.                                                                                                                                                                      |
| Operational Status | Displays the operational status of the Cisco radios (Up or Down).                                                                                                                                       |
| Alarm Status       | Alarms are color coded as follows: <ul style="list-style-type: none"> <li>• Clear = No Alarm</li> <li>• Red = Critical Alarm</li> <li>• Orange = Major Alarm</li> <li>• Yellow = Minor Alarm</li> </ul> |
| Audit Status       | The audit status of the access point.                                                                                                                                                                   |
| Serial Number      | The serial number of the access point.                                                                                                                                                                  |
| AP Mode            | Describes the role of the access point modes such as Local, H-REAP, Monitor, Rogue Detector, Sniffer, Bridge, or SE-Connect. (as described in <a href="#">Step 6</a> of Configuring Access Points).     |

## Viewing Mesh Link Details

You can access mesh link details in several ways:

- Click the **Mesh** dashboard on the NCS home page
- Choose **Monitor > Access Points**, and click the **Mesh Links** tab and then click the **Details** link
- After you import a KML file from Google Earth, click the **AP Mesh** link

The current statistics are displayed at the top of the page followed by diagrams for certain statistics.

- SNR Graph—SNR Up and Down graphs are combined into one graph. Each set of data is represented by different colors.
- Link Metrics Graph—The Adjusted Link Metric and Unadjusted Link Metric is combined into one graph. Each set of data is represented by different colors.
- Packet Error Rate Graph—Displays the packet error rates in a graph.
- Link Events—The last five events for the link are displayed.

- Mesh Worst SNR Links—Displays the worst signal-to-noise ratio (SNR) links.
- AP Uptime—These statistics help determine if an access point is rebooting frequently.
- LWAPP Join Taken Time—These statistics determine how long it takes an access point to join.
- Location Links—Allows you to navigate to the NCS map or the Google Earth location.

## Viewing or Editing Rogue Access Point Rules

You can view or edit current rogue access point rules on a single WLC. See the “[Configuring a Rogue AP Rules Template](#)” section on page 11-78 for more information.

To access the rogue access point rules, follow these steps:

- 
- Step 1** Choose **Configure > Controllers**.
  - Step 2** Click an IP address under the IP Address column.
  - Step 3** From the left sidebar menu, choose **Security > Rogue AP Rules**. The Rogue AP Rules displays the rogue access point rules, the rule types (malicious or friendly), and the rule sequence.
  - Step 4** Choose a **Rogue AP Rule** to view or edit its details.
- 

## Configuring Switches

You can add switches to the NCS database in order to view overall switch health and endpoint monitoring and to do switchport tracing. While this switch functionality appears under the Configuration menu in NCS, you are configuring the NCS system and not the switches. You cannot configure switch features using NCS.

NCS allows you to:

- Add switches under **Configure > Switches** and specify CLI and SNMP credentials. See [Adding Switches](#) for more information.
- Monitor Switches under **Monitor > Switches**. See [Monitoring Switches](#) for more information.
- Run switch-related reports under the Reports menu. See

### Note

From the Configure > Switches page, you can also add a location-capable switch for tracking wired clients by mobility services engine and NCS.

- [Configuring Switches, page 9-190](#)
- [Configuring Spectrum Experts, page 9-200](#)

### Note

The following switches are supported: 3750, 3560, 3750E, 3560E, and 2960.

### Related Topic

- [Features Available by Switch Type](#)
- [Configuring Switch NMSP and Location](#)

## Features Available by Switch Type

When you add a switch to NCS, you specify how the switch is to be managed. Based on how you specify the switch is to be managed, NCS determines which features are available:

- Monitored switches—You can add switches (under **Configure > Switches**) and monitor switch operation (under **Monitor > Switches**). Each switch counts as a single device against the total device count for your license. If you have unused device counts available in your license engine, you can add a switch to NCS. If you have no remaining device counts available, you cannot add additional switches to NCS.
- Switch Port Tracing (SPT) only switches—Switches perform switch port tracing only. SPT-only switches appear under **Configure > Switches** and in inventory reports, but SPT-only switches do not appear under **Monitor > Switches** or on the dashboards. Licensing does not apply to SPT switches.

## Viewing Switches

Select **Configure > Switches** to see a summary of all switches in the NCS database. The summary information includes the following:

- Management IP Address—IP address of the switch. Click the IP address of a switch to get more details. See [Viewing Switch Details](#) for more information.
- Device Name—Name of the switch.
- Device Type— Type of switch.
- Reachability Status—Indicates **Reachable** if the switch is reachable or **Unreachable** if the switch is unreachable.
- Inventory Collection Status—Status of the last inventory collection. The possible values are OK, Partial, Failed, NA (for SPT-only switches), or In Progress.
- Inventory Status Detail—Specifies the status of the latest inventory collection. If the inventory collection was not successful, lists the possible reasons for the failure.
- Last Inventory Collection Date—Displays the most recent date in which the inventory was collected.
- Creation Time— Date and time the switch was added to NCS.
- License Status—Indicates the license status of the switch, which can be **Full Support** or **SPT only**. See [Features Available by Switch Type](#) for more information.

Click any column heading to sort the information by that column. You can switch between ascending and descending sort order by clicking the column heading more than once.

## Modifying SNMP Parameters

To modify SNMP parameters for a switch, follow these steps:

- 
- Step 1** Select **Configure > Switches**, then click the IP address of the switch for which you want to change SNMP credentials.
- Step 2** Modify the necessary SNMP Parameters fields, then click:
- **Reset** to restore the previously saved parameters.
  - **Save** to save and apply the changes you made.
  - **Cancel** to exit without saving your changes and return to the previous screen.
- 

## Modifying Telnet/SSH Parameters

To modify Telnet or SSH parameters for a switch, follow these steps:

- 
- Step 1** Select **Configure > Switches**, then click the IP address of the switch for which you want to change Telnet or SSH credentials.
- Step 2** Modify the necessary Telnet/SSH Parameters fields, then click:
- **Reset** to restore the previously saved parameters.
  - **Save** to save and apply the changes you made.
  - **Cancel** to exit without saving your changes and return to the previous screen.

## Adding Switches

When you add a switch to the NCS database, by default, NCS verifies the SNMP credentials of the switch. If the device credentials are not correct, you receive an SNMP failure message but the switch is added to the NCS database.

To add a switch to NCS, follow these steps:

- 
- Step 1** Choose **Configure > Switches**.
- Step 2** From the Select a command drop-down list, choose **Add Switches**, then click **Go**.
- Step 3** Complete the fields as described in [Table 9-7](#):

**Table 9-7** Adding a Switch

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General Parameters</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Add Format Type           | Select: <ul style="list-style-type: none"> <li>• <b>Device Info</b> to manually enter comma-separated IP addresses of Ethernet switches.</li> <li>• <b>CSV File</b> to import a CSV file that contains IP addresses of multiple switches. Enter the CSV file path in the text box or use the Browse button to navigate to the CSV file on your computer. See <a href="#">Configuring SNMPv3 on Switches</a> for more information.</li> </ul> |
| IP Addresses              | If you selected Device Info, enter comma-separated IP addresses of the Ethernet switches.                                                                                                                                                                                                                                                                                                                                                    |

| User Name                                                                                   | Enter the user name.                                                                                                                                                                                                                                                                                       |
| Password                                                                                    | Enter the password.                                                                                                                                                                                                                                                                                        |
| Confirm Password                                                                            | Confirm the password by entering it again.                                                                                                                                                                                                                                                                 |
| Enable Password                                                                             | Enter the enable password.                                                                                                                                                                                                                                                                                 |
| Confirm Password                                                                            | Confirm the enable password by entering it again.                                                                                                                                                                                                                                                          |
| Timeout (in secs)                                                                           | Enter the timeout value (in seconds).                                                                                                                                                                                                                                                                      |

**Step 4** Click:

- **Add** to add the switch.
- **Cancel** to cancel the operation and return to the list of switches.

## Configuring SNMPv3 on Switches

The following is an example for configuring SNMPv3 on the switch:

```
snmp-server view v3default iso included
snmp-server group v3group v3 auth write v3default snmp-server user <username>
<v3group> v3 auth <md5 or sha> <authentication password>
```

If the switch has VLANs, you must configure each VLAN, otherwise switch porting tracing will fail. The following is an example if the switch has VLANs 1 and 20.

```
snmp-server group v3group v3 auth context vlan-1 write v3default
snmp-server group v3group v3 auth context vlan-20 write v3default
snmp-server group v3group v3 auth context vlan-20 write v3default
```

**Note** When you create SNMP v3 view, make sure you include all of the OIDs.

## Sample CSV File for Importing Switches

The first row of the CSV file is used to describe the columns included. The IP Address column is mandatory. The following example shows a sample CSV file.

```
ip_address, network_mask, snmp_version, snmp_community, snmpv3_user_name,
snmpv3_auth_type, snmpv3_auth_password, snmpv3_privacy_type, snmpv3_privacy_password,
snmp_retries,
snmp_timeout, protocol, telnet_username, telnet_password, enable_password, telnet_timeout
16.1.1.3, 255.255.255.0, v2, public, , , , , 3, 10, telnet, cisco, cisco, cisco, 60
16.1.1.4, 255.255.255.0, v2, public, , , , , 3, 10, ssh2, cisco, cisco, cisco, 60
16.1.1.5, 255.255.255.0, v2, public, , , , , 3, 10, , cisco, cisco, cisco, 60
16.1.1.6, 255.255.255.0, v2, public, , , , , 3, 10, telnet, cisco, cisco, cisco, 60
3.3.3.3, 255.255.255.0, v3, , default, HMAC-MD5, default, DES, default, 3, 4
4.4.4.4, 255.255.255.0, v3, , default, HMAC-MD5, default, DES, default, 3, 4, telnet, cisco, cisco,
cisco, 60
```

The CSV file can contain the following fields:

- ip\_address—IP address
- network\_mask—Network mask
- snmp\_version—SNMP credentials version. Can be v1, v2, or v3.
- snmp\_community—SNMP community (Mandatory for v2.)
- snmpv2\_community—SNMP V2 community.
- snmpv3\_user\_name—SNMP V3 username (Mandatory for v3.)
- snmpv3\_auth\_type—SNMP V3 authorization type. Can be None or HMAC-MD5 or HMAC-SHA (Mandatory for v3.)
- snmpv3\_auth\_password—SNMP V3 authorization password (Mandatory for v3.)
- snmpv3\_privacy\_type—SNMP V3 privacy type. Can be None or DES or CFB-AES-128 (Mandatory for v3.)
- snmpv3\_privacy\_password—SNMP V3 privacy password (Mandatory for v3.)
- snmp\_retries—SNMP retries
- snmp\_timeout—SNMP timeout
- protocol—telnet, ssh2
- telnet\_username—for switches and APs, if configured (Mandatory if configured.)
- telnet\_password—for switches and APs (mandatory)
- enable\_password

- telnet\_timeout

## Configuring Switch NMSP and Location

Choose **NCS > Configure > Switches > Switch IP Address > NMSP & Location** to view the NMSP and Location information for switches.

### Note

NMSP is supported by:

- Cisco Catalyst 3000 and 4000 series switches
- IOS Release 12.50 and above

You can enable or disable NMSP status and configure switch and switch port location as described in the following sections:

- [Enabling and Disabling NMSP for Switches](#)
- [Configuring a Switch Location](#)
- [Configuring a Switch Port Location](#)

## Enabling and Disabling NMSP for Switches

You can enable or disable NMSP for a switch by choosing **NCS > Configure > Switches > Switch IP Address > NMSP & Location > NMSP Status**.

[Table 9-8](#) lists the options available in the NMSP Status Page.

**Table 9-8** Parameters of the NMSP Status page

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NMSP           | Select or Unselect this option to enable or disable NMSP for the switch.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MSE IP Address | Displays the IP address of the MSE if the switch is associated to an MSE. To associate this switch to an MSE, click Go to Synchronize button. This takes to the Synchronization page. You can synchronize this switch with an MSE. Alternately, you could use <b>NCS &gt; Services &gt; Synchronize Services &gt; Wired Switches</b> to synchronize switches to an MSE.<br><br>For more information on Synchronization, see <a href="#">“Synchronizing Services” section on page 16-10</a> . |

## Configuring a Switch Location

You can configure the location for a switch using the Switch Location option.

**Step 1** Choose **NCS > Configure > Switches > Switch IP Address > NMSP & Location > Switch Location**.

**Step 2** In the Map Location pane, select the following from the drop-down list boxes:

- Campus

- Building
- Floor

**Step 3** Click **Import Civic** to import the civic information to the switch.

The fields in the Civic Location pane are populated after the civic information is imported.

---

## Configuring a Switch Port Location

You can configure location for switch ports using the Switch Port Location option.

---

**Step 1** Choose **NCS > Configure > Switches > Switch IP Address > NMSP & Location > Switch Port Location**.

**Step 2** Select one or more ports on which you want to configure location.

**Step 3** From the drop-down list, select **Configure Location**, then click **Go**.

The Switch Port Location Configuration page appears.

The Switch Ports pane lists the ports that you have selected to configure location.

**Step 4** In the Map Location pane, select the following from the drop-down list boxes:

- Campus
- Building
- Floor

**Step 5** Click **Import Civic** to import the civic information to the switch port.

The fields in the Civic Location pane are populated after the civic information is imported.

---

## Removing Switches

When you remove a switch from the NCS database,

- Inventory information for that switch is removed from the database.
- Alarms for the switch remain in the database with a status of Clear. By default, cleared alarms are not displayed in the NCS interface.
- Saved reports remain in the database even if the switch on which the report was run is removed.

To remove a switch from NCS, follow these steps:

---

**Step 1** Choose **Configure > Switches**.

**Step 2** Select the check box(es) of the switch(es) you want to remove.

**Step 3** From the Select a command drop-down list, choose **Remove Switches**.

**Step 4** Click **Go**.

**Step 5** Click **OK** to confirm the deletion.

---

**Related Topic**

- [Adding Switches](#)

## Refreshing Switch Configuration

By default, inventory information is collected every six hours. If you make configuration changes and want the changes displayed immediately instead of waiting for the next inventory collection, you can refresh the switch as shown in the following steps:

- 
- Step 1** Choose **Configure > Switches**.
  - Step 2** Select the check box(es) of the switch(es) whose configuration you want to refresh.
  - Step 3** From the Select a command drop-down list, choose **Refresh Config from Switch**.
  - Step 4** Click **Go**.
- 

## Enabling Traps and Syslogs on Switches for Wired Client Discovery

This section describes how to configure switches to send traps and syslogs to NCS to discover the clients as they connect/disconnect.

This section consists of the following topics:

- [MAC Notification for Traps \(used for non-identity client discovery\)](#), page 9-198
- [Syslog Configuration](#), page 9-199

### MAC Notification for Traps (used for non-identity client discovery)

This IOS switch feature forwards SNMP traps from the switch to the NCS server for MAC notifications (for non-802.1x clients).

IOS configuration example:

```
snmp-server enable traps mac-notification change move threshold
snmp-server host<IP address of NCS server> version 2c <community-string> mac-notification
mac address-table notification change interval 5
mac address-table notification change history-size 10
mac address-table notification change

interface <interface>
description non-identity clients
switchport access vlan <VLAN ID>
switchport mode access
snmp trap mac-notification change added <- interface level config for MAC Notification
snmp trap mac-notification change removed <- interface level config for MAC Notification
```

### Debug Commands

```
debug snmp packets
```

## Show Commands

```
show mac address-table notification change
```

## References

For more information about Configuring MAC Change Notification Traps, see <http://www.cisco.com/en/US/docs/switches/lan/catalyst4500/12.2/31sg/configuration/guide/swadmin.html#wp1246821>

## Syslog Configuration

### Note

This feature is used for identity clients discovery.

The syslog configuration forwards syslog messages from a catalyst switch to NCS server.

IOS configuration Example:

```
archive
 log config
 notify syslog contenttype plaintext
 logging facility auth
 logging <IP address of NCS server>
```

For more information, see

[http://www.cisco.com/en/US/docs/switches/lan/catalyst3750/software/release/12.2\\_50\\_se/configuration/guide/swlog.html](http://www.cisco.com/en/US/docs/switches/lan/catalyst3750/software/release/12.2_50_se/configuration/guide/swlog.html)

# Configuring Unknown Devices

To configure the unknown devices, follow these steps:

- 
- Step 1** Choose **Configure > Unknown Devices**. The Unknown Devices page appears. The summary information includes the following:
- IP Address—IP address of the device.
  - Device Type— Type of device.
  - Reachability Status—Indicates Reachable if the device is reachable or Unreachable if the device is unreachable.
  - Inventory Collection Status—Status of the last inventory collection. The possible values are OK, Partial, Failed, NA, or In Progress
  - Inventory Status Detail—Specifies the status of the latest inventory collection. If the inventory collection was not successful, lists the possible reasons for the failure.
  - Creation Time— Date and time the device was added to NCS.
- Step 2** From the Unknown Devices page, you can perform the following functions:
- Remove Devices— To remove a device from the unknown devices table, select the device(s) and select **Remove Devices** from the Select a command drop-down list.

- Update Device Credentials—To update the device credentials of a device, select the device and select **Update Device Credentials** from the Select a command drop-down list. The Update Device Credentials page appears.
- Bulk Update Devices—To update the device credentials in a bulk, select **Bulk Update Devices** from the Select a command drop-down list. The Bulk Update Devices page appears. You can choose a CSV file.

**Note** The CSV file contains a list of devices to be updated, one device per line. Each line is a comma separated list of device attributes. The first line describes the attributes included. The IP address attribute is mandatory.

## Configuring Spectrum Experts

A Spectrum Expert client acts as a remote interference sensor and sends dynamic interference data to NCS. This feature allows the NCS to collect, monitor, and archive detailed interferer data from Spectrum Experts in the network.

To configure spectrum experts, choose **Configure > Spectrum Experts**. This page provides a list of all Spectrum Experts including:

- Hostname—The hostname or IP address of the Spectrum Expert laptop.
- MAC Address—The MAC address of the spectrum sensor card in the laptop.
- Reachability Status—Specifies whether the Spectrum Expert is successfully running and sending information to NCS. The status appears as reachable or unreachable.

This section contains the following topics:

- [Adding a Spectrum Expert, page 9-200](#)
- [Monitoring Spectrum Experts, page 9-201](#)

## Adding a Spectrum Expert

To add a Spectrum Expert, follow these steps:

- Step 1** Choose **Configure > Spectrum Experts**.
- Step 2** From the Select a command drop-down list, choose **Add Spectrum Expert**.

**Note** This link only appears when no spectrum experts are added. You can also access the Add Spectrum Expert page by choosing **Add Spectrum Expert** from the Select a command drop-down list.

- Step 3** Enter the Spectrum Expert's Hostname or IP address. If you use hostname, your spectrum expert must be registered with DNS in order to be added to NCS.

**Note**

To be correctly added as a spectrum expert, the spectrum expert client must be running and configured to communicate to NCS.

## Monitoring Spectrum Experts

You also have the option to monitor spectrum experts.

To monitor spectrum experts, follow these steps:

- Step 1** Choose **Monitor > Spectrum Experts**.
- Step 2** From the left sidebar menu, you can access the Spectrum Experts > Summary page and the Interferers > Summary page.

## Viewing Spectrum Experts Summary

The Spectrum Experts Summary page provides a table of the Spectrum Experts added to the system. The table provides the following Spectrum Expert information:

Hostname—Displays the host name or IP address.

Active Interferers—Indicates the current number of interferes being detected by the Spectrum Experts.

Alarms APs—The number of access points seen by the Spectrum Experts that are potentially affected by detected interferers.

Alarms—The number of active interference traps sent by the Spectrum Expert. Click to access the Alarm page that is filtered to the active alarms for this Spectrum Expert.

Reachability Status—Indicates “Reachable” in green if the Spectrum Expert is running and sending data to NCS. Otherwise, indicates “unreachable” in red.

Location—When the Spectrum Expert is a wireless client, a link for location is available. It shows the location of the Spectrum Expert with a red box that shows the effective range.

## Viewing Interferers Summary

The Interferers Summary page displays a list of all the interferers detected over a 30-day interval. The table provides the following interferers’ information:

- Interferer ID—An identifier that is unique across different spectrum experts.
- Category—Indicates the category of the interferer. Categories include: Bluetooth, cordless phones, microwave ovens, 802.11 FH, generic: fixed-frequency, jammers, generic: frequency-hopped, generic:continuous, and analog video.
- Type—Active indicates that the interferer is currently being detected by a spectrum expert. Inactive indicates that the interferer is no longer detected by a spectrum expert or the spectrum expert saw that the interferer is no longer reachable by NCS.
- Discover Time—Indicates when the interferer was discovered.

- Affected Channels—Identifies affected channels.
- Number of APs Affected—The number of access points managed by NCS that the spectrum expert detects or the interferers that the spectrum expert detected on the channels of the access point. Only active interferers are shown. If all of the following conditions are met, the access point is labelled as *affected*:
  - If the access point is managed by NCS.
  - If the spectrum expert detects the access point.
  - If the spectrum expert detects an interferer on the serving channel of the access point.
- Power—Indicated in dBm.
- Duty Cycle—Indicated in percentage. 100% is the worst value.
- Severity—Indicates the severity ranking of the interferer. 100 is the worst case whereas 0 is no interference.

## Viewing Spectrum Experts Details

The Spectrum Expert Details page provides all interference details from a single Spectrum Expert. This page updates every 20 seconds and gives a real-time look at the remote spectrum expert. This page includes the following items:

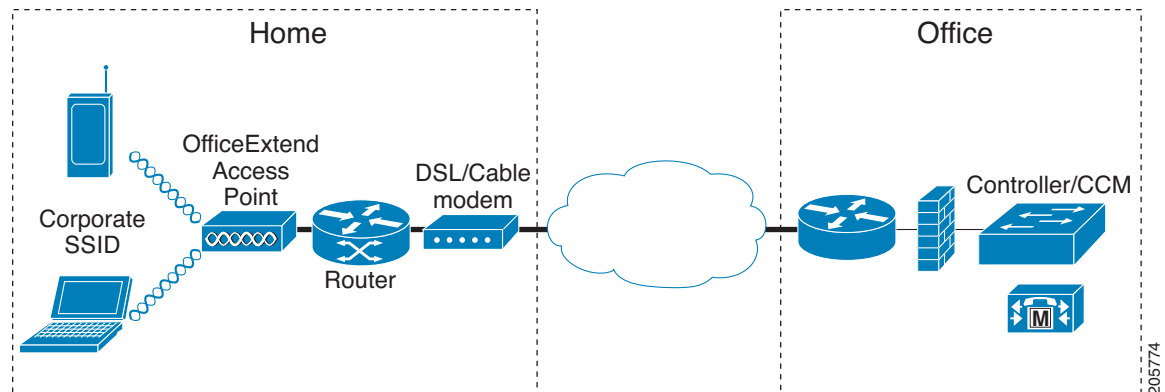

- Total Interferer Count—Given from the specific spectrum expert.
- Active Interferers Count Chart—Displays a pie chart that groups interferers by category.
- Active Interferer Count Per Channel—Displays the number of interferers grouped by category on different channels.
- AP List—Provides a list of access points detected by the spectrum expert. These access points are on channels that have active interferers detected.
- Affected Clients List—Provides a list of clients that are currently authenticated to an access point. You can select specific RADIUS or LDAP servers to provide external authentication on the Security > AAA page.

## OfficeExtend Access Point

An OfficeExtend access point provides secure communications from a controller to an access point at a remote location, seamlessly extending the corporate WLAN over the Internet to an employee's residence. The teleworker's experience at the home office is exactly the same as it would be at the corporate office. Datagram Transport Layer Security (DTLS) encryption between the access point and the controller ensures that all communications have the highest level of security.

Figure 9-21 illustrates a typical OfficeExtend access point setup.

Figure 9-21 Typical OfficeExtend Access Point Setup

**Note**

OfficeExtend access points are designed to work behind a router or other gateway device that is using network address translation (NAT). NAT allows a device, such as a router, to act as an agent between the Internet (public) and a personal network (private), thereby enabling an entire group of computers to be represented by a single IP address. In controller release 6.0, only one OfficeExtend access point can be deployed behind a single NAT device.

Currently, only Cisco Aironet 1130 series and 1140 series access points that are joined to a Cisco 5500 series controller with a WPlus license can be configured to operate as OfficeExtend access points.

**Note**

Your firewall must be configured to allow traffic from access points using CAPWAP. Make sure that UDP ports 5246 and 5247 are enabled and are not blocked by an intermediate device that could prevent an access point from joining the controller.

## Licensing for an OfficeExtend Access Point

Make sure that the WPlus license is installed on the 5500 series controller. After the license is installed, you can enable the OfficeExtend mode on an 1130 series or 1140 series access point.

**Note**

The operating system software automatically detects and adds an access point to the Cisco NCS database as it associates with existing controllers in the Cisco NCS database.

## Configuring Link Latency Settings for Access Points

You can configure link latency on the controller to measure the link between an access point and the controller. This feature can be used with all access points joined to a controller but is especially useful for hybrid-REAP access points, for which the link could be a slow or unreliable WAN connection.

**Note**

Link latency is supported for use only with hybrid-REAP access points in connected mode. Hybrid-REAP access points in standalone mode are not supported.

Link latency monitors the round-trip time of the CAPWAP heartbeat packets (echo request and response) from the access point to the controller and back. This time can vary due to network link speed and controller processing loads. The access point timestamps the outgoing echo requests to the controller and the echo requests received from the controller. The access point sends this delta time to the controller as the system round-trip time. The access point sends heartbeat packets to the controller at a default interval of 30 seconds.

**Note**

Link latency calculates the CAPWAP response time between the access point and the controller. It does not measure network latency or ping responses.

The controller displays the current round-trip time as well as a running minimum and maximum round-trip time. The minimum and maximum times continue to run as long as the controller is up or can be cleared and allowed to restart.

To configure link latency, follow these steps:

- 
- Step 1** In the **Configure > Access Point** details page, select the **Enable Link Latency** check box to enable link latency for this access point or unselect it to prevent the access point from sending the round-trip time to the controller after every echo response is received. The default value is unselected.
- Step 2** Click **Save** to save your changes.
- The link latency results appear below the **Enable Link Latency** check box:
- **Current**—The current round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the controller and back.
  - **Minimum**—Since link latency has been enabled or reset, the minimum round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the controller and back.
  - **Maximum**—Since the link latency has been enabled or reset, the maximum round-trip time (in milliseconds) of CAPWAP heartbeat packets from the access point to the controller and back.
- Step 3** To clear the current, minimum, and maximum link latency statistics on the controller for this access point, click **Reset Link Latency**. The updated statistics appear in the **Minimum** and **Maximum** fields.
- 

## Configuring Chokepoints

Chokepoints are low frequency transmitting devices. When a tag passes within range of placed chokepoint, the low-frequency field awakens the tag that in turn sends a message over the Cisco Unified Wireless Network including the chokepoint device ID. The transmitted message includes sensor information (such as temperature and pressure). A chokepoint location system provides room level accuracy (ranging from few inches to 2 feet depending on the vendor).

Chokepoints are installed and configured as recommended by the Chokepoint vendor. After the chokepoint installation is complete and operational, the chokepoint can be entered into the location database and plotted on a NCS map.

- [Configure New Chokepoints, page 9-205](#)
- [Editing Current Chokepoints, page 9-207](#)

## Configure New Chokepoints

- [Adding a Chokepoint to NCS Database, page 9-205](#)
- [Adding a Chokepoint to a NCS Map, page 9-205](#)
- [Removing a Chokepoint from a NCS Map, page 9-206](#)
- [Removing a Chokepoint from NCS, page 9-207](#)

### Adding a Chokepoint to NCS Database

To add a chokepoint to the NCS database, follow these steps:

- 
- Step 1** Choose **Configure > Chokepoints**.
- Step 2** From the Select a command drop-down list, choose **Add Chokepoints**.
- Step 3** Click **Go**.
- Step 4** Enter the MAC address and name for the chokepoint.
- Step 5** Select the check box to indicate that it is an Entry/Exit Chokepoint.
- Step 6** Enter the coverage range for the chokepoint.

---

**Note** Chokepoint range is a visual representation only. It is product-specific. The actual range must be configured separately using the applicable chokepoint vendor software.

---

- Step 7** Click **OK**.

---

**Note** After the chokepoint is added to the database, it can be placed on the appropriate NCS floor map.

---

### Adding a Chokepoint to a NCS Map

To add the chokepoint to a map, follow these steps:

- 
- Step 1** Choose **Monitor > Maps**.
- Step 2** In the Maps page, click the link that corresponds to the floor location of the chokepoint.
- Step 3** From the Select a command drop-down list, choose **Add Chokepoints**.
- Step 4** Click **Go**.

---

**Note** The Add Chokepoints summary page lists all recently-added chokepoints that are in the database but not yet mapped.

---

- Step 5** Select the check box next to the chokepoint that you want to place on the map.
- Step 6** Click **OK**.

A map appears with a chokepoint icon located in the top-left hand corner. You are now ready to place the chokepoint on the map.

**Step 7** Left-click the chokepoint icon and drag and place it in the proper location.

**Note** The MAC address, name, and coverage range of the chokepoint appear in the selected chokepoints detail page when you click the chokepoint icon for placement.

**Step 8** Click **Save**.

You are returned to the floor map and the added chokepoint appears on the map.

**Note** The newly created chokepoint icon may or may not appear on the map depending on the display settings for that floor.

**Note** The rings around the chokepoint icon indicate the coverage area. When a CCX tag and its asset passes within the coverage area, location details are broadcast, and the tag is automatically mapped on the chokepoint coverage circle. When the tag moves out of the chokepoint range, its location is calculated as before and is no longer mapped on the chokepoint rings.

**Note** MAC address, name, entry/exit chokepoint, static IP address, and range of the chokepoint display when you pass a mouse over its map icon

**Step 9** If the chokepoint does not appear on the map, select the **Chokepoints** check box located in the Floor Settings menu.

**Note** Do not select the **Save Settings** check box unless you want to save this display criteria for all maps.

**Note** You must synchronize network design to the mobility services engine or location server to push chokepoint information.

## Removing a Chokepoint from a NCS Map

To remove an chokepoint from the map, follow these steps:

- Step 1** Choose **Monitor > Maps**.
- Step 2** On the Maps page, choose the link that corresponds to the floor location of the chokepoint.
- Step 3** From the Select a command drop-down list, choose **Remove Chokepoints**.
- Step 4** Click **Go**.

**Step 5** Click **OK** to confirm the deletion.

---

## Removing a Chokepoint from NCS

To remove an chokepoint from NCS, follow these steps:

- 
- Step 1** Choose **Configure > Chokepoints**.
- Step 2** Select the check box of the chokepoint that you want to delete.
- Step 3** From the Select a command drop-down list, choose **Remove Chokepoints**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the deletion.
- 

## Editing Current Chokepoints

To edit a current chokepoint in the NCS database and appropriate map, follow these steps:

- 
- Step 1** Choose **Configure > Chokepoints**. The Configure > Chokepoints page displays the following information for each current chokepoint: MAC address, chokepoint name, entry/exit chokepoint, range, static IP address, and map location for the chokepoint.
- Step 2** Click the chokepoint you want to edit in the MAC Address column.
- Step 3** Edit the following parameters, as necessary:
- Name
  - Entry/Exit Chokepoint—Click to enable.
  - Range—Coverage range for the chokepoint.

---

**Note** The chokepoint range is product-specific and is supplied by the chokepoint vendor.

---

- Static IP Address
- Step 4** Click **Save**.
- 

## Configuring WiFi TDOA Receivers

- [Using WiFi TDOA Receivers to Enhance Tag Location Reporting](#), page 9-208
- [Adding Wi-Fi TDOA Receivers to Cisco NCS and Maps](#), page 9-208
- [Viewing or Editing Current Wi-Fi TDOA Receivers](#), page 9-210
- [Removing Wi-Fi TDOA Receivers from Cisco NCS and Maps](#), page 9-210

## Using WiFi TDOA Receivers to Enhance Tag Location Reporting

The Wi-Fi TDOA receiver is an external system designed to receive signals transmitted from a tagged, tracked asset. These signals are then forwarded to the mobility services engine to aid in the location calculation of the asset. TDOA receivers use the method of Time Difference of Arrival (TDOA) to calculate tag location. This method uses data from a minimum of three TDOA receivers to generate a tagged asset location.

**Note**

- If a TDOA receiver is not in use and the partner engine software is resident on the mobility service engine, then the location calculations for tags are generated using RSSI readings from access points.
- The Cisco Tag engine can calculate the tag location using the RSSI readings from access points.

Before using a TDOA receiver within the Cisco Unified Wireless Network, you must:

1. Have a mobility services engine active in the network.  
See the “[Adding a Mobility Services Engine](#)” section on page 16-5 for details on adding a mobility services engine.
2. Add the TDOA receiver to the NCS database and map.  
See the “[Adding Wi-Fi TDOA Receivers to Cisco NCS and Maps](#)” section on page 9-208 for details on adding the TDOA receiver to NCS.
3. Activate or start the partner engine service on the MSE using NCS.
4. Synchronize NCS and mobility services engines.  
See the “[Synchronizing Services](#)” section on page 16-10 for details on synchronization.
5. Set up the TDOA receiver using the *AeroScout System Manager*.

**Note**

See the *AeroScout Context-Aware Engine for Tags, for Cisco Mobility Services Engine User's Guide* for configuration details at the following URL:  
<http://support.aeroscout.com>.

## Adding Wi-Fi TDOA Receivers to Cisco NCS and Maps

After the Wi-Fi TDOA receiver is installed and configured by the *AeroScout System Manager* and the partner software is downloaded on the mobility services engine, you are ready to add the TDOA receiver to the mobility services engine database and position it on a NCS map.

After adding TDOA receivers to NCS maps, you continue to make configuration changes to the TDOA receivers using the *AeroScout System Manager* application rather than NCS.

**Note**

For more details on configuration options, see the *AeroScout Context-Aware Engine for Tags, for Cisco Mobility Services Engine User Guide* at the following link: <http://support.aeroscout.com>.

To add a TDOA receiver to the NCS database and appropriate map, follow these steps:

---

**Step 1** In NCS, click **Configure > WiFi TDOA Receivers** to open the All WiFi TDOA Receivers summary page.

---

**Note** To view or edit current WiFi TDOA receiver details, click the MAC Address link to open the details page.

---

**Step 2** From the Select a command drop-down list, choose **Add WiFi TDOA Receivers**.

**Step 3** Click **Go**.

**Step 4** Enter the MAC address, name and static IP address of the TDOA receiver.

**Step 5** Click **OK** to save the TDOA receiver entry to the database.

---

**Note** After you add the TDOA receiver to the database, you can place the TDOA receiver on the appropriate NCS floor map. To do so, continue with [Step 6](#).

---

---

**Note** A WiFi TDOA Receiver must be configured separately using the receiver vendor software.

---

**Step 6** To add the TDOA receiver to a map, choose **Monitor > Maps**.

**Step 7** In the Maps page, select the link that corresponds to the floor location of the TDOA receiver.

**Step 8** From the Select a command drop-down list, choose **Add WiFi TDOA receivers**.

**Step 9** Click **Go**.

---

**Note** The All WiFi TDOA Receivers summary page lists all recently-added TDOA receivers that are in the database but not yet mapped.

---

**Step 10** Select the check box next to each TDOA receiver to add it to the map.

**Step 11** Click **OK**. A map appears with a TDOA receiver icon located in the top-left hand corner. You are now ready to place the TDOA receiver on the map.

**Step 12** Left-click the TDOA receiver icon and drag and place it in the proper location on the floor map.

---

**Note** The MAC address and name of the TDOA receiver appear in the left pane when you click the TDOA receiver icon for placement.

---

**Step 13** Click **Save** when the icon is placed correctly on the map. The added TDOA receiver appears on the floor heat map.

---

**Note** The icon for the newly added TDOA receiver may or may not appear on the map depending on the display settings for that floor. If the icon did not appear, proceed with [Step 14](#).

---

**Step 14** If the TDOA receiver does not appear on the map, click **Layers** to collapse a selection menu of possible elements to display on the map.

**Step 15** Select the **WiFi TDOA Receivers** check box. The TDOA receiver appears on the map.

---

**Note** When you place your cursor over a TDOA receiver on a map, configuration details display for that receiver.

---

**Step 16** Click **X** to close the Layers page.

---

**Note** Do not choose **Save Settings** from the Layers menu unless you want to save this display criteria for all maps.

---

**Step 17** You can now download the partner engine software to the mobility services engine.

---

## Viewing or Editing Current Wi-Fi TDOA Receivers

To view a current TDOA receiver to the NCS database, follow these steps:

- 
- Step 1** In NCS, choose **Configure > WiFi TDOA Receivers** to open the All WiFi TDOA Receivers summary page.
- Step 2** Click the MAC Address link to view the TDOA receiver details including MAC address, name, and static IP address.
- Step 3** If you make any changes to the receiver name or IP address, click **Save** to confirm these changes.

---

**Note** A WiFi TDOA Receiver must be configured separately using the receiver vendor software.

---

## Removing Wi-Fi TDOA Receivers from Cisco NCS and Maps

You can remove one or multiple WiFi TDOA receivers at a time. If you remove a TDOA receiver from a map it remains in the NCS database but is labeled as unassigned.

To delete a TDOA receiver from NCS, follow these steps:

- 
- Step 1** In NCS, choose **Configure > WiFi TDOA Receivers** to open the All WiFi TDOA Receivers summary page.
- Step 2** Select the check box next to each TDOA receiver to be deleted.
- Step 3** From the Select a command drop-down list, choose **Remove WiFi TDOA Receivers**.
- Step 4** Click **Go**.
- Step 5** To confirm TDOA receiver deletion, click **OK** in the dialog box.

In the **All WiFi TDOA Receivers** page, a message confirms the deletion. The deleted TDOA receiver is no longer listed in the page.

---

# Configuring Scheduled Configuration Tasks

The Scheduled Configuration Tasks feature allows you to view, modify, and delete scheduled access point template and configuration group tasks. To access the Scheduled Configuration Tasks page, choose **Configure > Scheduled Configuration Tasks**.

This section contains the following topics:

- [AP Template Tasks, page 9-211](#)
- [Configuring Config Groups, page 9-213](#)
- [Viewing WLAN Configuration Scheduled Task Results, page 9-215](#)
- [Downloading Software Task, page 9-215](#)

## AP Template Tasks

The AP Template Tasks page allows you to view, modify, delete, enable, or disable current access point template tasks. To access the AP Template Tasks page and view current access point template tasks, choose **Configure > Scheduled Configuration Tasks**.

- [Modifying a Current AP Template Task, page 9-211](#)
- [Viewing AP Status Report for the Scheduled Task, page 9-211](#)
- [Enabling or Disabling a Current AP Template Task, page 9-212](#)
- [Viewing AP Template Task History](#)
- [Deleting a Current AP Template Task, page 9-212](#)

## Modifying a Current AP Template Task

To modify a current access point template task, follow these steps:

- 
- |               |                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Choose <b>Configure &gt; Scheduled Configuration Tasks</b> .                                             |
| <b>Step 2</b> | Select the template name of the applicable task.                                                         |
| <b>Step 3</b> | In the AP Radio/Template page, click the <b>Apply/Schedule</b> tab.                                      |
| <b>Step 4</b> | Make any necessary changes to the current schedule or access point template, and click <b>Schedule</b> . |
- 

## Viewing AP Status Report for the Scheduled Task

The AP Status Report for the scheduled task includes the following information:

- **AP Name**—Lists all of the access points included in the scheduled access point template task.
- **Ethernet MAC**—Indicates the Ethernet MAC addresses for the applicable access points.
- **Controller**—Indicates the associated controller for each of the applicable access points.
- **Map**—Displays the map location for the applicable access points.
- **Status**—Indicates whether the access point template has been successfully applied. Possible states include Not Initiated, Success, Failure, Partial Failure, and Not Reachable.

- **Task Execution Time**—Indicates the execution time of the scheduled task for the applicable access point.

To view the status report for the access points included in the scheduled task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** Select the AP Status Report for the applicable task.
- 

## Enabling or Disabling a Current AP Template Task

To enable or disable a current access point template task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** Select the check box of the scheduled task to be enabled or disabled.
  - Step 3** From the Select a command drop-down list, choose **Enable Schedule** or **Disable Schedule**, as applicable.
  - Step 4** Click **Go**.
- 

## Viewing AP Template Task History

To view previous scheduled task reports, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** Select the check box of the applicable scheduled task.
  - Step 3** From the Select a command drop-down list, choose **View History**.
  - Step 4** Click **Go**.
- 

## Deleting a Current AP Template Task

To delete a scheduled access point template task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** Select the check box of the applicable scheduled task.
  - Step 3** From the Select a command drop-down list, choose **Delete Task(s)**.
  - Step 4** Click **Go**.
  - Step 5** Click **OK** to confirm the deletion.
-

## Configuring Config Groups

The Config Group Tasks page allows you to view, modify, delete, enable, or disable current configuration group tasks. To access the Config Group Tasks page and view current config group tasks, choose **Configure > Scheduled Configuration Tasks > ConfigGroup**.

- [Modifying a Current Config Group Task, page 9-213](#)
- [Viewing Controller Status Report for the Scheduled Task, page 9-213](#)
- [Enabling or Disabling a Current Config Group Task, page 9-214](#)
- [Viewing Config Group Task History, page 9-214](#)
- [Deleting a Current Config Group Task, page 9-214](#)

## Modifying a Current Config Group Task

To modify a current configuration group task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **ConfigGroup**.
  - Step 3** Select the group name of the applicable task.
  - Step 4** From the Config Groups page, click the **Apply/Schedule** tab.
  - Step 5** Make any necessary changes to the current schedule and click **Schedule**.
- 

## Viewing Controller Status Report for the Scheduled Task

The Controller Status Report for the scheduled task includes the following information:

- Group Name—Name of the config group.
- Schedule—Indicates whether the task is enabled, disabled, or expired.
- Last Run Time—Indicates the date and time of the most recent scheduled task.
- Next Scheduled Run—Indicates the date and time of the next scheduled task.
- Controller Status Report—Indicates the number of status reports for this config group. Click the number link to view the status reports.

To view the controller status report, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **ConfigGroup**.
  - Step 3** Select the Controller Status Report for the applicable task. The Controller Status Report provides the following information:
    - Controller
    - Status of task (such as Not Initiated, Success, Failure, Partial Failure, Partial Success, Not Reachable)
    - Number of templates applied

- Number of templates failed
  - Time and date of the task execution
- 

## Enabling or Disabling a Current Config Group Task

To enable or disable a current configuration group task, follow these steps:

---

- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **ConfigGroup**.
  - Step 3** Select the check box of the scheduled task to be enabled or disabled.
  - Step 4** From the Select a command drop-down list, choose **Enable Schedule** or **Disable Schedule**, as applicable.
  - Step 5** Click **Go**.
- 

## Viewing Config Group Task History

To view previous scheduled task reports, follow these steps:

---

- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **ConfigGroup**.
  - Step 3** Select the check box of the applicable scheduled task.
  - Step 4** From the Select a command drop-down list, choose **View History**.
  - Step 5** Click **Go**.
- 

## Deleting a Current Config Group Task

To delete a scheduled configuration group task, follow these steps:

---

- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **ConfigGroup**.
  - Step 3** Select the check box of the applicable scheduled task.
  - Step 4** From the Select a command drop-down list, choose **Delete Task(s)**.
  - Step 5** Click **Go**.
  - Step 6** Click **OK** to confirm the deletion.
-

## Viewing WLAN Configuration Scheduled Task Results

**Note** There is no drop-down command list provided for WLAN Configuration.

To view and manage all scheduled WLAN tasks in NCS, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
- Step 2** From the left sidebar menu, choose **WLAN Configuration** to open the WLAN Configuration Task List page.
- Step 3** If scheduled configuration tasks are available, the WLAN Configuration Task List page contains the following parameters:
- Schedule Task Name—The user-defined name of the new scheduled task.
  - Schedule—Indicates the status of the scheduled task.
  - WLAN Status—Indicates the status of the WLAN.
  - Controller IP Address—Indicates the IP address of the controller.
  - Last Run Time—Indicates the date and time of the most recent scheduled task.
  - Next Scheduled Run—Indicates the date and time of the next scheduled task.
  - Recurrence—Indicates Daily or Weekly if the scheduled task is recurring.
- Step 4** Select the Task Name link to open the WLAN Schedule Detail page. In this page, you can modify the date and time of the scheduled task. See the [“Managing WLAN Status Schedules”](#) section on page 9-75 for more information.
- Step 5** Select the check box of the scheduled task and use the Select a command drop-down list located in the WLAN Configuration Task List page to enable, disable, or delete selected tasks.
- Enable Schedule—Enable the task if its schedule is disabled on the server.
  - Disable Schedule—Disable the running scheduled task on the server. Once disabled, the task will not run at the scheduled time. You can re-enable the task at a later time.
  - View History—View the execution results for individual WLAN tasks including reasons for any failures.
  - Delete Task(s)—Delete the selected task from the NCS server.
- 

## Downloading Software Task

By using this feature you can schedule tasks for downloading software to controllers. The Download Software Tasks page allows you to add, delete, view, enable, or disable scheduled download software tasks. To access the Download Software Tasks page and view current download software tasks, choose **Configure > Scheduled Configuration Tasks > Download Software**.

- [Adding a Download Software Task, page 9-216](#)
- [Modifying a Download Software Task, page 9-217](#)
- [Selecting Controllers for the Download Software Task, page 9-218](#)
- [Viewing Download Software Results, page 9-218](#)

- [Deleting a Download Software Task, page 9-219](#)
- [Enabling or Disabling a Download Software Task, page 9-219](#)

## Adding a Download Software Task

To add a download software task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
- Step 2** From the left sidebar menu, choose **Download Software** to open the Download Software Task List page.
- Step 3** From the Select a command drop-down list, choose **Add Download Software Task**.
- Step 4** Click **Go**. The New Download Software Task page appears.
- Step 5** Configure the following information:
- General
    - Task Name—Enter a Scheduled Task Name to identify this scheduled software download task.
  - Schedule Details
    - Download Type—Select the download type. Select the **Download software to controller** check box to schedule download software to controller or select the **Pre-download software APs** check box to schedule the pre-download software APs. If you select **Download software to controller**, specify the image details.

---

**Note** The pre-download option is displayed only when all selected controllers are using the version 7.0.x.x or later.

---

---

**Note** To see Image Predownload status per AP, enable the task in the Administration > Background Task > AP Image Predownload Task page, and run an AP Image Predownload report from the Report Launch Pad.

---

- Reboot Type—Indicates whether the reboot type is manual, automatic, or scheduled.

---

**Note** Reboot Type Automatic can be set only when the **Download software to controller** option is selected.

---

- Download date/time—Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date. Select the time from the hours and minutes drop-down lists.
- Reboot date/time—This option appears only if select the reboot type “Scheduled”. Enter a date in the provided text box or click the calendar icon to open a calendar from which you can choose a date to reboot the controller. Select the time from the hours and minutes drop-down lists.

---

**Note** Schedule enough time (at least 30mins) between Download and Reboot so that all APs can complete the software pre-download.

---

**Note** If any one of the AP is in pre-download progress state at the time of scheduled reboot, the controller will not reboot. In such a case, wait for the pre-download to finish for all the APs and reboot the controller manually.

- Notification (Optional)—Enter the e-mail address of recipient to send notifications via e-mail.

**Note** To receive email notifications, configure the NCS mail server in the Administration > Settings > Mail Server Configuration page.

- Image Details—Specify the TFTP or FTP Server Information:

**Note** Complete these details if you selected the Download software to controller option under Schedule Details.

TFTP—Specify the TFTP Server Information:

- From the File is Located on drop-down list, choose **Local machine** or **TFTP server**.

**Note** If you choose TFTP server, select the Default Server or add a New server using the Server Name drop-down list.

- Specify the IP address of the TFTP server. This is automatically populated if the default server is selected.
- Specify the local file name or click **Browse** to navigate to the appropriate file.
- If you selected TFTP server previously, specify the File Name.

FTP—Specify the FTP Server Information:

- FTP Credentials Information—Enter the FTP username, password, and port if you selected the FTP radio button.
- From the File is Located on parameter, choose **Local machine** or **FTP server**.

**Note** If you choose FTP server, select the Default Server or add a New server using the Server Name drop-down list.

- Specify the IP address of the FTP server. This is automatically populated if the default server is selected.
- Specify the local file name or click the **Browse** button to navigate to the appropriate file.
- If you selected FTP server previously, specify the File Name.

**Step 6** Click **Save**.

## Modifying a Download Software Task

To modify a download software task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **Download Software**.
  - Step 3** Select the Task Name link to open the Download Software Task page.
  - Step 4** Make any necessary changes.

**Note** Any changes in Download Type (Download/Pre-download) or Server Type (FTP/TFTP) for the task in 'Enabled' state will set the task to 'Disabled' state and all the existing controllers will be disassociated from the task.

---

- Step 5** Click **Save**.
- 

## Selecting Controllers for the Download Software Task

This page lists all the supported controllers that can be selected for the scheduled image download/pre-download task.

To select a controller for scheduled image download, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
  - Step 2** From the left sidebar menu, choose **Download Software**.
  - Step 3** Click the Controller to open the Download Software Task details page.
  - Step 4** In the Download Software Task details page, Click **Select Controller** to view the controller list.

**Note** The Select Controllers page can also be accessed from Configure > Scheduled Configuration Tasks > Download Software > click hyperlink in the Select Controller column for any download task which is in Enabled, Disabled or in Expired state.

---

**Note** If the pre-download option is chosen for the task, then the controllers with software version 7.0.x.x or later only will be listed.

---

**Note** Controllers with Reachability Status 'Unreachable' cannot be selected for Download Software Task.

---

- Step 5** Make any necessary changes.
  - Step 6** Click **Save**.
- 

## Viewing Download Software Results

To view the Schedule Run Results report, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
- Step 2** From the left sidebar menu, choose **Download Software**.
- Step 3** Select the **Task Name** check box.
- Step 4** From the Select a command drop-down list, choose **Schedule Run Results**.
- Step 5** Click **Go**. The Schedule Run Results page provides the information:
- IP Address—The IP address of the controller to which the software to be downloaded.
  - Controller Name—Name of the controller.
  - Scheduled Run Time—Scheduled time of the download process.
  - Last Updated Time—Last update time of the schedule download status (or result).
  - Transfer Status—Current download status of the image in controller. For example, Not Initiated, Wrong file Type, Writing the code into flash, Transfer Successful.
  - Reboot Status—Reboot status of the controller. For example, NA (if the reboot type is “Manual”), Reboot failed, Reboot Successful.
  - Details—Detailed status about the download and reboot process.

## Deleting a Download Software Task

To delete a scheduled download software task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
- Step 2** From the left sidebar menu, choose **Download Software**.
- Step 3** Select the check box of the applicable scheduled task.
- Step 4** From the Select a command drop-down list, choose **Delete Download Software Task**.
- Step 5** Click **Go**.
- Step 6** Click **OK** to confirm the deletion.
- 

## Enabling or Disabling a Download Software Task

To enable or disable a download software task, follow these steps:

- 
- Step 1** Choose **Configure > Scheduled Configuration Tasks**.
- Step 2** From the left sidebar menu, choose **Download Software**.
- Step 3** Select the check box of the scheduled task to be enabled or disabled.
- Step 4** From the Select a command drop-down list, choose **Enable Schedule** or **Disable Schedule**, as applicable.
- Step 5** Click **Go**.
-

# Configuring wIPS Profiles

NCS provides several pre-defined profiles from which to choose. These profiles (based on customer types, building types, industry types, and so on) allow you to quickly activate the additional wireless threat protection available through Cisco Adaptive wIPS. You can use a profile 'as is' or customize it to better meet your needs.

**Tip**

---

To learn more about Cisco Adaptive wIPS features and functionality, go to **Cisco.com** to watch a multimedia presentation. Here you will find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

Pre-defined profiles include:

- Education
- EnterpriseBest
- EnterpriseRogue
- Financial
- HealthCare
- HotSpotOpen
- Hotspot8021x
- Military
- Retail
- Tradeshow
- Warehouse

The wIPS Profiles page provides access to the wIPS profile list and the SSID group list. To access the wIPS Profile page, choose **Configure > wIPS Profiles**.

The current wIPS profile list and the SSID group list can be accessed from the left sidebar menu.

The wIPS Profiles page defaults to the Profile List. The SSID Group List page is accessible from the left sidebar menu.

**Note**

---

Adaptive wIPS does not support the NCS partitioning feature.

---

## Profile List

The wIPS Profiles > Profile List page allows you to view, edit, apply, or delete current wIPS profiles and to add new profiles.

**Tip**

---

To learn more about Cisco Adaptive wIPS features and functionality, go to **Cisco.com** to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

To access the wIPS profile list for NCS, choose **Configure > wIPS Profiles**. The page defaults to the wIPS Profiles > Profile List. If the Profile List is not currently displayed, choose **Profile List** from the wIPS Profiles left sidebar menu.

The Profile List provides the following information for each profile:

- Profile Name—Indicates the user-defined name for the current profile. Click the profile name to view or edit profile details.

---

**Note** When you hover your mouse over the profile name, the Profile ID and version display.

---

- MSE(s) Applied To—Indicates the number of mobility services engines (MSEs) to which this profile is applied. Click the MSE number to view profile assignment details.
- Controller(s) Applied To—Indicates the number of controllers to which this profile is applied. Click the controller number to view profile assignment details.

Access the following features from the Select a command drop-down list:

- [Adding a Profile, page 9-221](#)
- [Deleting a Profile, page 9-224](#)
- [Applying a Current Profile, page 9-224](#)

The profile editor allows you to create new or modify current profiles. See the “[Profile Editor](#)” section on [page 9-222](#) for more information.

## Adding a Profile

A new wIPS profile can be created using the default or a pre-configured profile.

### Tip

---

To learn more about Cisco Adaptive wIPS features and functionality, go to **Cisco.com** to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

To add a wIPS profile, follow these steps:

- 
- Step 1** Select **Configure > wIPS Profiles**. The page defaults to the wIPS Profiles > Profile List.
  - Step 2** From the Select a command drop-down list, choose **Add Profile**.
  - Step 3** Click **Go**.
  - Step 4** Type a profile name in the Profile Name text box of the Profile Parameters page.
  - Step 5** Select the applicable pre-defined profile, or choose **Default** from the drop-down list. Pre-defined profiles include:
    - Education
    - EnterpriseBest
    - EnterpriseRogue
    - Financial
    - HealthCare
    - HotSpotOpen

- Hotspot8021x
- Military
- Retail
- Tradeshow
- Warehouse

**Step 6** Select one of the following:

- Save—Saves the profiles to the NCS database with no changes and no mobility services engine or controller assignments. The profile appears in the profile list. Click the profile name to access the [“Profile Editor” section on page 9-222](#) to edit the profile at a later time.
  - Save and Edit—Saves the profile and launches the [“Profile Editor” section on page 9-222](#).
  - Cancel—Closes the Profile Parameters page without creating a profile.
- 

## Profile Editor

### Tip

To learn more about Cisco Adaptive wIPS features and functionality, [Cisco.com](http://Cisco.com) to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

The profile editor allows you to configure profile details including the following:

- SSID groups—Add, edit, or delete SSID groups.
- Policy inclusion—Determine which policies are included in the profile.
- Policy level settings—Configure settings for each policy such as threshold, severity, notification type, and ACL/SSID groups.
- MSE/controller applications—Select the mobility services engine(s) or controller(s) to which you want to apply the profile.

To configure profile details, follow these steps:

---

**Step 1** Access the profile editor. This can be done in two ways:

- When creating a new profile, click **Save and Edit** in the Profile Parameters page.
- Click the profile name from the Profile List page.

**Step 2** From the SSID Groups page, you can edit and delete current groups or add a new group. For more information on adding, editing, or deleting SSID groups, see the [“Configure > wIPS > SSID Group List” section on page 9-225](#) for more information.

**Step 3** When SSID groups have been added or edited as needed, select one of the following:

- Save—Saves the changes made to the SSID groups.
- Cancel—Returns to the profile list with no changes made.
- Next—Proceeds to the Profile Configuration page.

- Step 4** From the Profile Configuration page, you can determine which policies are included in the current profile. The check boxes in the policy tree (located in the left Select Policy pane) indicate which policies are enabled or disabled in the current profile. You can enable or disable an entire branch or an individual policy as needed by selecting the check box for the applicable branch or policy.

---

**Note** By default, all policies are selected.

---

---

**Note** For detailed information regarding each of the wIPS policies, see the [“wIPS Policy Alarm Encyclopedia” section on page 19-1](#).

---

- Step 5** In the Profile Configuration page, click an individual policy to display the policy description and to view or modify current policy rule settings.

The following options are available for each policy:

- **Add**—Click **Add** to access the Policy Rule Configuration page to create a new rule for this policy.
- **Edit**—Select the check box of the applicable rule, and click **Edit** to access the Policy Rule Configuration page to edit the settings for this rule.
- **Delete**—Select the check box of the rule you want to delete, and click **Delete**. Click **OK** to confirm the deletion.

---

**Note** There must be at least one policy rule in place. You cannot delete a policy rule if it is the only one in the list.

---

- **Move Up**—Select the check box of the rule you want to move up in the list. Click **Move Up**.
- **Move Down**—Select the check box of the rule you want to move down in the list. Click **Move Down**.

The following settings can be configured at the policy level:

- **Threshold** (not applicable to all policies)—Indicates the threshold or upper limit associated with the selected policy. When the threshold is reached for a policy, an alarm is triggered.

---

**Note** Since every policy must contain at least one threshold, default thresholds are defined for each based on standard wireless network issues.

---

---

**Note** Threshold options vary based on the selected policy.

---

---

**Note** Alarms from Cisco Adaptive wIPS DoS and security penetration attacks are classified as security alarms. A summary of these attacks is located in the Security Summary page. Choose **Monitor > Security** to access this page. The wIPS attacks are located in the Threats and Attacks section.

---

- **Severity**—Indicates the level of severity of the selected policy. Parameters include critical, major, info, and warning. The value of this parameter may vary depending on the wireless network.
- **Notification**—Indicates the type of notification associated with the threshold.

- ACL/SSID Group—Indicates the ACL or SSID Group(s) to which this threshold is be applied.

**Note** Only selected groups trigger the policy.

- Step 6** When the profile configuration is complete, select one of the following:
- Save—Saves the changes made to the current profile.
  - Cancel—Returns to the profile list with no changes made.
  - Back—Returns to the SSID Groups page.
  - Next—Proceeds to the MSE/Controller(s) page.
- Step 7** In the Apply Profile page, select the check box(es) of the mobility services engine and controller(s) to which you want to apply the current profile.
- Step 8** When the applicable mobility services engine(s) and controller(s) are selected, choose one of the following:
- Apply—Applies the current profile to the selected mobility services engine/controller(s).
  - Cancel—Returns to the profile list with no changes made.

**Note** A created profile can also be applied directly from the profile list. From the Profile List page, select the check box of the profile you want to apply and click **Apply Profile** from the Select a command drop-down list. Click **Go** to access the Apply Profile page.

## Deleting a Profile

To delete a wIPS profile, follow these steps:

- Step 1** Choose **Configure > wIPS Profiles**. The page defaults to the wIPS Profiles > Profile List.
- Step 2** Select the check box of the wIPS profile(s) you want to delete.
- Step 3** From the Select a command drop-down list, choose **Delete Profile**.
- Step 4** Click **Go**.
- Step 5** Click **OK** to confirm the deletion.

**Note** If the profile is already applied to a controller, it cannot be deleted.

## Applying a Current Profile

**Tip**

To learn more about Cisco Adaptive wIPS features and functionality, **Cisco.com** to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

To apply a wIPS profile, follow these steps:

- 
- Step 1** Choose **Configure > wIPS Profiles**. The page defaults to the wIPS Profiles > Profile List.
  - Step 2** Select the check box of the wIPS profile(s) you want to apply.
  - Step 3** From the Select a command drop-down list, choose **Apply Profile**.
  - Step 4** Click **Go**.
  - Step 5** Select the mobility services engine(s) and controller(s) to which the profile will be applied.

---

**Note** If the new assignment is different than the current assignment, you are prompted to save the profile with a different name

---

- Step 6** When the applicable mobility services engine(s) and controller(s) are selected, choose one of the following:
    - **Apply**—Applies the current profile to the selected mobility services engine/controller(s).
    - **Cancel**—Returns to the profile list with no changes made.
- 

## Configure > wIPS > SSID Group List

The SSID (Service Set Identifier) is a token or key which identifies an 802.11 (Wi-Fi) network. You must know the SSID to join an 802.11 network. SSIDs can be associated with a wIPS profile as a group using the SSID group list feature.

An SSID group can be added to a profile by importing it from the Global SSID Group List page (Configure > wIPS Profiles > SSID Group List) or by adding one directly from the SSID Groups page located in the “[Profile Editor](#)” section on page 9-222.

- [Global SSID Group List](#)—A global SSID group can be set up separately and added to multiple profiles as needed.
- [SSID Groups](#)

**Tip**

---

To learn more about Cisco Adaptive wIPS features and functionality, [Cisco.com](#) to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

## Global SSID Group List

The SSID Group List page allows you to add or configure global SSID groups that you may later import into an applicable wIPS profile.

**Tip**

---

To learn more about Cisco Adaptive wIPS features and functionality, [Cisco.com](#) to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

To access the SSID Group List page, choose **Configure > wIPS Profiles**. From the left sidebar menu, choose **SSID Group List**. The SSID Group List page displays current SSID groups and their associated SSIDs.

The following functions are available in this page:

- [Adding a Group, page 9-226](#)
- [Editing a Group, page 9-226](#)
- [Deleting Group, page 9-227](#)

## Adding a Group

To add an SSID Group, follow these steps:

- 
- Step 1** Choose **Configure > wIPS Profiles**.
  - Step 2** From the left sidebar menu, choose **SSID Group List**.
  - Step 3** From the Select a command drop-down list, choose **Add Group**.
  - Step 4** Click **Go**.
  - Step 5** In the SSID configuration page, type an SSID group name in the available text box.
  - Step 6** Enter the SSIDs in the SSID List text box. Separate multiple SSIDs with a space.
  - Step 7** When finished, select one of the following:
    - **Save**—Saves the SSID group and adds it to the SSID Group List.
    - **Cancel**—Closes the SSID configuration page without saving the new SSID group.

### Note

To import the SSID groups to a profile, choose **Configure > wIPS Profile**. Click the profile name for the applicable profile to open the SSID Groups page. From the Select a command drop-down list, choose **Add Groups from Global List**. Select the check box(es) for the SSID group(s) you want to import and click **Save**.

---

## Editing a Group

To edit a current SSID Group, follow these steps:

- 
- Step 1** Choose **Configure > wIPS Profiles**.
  - Step 2** From the left sidebar menu, choose **SSID Group List**.
  - Step 3** Select the check box of the SSID group that you want to edit.
  - Step 4** From the Select a command drop-down list, choose **Edit Group**.
  - Step 5** Click **Go**.
  - Step 6** In the SSID configuration page, make the necessary changes to the SSID group name or the SSID list.
  - Step 7** When finished, select one of the following:
    - **Save**—Saves the current changes and closes the SSID configuration page.

- **Cancel**—Closes the SSID configuration page without saving the changes.
- 

## Deleting Group

To delete a current SSID Group, follow these steps:

---

- Step 1** Choose **Configure > wIPS Profiles**.
  - Step 2** From the left sidebar menu, choose **SSID Group List**.
  - Step 3** Select the check box of the SSID group(s) that you want to delete.
  - Step 4** From the Select a command drop-down list, choose **Delete Group**.
  - Step 5** Click **Go**.
  - Step 6** Click **OK** to confirm the deletion.
- 

## SSID Groups

The SSID Groups page is the first page displayed when you access the “[Profile Editor](#)” section on [page 9-222](#). This page displays SSID groups that are included for the current wIPS profile.

From this page, you can add, import, edit, or delete an SSID group for the current profile.

### Tip

To learn more about Cisco Adaptive wIPS features and functionality, [Cisco.com](#) to watch a multimedia presentation. Here you will also find learning modules for a variety of NCS topics. Over future releases, we will add more overview and technical presentations to enhance your learning.

---

The following functions for the current profile are available in this page:

- [Adding a Group, page 9-227](#)
- [Adding Groups from Your Global List, page 9-228](#)
- [Editing a Group, page 9-228](#)
- [Deleting Group, page 9-228](#)

## Adding a Group

To add an SSID Group to the current wIPS profile, follow these steps:

---

- Step 1** Choose **Configure > wIPS Profiles**.
- Step 2** From the left sidebar menu, choose **Profile List**.
- Step 3** Click the profile name of the applicable wIPS profile.
- Step 4** From the Select a command drop-down list, choose **Add Group**.
- Step 5** Click **Go**.
- Step 6** In the SSID configuration page, type an SSID group name in the available text box.
- Step 7** Enter the SSIDs in the SSID List text box. Separate multiple SSIDs with a comma.

- Step 8** When finished, select one of the following:
- **Save**—Saves the SSID group and adds it to the SSID Group List.
  - **Cancel**—Closes the SSID configuration page without saving the new SSID group.
- 

### Adding Groups from Your Global List

SSID groups can also be added by importing them from your Global SSID Groups list. See the [“Global SSID Group List” section on page 9-225](#) for more information on creating a global SSID groups list.

To import SSID groups into a profile, follow these steps:

- 
- Step 1** Select **Configure > wIPS Profile**.
- Step 2** Click the profile name for the applicable profile to open the SSID Groups page.
- Step 3** From the Select a command drop-down list, choose **Add Groups from Global List**.
- Step 4** Select the check box(es) for the SSID group(s) you want to import.
- Step 5** Click **Save**.
- 

### Editing a Group

To edit a current SSID Group, follow these steps:

- 
- Step 1** Choose **Configure > wIPS Profiles**.
- Step 2** From the left sidebar menu, choose **Profile List**.
- Step 3** Click the profile name of the applicable wIPS profile.
- Step 4** Select the check box of the SSID group that you want to edit.
- Step 5** From the Select a command drop-down list, choose **Edit Group**.
- Step 6** Click **Go**.
- Step 7** In the SSID configuration page, make the necessary changes to the SSID group name or the SSID list.
- Step 8** When finished, select one of the following:
- **Save**—Saves the current changes and closes the SSID configuration page.
  - **Cancel**—Closes the SSID configuration page without saving the changes.
- 

### Deleting Group

To delete a current SSID Group, follow these steps:

- 
- Step 1** Choose **Configure > wIPS Profiles**.
- Step 2** From the left sidebar menu, choose **Profile List**.
- Step 3** Click the profile name of the applicable wIPS profile.
- Step 4** Select the check box of the SSID group that you want to delete.

- Step 5** From the Select a command drop-down list, choose **Delete Group**.
- Step 6** Click **Go**.
- Step 7** Click **OK** to confirm the deletion.
- 

## Configuring ACS View Servers

To facilitate communication between NCS and the ACS View Server and to access the ACS View Server tab, you must add a view server with credentials.

**Note** NCS only supports ACS View Server 5.1 or above.

---

To configure the ACS View Server Credentials, follow these steps:

---

- Step 1** Choose **Configure > ACS View Server**.
- Step 2** Enter the port number of the ACS View Server you are adding. (Some ACS View Servers do not allow you to change the port on which HTTPS runs.)
- Step 3** Enter the password that was established on the ACS View Server. Confirm the password.
- Step 4** Specify the time in seconds after which the authentication request times out and a retransmission is attempted by the controller.
- Step 5** Specify the number of retries that will be attempted.
- Step 6** Click **Submit**.
- 

## Configuring ACS View Server Credentials

To facilitate communication between NCS and the ACS View Server and to access the ACS View Server tab, you must add a view server with credentials.

To configure the ACS View Server Credentials, follow these steps:

---

**Note** NCS only supports ACS View Server 5.1 or above.

---

- Step 1** Choose **Configure > ACS View Server**.
- Step 2** Enter the port number of the ACS View Server you are adding. (Some ACS View Servers do not allow you to change the port on which HTTPS runs.)
- Step 3** Enter the password that was established on the ACS View Server. Confirm the password.
- Step 4** Specify the number of retries that will be attempted.
- Step 5** Click **Submit**.
-

# Configuring TFTP Servers

Use the **Configure > TFTP Servers** page to add or delete TFTP servers from NCS.

**Note**

The NCS uses an integral TFTP server. This means that third-party TFTP servers cannot run on the same workstation as the NCS, because the NCS and the third-party TFTP servers use the same communication port.

This section contains the following topics:

- [Adding a TFTP Server, page 9-230](#)
- [Deleting TFTP Servers, page 9-230](#)

## Adding a TFTP Server

To add a TFTP server, follow these steps:

- 
- Step 1** Choose **Configure > TFTP Servers**.
  - Step 2** From the Select a command drop-down list, choose **Add TFTP Server**.
  - Step 3** Enter a TFTP server name. This is a user-defined name for the server.
  - Step 4** Enter the IP address of the TFTP server.
  - Step 5** Click **Save**.
- 

## Deleting TFTP Servers

To delete a TFTP server, select the check box for the applicable server, and choose **Delete TFTP Servers** from the Select a command drop-down list. Click **Go** and then click **OK** to confirm the deletion.

## Interactive Graphs

This section contains the following topics:

- [Interactive Graphs Overview, page 9-230](#)
- [Interactive Graph Features, page 9-231](#)

## Interactive Graphs Overview

Interactive graph features are based upon Adobe Flex technology that uses flash to render the graphs on the browser and provide interactivity to the user.

Minimum Requirements include:

- Windows—Flash Player version 9.0.115.0.

- Linux—Flash Player version 9.0.115.0.

**Note** If you do not have a flash player or your version is not recent enough, an error page prompts you with this information. Click the **Get Latest Flash Player** link to access Adobe website. From this site, you can download the latest version of the flash player. You only need to download the flash player once. Remember to restart the browser following the download.

NCS Interactive Graphs include line, area, pie, and stacked bar graphs.

## Interactive Graph Features

Interactive graph features include the following:

- Two distinct types of graphs:
  - [Time-based Graphs](#)
  - Non-Time based
- Support for automatic refresh—The graphs refresh automatically within a predetermined interval of time.
- Two graph views:
  - Graph (Chart) view (default)
  - Table (Grid) view

**Note** Use the two toggle buttons located at the bottom left side of the graph page to switch between the two graph views. To view the button type, hover your mouse cursor over the applicable button for a tool tip identifying View in Chart or View in Grid. Click **View in Chart** to view the data in a graph. Click **View in Grid** to view the data in a table.

- Enlarged View—Click the button located at the bottom right side of the graph to enlarge the graph in a separate page. The Chart View and Grid View buttons are available in the new page to change the type of graph displayed.

## Time-based Graphs

For graphs that are time-based, there is a link bar at the top of the graph page that displays 6h, 1d, 1w, 2w, 4w, 3m, 6m, 1y, and Custom. When selected, the data for that time frame is retrieved and the corresponding graph is displayed. The time-frame options include the following:

- 6h—Denotes the last six hours of data from the current time. The data is gathered from the current database table.
- 1d—Denotes the last day (24 hours) of data from the current time. The data is gathered from the current database table.
- 1w—Denotes the last week (seven days) of data from the current time. The data is gathered from the hourly aggregated table.
- 2w—Denotes the last two weeks of data from the current time. The data is gathered from the hourly aggregated table.

- 4w—Denotes the last four weeks of data from the current time. The data is gathered from the hourly aggregated table.
- 3m—Denotes the last three months of data from the current time. The data is gathered from the daily aggregated table.
- 6m—Denotes the last six months of data from the current time. The data is gathered from the weekly aggregated table.
- 1y—Denotes the past year (12 months) of data from the current time. The data is gathered from the weekly aggregated table.
- Custom—User-selected time period. Both days and hours can be set for the start and end dates. The use of a current or hourly, daily, or weekly aggregated source for data depends upon the selected start date.

**Note**

---

The data management settings for aggregated tables are located in “[Configuring Administrative Settings](#)” section on page 15-3 under the Administration menu. The default settings have a value of 31 days for Daily Aggregated Data and ten weeks for Weekly Aggregated Data.

---

For more information on Interactive Graphs, see the “[Interactive Graphs](#)” section on page 9-230.

---

# CHAPTER 10

## Managing Clients

---

A client is a device that is connected to an access point or a switch. NCS supports both wired and wireless clients. After you add controllers and switches to NCS, the client discovery process starts. Wireless clients are discovered from managed controllers or autonomous access points. The wireless client count includes autonomous clients as well. Only in the case of switches, NCS polls for clients immediately after the device is added. In the case of controllers, these are polled during regular client status poll. NCS gets the client information from the switch and updates this information in the database. For wired clients, the client status polling to discover client associations occurs in every two hours (by default). A complete polling happens twice every day to poll complete information of all wired clients connected to all switches.

NCS uses background tasks to perform the data polling operations. There are three tasks associated with clients:

1. Autonomous AP Client Status
2. Lightweight Client Status
3. Wired Client Status

---

**Note** You can refresh the data collection tasks (such as polling interval) from the Administration > Background Tasks page. For details, see the [“Performing Background Tasks” section on page 15-15](#).

---

---

**Note** NCS enables you to track clients and be notified when these clients connect to the network. For details, see the [“Tracking Clients” section on page 10-30](#).

---

---

**Note** For more information about enabling traps and syslogs on switches for wired client discovery, see the [“Tracking Clients” section on page 10-30](#).

---

Not all users or devices are authenticated via 802.1x (for example, printers). In such a case, a network administrator can assign a username to a device. For details, see the [“Configuring Unknown Devices” section on page 9-199](#).

If a client device is authenticated to the network through web auth, NCS may not have username information for the client.

client status is noted as connected, disconnected, or unknown:

- Connected clients—Clients that are active and connected to a wired switch.
- Disconnected clients—Clients that are disconnected from the wired switch.
- Unknown clients—Clients that are marked as unknown when the SNMP connection to the wired switch is lost.

---

**Note** See the [“Configuring Unknown Devices” section on page 9-199](#) for more information about tracking clients.

---

NCS supports both Identity and non-identity wired clients. The support for wired clients is based on the Identity service. The identity service provides secure network access to users and devices and it also enables the network administrators to provision services and resources to the users based on their job functions.

This chapter describes the following sections:

- [Client Dashlets on the General Dashboard, page 10-3](#)
- [Client Dashboard, page 10-3](#)
- [Monitoring Clients and Users, page 10-10](#)
- [Client Troubleshooting, page 10-20](#)
- [Tracking Clients, page 10-30](#)
- [Enabling Automatic Client Troubleshooting, page 10-32](#)
- [Client Details from Access Point Page, page 10-33](#)
- [Viewing Currently Associated Clients, page 10-33](#)
- [Running Client Reports, page 10-33](#)
- [Running ISE Reports, page 10-33](#)
- [Specifying Client Settings, page 10-33](#)
- [Receiving Radio Measurements for a Client, page 10-33](#)
- [Viewing Client V5 Statistics, page 10-35](#)
- [Viewing Client Operational Parameters, page 10-36](#)
- [Viewing Client Profiles, page 10-38](#)
- [Disabling a Current Client, page 10-38](#)
- [Removing a Current Client, page 10-39](#)
- [Enabling Mirror Mode, page 10-39](#)
- [Viewing a Map \(High Resolution\) of a Client Recent Location, page 10-39](#)
- [Viewing a Map \(High Resolution\) of a Client Current Location, page 10-39](#)
- [Running a Client Sessions Report for the Client, page 10-40](#)
- [Viewing a Roam Reason Report for the Client, page 10-40](#)
- [Viewing Detecting Access Point Details, page 10-41](#)
- [Viewing Client Location History, page 10-41](#)
- [Viewing Voice Metrics for a Client, page 10-41](#)

# Client Dashlets on the General Dashboard

## Note

The dashlets that you see on the dashboard are presented in the form of interactive graphs. See the [“Interactive Graphs” section on page 9-230](#) for more information.

When you log into NCS, the General dashboard displays a few client-related dashlets.

- **Client Count By Association/Authentication**—Displays the total number of clients by Association and authentication in NCS over the selected period of time.
  - Associated client—All clients connected regardless of whether it is authenticated or not.
  - Authenticated client—All clients connected and passed authentication, authorization and other policies, and ready to use the network.
- **Client Count By Wireless/Wired**—Displays the total number of wired and wireless clients in NCS over the selected period of time.

## Client Dashboard

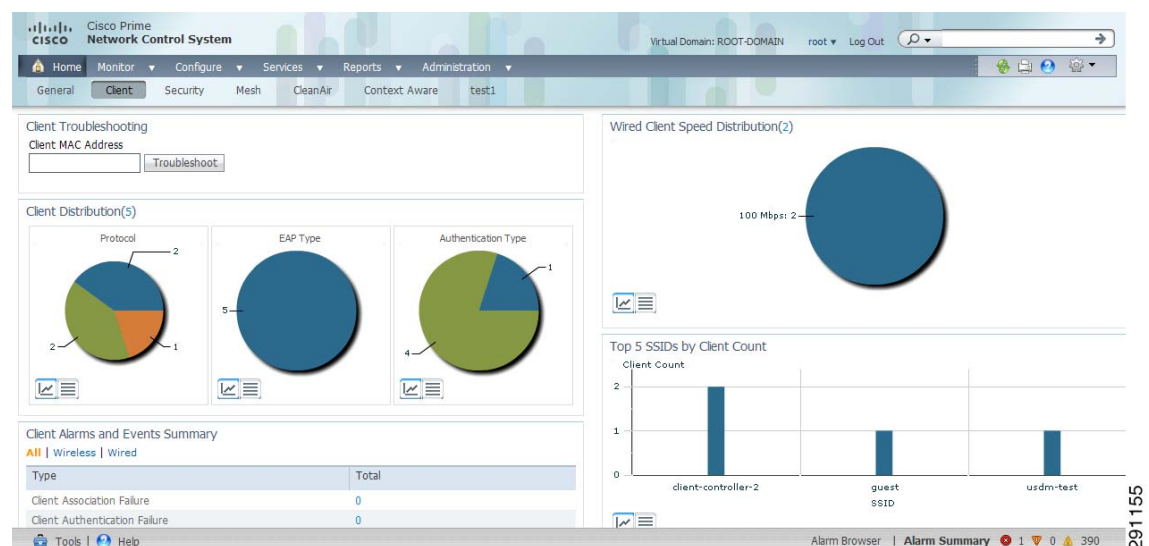

## Note

The dashlets that you see on the dashboard are presented in the form of interactive graphs. See the [“Interactive Graphs” section on page 9-230](#) for more information.

The Client dashboard (see [Figure 10-1](#)) on the NCS home page displays the client-related dashlets. These dashlets enable you to monitor the clients on the network. The data for graphs is also polled/updated periodically and stored in the NCS database. On the other hand most of the information in Client Details page are polled directly from the controller/switch.

**Figure 10-1** Client Dashboard

291155

Click the **Edit Content** link to choose the dashlets you want to have appear on the Client dashboard. You can choose the dashlet from the Available dashlets list and then click to add it to the left or right column. For more information on using the Edit Content link, see the “Dashboards” section on page 2-13. For example, if you wanted to see the client count in both the General and Client dashboards, you could add the same dashlet to both.

To return to the original client dashboard before customization, click **Edit Tabs** and click **Reset to Factory Default**.

The client dashboard displays the following dashlets:

- [Client Troubleshooting Dashlet, page 10-4](#)
- [Client Distribution Dashlet, page 10-4](#)
- [Client Alarms and Events Summary Dashlet, page 10-6](#)
- [Client Traffic Dashlet, page 10-7](#)
- [Wired Client Speed Distribution Dashlet, page 10-8](#)
- [Top 5 SSIDs by Client Count, page 10-9](#)
- [Top 5 Switches by Switch Count, page 10-9](#)
- [Client Posture Status Dashlet, page 10-9](#)
- [Client Posture Status Dashlet, page 10-9](#)

## Client Troubleshooting Dashlet

To troubleshoot a client, enter a client MAC address, and then click the **Troubleshoot** button (see [Figure 10-2](#)). The properties information appears.

**Figure 10-2** Client Troubleshooting

### Note

If the client is not currently associated, most of the information will not appear.

For details about client troubleshooting see “[Client Troubleshooting](#)” section on page 10-20.

## Client Distribution Dashlet

This dashlet (see [Figure 10-3](#)) shows how many clients are on your network presently. You can see how clients are distributed by protocol, EAP type, and authentication type.

- Protocol
  - 802.11—wireless client protocol
  - 802.3—wired client protocol.

**Note**

You can click a protocol to access the list of users belonging to that protocol. For example, if you click the 802.3 protocol, you can directly access the list of the wired clients and users in the Clients and Users page.

- EAP-Type—Represents Extensible Authentication Protocol (EAP) types such as EAP-FAST, PEAP, and so on
- Authentication Type—Represents types such as WPA (TKIP), WPA2 (AES), open, and so on

You can choose to display this information in table form or in a pie chart. The pie charts are clickable. If you hover your mouse cursor over a particular portion of the pie chart, a heading and percentage appears, and you can then click the pie chart piece to open a filtered list. When you click the number (next to the header ‘Client Distribution’) represented by Client Distribution, you get a list of clients represented by this number (the same page that you see when you choose Monitor > Clients and Users). You can filter the data that is displayed in client distribution by clicking the Dashlet Options icon and choosing either controller IP, SSID, or floor area.

**Figure 10-3** Client Distribution

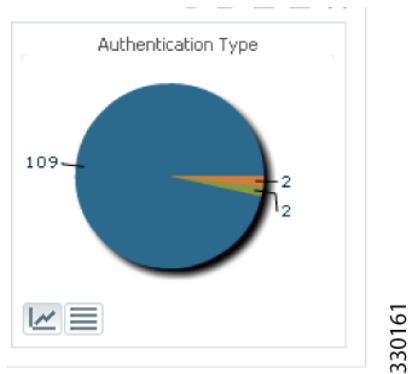

**Note**

The *Edited* label next to the Client Distribution count indicates that the dashlet has been customized. If you reset to the default page, the *Edited* label is cleared.

## Client Authentication Type Distribution

This Client Authentication Type graph shows the number of clients for each authentication type (see Figure 10-4). You can choose to display this information in table form or in a pie chart. When you click the number represented by Total Clients, you get a list of clients represented by this number (the same page that you see when you choose Monitor > Clients and Users). You can filter the data that is displayed in client authentication type distribution by clicking the Dashlet Options icon and choosing either controller IP, SSID, or floor area.

**Figure 10-4** Client Authentication Type

## Client Alarms and Events Summary Dashlet

This dashlet (see [Figure 10-5](#)) shows the most recent client alarms of both wired and wireless clients.

- Client Association Failure
- Client Authentication Failure
- Client WEP Key Decryption Error
- Client WPA MIC Error Counter Activated
- Client Excluded
- Autonomous AP Client Authentication Failure
- Wired Client Authentication Failure
- Wired Client Authorization Failure
- Wired Client Critical VLAN Assigned
- Wired Client Auth fail VLAN Assigned
- Wired Client Guest VLAN Assigned
- Wired Client Security Violation

**Note** For more information about the alarms and events, see the [“Alarm and Event Dictionary” section on page 13-1](#).

Click the number in the Total column to open the Events page (the same page that you see when you choose Monitor > Events).

**Figure 10-5** Client Alarms and Events Summary

| Type                                        | Total |
|---------------------------------------------|-------|
| Client Association Failure                  | 0     |
| Client Authentication Failure               | 0     |
| Client WEP Key Decryption Error             | 0     |
| Client WPA MIC Error Counter Activated      | 0     |
| Client Excluded                             | 0     |
| Autonomous AP Client Authentication Failure | 0     |
| Wired Client Authentication Failure         | 0     |
| Wired Client Authorization Failure          | 0     |
| Wired Client Critical VLAN Assigned         | 0     |
| Wired Client Auth fail VLAN Assigned        | 0     |
| Wired Client Guest VLAN Assigned            | 0     |
| Wired Client Security Violation             | 0     |
| Radius Server not reachable                 | 0     |

## Client Traffic Dashlet

Controllers keep counters for the number of bytes transferred and received for each client. NCS reads the number every 15 minutes and then calculates the difference, comparing the prior polling. This client traffic data is then aggregated every hour, every day, and every week (see [Figure 10-6](#)). It shows the average and maximum values in megabytes per second for both downstream and upstream traffic. You can display the information in table form or in an area chart. When generating the chart based on the floor, NCS adds up all client traffic on this floor. You can filter the data that is displayed in client traffic by clicking the Dashlet Options icon and choosing either controller IP, SSID, or floor area.

For wireless clients, client traffic information comes from controller. For wired clients, the client traffic information comes from ISE, and hence you need to enable accounting information and other necessary functions on switches.

Figure 10-6 Client Traffic

If you click **View History**, the Client Traffic Historical Charts dashlet appears for the various time frames. The Client Traffic Historical Charts dashlet shows the client traffic over the last 6 hours, last day, last week, last month, and last year. The blue line shows the authenticated client count and the orange line shows the associated client count. The upper right-hand corner shows when the chart was last updated.

## Wired Client Speed Distribution Dashlet

This dashlet displays the wired client speeds and the client count for each speed. There are three different speeds on which clients run:

- 10 Mbps
- 100 Mbps
- 1 Gbps

Figure 10-7 Wired Client Speed Distribution

**Note** Since ports are in Auto Negotiate mode (by default). For example, you will 100 Mbps speed for a client that runs in 100 Mbps speed.

## Top 5 SSIDs by Client Count

This dashlet (see [Figure 10-8](#)) shows the count of currently associated and authenticated clients. You can choose to display the information in table form or in an area chart.

**Figure 10-8** Top 5 SSIDs by Client Count

**Note**

In NCS 1.0, the WGB, Wired Guest, and OEAP 600 (Office Extended Access Point 600) are tracked as wireless clients.

## Top 5 Switches by Switch Count

This dashlet (see [Figure 10-9](#)) displays the five switches that have the most clients as well as the number of clients associated to the switch.

**Figure 10-9** Top 5 Switches by Switch Count Dashlet

## Client Posture Status Dashlet

NCS collects the posture status information from the Identity Services Engine (ISE). You need to add an ISE for authorization and authentication purpose. For information about adding ISE, see [“Adding an Identity Services Engine” section on page 16-81](#). After you enable necessary functions in ISE, NCS shows the data in the Client Posture Status dashlet.

This dashlet (see [Figure 10-10](#)) displays the client posture status and the number of clients in each of the following status:

- Compliant
- Non-compliant
- Unknown
- Pending
- Not Applicable
- Error

**Figure 10-10** Client Posture Status Dashlet

330163

## Monitoring Clients and Users

Using the Monitor Clients and Users feature, you can view all the clients in your network—both wired and wireless. In addition, you can view the client association history and statistical information. These tools are useful when users complain of network performance as they move throughout a building with their laptop computers. The information may help you assess what areas experience inconsistent coverage and which areas have the potential to drop coverage.

The Client Detail page shows the association history graph to represent the time-based data. The information will help you identify, diagnose, and resolve client issues.

**Note** Some of the features mentioned in this chapter are not applicable for wired clients (for example, disabling or removing).

Choose **Monitor > Clients and Users** to view both wired and wireless clients information. The Clients and Users page appears. In the Clients and Users page, you see the clients in tabular format with different tools available at the top of the table.

This section contains the following topics:

- [Filtering Client and Users, page 10-11](#)
- [Viewing Clients and Users, page 10-12](#)
- [Configuring the Search Results Display, page 10-32](#)

## Filtering Client and Users

When you navigate to the Clients and Users list page, all Associated Clients are displayed by default. There are 14 preset filters that allow you to view a subset of clients (see [Table 10-1](#)).

**Note**

In NCS 1.0, the WGB, Wired Guest, and OEAP 600 (Office Extended Access Point 600) are tracked as wireless clients.

[Table 10-1](#) lists the quick filters that are available on the Clients and Users page. Click the Show drop-down list to select the filter that you want to show.

**Table 10-1** Client List Filters

| Filter                                | Results                                                                |
|---------------------------------------|------------------------------------------------------------------------|
| All                                   | All clients including inactive                                         |
| 2.4GHz Clients                        | All clients using 2.4 GHz radio band                                   |
| 5GHz Clients                          | All clients using 5.0 GHz radio band                                   |
| All Lightweight Clients               | All clients connected to lightweight APs                               |
| All Autonomous Clients                | All clients connected to autonomous APs                                |
| All Wired Clients                     | All clients directly connected to switch managed by NCS                |
| Associated Clients                    | All clients connected regardless of whether it is authenticated or not |
| Clients detected by MSE               | All clients detected by MSE including wired and wireless               |
| Clients detected in last 24 hours     | All clients detected in last 24 hours                                  |
| Clients Known by ISE                  | Shows all the clients which are authenticated by ISE.                  |
| Clients with Problems                 | Clients which are associated, but have not completed policy.           |
| Excluded Clients                      | All lightweight wireless clients being excluded by controller          |
| H-REAP Locally Authenticated          | Clients connected to H-REAP APs and authenticated locally              |
| New Clients detected in last 24 hours | New Clients detected in last 24 hours                                  |

Table 10-1 Client List Filters

| Filter             | Results                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On Network Clients | Clients which have gone through authentication/authorization and able to send and receive data. This means the clients that have completed all set policies and are on the network. The clients are not Identity clients, are always shown as 'On Network'.                                                                                                                                                                    |
| WGB Clients        | All WGB clients.<br><b>Note</b> If an access point is bridge capable, and the AP mode was set to Bridge, you can view clients identified as WGBs. WGB clients bridge wireless to wired. Any Cisco IOS access point can take on the role of a WGB, acting as a wireless client with a wired client connected to it. The information about this WGB is propagated to the controller and appears as a client in both NCS and WLC. |

In addition, you can use the filter button () to filter the records that match the filter rules. If you want to specify a filter rule, choose All from the Show drop-down list before you click .

**Note** When you select a preset filter and click the filter button, the filter criteria is greyed out. You can only see the filter criteria but will not be able to change it. When the All option is selected to view all the entries, clicking the filter button shows the Quick Filter options, where you can filter the data using the filterable fields, there is also a free form text box, where you can enter text and filter the table.

## Viewing Clients and Users

**Note** You can use the advanced search feature to narrow the client list based on specific categories and filters. See the [“Using the Search Feature”](#) section on page 2-33 section or the [“Advanced Search”](#) section on page 2-34 for more information. You can also filter the current list using the Show drop-down list. See the [“Filtering Client and Users”](#) section on page 10-11 for more information.

**Note** See the [“Configuring the Search Results Display”](#) section on page 10-32 for other available client parameters. See the [“Filtering Client and Users”](#) section on page 10-11 for information on filtering this client list.

**Note**

To view complete details in the Monitor > Client and Users page and to perform operations such as Radio Measurement, users in User Defined groups need permission for Monitor Clients, View Alerts & Events, Configure Controllers, and Client Location.

To view clients and users, follow these steps:

- Step 1** Choose **Monitor > Clients and Users** to view both wired and wireless clients information. The Clients and Users page appears (see [Figure 10-11](#)).

**Figure 10-11 Clients and Users**

| IP Address       | MAC Address        | User Name     | Type | Vendor       | Device Name        | Location            | VLAN | Status     | Interface             | Protocol | Association Time |
|------------------|--------------------|---------------|------|--------------|--------------------|---------------------|------|------------|-----------------------|----------|------------------|
|                  | 00:40:96:a8:2a:46  | Unknown       |      | Cisco        | usdm-controller-63 | Root Area           | 36   | Associated | management            | 802.11a  |                  |
| 36.0.0.18        | 00:1f:3a:68:83:f7  | Unknown       |      | Hon Hai P... | usdm-controller-63 | Root Area           | 36   | Associated | management            | 802.11a  | 2011-Apr-27, 6   |
| 36.0.0.19        | 00:1f:3a:68:84:31  | Unknown       |      | Hon Hai P... | usdm-controller-63 | Root Area           | 36   | Associated | management            | 802.11a  | 2011-Apr-27, 1   |
| 169.254.237.1... | 00:0e:0c:71:37:5d  | 00-0E-0C-7... |      | Intel        | Identity-118       | System Campus > SJN | 0    | Associated | GigabitEthernet1/0/11 | 802.3    | 2011-Apr-27, 1   |
|                  | 00:1e:13:5d:54:... | Unknown       |      | Cisco        | Identity-118       | System Campus > SJN | 100  | Associated | GigabitEthernet1/0/12 | 802.3    | 2011-Apr-27, 6   |

The Clients and Users table displays a few columns by default. If you want display the additional columns that are available, click , and then click Columns. The available columns appear. Select the columns that you want to show in the Clients and Users table. When you click anywhere on a row, the row will be selected and the client details are shown.

The following are columns that are available to show in the Clients and Users table:

- IP Address—Client IP address.
- MAC Address—Client MAC address.
- User Name—Username based on 802.1x authentication. Unknown is displayed for client connected without a username.
- Type—Indicates the client type.
  - indicates a lightweight client
  - indicates a wired client
  - indicates an autonomous client
- Vendor—Device vendor derived from OUI.
- AP Name—Wireless only
- Device Name—Network authentication device name, for example, WLC, switch.
- Location—Map location of connected device.
- ISE—Yes/No. This column represents whether the client is authenticated using the ISE which is added to NCS.
- Endpoint Type—Endpoint type as reported by ISE, available only when ISE is added (for example, iPhone, iPad, Windows workstation).
- Posture—Latest client posture status

- SSID—Wireless only
- Profile Name—Wireless only
- VLAN—Indicates the access VLAN ID for this client.
- Status—Current client status
  - Idle—Normal operation; no rejections of client association requests.
  - Auth Pending—Completing an AAA transaction.
  - Authenticated—802.11 authentication complete.
  - Associated—802.11 association complete. This is also used by wired clients to represent that a client currently connected to the network.
  - Power Save—Client is in power save mode.
  - Disassociated—802.11 disassociation complete. This is also used by wired clients to represent that a client is currently not on the network.
  - To Be Deleted—The client will be deleted after disassociation.
  - Excluded—Automatically disabled by system due to perceived security threat.
- Interface—Controller interface (wireless) or switch interface (wired) that client is connected to.
- Protocol
  - 802.11—wireless
  - 802.3—wired
- Speed—Ethernet port speed (wired only). Displays “N/A” for wireless
- Association Time—Last association start time (for wireless client). For a wired client, this is the time when client connected to a switch port. This is blank for a client which is associated by having problems being on the network.
- Session Length—Session length
- On Network—Shows Yes for the clients which are associated and successfully finished authentication, if required.
- Authentication Type—WPA, WPA2, 802.1x, MAC Auth Bypass, or Web Auth.
- Authorization Profile Names—Authorization profiles applied to this client by ISE. This contains data only when ISE is added and client is authenticated by ISE.
- Traffic (MB)—Traffic (transmitted/received) in this session in MB
- Average Session Throughput (kbps)—Average session throughput in kbps
- Automated Test Run—Indicates whether client is in auto test mode. This is applicable for wireless clients only.
- AP MAC Address—Wireless only
- AP IP Address—Wireless only
- Anchor Controller—Lightweight wireless only
- CCX—Lightweight wireless only
- Client Host Name—Wired and wireless. Result of DNS reverse lookup.
- Device IP Address—IP address of the connected device (WLC, switch or autonomous AP)
- Port—Switch port on WLC
- E2E—Lightweight wireless only

- Encryption Cipher—Wireless only
- MSE—MSE server managing this client
- RSSI—Wireless only
- SNR—Wireless only
- Session ID—Audit-session-ID used in ISE and switch
- Session Time—For active session, current time - session start time
- Vender Name—Vender name derived from OUI

**Step 2** Select a client or user. The following information appears:

- [Client Attributes](#)
- [Client Statistics](#)

**Note** Client Statistics shows the statistics information after the client details are shown.

- [Client Association History](#)
- [Client Event Information](#)
- [Client Location Information](#)
- [Wired Location History](#)
- [Client CCXv5 Information](#)

The following attributes are populated only when ISE is added to NCS:

- ISE
- Endpoint Type
- Posture
- Authorization Profile Names

**Note**

NCS queries ISE for client authentication records for the last 24 hours to populate this data. If the client is connected to the network 24 hours before it is discovered in NCS, you may not see the ISE-related data in the table. You may see the data in client details page. To workaround this, reconnect the client to network. The ISE information is shown in the table after the next client background task run.

## Client Attributes

When you select a client from the Clients and Users list, the client attributes appear under the Clients and Users list. Clients are identified using the MAC address.

**Note**

The details that appear in the client attribute group box are from the device, whereas the details that appear in the Clients and Users list are from the database. Therefore, there can some discrepancy on the details that appear on the Clients and Users list and the Client Attributes group box.

**Note**

For wired clients, the information comes from switch. Also, the data that appears in the details page is live data collected on demand from the controller/switch/ISE.

These details include the following client details:

- General—Lists the generation information such as User Name, MAC address, and so on.

**Note**

Click the  icon next to the username to access the correlated users of a user.

- Session —Lists the client session information.
- Security (wireless and Identity wired clients only)—Lists Security policy, authentication information, and EAP type.

**Note**

The identity clients are the clients whose authentication type will be 802.1x, MAC Auth Bypass or Web Auth. For non-identity clients, the authentication type will be N/A.

**Note**

The data that appears under the client attributes differs based on identity and non-identity clients. For identity clients, you can see the security information such as Authentication status, Audit Session ID, and so on.

- Statistics (wireless only)
- Traffic—Shows the client traffic information.

**Note**

For wireless clients, client traffic information comes from controller. For wired clients, the client traffic information comes from ISE, and hence you need to enable accounting information and other necessary functions on switches.

## Client Statistics

The Statistics includes the following information for the selected client:

- Client AP Association History
- Client RSSI History (dBm)—History of RSSI (Received Signal Strength Indicator) as detected by the access point with which the client is associated.
- Client SNR History—History of SNR (signal-to-noise Ratio of the client RF session) as detected by the access point with which the client is associated
- Bytes Sent and Received (Kbps)—Bytes sent and received with the associated access point.
- Packets Sent and Received (per second)—Packets sent and received with the associated access point.
- Data rate over time

**Note**

Hover your mouse cursor over points on the graph for additional statistical information.

**Note**

This information is presented in interactive graphs. See the [“Interactive Graphs” section on page 9-230](#) for more information.

## Client Association History

The Association History section displays information regarding the last ten association times for the selected client. This information can help in troubleshooting the client.

- Client Association History (for wireless clients) includes the following information:
  - Date and time of association
  - Duration of association
  - Username
  - IP address
  - Access point name
  - Controller name
  - SSID
  - Protocol
  - Amount of traffic (MB)
  - Hostname
  - Roam reason (such as *No longer seen from controller* or *New association detected*)
- Client Association History (for wired clients) includes the following information:
  - Date and time of association
  - Duration of association
  - Username
  - IP address
  - Access point and controller name
  - Map location
  - SSID
  - Protocol
  - Amount of traffic (MB)
  - Hostname
  - Roam reason (such as *No longer seen from controller* or *New association detected*)

**Note**

Click the **Edit View** link to add, remove or reorder columns in the Current Associated Clients table. See the [“Configuring the List of Access Points Display” section on page 5-45](#) for adding a new parameters than can be added through Edit View.

## Client Event Information

The Event section of the Client Details page displays all events for this client including the event type as well as the date and time of the event.

Click an event type to view its details. See the [“Monitoring Failure Objects” section on page 5-144](#) for more information.

## Client Location Information

The following location parameters appear (if available) for the selected client:

- Map Area—The map area in which the client was last located.
- ELIN—The Emergency Location Identification Number. This is applicable only to the wired clients that are located by MSE.
- Civic Address—The fields under the Civic Address tab is populated if a civic address is imported for a client. This is applicable only to the wired clients that are located by MSE.
- Advanced—Detailed information about the client. The fields under this tab is populated if a civic address is imported for a client.

For more information on the importing Civic information for the client, see [“Configuring a Switch Location” section on page 9-196](#).

## Wired Location History

You can view the Location History for wired clients.

---

**Note** The wired clients have to be located by MSE and the history for wired clients should be enabled on the MSE.

---

The following Location History information is displayed for a client:

- Timestamp
- State
- Port Type
- Slot

## Wireless Location History

You can view the Location History for wireless clients.

**Note** The wireless clients have to be located by MSE and the history for wired clients should be enabled on the MSE.

## Client CCXv5 Information

CCXv5 clients are client devices that support Cisco Compatible Extensions version 5 (CCXv5). Reports specific to CCXv5 clients provide client details that enhance client diagnostics and troubleshooting.

**Note**

The CCXv5 manufacturing information is displayed for CCXv5 clients only.

To view specific client details, perform a client search using the applicable search parameters. For more information on performing a client search, see the [“Client CCXv5 Information” section on page 10-19](#) or the [“Advanced Search” section on page 2-34](#).

CCXv5 information displays in the **Monitor Clients > Client Details** page. CCXv5 information includes the following:

CCXv5 Manufacturing Information:

- Organizational Unique Identifier—The IEEE assigned organizational unique identifier, for example the first 3 bytes of the MAC address of the wireless network connected device.
- ID—The manufacturer identifier of the wireless network adapter.
- Model—Model of the wireless network adapter.
- Serial Number—Serial number of the wireless network adapter.
- Radio—Radio type of the client.
- MAC Address—MAC address assigned to the client.
- Antenna Type—Type of antenna connected to the wireless network adapter.
- Antenna Gain—The peak gain of the dBi of the antenna for directional antennas and the average gain in dBi for omni-directional antennas connected to the wireless network adapter. The gain is in multiples of 0.5 dBm. An integer value 4 means  $4 \times 0.5 = 2$  dBm of gain.

**Note** Click **More** to view the following additional CCXv5 parameters.

Automated Troubleshooting Report—If the automated test runs, this report displays the location of automated troubleshooting log AUTO\_TS\_LOG<ClientMac>.txt. If no automated test runs, Not Exists appears.

- Click **Export** to save the .zip file. The file contains three logs: automated troubleshoot report, frame log, and watch list log.

**Note** The **Settings > Client** page allows you to enable automatic client troubleshooting on a diagnostic channel. This feature is only available for Cisco Compatible Extension clients version 5. See the [“Processing Diagnostic Trap” section on page 15-77](#) for more information.

Radio Receiver Sensitivity—Displays receiver sensitivity of the wireless network adapter including:

- Radio
- Data Rate
- Minimum and Maximum RSSI

CCXV5 Capability Information—Displays the Capability Information parameters for CCXv5 clients only.

- Radio
- Client Status—Success or failure.
- Service Capability—Service capabilities such as voice, streaming (uni-directional) video, interactive (bi-directional) video.

Radio Channels—Identifies the channels for each applicable radio.

Transmit Data Rates—Identifies the transmission data rates (Mbps) for each radio.

Transmit Power Values—Identifies the transmission power values including:

- Power mode
- Radio
- Power (dBm)

## Client Troubleshooting

You can begin troubleshooting several ways: by entering a MAC address in the Client dashboard, by using the search function, or by selecting a row in the Monitor > Clients and Users page. Any method provides all the information necessary to troubleshoot historical client issues. You can monitor the status of the connection, verify the user's current and past locations, and troubleshoot client connectivity problems. You may want to use the client troubleshooting option if a user experiences repeated connectivity issues. The Client Details page shows SNR over time, RSSI over time, client reassociations, client reauthentications, and any RRM events. An administrator can correlate reassociations and reauthentications and determine if the problem was with the network or client.

---

**Note** You can troubleshoot current client issues only. You cannot troubleshoot the historic client issues. However, for location assisted clients, you can find the location history.

---

---

**Note** The client troubleshooting feature is available for identity wired clients only. This feature is not available for non-identity wired clients.

---

NCS 1.0 provides integrated management for wired and wireless devices or clients. You can monitor and troubleshoot both wired and wireless clients. SNMP is used to discover clients and collect client data. ISE is polled periodically to collect client statistics and other attributes to populate related dashboard dashlets and reports. If ISE is added to the systems and devices are authenticating to it, the Client Details page displays security information.

To launch the Client Troubleshooting tool, select a client, and then click the  icon indicated above the IP address that you want to troubleshoot. The Troubleshooting Client page appears.

The troubleshooting page displays the following states for wired clients:

- Link Connectivity
- 802.1X Authentication
- MAC Authentication
- Web Authentication
- IP Connectivity
- Authorization
- Successful Connection

**Note** The exact states displayed depends on the security used by the client.

The following are the security mechanisms used by clients:

- 802.1X
- MAC Authentication
- Web Authentication

[Table 10-2](#) summarizes the validity of states against the security types. The states are arranged in the order the client goes through.

**Table 10-2** Security Mechanisms

| Security/Client State | Link Connectivity | 802.1X Authentication | MAC Authentication | Web Authentication | IP Connectivity | Authorization |
|-----------------------|-------------------|-----------------------|--------------------|--------------------|-----------------|---------------|
| 802.1X                | X                 | X                     |                    |                    | X               | X             |
| MAC Authentication    | X                 |                       | X                  |                    | X               | X             |
| Web Authentication    | X                 |                       |                    | X                  | X               | X             |

Table 10-3 provides the list of problems and suggested actions depending on the state in which a client failed:

**Table 10-3 Client State, Problem, and Suggested Action**

| Client State          | Problem                           | Suggested Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link Connectivity     | Cannot find the client in network | <ul style="list-style-type: none"> <li>• Check whether the client cable is plugged into the network</li> <li>• Check whether the client is using proper cable to connect to the network</li> <li>• Make sure that the port to which client is connected is not disabled administratively.</li> <li>• Make sure that the port to which client is connected is not error disabled.</li> <li>• Check whether the speed and duplex are set to Auto on the port to which client is connected.</li> </ul>                                                                           |
|                       | Authentication in progress        | <ul style="list-style-type: none"> <li>• Wait for some time and check the status again.</li> <li>• If the client is in this state from a long time, check the following: <ul style="list-style-type: none"> <li>– Check whether the supplicant on the client is configured properly as required.</li> <li>– Modify the timers related to authentication method and try.</li> <li>– If you are not sure which authentication method will work with the client, use the fall back authentication feature.</li> <li>– Try disconnecting and reconnecting.</li> </ul> </li> </ul> |
| 802.1X Authentication | 802.1X Authentication Failure     | <ul style="list-style-type: none"> <li>• Check whether Radius Server(s) is reachable from the switch.</li> <li>• Check whether client choice of EAP is supported by Radius Server(s).</li> <li>• Check client's username/password/certificate is valid.</li> <li>• See whether the certificates used by Radius server are accepted by the client.</li> </ul>                                                                                                                                                                                                                  |
| MAC Authentication    | MAC Authentication Failure        | <ul style="list-style-type: none"> <li>• Check whether Radius Server(s) is reachable from the switch.</li> <li>• Check whether the client's MAC address is in known client's list on the Radius Server.</li> <li>• Check whether the client's MAC address is not in excluded client's list.</li> </ul>                                                                                                                                                                                                                                                                        |

**Table 10-3** Client State, Problem, and Suggested Action (continued)

| Client State          | Problem                                                       | Suggested Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web Authentication    | Client could not be authenticated through web/guest interface | <ul style="list-style-type: none"> <li>• Check that the guest credentials are valid and not expired</li> <li>• Check whether client is able to get redirected to login page</li> <li>• Check whether radius server is reachable.</li> <li>• Check whether pop-ups are not blocked.</li> <li>• If not getting redirected then <ul style="list-style-type: none"> <li>– Check DNS resolution on client is working.</li> <li>– Check that client is not using any proxy settings.</li> <li>– Check whether the client can access https://&lt;virtual-ip&gt;/login.html</li> </ul> </li> <li>• Check whether client's browser accepts the self signed certificate offered by controller</li> </ul> |
| IP Connectivity       | Client could not complete DHCP interaction                    | <ul style="list-style-type: none"> <li>• Check whether the DHCP server is reachable.</li> <li>• Check whether DHCP server is configured to serve the WLAN.</li> <li>• Check whether DHCP scope is exhausted.</li> <li>• Check whether multiple DHCP servers are configured with overlapping scopes.</li> <li>• Check local DHCP server is present if DHCP bridging mode enabled (move it to second) client is configured to get address from DHCP server</li> <li>• Check if client has static IP configured and ensure client generates IP traffic</li> </ul>                                                                                                                                 |
| Authorization         | Authorization Failure                                         | <ul style="list-style-type: none"> <li>• Check that the VLAN defined for authorization is available on the switch</li> <li>• Check that default port ACL is configured for ACL authorization</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Successful Connection | None                                                          | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Using the Search Feature to Troubleshoot Clients

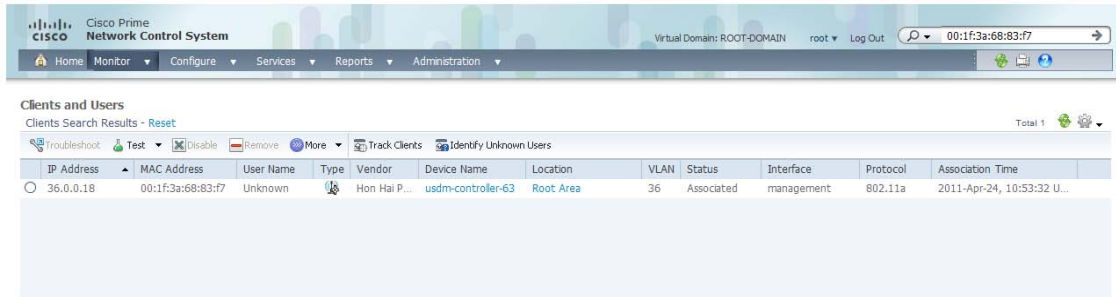

Client search is the primary method for you to locate clients. For a detailed description of the search feature, see to the [“Using the Search Feature”](#) section on page 2-33.

To troubleshoot a client using the search feature, follow these steps:

---

**Step 1** Choose **Monitor > Clients and Users**.

- Step 2** Type the full or partial client MAC address in the advanced search field, and click **Search**. The Search Results page appears.
- Step 3** Click **View List** to see the clients that matched the search criteria in the Clients page. The Monitor > Clients and Users page appears (see [Figure 10-12](#)).

**Figure 10-12** Client and Users

291412

**Note** You can click the **Reset** link to set the table to the default display so that the search criteria is no longer applied.

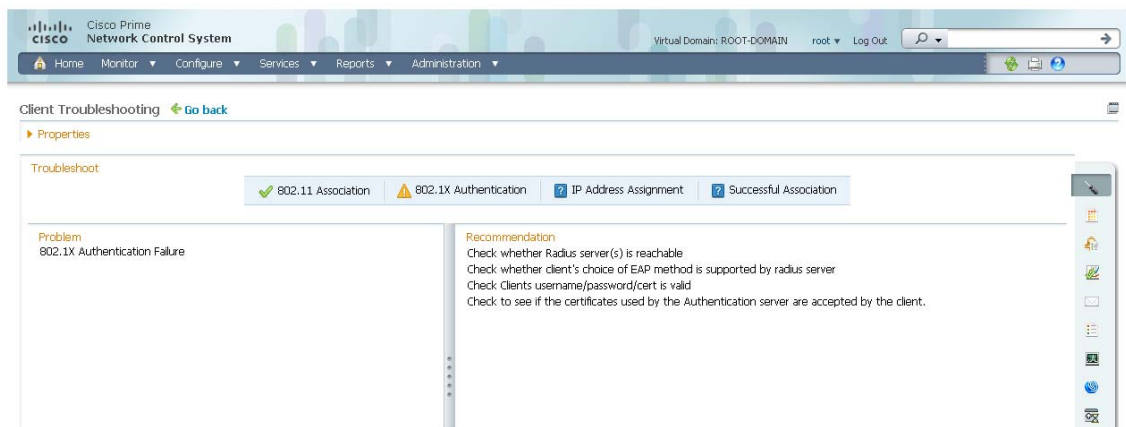

- Step 4** Select a client, and then click the  icon indicated above the IP address that you want to troubleshoot. The Troubleshooting Client page appears (see [Figure 10-13](#)). If you are troubleshooting a Cisco Compatible Extension v5 client (wireless), your Troubleshooting Client page has additional tabs.

**Note** If you receive a message that the client does not seem to be connected to any access point, you must reconnect the client and click **Refresh**.

**Note** You can use the detach/clone icon located in the top right corner of the page to detach the current page into a new window/tab.

**Figure 10-13** Troubleshooting Client Page

291157

**Note** Click **Go back** to return to the page from where you launched client troubleshooting. For example, if you have launched client troubleshooting from the list page, you can return to the list page.

The summary page briefly describes the problem and recommends a course of action.

**Note** Some Cisco Compatible Extension features do not function properly when you use a web browser other than Mozilla Firefox 3.6 or later or Internet Explorer 7.0 or later on a Windows workstation.

**Step 5** To view log messages logged against the client, click the **Log Analysis** tab (see [Figure 10-14](#)).

**Step 6** To begin capturing log messages about the client from the controller, click **Start**. To stop log message capture, click **Stop**. To clear all log messages, click **Clear**.

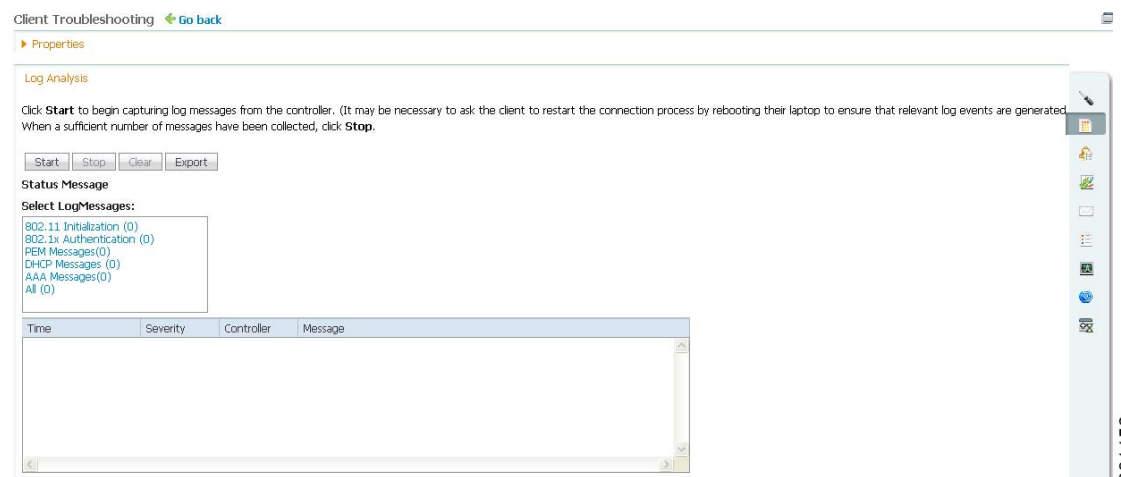

**Note** Log messages are captured for ten minutes and then stopped automatically. You must click **Start** to continue.

**Step 7** To select log messages to display, click one of the links under Select Log Messages (the number between parentheses indicates the number of messages). The messages appear in the box. The message includes the following information:

- A status message
- The controller time
- A severity level of info or error (errors are displayed in red)
- The controller to which the client is connected

**Figure 10-14 Log Analysis**

**Step 8** To display a summary of the client's event history, click the **Event History** tab (see [Figure 10-15](#)).

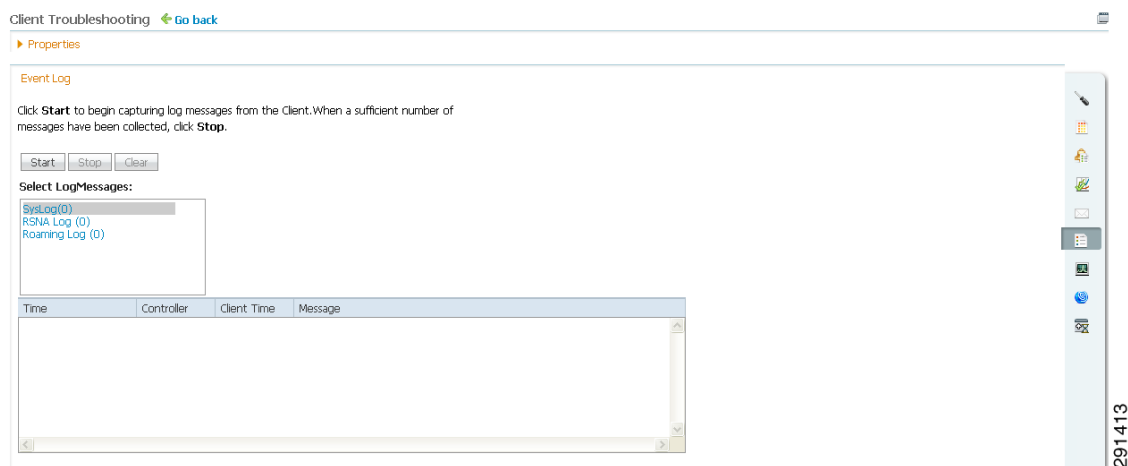

Event History provides messages related to connectivity events for this client. In this example (see [Figure 10-15](#)), the client failed to successfully authenticate. Date/time is provided to assist the network administrator in troubleshooting this client.

**Figure 10-15** Event History Tab

- Step 9** To view the event log, click the **Event Log** tab (see [Figure 10-16](#)). Click **Start** to begin capturing log messages from the Client. When a sufficient number of messages have been collected, click **Stop**.

**Figure 10-16** Event Log

- Step 10** If you click the ACS View Server tab, you can interact with the Cisco Access Control (ACS) System View Server. This tab displays the latest authentication records received either from ACS View server or Identity Services Engine (ISE), whichever is configured in NCS. You must have View Server credentials established before you can access this tab. (The tab will show the server list as empty if no view servers are configured.) See the [“Configuring ACS View Server Credentials”](#) section on page 9-229 for steps on establishing credentials.

If the ACS View Server is already configured, you can select a time range and click **Submit** to retrieve the authentication records from ACS View Server. NCS uses the ACS View NS API to retrieve the records.

- Step 11** You can click the Identity Services Engine tab to view information about the ISE authentication. Enter the date and time ranges to retrieve the historical authentication and authorization information and click **Submit**. The results of the query are displayed in the Authentication Records portion of the page.

- Step 12** You can click the CleanAir tab to view information about the air quality parameters and the active interferers for the CleanAir enabled access point. This tab provides the following information about the air quality detected by the CleanAir enabled access point.

- AP Name—Click to view the access point details. See the [“Monitoring Access Points Details”](#) section on page 5-56 for more information.

- AP MAC Address
- Radio
- CleanAir Capable—Indicates if the access point is CleanAir Capable.
- CleanAir Enabled—Indicates if CleanAir is enabled on this access point.
- Admin Status—Enabled or disabled.
- Operational Status—Displays the operational status of the Cisco Radios (Up or Down).
- Channel—The channel upon which the Cisco Radio is broadcasting.
- Extension Channel—Indicates the secondary channel on which Cisco radio is broadcasting.
- Channel Width—Indicates the channel bandwidth for this radio interface. See the “[Configuring 802.11a/n RRM Dynamic Channel Allocation](#)” section on page 9-121 for more information on configuring channel bandwidth.
- Power Level—Access Point transmit power level: 1 = Maximum power allowed per Country Code setting, 2 = 50% power, 3 = 25% power, 4 = 6.25 to 12.5% power, and 5 = 0.195 to 6.25% power.
- The power levels and available channels are defined by the Country Code setting, and are regulated on a country by country basis.
- Average AQ Index—Average air quality index.
- Minimum AQ Index—Minimum air quality index.

The following information about the active interferers is displayed:

- Interferer Name—The name of the interfering device.
- Affected Channels—The channel the interfering device is affecting.
- Detected Time—The time at which the interference was detected.
- Severity—The severity index of the interfering device.
- Duty Cycle(%)—The duty cycle (in percentage) of the interfering device.
- RSSI(dBm)—The Received Signal Strength Indicator of the interfering device.
- Click **CleanAir Details** to know more about the air quality index.

**Step 13** (Optional) If Cisco Compatible Extension Version 5 clients are available, you can click a Test Analysis tab as shown in [Figure 10-17](#).

Figure 10-17 Test Analysis Tab

Client Troubleshooting [Go back](#)

Properties

Test Analysis

The following tests are available for clients. Use the checkboxes to select the test(s) you would like to perform, then click **Start**. Click **Stop** to halt the tests. When a test is completed, click on the test status to view the results.

| Select                   | Diagnostic Test       | Input1                                                   | Input2                                           | Status        | Results |
|--------------------------|-----------------------|----------------------------------------------------------|--------------------------------------------------|---------------|---------|
| <input type="checkbox"/> | DHCP                  |                                                          |                                                  | Not initiated | None    |
| <input type="checkbox"/> | IP Connectivity       |                                                          |                                                  | Not initiated | None    |
| <input type="checkbox"/> | DNS Ping              |                                                          |                                                  | Not initiated | None    |

Start Stop Frame

Results

No results available.

The Test Analysis tab allows you to run a variety of diagnostic tests on the client. Select the check box for the applicable diagnostic test, enter any appropriate input information and click **Start**. The following diagnostic tests are available:

- **DHCP**—Executes a complete DHCP Discover/Offer/Request/ACK exchange to determine that the DHCP is operating properly between the controller and the client.
- **IP Connectivity**—Causes the client to execute a ping test of the default gateway obtained in the DHCP test to verify that IP connectivity exists on the local subnet.
- **DNS Ping**—Causes the client to execute a ping test of the DNS server obtained in the DHCP test to verify that IP connectivity exists to the DNS server.
- **DNS Resolution**—Causes the DNS client to attempt to resolve a network name known to be resolvable to verify that name resolution is functioning correctly.
- **802.11 Association**—Directs an association to be completed with a specific access point to verify that the client is able to associate properly with a designated WLAN.
- **802.1X Authentication**—Directs an association and 802.1X authentication to be completed with a specific access point to verify that the client is able to properly complete an 802.1x authentication.
- **Profile Redirect**—At any time, the diagnostic system may direct the client to activate one of the client's configured WLAN profiles and to continue operation under that profile.

**Note**

To run the profile diagnostic test, the client must be on the diagnostic channel. This test uses the profile number as an input. To indicate a wildcard redirect, enter 0. With this redirect, the client is asked to disassociate from the diagnostic channel and to associate with any profile. You can also enter a valid profile ID. Because the client is on the diagnostic channel when the test is run, only one profile is returned in the profile list. You should use this profile ID in the profile redirect test (when wildcard redirecting is not desired).

- Step 14** (Optional) If Cisco Compatible Extension Version 5 clients are available, a Messaging tab as shown in [Figure 10-18](#) appears. Use this tab to send an instant text message to the user of this client. From the Message Category drop-down list, choose a message and click **Send**.

**Figure 10-18** Messaging Tab

- Step 15** You can click the **Identity Services Engine** tab to view information about the identity services parameters. You must have Identity Services Engine (ISE) configured before you can access this tab. (The tab will show the server list as empty if no ISEs are configured.)

**Note** If ISE is not configured it provides a link to add an ISE to NCS.

ISE provides authentication records to NCS via REST API. Network administrator can choose time period for retrieving authentication records from ISE (see [Figure 10-19](#)).

**Figure 10-19** Identity Services Engine Tab

- Step 16** To view the client location history, click the **Context Aware History** tab (see [Figure 10-20](#)).

**Figure 10-20 Identity Services Engine Tab**

Identity Services Engine

Last: 5 Days

Between Date: 12/31/2009 (Mm/dd/yyyy) Time: 17:38:31

**Step 17** Close the Troubleshooting Client page.

## Tracking Clients

This feature enables you to track clients and be notified when these clients connect to the network.

To track clients, follow these steps:

**Step 1** Choose **Monitor > Clients and Users**.

**Step 2** Click **Track Clients**. The Track Clients dialog box appears listing the currently tracked clients.

**Tip** This table supports a maximum of 2000 rows. To add or import new rows, you must first remove some older entries.

**Step 3** To track a single client, click **Add**, and then enter the following parameters

- Client MAC address
- Expiration—Choose Never or enter a date.

**Step 4** To track multiple clients, click **Import**. This allows you to import a client list from a CSV file. Enter MAC Address and username.

A sample csv file can be downloaded that provides data format.

```
MACAddress, Expiration: Never/Date in MM/DD/YYYY format
00:40:96:b6:02:cc,10/07/2010
00:02:8a:a2:2e:60,Never
```

## Notification Settings

To specify notification settings for the tracked clients, follow these steps:

**Step 1** Choose **Monitor > Clients and Users**.

**Step 2** Click **Track Clients**. The Track Clients dialog box appears listing the currently tracked clients.

- Step 3** Select the tracked client(s) for which you want to specify notification settings.
- Step 4** Specify the notification settings. There are three options for notifications:
- a. Purged Expired Entries—you can set duration to keep tracked clients in NCS database. Clients can be purged:
    - after 1 week
    - after 2 weeks
    - after 1 month
    - after 2 months
    - after 6 months
    - kept indefinitely
  - b. Notification Frequency—you can specify when NCS sends notification of tracked client:
    - on first detection
    - on every detection
  - c. Notification Method—you can specify for tracked client event to generate alarm or send email.
- Step 5** Click **Save**.
- 

## Identifying Unknown Users

Not all users or devices are authenticated via 802.1x (for example, printers). In such a case, a network administrator can assign a username to a device.

If a client device is authenticated to the network through web auth, NCS may not have username information for the client.

Clients are marked as unknown when the NMSP connection to the wired switch is lost. A client status is noted as connected, disconnected, or unknown:

- Connected clients—Clients that are active and connected to a wired switch.
- Disconnected clients—Clients that are disconnected from the wired switch.
- Unknown clients—Clients that are marked as unknown when the NMSP connection to the wired switch is lost.

To view the unknown devices, follow these steps:

---

- Step 1** Choose **Monitor > Clients and Users**.
- Step 2** Click **Identify Unknown Users**.
- Step 3** Click **Add** to assign client MAC addresses to username.
- Step 4** Enter MAC Address and username.

**Note** Once a client and MAC address has been added, NCS uses this data for client lookup based on matching MAC address.

---

- Step 5** Click **Add**.

- Step 6** Repeat Step 3 to Step 5 for each client that you want to enter MAC Address and its corresponding username.
- Step 7** Click **Save**.

**Note** This table supports a maximum of 10000 rows. To add or import new rows, you must first remove some older entries.

## Configuring the Search Results Display

The **Edit View** page allows you to add, remove, or reorder columns in the clients table.

To edit the available columns in the clients table, follow these steps:

- Step 1** Choose **Monitor > Clients and Users**.
- Step 2** Click the **Edit View** link.
- Step 3** To add an additional column to the clients table, click to highlight the column heading in the left column. Click **Show** to move the heading to the right column. All items in the right column are displayed in the clients table.
- Step 4** To remove a column from the clients table, click to highlight the column heading in the right column. Click **Hide** to move the heading to the left column. All items in the left column are not displayed in the clients table.
- Step 5** Use the **Up/Down** buttons to specify the order in which the information appears in the table. Highlight the desired column heading and click **Up** or **Down** to move it higher or lower in the current list.
- Step 6** Click **Reset** to restore the default view.
- Step 7** Click **Submit** to confirm the changes.

**Note** Additional client parameters include: AP MAC Address, Anchor Controller, Authenticated, CCX, Client Host Name, Controller IP Address, Controller Port, E2E, Encryption Cipher, MSE, RSSI, SNR, and H-REAP Local Authentication.

## Enabling Automatic Client Troubleshooting

In the Settings > Client page, you can enable automatic client troubleshooting on a diagnostic channel. This feature is available only for Cisco Compatible Extension clients version 5.

To enable automatic client troubleshooting, follow these steps:

- Step 1** Choose **Administration > Settings**.
- Step 2** From the left sidebar menu, choose **Client**.
- Step 3** Select the **Automatically troubleshoot client on diagnostic channel** check box.

**Note**

When the check box is selected, NCS processes the diagnostic association trap. When it is not selected, NCS raises the trap, but automated troubleshooting is not initiated.

**Step 4** Click **Save**.

## Client Details from Access Point Page

You can also view the client information from the access point page. Choose **Monitor > Access Points**. Click an access point URL from the column to see details about that access point. Click the **Current Associated Clients** tab.

## Viewing Currently Associated Clients

You can also view the currently associated clients (wired) from the switch details page. Choose **Monitor > Controllers**, select an IP address, and choose **Clients > Current Associated Clients** from the left sidebar menu. For details see

## Running Client Reports

You can run client reports such as busiest clients, client count, client sessions, client summary, throughput, unique clients and v5 clients statistics from the Report Launch pad. See the [“Creating and Running a New Report” section on page 14-6](#).

## Running ISE Reports

You can also launch ISE reports from the Report Launch pad. See the [“Creating and Running a New Report” section on page 14-6](#). For more information about running the ISE reports, see the ISE online help.

## Specifying Client Settings

The Administration > Settings > Client page allows you to specify various client settings. For details, see [“Configuring Clients” section on page 15-76](#).

## Receiving Radio Measurements for a Client

In the client page, you can receive radio measurements only if the client is Cisco Compatible Extensions v2 (or higher) and is in the associated state (with a valid IP address). If the client is busy when asked to do the measurement, it determines whether to honor the measurement or not. If it declines to make the measurement, it shows no data from the client.

To receive radio measurements, follow these steps:

---

**Step 1** Choose **Monitor > Clients and Users**.

**Step 2** Choose a client from the Client Username column.

**Note** You can also perform a search for a specific client using the NCS Search feature. See the [“Using the Search Feature”](#) section on page 2-33 or the [“Advanced Search”](#) section on page 2-34 for more information.

---

**Step 3** From the **Test** drop-down list, choose **Radio Measurement**.

**Note** The Radio Measurement option only appears if the client is Cisco Compatible Extensions v2 (or higher) and is in the associated state (with a valid IP address).

---

**Step 4** Select the check box to indicate if you want to specify beacon measurement, frame measurement, channel load, or noise histogram.

**Step 5** Click **Initiate**. The different measurements produce differing results. See the [“Radio Measurement Results for a Client”](#) section on page 10-34 for more information.

**Note** The measurements take about 5 milliseconds to perform. A message from NCS indicates the progress. If the client chooses not to perform the measurement, that will also be communicated.

---

## Radio Measurement Results for a Client

Depending on the measurement type requested, the following information may appear:

- Beacon Response
  - Channel—The channel number for this measurement
  - BSSID—6-byte BSSID of the station that sent the beacon or probe response
  - PHY—Physical Medium Type (FH, DSS, OFDM, high rate DSS or ERP)
  - Received Signal Power—The strength of the beacon or probe response frame in dBm
  - Parent TSF—The lower 4 bytes of serving access point TSF value
  - Target TSF—The 8-byte TSF value contained in the beacon or probe response
  - Beacon Interval—The 2-byte beacon interval in the received beacon or probe response
  - Capability information—As found in the beacon or probe response
- Frame Measurement
  - Channel—Channel number for this measurement
  - BSSID—BSSID contained in the MAC header of the data frames received
  - Number of frames—Number of frames received from the transmit address
  - Received Signal Power—The signal strength of 802.11 frames in dBm

- Channel Load
  - Channel—The channel number for this measurement
  - CCA busy fraction—The fractional duration over which CCA indicated the channel was busy during the measurement duration defined as ceiling (255 times the duration the CCA indicated channel was busy divided by measurement duration)
- Noise Histogram
  - Channel—The channel number for this measurement
  - RPI density in each of the eight power ranges

## Viewing Client V5 Statistics

To access the Statistics request page, follow these steps:

---

**Step 1** Choose **Monitor > Clients and Users**.

**Step 2** Choose a client from the Client Username column.

**Step 3** From the **Test** drop-down list, choose **V5 Statistics**.

---

**Note** This menu will be shown only for CCX v5 and later clients.

---

**Step 4** Click **Go**.

**Step 5** Select the desired type of stats (Dot11 Measurement or Security Measurement).

**Step 6** Click **Initiate** to initiate the measurements.

---

**Note** The duration of measurement is five seconds.

---

**Step 7** Depending on the V5 Statistics request type, the following counters are displayed in the results page:

- Dot11 Measurement
  - Transmitted Fragment Count
  - Multicast Transmitted Frame Count
  - Failed Count
  - Retry Count
  - Multiple Retry Count
  - Frame Duplicate Count
  - Rts Success Count
  - Rts Failure Count
  - Ack Failure Count
  - Received Fragment Count
  - Multicast Received Frame Count
  - FCS Error Count—This counter increments when an FCS error is detected in a received MPDU.

- Transmitted Frame Count
  - Security
    - Pairwise Cipher
    - Tkip ICV Errors
    - Tkip Local Mic Failures
    - Tkip Replays
    - Ccmp Replays
    - Ccmp Decryp Errors
    - Mgmt Stats Tkip ICV Errors
    - Mgmt Stats Tkip Local Mic Failures
    - Mgmt Stats Tkip Replays
    - Mgmt Stats Ccmp Replays
    - Mgmt Stats Ccmp Decrypt Errors
    - Mgmt Stats Tkip MHDR Errors
    - Mgmt Stats Ccmp MHDR Errors
    - Mgmt Stats Broadcast Disassociate Count
    - Mgmt Stats Broadcast Deauthenticate Count
    - Mgmt Stats Broadcast Action Frame Count
- 

## Viewing Client Operational Parameters

To view specific client operational parameters, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the **Test** drop-down list, choose **Operational Parameters**.

The following information is displayed:

Operational Parameters:

- Device Name—User-defined name for device.
- Client Type—Client type can be any of the following:
  - laptop(0)
  - pc(1)
  - pda(2)
  - dot11mobilephone(3)
  - dualmodephone(4)
  - wgb(5)
  - scanner(6)

- tabletpc(7)
  - printer(8)
  - projector(9)
  - videoconfsystem(10)
  - camera(11)
  - gamingsystem(12)
  - dot11deskphone(13)
  - cashregister(14)
  - radiotag(15)
  - rfidsensor(16)
  - server(17)
- Transmit Power Mode—Power mode of the client.
  - Data Rate—Data rates that the client will use for transmissions.
  - SSID—SSID being used by the client.
  - IP Address—IP address assigned to the client.
  - Subnet Mask—The mask for the IP address assigned to the client.
  - Default Gateway—The default gateway chosen for the client.
  - Operating System—Identifies the operating system that is using the wireless network adaptor.
  - Operating System Version—Identifies the version of the operating system that is using the wireless network adaptor.
  - WNA Firmware Version—Version of the firmware currently installed on the client.
  - Enterprise Phone Number—Enterprise phone number for the client.
  - Cell Phone Number—Cell phone number for the client.
  - Power Save Mode—Will display any of the following power save modes: awake, normal, or maxPower.

Radio Information:

- Radio Type—The following radio types are available:
  - unused(0)
  - fhss(1)
  - dsss(2)
  - irbaseband(3)
  - ofdm(4)
  - hrdss(5)
  - erp(6)
- Radio Channel—Radio channel in use.

DNS/WNS Information:

- DNS Servers—IP address for DNS server.
- WNS Servers—IP address for WNS server.

Security Information:

- Credential Type—Indicates how the credentials are configured for the client.
  - Authentication Method—Method of authentication used by the client.
  - EAP Method—Method of Extensible Authentication Protocol (EAP) used by the client.
  - Encryption Method—Encryption method used by the client.
  - Key Management Method—Key management method used by the client.
- 

## Viewing Client Profiles

To view specific client profile information, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the **More** drop-down list, choose **Profiles**.

The following information is displayed:

- Profile Name—List of profile names as hyperlinks. Click to display the profile details.
  - SSID—SSID of the WLAN to which the client is associated.
- 

## Disabling a Current Client

To disable a current client, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client that you want to disable.
  - Step 3** Click **Disable**. The Disable Client page appears.
  - Step 4** Enter a description in the Description text box.
  - Step 5** Click **OK**.

**Note**

Once a client is disabled, it cannot join any network/ssid on controller(s). To re-enable the client, choose **Configure > Controllers > IP Address > Security > Manually Disabled Clients**, and remove the client entry from there.

---

## Removing a Current Client

To remove a current client, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client that you want to remove.
  - Step 3** Choose **Remove**.
  - Step 4** Click **Remove** to confirm the deletion.
- 

## Enabling Mirror Mode

When enabled, mirror mode enables you to duplicate (to another port) all of the traffic originating from or terminating at a single client device or access point.

**Note**

Mirror mode is useful in diagnosing specific network problems but should only be enabled on an unused port as any connections to this port become unresponsive.

---

To enable mirror mode, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Enable Mirror Mode**.
  - Step 4** Click **Go**.
- 

## Viewing a Map (High Resolution) of a Client Recent Location

To display a high-resolution map of the client recent location, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Recent Map (High Resolution)**.
  - Step 4** Click **Go**.
- 

## Viewing a Map (High Resolution) of a Client Current Location

To display a high-resolution map of the client present location, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Present Map (High Resolution)**.
  - Step 4** Click **Go**.
- 

## Running a Client Sessions Report for the Client

To view the most recent client session report results for this client, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Client Sessions Report**.
  - Step 4** Click **Go**. The Client Session report details display. See the [“Client Sessions” section on page 14-46](#) for more information.
- 

## Viewing a Roam Reason Report for the Client

To view the most recent roam report for this client, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Roam Reason**.
  - Step 4** Click **Go**.

This page displays the most recent roam report for the client. Each roam report has the following information:

- New AP MAC address
  - Old (previous) AP MAC address
  - Previous AP SSID
  - Previous AP channel
  - Transition time—Time that it took the client to associate to a new access point.
  - Roam reason—Reason for the client roam.
-

## Viewing Detecting Access Point Details

To display details of access points that can hear the client including at which signal strength/SNR, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Detecting APs**.
  - Step 4** Click **Go**.
- 

## Viewing Client Location History

To display the history of the client location based on RF fingerprinting, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Location History**.
  - Step 4** Click **Go**.
- 

## Viewing Voice Metrics for a Client

To view traffic stream metrics for this client, follow these steps:

- 
- Step 1** Choose **Monitor > Clients and Users**.
  - Step 2** Choose a client from the Client Username column.
  - Step 3** From the More drop-down list, choose **Voice Metrics**.
  - Step 4** Click **Go**.

The following information appears:

- Time—Time that the statistics were gathered from the access point(s).
- QoS
- AP Ethernet MAC
- Radio
- % PLR (Downlink)—Percentage of packets lost on the downlink (access point to client) during the 90 second interval.
- % PLR (Uplink)—Percentage of packets lost on the uplink (client to access point) during the 90 second interval.

- Avg Queuing Delay (ms) (Uplink)—Average queuing delay in milliseconds for the uplink. Average packet queuing delay is the average delay of voice packets traversing the voice queue. Packet queue delay is measured beginning when a packet is queued for transmission and ending when the packet is successfully transmitted. It includes time for re-tries, if needed.
  - % Packets > 40 ms Queuing Delay (Downlink)—Percentage of queuing delay packets greater than 40 ms.
  - % Packets 20ms—40ms Queuing Delay (Downlink)—Percentage of queuing delay packets greater than 20 ms.
  - Roaming Delay—Roaming delay in milliseconds. Roaming delay, which is measured by clients, is measured beginning when the last packet is received from the old access point and ending when the first packet is received from the new access point after a successful roam.
-

# CHAPTER 11

## Using Templates

---

This chapter describes how to add and apply templates. Templates allow you to set parameters that you can then apply to multiple devices without having to re-enter the common information. This chapter contains the following sections:

- [Information About Templates, page 11-1](#)
- [Accessing Controller Template Launch Pad, page 11-1](#)
- [Adding Controller Templates, page 11-2](#)
- [Deleting Controller Templates, page 11-2](#)
- [Applying Controller Templates, page 11-2](#)
- [Configuring Controller Templates, page 11-4](#)
- [Configuring AP Configuration Templates, page 11-127](#)
- [Configuring Switch Location Configuration Templates, page 11-137](#)
- [Configuring Autonomous AP Migration Templates, page 11-138](#)

## Information About Templates

The Controller Template Launch Pad is a hub for all controller templates. From this Template Launch Pad you can add and apply controller templates, view templates, or make modifications to existing templates. This chapter also includes steps for applying and deleting controller templates and creating or changing access point templates.

**Note**

---

Template information can be overridden on individual devices.

---

## Accessing Controller Template Launch Pad

To access the Controller Template Launch Pad, choose **Configure > Controller Template Launch Pad**. The controller template launch pad provides access to all NCS templates from a single page. From this page, you can view current controller templates or create and save new templates.

**Tip**

---

Hover your mouse cursor over the tool tip next to the template type to view more details regarding the template.

---

## Adding Controller Templates

To add a new controller template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click **New** beside the template you want to add.
  - Step 3** Enter the template name.

**Note**

---

Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

---

- Step 4** Provide a description of the template.
  - Step 5** Click **Save**.
- 

## Deleting Controller Templates

To delete a controller template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click the template type to open its template list page.
  - Step 3** Select the check box(es) of the template(s) you want to delete.
  - Step 4** From the Select a command drop-down list, choose **Delete Templates**.
  - Step 5** Click **Go**.
  - Step 6** Click **OK** to confirm the deletion. If this template is applied to controllers, the Remove Template Confirmation page opens and lists all controllers to which this template is currently applied.
  - Step 7** Select the check box of each controller from which you want to remove the template.
  - Step 8** Click **OK** to confirm the deletion or **Cancel** to close this page without deleting the template.
- 

## Applying Controller Templates

You can apply a controller template directly to a controller or to controllers in a selected configuration group.

To apply a controller template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** From the left sidebar menu, choose the category of templates to apply.
- Step 3** Click the template name for the template that you want to apply to the controller.
- Step 4** Click **Apply to Controllers** to open the Apply to Controllers page.
- Step 5** Select the check box for each controller to which you want to apply the template.

---

**Note** To select all controllers, select the check box that appears at the left most corner of the controllers table.

---

---

**Note** Select the “Ignore errors on Apply template to Controllers” check box to ignore errors and apply all commands in the template to the controller. If this check box is not selected, any errors encountered while applying a command in the template to a controller causes the rest of the commands to be not applied.

---

- Step 6** Choose between applying the template directly to a controller or to all controllers in a selected configuration group.

To apply the template directly to a controller (or controllers), follow these steps:

- a. Select the **Apply to controllers selected directly** radio button. The Apply to Controllers page lists the IP address for each available controller along with the controller name and the configuration group name (if applicable).
- b. Select the check box for each controller to which you want to apply the template.

---

**Note** Select the “Ignore errors on Apply template to Controllers” check box to ignore errors and apply all commands in the template to the controller. If this check box is not selected, any errors encountered while applying a command in the template to a controller causes the rest of the commands to be not applied.

---

To apply the template to all controllers in a selected configuration group, follow these steps:

- a. Select the **Apply to controllers in the selected Config Groups** radio button. The Apply to Controllers page lists the name of each configuration group along with the mobility group name and the number of controllers included.
- b. Select the check box for each configuration group to which you want to apply the template.

---

**Note** Configuration groups which have no controllers cannot be selected to apply the templates.

---

- Step 7** You can perform the following additional operations:
- If you select the **Save Config to Flash after apply** check box, the save config to Flash command would be executed after the template is applied successfully.
  - If you select the **Reboot Controller after apply** check box, the controller reboots after the template is applied successfully.

**Note**

The above configuration results can be viewed in the Template Results page by enabling View Save Config / Reboot Results option.

**Step 8** Click **Save**.

**Note**

You can apply some templates directly from the Template List page. Select the check box(es) of the template(s) that you want to apply, choose **Apply Templates** from the Select a command drop-down list, and click **Go** to open the Apply to Controllers page. Select the check box(es) of the controllers to which you want to apply this template, and click **OK**.

## Configuring Controller Templates

This section contains the following topics:

- [Configuring System Templates, page 11-4](#)
- [Configuring WLAN Templates, page 11-22](#)
- [Configuring H-REAP Templates, page 11-38](#)
- [Configuring Security Templates, page 11-41](#)
- [Configuring Security - Access Control Templates, page 11-69](#)
- [Configuring Security - CPU Access Control List Templates, page 11-75](#)
- [Configuring Security - Rogue Templates, page 11-76](#)
- [Configuring 802.11 Templates, page 11-84](#)
- [Configuring Radio Templates \(802.11a/n\), page 11-86](#)
- [Configuring Radio Templates \(802.11b/g/n\), page 11-101](#)
- [Configuring Mesh Templates, page 11-114](#)
- [Configuring Management Templates, page 11-115](#)
- [Configuring CLI Templates, page 11-123](#)
- [Configuring Location Configuration Templates, page 11-125](#)

## Configuring System Templates

This section contains the following topics:

- [Configuring General Templates, page 11-5](#)
- [Configuring SNMP Community Controller Templates, page 11-9](#)
- [Configuring an NTP Server Template, page 11-10](#)
- [Configuring User Roles Controller Templates, page 11-11](#)

- [Configuring Dynamic Interface Templates, page 11-15](#)
- [Configuring Controller System Interface Groups, page 9-41](#)
- [Configuring QoS Templates, page 11-18](#)
- [Configuring AP Timers Template, page 11-19](#)
- [Configuring a Traffic Stream Metrics QoS Template, page 11-20](#)

## Configuring General Templates

To add a general template or make changes to an existing general template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

Click **General** or choose **System > General** from the left sidebar menu. The System > General Template page appears, and the number of controllers and virtual domains the template is applied to automatically populates. The last column shows when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page that displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 2** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The General template page appears (see [Figure 11-1](#)).

User Idle Timeout  (secs)

ARP Timeout  (secs)

Global TCP Adjust MSS

Save Cancel

291163

**Step 3** Use the drop-down list to enable or disable flow control mode.

**Step 4** Use the drop-down list to enable or disable 802.3 bridging.

**Note** This 802.3 bridging option is not available for 5500 and 2106 series controllers.

- Step 5** Use the drop-down list to choose the desired Web RADIUS authentication. You can choose to use PAP, CHAP, or MD5-CHAP for authentication between the controller and the client during the user credential exchange.
- Step 6** Specify the number of seconds for the AP Primary Discovery Timeout. The default is 120 seconds, and the valid range is 30 to 3600.
- Step 7** Specify the Back-up Primary and Secondary Controller details (Controller IP Address and Controller Name)
- Step 8** Specify Layer 2 or Layer 3 transport mode. When set to Layer 3, the lightweight access point uses IP addresses to communicate with the access points; these IP addresses are collected from a mandatory DHCP server. When set to Layer 2, the lightweight access point uses proprietary code to communicate with the access points.

---

**Note** The older version of controllers upto 5.2 will use LWAPP and the new controller version uses CAPWAPP.

---

- Step 9** Choose to enable or disable broadcast forwarding. The default is disabled.
- Step 10** Choose **Enable** or **Disable** from the LAG Mode drop-down list. Link aggregation allows you to reduce the number of IP addresses needed to configure the ports on your controller by grouping all the physical ports and creating a link aggregation group (LAG).
- If LAG is enabled on a controller, any dynamic interfaces that you have created are deleted to prevent configuration inconsistencies in the interface database. When you make changes to the LAG configuration, the controller has to be rebooted for the changes to take effect.

---

**Note** Interfaces cannot be created with the Dynamic AP Manager flag set. Also, you cannot create more than one LAG on a controller.

---

- Step 11** Choose to enable or disable peer-to-peer blocking mode. If you choose Disable, any same-subnet clients communicate through the controller. If you choose Enable, any same-subnet clients communicate through a higher-level router.
- Step 12** From the Over Air AP Provision Mode drop-down list, choose **enable** or **disable**.
- Step 13** From the AP Fallback drop-down list, choose **enable** or **disable**. Enabling fallback causes an access point that lost a primary controller connection to automatically return to service when the primary controller returns.
- Step 14** When a controller fails, the backup controller configured for the access point suddenly receives a number of discovery and join requests. This may cause the controller to reach a saturation point and reject some of the access points. By assigning priority to an access point, you have some control over which access points are rejected. In a failover situation when the backup controller is saturated, the higher priority access points can join the backup controller if the lower priority access points are disjoined. Choose **enable** from the AP Failover Priority drop-down list if you want to allow this capability.
- Step 15** Choose to enable or disable Apple Talk bridging.

---

**Note** This Apple Talk bridging option is not available on 5500 series controllers.

---

- Step 16** Choose to enable or disable the Fast SSID Change option. If the option is enabled, the client connects instantly to the controller between SSIDs without having much loss of connectivity. Normally, each client is connected to a particular WLAN identified by the SSID. If the client moves out of reach of the

connected access point, the client has to reconnect to the controller using a different access point. This normal process consumes some time as the DHCP (Dynamic Host Configuration Protocol) server has to assign an IP address to the client.

- Step 17** Because the master controller is normally not used in a deployed network, the master controller setting is automatically disabled upon reboot or operating system code upgrade. You may enable the controller as the master controller from the Master Controller Mode drop-down list.
- Step 18** Choose to enable or disable access to the controller management interface from wireless clients. Because of IPSec operation, management via wireless is only available to operators logging in across WPA or Static WEP. Wireless management is not available to clients attempting to log in via an IPSec WLAN.
- Step 19** Choose to enable or disable symmetric tunneling mode. With symmetric mobility tunneling, the controller provides inter-subnet mobility for clients roaming from one access point to another within a wireless LAN. The client traffic on the wired network is directly routed by the foreign controller. If a router has Reverse Path Forwarding (RPF) enabled (which provides additional checks on incoming packets), the communication is blocked. Symmetric mobility tunneling allows the client traffic to reach the controller designated as the anchor, even with RPF enabled.

---

**Note** All controllers in a mobility group should have the same symmetric tunneling mode.

---

---

**Note** For symmetric tunneling to take effect, you must reboot.

---

- Step 20** Use the drop-down list to enable or disable ACL counters. The values per ACL rule can be viewed for each controller.
- Step 21** Enter the operator-defined RF mobility group name in the Default Mobility Domain Name text box.
- Step 22** At the Mobility Anchor Group Keep Alive Interval, determine the delay between tries for clients attempting to join another access point. With this guest tunneling N+1 redundancy feature, the time it takes for a client to join another access point following a controller failure is decreased because a failure is quickly identified, the clients are moved away from the problem controller, and the clients are anchored to another controller.

---

**Note** When you hover your mouse cursor over the parameter field, the valid range for that field appears.

---

- Step 23** At the Mobility Anchor Group Keep Alive Retries, specify the number of queries to anchor before the client declares it unreachable.
- Step 24** Enter the RF network group name between 8 and 19 characters. Radio Resource Management (RRM) neighbor packets are distributed among access points within an RF network group. The Cisco access points only accept RRM neighbor packets sent with this RF network name. The RRM neighbor packets sent with different RF network names are dropped.
- Step 25** Specify the time out for idle clients. The factory default is 300 seconds. When the timeout expires, the client loses authentication, briefly disassociates from the access point, reassociates, and re-authenticates.
- Step 26** Specify the timeout in seconds for the address resolution protocol. The factory default is 300 seconds.
- Step 27** Select the **Global TCP Adjust MSS** check box to start checking the TCP packets originating from the client, for the TCP SYN/ TCP ACK packets and MSS value and reset it to the configured value on the upstream and downstream side.

- Step 28** Choose **enable** or **disable** Web Auth Proxy Redirect Mode, if a manual proxy configuration is configured on the client's browser, all web traffic going out from the client will be destined to the PROXY IP and PORT configured on the browser.
- Step 29** Enter the Web Auth Proxy Redirect Port. The default ports are 8080 and 3128. The range is 0 to 65535.
- Step 30** Enter the AP Retransmit Count and Intervals. The AP Retransmit Count default value is 5 and the range is from 3 to 8. The AP Retransmit Interval default value is 3. The range is 2 to 5.
- Step 31** Click **Save**.
- 

## Configuring SNMP Community Controller Templates

Create or modify a template for configuring SNMP communities on controllers. Communities can have read-only or read-write privileges using SNMP v1, v2, or v3.

To add a new template with SNMP community information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **New** beside the template you want to add.
- Step 3** Add or modify the following parameters:
- Template Name
-  **Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.
- 
- Community Name
  - Confirm Community Name—Retype the community name.
  - IP Address—The IP address of the server.
  - Netmask
  - Access Mode—Choose **Read Only** or **Read Write** from the drop-down list.
    - Read Only—Cannot be edited.
    - Read Write—Can be edited.
  - Admin Status—Select the check box to enable this template and also to enable the Update Discover Community option.
  - Update Discover Community—Select the check box to update the SNMP version as v2. This updates the Read/Write Community as the template community name for the applied controllers.
-  **Note** If Access Mode option is configured as Read Only, then NCS will have only read access to the controller after applying this template.
- 
- Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates”](#) section on page 11-2 for more information.

**Note** If a template is applied successfully and the Update Discover Community option is enabled, then the applied community name will be updated in the NCS database for that applied controller. Also, NCS uses that community name for further communication with that controller.

## Configuring an NTP Server Template

**Note** NTP is used to synchronize computer clocks on the Internet.

To add an NTP template or make modifications to an existing NTP template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Network Time Protocol** or choose **System > Network Time Protocol** from the left sidebar menu. The **System > NTP Server Template** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
 

The Applied to Controllers number is a link. Clicking the number opens the Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens to an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Network Time Protocol template page appears (see [Figure 11-2](#)).

**Figure 11-2** NTP Servers Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb navigation is: Configure > Controller Template Launch Pad > System > Network Time Protocol > Controller Template 'test template'. The left sidebar shows the 'System' menu with 'Network Time Protocol' selected. The main content area displays the configuration for the 'test template' with the following fields:

|                        |                 |
|------------------------|-----------------|
| Template Name          | test template   |
| Server Address         | 209.165.200.225 |
| Applied To Controllers | 0               |

Below the fields are buttons for 'Save', 'Apply to Controllers...', 'Delete', and 'Cancel'.

- Step 4** Enter the NTP server IP address.
- Step 5** Click **Save**.

## Configuring User Roles Controller Templates

This section describes how to create or modify a template for configuring user roles. User roles determine how much bandwidth the network can use. Four QoS levels (Platinum, Bronze, Gold, and Silver) are available for the bandwidth distribution to Guest Users. Guest Users are associated with predefined roles (Contractor, Customer, Partner, Vendor, Visitor, Other) with respective bandwidth configured by the Admin. These roles can be applied when adding a new Guest User. See the [“Configuring a Guest User Template” section on page 11-56](#) for more information on adding Guest Users.

To add a new template with User Roles information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **New** beside the template you want to add.
- Step 3** Add or modify the following parameters:
- Role Name
  - Average Data Rate—The average data rate for non-UDP (User Datagram Protocol) traffic.
  - Burst Data Rate—The peak data rate for non-UDP traffic.
  - Average Real-time Rate—The average data rate for UDP traffic.
  - Burst Real-time Rate—The peak data rate for UDP traffic.
- Step 4** Click **Save**. Once saved, the template displays in the Template List page. From the Template List page, you can apply this template to controllers. See the [“Applying Controller Templates” section on page 11-2](#) for more information.
- 

## Configuring AP Username Password Controller Templates

Create or modify a template for setting an access point username and password. All access points inherit the password as they join the controller and these credentials are used to log into the access point via the console or Telnet/SSH.

**Note**

See the [“Configuring a Global Access Point Password” section on page 9-59](#) for more information regarding global passwords.

---

The AP Username Password page enables you to set a global password that all access points inherit as they join a controller. When you are adding an access point, you can also choose to accept this global username and password or override it on a per-access point basis. See the [“Configuring AP Configuration Templates” section on page 11-127](#) to see where the global password is displayed and how it can be overridden on a per-access point basis.

Also in controller software release 5.0, after an access point joins the controller, the access point enables console port security and you are prompted for your username and password whenever you log into the access point console port. When you log in, you are in non-privileged mode and you must enter the enable password in order to use the privileged mode.

To add a new template with AP Username Password information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **New** beside the template you want to add.

**Step 3** Add or modify the following parameters:

- AP Username—Type the username that you want to be inherited by all access point that join the controller.
- AP Password—Type the password that you want to be inherited by all access point that join the controller.
- Confirm Password—Retype the access point password.
- Enable Password

---

**Note** For Cisco IOS access points, you must also enter and confirm an enable password.

---

- Confirm Enable Password

**Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the “[Applying Controller Templates](#)” section on page 11-2 for more information.

---

**Note** See the “[Configuring a Global Access Point Password](#)” section on page 9-59 for more information regarding global passwords.

---

## Configuring AP 802.1X Supplicant Credentials

You can configure 802.1X authentication between lightweight access points and the switch. The access point acts as an 802.1X supplicant and is authenticated by the switch using EAP-FAST with anonymous PAC provisioning. You can set global authentication settings that all access points inherit as they join the controller. All access points that are currently joined to the controller and any that join in the future are included.

To add or modify an existing AP 802.1X Supplicant Credentials template, follow these steps:

---

**Note** If desired, you can override the global authentication settings and assign unique authentication settings for a specific access point. See the “[Configuring Access Points](#)” section on page 9-151 for more information.

---

**Step 1** Choose **Configure > Controller Templates Launch Pad**.

**Step 2** Click **AP 802.1X Supplicant Credentials** or choose **System > AP 802.1X Supplicant Credentials** from the left sidebar menu. The AP 802.1X Supplicant Credentials Templates page displays all currently saved AP 802.1X Supplicant Credentials templates. It also displays the number of controllers and virtual domains to which each template is applied.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** Click a template name to open the Controller Template list page. From there, you can edit the current template parameters.
- Step 4** Click **Save**.
- 

## Configuring a Global CDP Configuration Template

Cisco Discovery Protocol (CDP) is a device-discovery protocol that runs on all Cisco network equipment. Each device sends identifying messages to a multicast address, and each device monitors the messages sent by other devices.

---

**Note** CDP is enabled on the bridge's Ethernet and radio ports by default.

---

To configure a Global CDP configuration template, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Global CDP Configuration** or choose **System > Global CDP Configuration** from the left sidebar menu. The Global CDP Configuration Templates page displays all currently saved Global CDP Configuration templates.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Global CDP Configuration template page appears.
- Step 4** Enter the new CDP template name.
- Step 5** In the Global CDP portion of the page, enter the following parameters:
- CDP on controller—Choose enable or disable CDP on the controller.

---

**Note** This configuration cannot be applied on WISM2 controllers.

---

- Global CDP on APs—Choose to enable or disable CDP on the access points.
  - Refresh-time Interval (seconds)—At the Refresh Time Interval parameter, enter the time in seconds at which CDP messages are generated. The default is 60.
  - Holdtime (seconds)—Enter the time in seconds before the CDP neighbor entry expires. The default is 180.
  - CDP Advertisement Version—Enter which version of the CDP protocol to use. The default is v1.
- Step 6** In the CDP for Ethernet Interfaces portion of the page, select the slots of Ethernet interfaces for which you want to enable CDP.

---

**Note** CDP for Ethernet Interfaces fields are supported for controller version 7.0.110.2 onwards.

---

- Step 7** In the CDP for Radio Interfaces portion of the page, select the slots of Radio interfaces for which you want to enable CDP.

---

**Note** CDP for Radio Interfaces fields are supported for controller version 7.0.110.2 onwards.

---

**Step 8** Click **Save**.

**Note**

The Global Interface CDP configuration will be applied only to the APs for which the CDP is enabled at AP level.

## Configuring DHCP Template

To add a DHCP template or make modifications to an existing DHCP template, follow these steps:

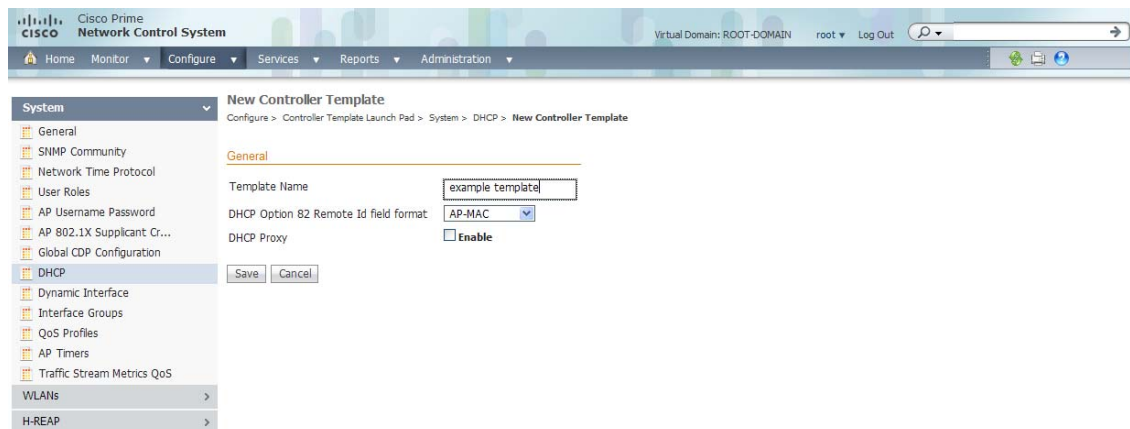

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **DHCP** or choose **System > DHCP** from the left sidebar menu. The System > DHCP Template page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The DHCP template page appears (see Figure 11-3).

**Figure 11-3** DHCP Template Page

**Step 4** You can enable or disable DHCP proxy on a global basis rather than on a WLAN basis. When DHCP proxy is enabled on the controller, the controller unicasts DHCP requests from the client to the configured servers. At least one DHCP server must be configured on either the interface associated with the WLAN or on the WLAN itself. DHCP proxy is enabled by default.

**Step 5** Enter the DHCP Timeout in seconds after which the DHCP request will time out. The default setting is 5. Allowed values range from 5 to 120 seconds.

**Note**

DHCP Timeout is applicable from the controller version 7.0.114.74 onwards.

291165

**Step 6** Click **Save**.

## Configuring Dynamic Interface Templates

To add a dynamic interface template or make modifications to an existing interface configuration, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Dynamic Interface** or choose **System > Dynamic Interface** from the left sidebar menu. The **System > Dynamic Interface Template** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the **Select a command** drop-down list, and click **Go**. To modify an existing template, click the template name. The **Dynamic Interface template** page appears (see [Figure 11-4](#)).

**Figure 11-4** *Dynamic Interface Template*

The screenshot shows the 'New Controller Template' configuration page in Cisco Prime Network Control System. The breadcrumb trail is 'Configure > Controller Template Launch Pad > System > Dynamic Interface > New Controller Template'. A warning message states: 'Device specific parameters (Interface Name, VLAN ID, Quarantine VLAN ID, IP address and Gateway) can be configured for all the managed controllers while applying this interface to controllers.' The configuration fields are as follows:

- General:** Template Name (empty text box)
- Interface Address:** Guest LAN (checked), Quarantine (unchecked), Netmask (0.0.0.0)
- Physical Information:** LAG Mode (unchecked), Primary Port Number (0), Secondary Port Number (0), AP Management (checked)
- Access Control List:** Primary DHCP Server (0.0.0.0), Secondary DHCP Server (0.0.0.0), ACL Name (none)

At the bottom, there are 'Save' and 'Cancel' buttons. Footnotes at the bottom of the page state:

1. If LAG Mode is selected along with this interface, then this settings can be applied only to LAG enabled controllers.
2. If an ACL Name is selected along with this interface, then this settings can be applied only to the controllers which have that ACL configured via WCS.

**Step 4** Select the **Guest LAN** check box to mark the interface as wired.

**Step 5** Enter the net mask address of the interface.

- Step 6** Enter which port is currently used by the interface.
- Step 7** Enter a secondary port to be used by the interface when the primary port is down. When the primary port is reactivated, the Cisco 4400 Series Wireless LAN Controller transfers the interfaces back to the primary port.

**Note** Primary and secondary port numbers are present only in the Cisco 4400 Series Wireless LAN Controllers.

- Step 8** Enter the IP address of the primary DHCP server.
- Step 9** Enter the IP address of the secondary DHCP server.
- Step 10** From the ACL Name drop-down list, choose a name from the list of defined names.
- Step 11** From the Add Format Type drop-down list in the Add Interface Format Type section, choose either **Device Info** or **File**. If you choose device info, you must configure the device specific parameters for each controller. If you choose File, you must configure CSV device specific parameters (Interface Name, VLAN Identifier, Quarantine VLAN Identifier, IP Address, and Gateway) for all the managed controllers specified in the CSV file (see [Table 11-1](#)). If you choose Device Info, continue to Step 12.

The sample CSV files are as follows.

**Table 11-1** Sample CSV Files

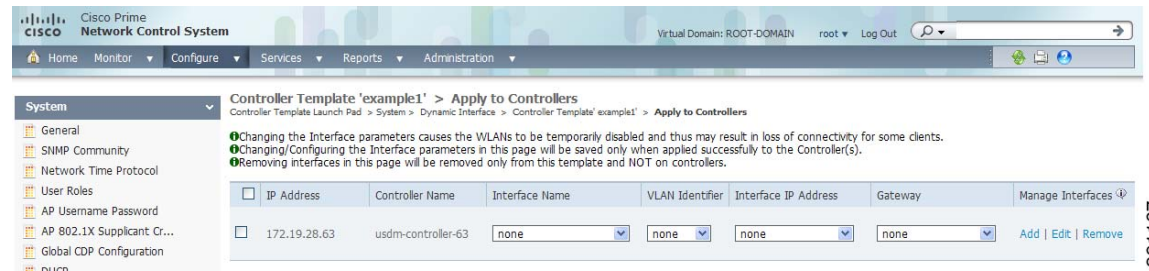

| ip_address      | interface_name | vlan_id | quarantine_vlan_id | interface_ip_address | gateway         |
|-----------------|----------------|---------|--------------------|----------------------|-----------------|
| 209.165.200.224 | dyn-1          | 1       | 2                  | 209.165.200.228      | 209.165.200.229 |
| 209.165.200.225 | interface-1    | 4       | 2                  | 209.165.200.230      | 209.165.200.231 |
| 209.165.200.226 | interface-2    | 5       | 3                  | 209.165.200.232      | 209.165.200.233 |
| 209.165.200.227 | dyna-2         | 2       | 3                  | 209.165.200.234      | 209.165.200.235 |

The first row of the CSV file is used to describe the columns included. The CSV files can contain the following fields:

- ip\_address
- interface\_name
- vlan\_id
- quarantine\_vlan\_id
- interface\_ip\_address
- gateway

- Step 12** If you choose Apply to Controllers, you advance to the Apply To page where you can configure device-specific parameters for each controller (see [Figure 11-5](#)).

Figure 11-5 Apply To Page

- Step 13** Use the **Add** and **Remove** options to configure device specific parameters for each controllers. If you click **Edit**, a dialog box appears with the current parameter input.
- Step 14** Make the necessary changes in the dialog box, and click **OK**.

**Note** If you change the interface parameters, the WLANs are temporarily disabled, so, you may lose connectivity for some clients. Any changes to the interface parameters are saved only after you successfully apply them to the controller(s).

**Note** If you remove an interface here, it is removed only from this template and NOT from the controllers.

### Applying a Dynamic Interface Template to Controllers

To apply a Dynamic Interface template to a controller, follow these steps:

- Step 1** In the Dynamic Interface controller template page, click **Apply to Controllers**.
- Step 2** Use the Manage Interfaces options to configure device-specific parameters:
- Add—Click **Add** to open the Add Interface dialog box. Enter an interface name, VLAN identifier, IP address, and gateway. When all parameters are entered, click **Done**.
  - Edit—Click **Edit** to make changes to current interfaces.
  - Remove—Click **Remove** to delete a current interface.
- Step 3** Select a check box for each controller to which you want to apply this template.
- Step 4** Click **Apply**.

**Note** Changing the Interface parameters causes the WLANs to be temporarily disabled and may result in loss of connectivity for some clients.

**Note** Interface parameter changes or configurations made on this page are saved only when applied successfully to the controller(s).

**Note**

Interfaces removed from this page are removed only from this template and not from controllers.

**Note**

See the “[Configuring Dynamic Interface Templates](#)” section on page 11-15 for more information on Dynamic Interface controller templates.

## Configuring QoS Templates

To modify the quality of service (QoS) profiles, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **QoS Profiles** or choose **System > QoS Profiles** from the left sidebar menu. The System > QoS Profiles page appears. The number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to edit the bronze, gold, platinum, or silver QoS profile, click in the Name column for the profile you want to edit. The Edit QoS Profile Template page appears (see [Figure 11-6](#)).

**Figure 11-6** Edit QoS Profile Template Page

The screenshot shows the configuration page for a Controller Template named 'bronze'. The left sidebar lists various configuration categories, with 'QoS Profiles' selected. The main content area shows the following details:

- Name:** bronze (Background)
- Description:** For Background
- Controllers Applied To:** 0
- Per-User Bandwidth Contracts (kbps):**
  - Average Data Rate: 0
  - Burst Data Rate: 0
  - Average Real-Time Rate: 0
  - Burst Real-Time Rate: 0
- Over the Air QoS:**
  - Maximum Rf Usage Per AP: 0 (percent)
  - Queue Depth: 0
- Wired QoS Protocol:**
  - Protocol: None

At the bottom, there are buttons for 'Save', 'Apply to Controllers...', and 'Cancel'.

- Step 4** Set the following values in the Per-User Bandwidth Contracts portion of the page. All have a default of 0 or Off.
- Average Data Rate - The average data rate for non-UDP traffic.
  - Burst Data Rate - The peak data rate for non-UDP traffic.
  - Average Real-time Rate - The average data rate for UDP traffic.

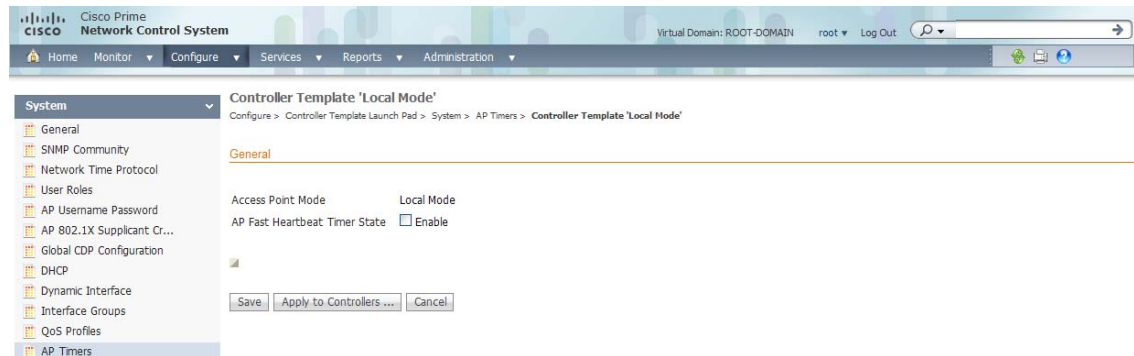

- Burst Real-time Rate - The peak data rate for UDP traffic.
- Step 5** Set the following values for the Over-the-Air QoS portion of the page.
- Maximum QoS RF Usage per AP - The maximum air bandwidth available to clients. The default is 100%.
  - QoS Queue Depth - The depth of queue for a class of client. The packets with a greater value are dropped at the access point.
- Step 6** Set the following values in the Wired QoS Protocol portion of the page.
- Wired QoS Protocol - Choose 802.1P to activate 802.1P priority tags or None to deactivate 802.1P priority flags.
  - 802.1P Tag - Choose 802.1P priority tag for a wired connection from 0 to 7. This tag is used for traffic and CAPWAP packets.
- Step 7** Click **Save**.
- 

## Configuring AP Timers Template

Some advanced timer configuration for HREAP and local mode is available for the controller on NCS. To configure a template for AP timers, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **AP Timers** or choose **System > AP Timers** from the left sidebar menu. The System > AP Timers page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The values in the Access Point Mode column are links. When you click a link, the Controller Template <access point mode> page appears. The Access Point Mode is automatically populated (see [Figure 11-7](#)).
- Step 3** Select the **AP Fast Heartbeat Timer State** check box to enable AP Fast Heartbeat Timeout.
- Step 4** Enter an AP Fast Heartbeat Timeout value. The valid range is 1 to 15 seconds. The default is 10 seconds. The recommended timeout values are:
- 10 to 15 seconds for 7500 series controllers.
  - 10 to 15 seconds for 5500 series of controllers with version 7.0.98.0 or lower.
  - 1 to 10 seconds for 5500 series of controllers with version above 7.0.98.0.
  - 1 to 10 seconds for other controllers.

Figure 11-7 AP Timers Page

**Step 5** Click **Save**.

291169

## Configuring an Interface Group Template

The interface group template page allows you to select list of interfaces and form a group.

**Note** You cannot create interfaces using this page.

To configure an interface group template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Interface Groups** or choose **System > Interface Groups** from the left sidebar menu. The System > Interface Groups page appears.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The New Controller Template page appears.
- Step 4** Specify the following details:
- Name—Interface Group name.
  - Description(optional)—A more detailed description of the interface group.
  - Quarantine—Indicates the type of interfaces that can be added to an interface group. If this option is enabled, you can add interfaces with quarantine VLAN ID set. If this options is disabled, you can add interfaces with quarantine VLAN ID not set.
- Step 5** Selected Controllers/Interfaces that you want to add to the group.
- Step 6** Click **Save**.
- 

## Configuring a Traffic Stream Metrics QoS Template

Traffic stream metrics are a series of statistics about VoIP over your wireless LAN and informs you of the QoS of the wireless LAN. These statistics are different than the end-to-end statistics provided by VoIP systems. End-to-end statistics provide information on packet loss and latency covering all the links

comprising the call path. However, traffic stream metrics are statistics for only the WLAN segment of the call. Because of this, system administrators can quickly determine whether audio problems are being caused by the WLAN or by other network elements participating in a call. By observing which access points have impaired QoS, system administrators can quickly determine the physical area where the problem is occurring. This is important when lack of radio coverage or excessive interference is the root problem.

Four QoS values (packet latency, packet jitter, packet loss, and roaming time), which can affect the audio quality of voice calls, are monitored. All the wireless LAN components participate in this process. Access points and clients measure the metrics, access points collect the measurements and then send them to the controller. The access points update the controller with traffic stream metric information every 90 seconds, and 10 minutes of data is stored at one time. Cisco NCS queries the controller for the metrics and displays them in the Traffic Stream Metrics QoS Status. These metrics are compared to threshold values to determine their status level and if any of the statistics are displaying a status level of fair (yellow) or degraded (red), the administrator investigates the QoS of the wireless LAN.

For the access points to collect measurement values, traffic stream metrics must be enabled on the controller.

To configure a Traffic Stream Metrics QoS template, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Traffic Stream Metrics QoS** or choose **System > Traffic Stream Metrics QoS** from the left sidebar menu. The System > Traffic Stream Metrics QoS Status page appears (see [Figure 11-8](#)).

**Figure 11-8 Traffic Stream Metrics QoS Status Template**

Traffic Stream Metrics QoS Controller Templates  
 Configure > Controller Template Launch Pad > System > Traffic Stream Metrics QoS

**Upstream Delay**

- Normal QoS is  percent or more of packets having delay less than 20ms.
- Fair QoS is  percent or more of packets having delay less than 40ms.
- Degraded QoS is  percent or more of packets having delay equal or greater than 40ms.

**Downstream Delay**

- Normal QoS is  percent or more of packets having delay less than 20ms.
- Fair QoS is  percent or more of packets having delay less than 40ms.
- Degraded QoS is  percent or more of packets having delay equal or greater than 40ms.

**Upstream Packet Loss Rate**

- Normal QoS is less than  percent.
- Fair QoS is less than  percent.
- Degraded QoS is equal or greater than  percent.

**Downstream Packet Loss Rate**

- Normal QoS is less than  percent.
- Fair QoS is less than  percent.
- Degraded QoS is equal or greater than  percent.

**Roaming Time**

- Normal QoS is less than  ms.
- Fair QoS is less than  ms.
- Degraded QoS is equal or greater than  ms.

291170

The Traffic Stream Metrics QoS Status Configuration page shows several QoS values. An administrator can monitor voice and video quality of the following:

- Upstream delay
- Upstream packet loss rate
- Roaming time
- Downstream packet loss rate
- Downstream delay

Packet Loss Rate (PLR) affects the intelligibility of voice. Packet delay can affect both the intelligibility and conversational quality of the connection. Excessive roaming time produces undesired gaps in audio.

There are three levels of measurement:

- Normal: Normal QoS (green)
- Fair: Fair QoS (yellow)
- Degraded: Degraded QoS (red)

System administrators should employ some judgement when setting the green, yellow, and red alarm levels. Some factors to consider are:

- Environmental factors including interference and radio coverage which can affect PLR.
  - End-user expectations and system administrator requirements for audio quality on mobile devices (lower audio quality can permit greater PLR).
  - Different codec types used by the phones have different tolerance for packet loss.
  - Not all calls will be mobile-to-mobile; therefore, some have less stringent PLR requirements for the wireless LAN.
- 

## Configuring WLAN Templates

This section contains the following topics:

- [Configuring WLAN Template, page 11-22](#)
- [Configuring WLAN AP Groups Template, page 11-36](#)

### Configuring WLAN Template

WLAN templates allow you to define various WLAN profiles for application to different controllers.

You can configure multiple WLANs with the same SSID. This feature enables you to assign different Layer 2 security policies within the same wireless LAN. Unlike previous release where profile name was used as the unique identifier, the template name is now the unique identifier with software release 5.1.

These restrictions apply when configuring multiple WLANs with the same SSID:

- WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on information advertised in the beacons and probes. These are the available Layer 2 security policies:
  - None (open WLAN)
  - Static WEP or 802.1
  - CKIP
  - WPA/WPA2
- Broadcast SSID must be enabled on the WLANs that share an SSID so that the access points can generate probe responses for these WLANs.
- Hybrid-REAP access points do not support multiple SSIDs.

To add a WLAN template or make modifications to an existing WLAN template, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.

- Step 2** Click **WLAN** or choose **WLANS > WLAN** from the left sidebar menu. The WLAN Template page appears with a summary of all existing defined WLANs. The following information headings are used to define the WLANs listed on the WLAN Template General page:
- **Template Name**—The user-defined name of the template. Clicking the name displays parameters for this template.
  - **Profile Name**—User-defined profile name used to distinguish WLANs with the same SSID.
  - **SSID**—Displays the name of the WLAN.
  - **WLAN/Guest LAN**—Determines if guest LAN or WLAN.
  - **Security Policies**—Indicates what security policy is chosen. None indicates no 802.1X.
  - **WLAN Status**—Determines whether the WLAN is enabled or not.
  - **Applied to Controllers**—The number of controllers the WLAN template is applied to. The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status.
  - **Applied to Virtual Domains**—The number of virtual domains the WLAN template is applied to. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
  - **Last Saved At**—Indicates when the template was last saved.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The WLAN template page appears (see [Figure 11-9](#)).

**Figure 11-9** **WLAN Template**

The screenshot shows the 'New Controller Template' configuration page. The left sidebar contains a navigation tree with 'WLANs' selected. The main panel has tabs for 'General', 'Security', 'QoS', and 'Advanced'. The 'General' tab is active, displaying the following configuration options:

- Template Name: [Text Input Field]
- Wired LAN:
- Profile Name: [Text Input Field]
- SSID: [Text Input Field]
- Status:  Enable
- Security Policies: **None**  
(Modifications done under security tab will appear after save operation.)
- Radio Policy: [All] (Dropdown)
- Interface:  Interface  Interface Group
- Multicast VLAN:  Enable
- BroadCast SSID:  Enable

At the bottom of the page, there are 'Save' and 'Cancel' buttons.

291171

- Step 4** Select the **Wired LAN** check box to indicate whether or not this WLAN is a wired LAN.

**Figure 11-10** WLAN Template

New Controller Template  
 Configure > Controller Template Launch Pad > WLANs > WLAN Configuration > New Controller Template

General Security QoS Advanced

Template Name

Wired LAN

LAN Type

Profile Name

Status  Enable

Security Policies **None**  
 (Modifications done under security tab will appear after save operation.)

Multicast VLAN  Enable

Egress Interface

Ingress Interface

291172

**Note** Specify if you want guest users to have wired guest access from an Ethernet connection designated and configured for guest access. Wired guest access ports might be available in a guest office or specific ports in a conference room and accounts are added to the network using the Lobby Ambassador portal. (See the [“Creating Guest User Accounts”](#) section on page 7-9).

**Note** The Egress or Ingress interface configurations are applicable for Wired LAN only.

**Step 5** Use the **Type** drop-down list to select the type of the wired LAN.

- Guest LAN—Indicates that this wired LAN is a Guest LAN.

**Note** If you selected the Guest LAN option, you need to select an Ingress interface which has not already been assigned to any Guest LAN.

- Remote LAN—Indicates that this wired LAN is a Remote LAN.

**Step 6** Enter a name in the Profile Name text box that identifies the WLAN or the guest LAN. Do not use any spaces in the name entered.

**Step 7** Enter the name of the WLAN SSID. An SSID is not required for a guest LAN.

WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on information advertised in the beacons and probes.

**Step 8** Select the **Enable** check box for the Status parameter.

**Step 9** Use the Radio Policy drop-down list to set the WLAN policy to apply to All (802.11a/b/g/n), 802.11a only, 802.11g only, 802.11b/g only, or 802.11a/g only.

**Step 10** Use the Interface/Interface Group drop-down list to choose the available names of interfaces created by the Controller > Interfaces module.

**Step 11** From the Egress Interface drop-down list, choose the Egress interface that you created in the [“Creating an Egress Interface”](#) section on page 9-48. This provides a path out of the controller for wired guest client traffic.

- Step 12** From the Ingress Interface drop-down list, choose the Ingress interface that you created in the “[Creating an Ingress Interface](#)” section on page 9-48. This provides a path between the wired guest client and the controller by way of the Layer 2 access switch.
- Step 13** Select the **Enable** check box to enable the multicast VLAN feature.
- Step 14** From the Multicast VLAN Interface drop-down list, choose the appropriate interface name. This list is automatically populated when you enable the multicast VLAN feature.
- Step 15** Click **Broadcast SSID** to activate SSID broadcasts for this WLAN.
- Step 16** Click **Save**.
- Step 17** To further configure the WLAN template, choose from the following:
- Click the **Security** tab to establish which AAA can override the default servers on this WLAN and to establish the security mode for Layer 2 and 3. Continue to the “[Security](#)” section on page 11-25.
  - Click the **QoS** tab to establish which quality of service is expected for this WLAN. Continue to the “[QoS](#)” section on page 11-31.
  - Click the **Advanced** tab to configure any other details about the WLAN, such as DHCP assignments and management frame protection. Continue to the “[Advanced](#)” section on page 11-32.

## Security

After choosing Security, you have an additional three tabs: Layer 2, Layer 3, and AAA Servers.

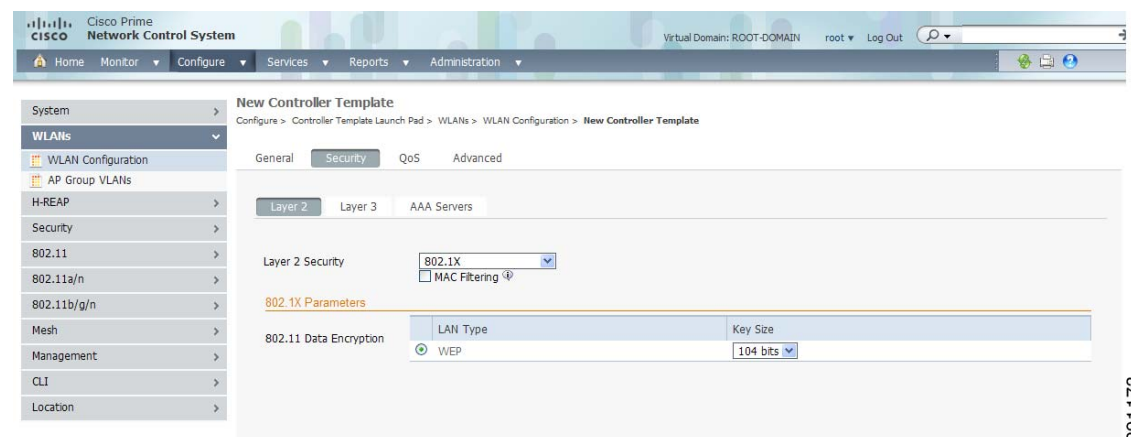

### Layer 2

When you click the Layer 2 tab, the Layer 2 tab appears (see [Figure 11-11](#)).

**Note** The tab contains different views depending on what option is chosen in the Layer 2 Security drop-down list.

**Figure 11-11** Layer 2 Tab

To configure the Layer 2 tab, follow these steps:

- Step 1** Use the Layer 2 Security drop-down list to choose None, 802.1X, Static WEP, Static WEP-802.1X, WPA + WPA2, or CKIP as described in [Table 11-2](#).

**Table 11-2** Layer 2 Security Options

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| None              | No Layer 2 security selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 802.1X            | WEP 802.1X data encryption type (Note 1):<br>40/64 bit key.<br>104 bit key.<br>152 bit key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Static WEP        | Static WEP encryption parameters:<br>Key sizes: Not set, 40/64, 104, and 152 bit key sizes.<br>Key Index: 1 to 4 (Note 2).<br>Encryption Key: Encryption key required.<br>Key Format: ASCII or HEX.<br>Allowed Shared Key Authentication—Select the check box to enable.<br><b>Note</b> Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device. |
| Static WEP-802.1X | Use this setting to enable both Static WEP and 802.1X policies. If this option is selected, static WEP and 802.1X parameters are displayed at the bottom of the page.<br>Static WEP encryption parameters:<br>Key sizes: Not set, 40/64, 104, and 152 bit key sizes.<br>Key index: 1 to 4 (Note 2).<br>Encryption Key: Enter encryption key.<br>Key Format: ASCII or HEX.<br>Allowed Shared Key Authentication—Select the check box to enable.<br>802.1 Data Encryption: 40/64 bit key, 104 bit key, 152 bit key.                                                                                                                         |

**Table 11-2** Layer 2 Security Options (continued)

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WPA+WPA2  | <p>Use this setting to enable WPA, WPA2, or both. See the WPA1 and WPA2 parameters displayed in the page when WPA+WPA2 is selected. WPA enables Wi-Fi Protected Access with TKIP-MIC Data Encryption or AES. When WPA+WPA2 is selected, you can use Cisco Centralized Key Management (CCKM) authentication key management, which allows fast exchange when a client roams from one access point to another.</p> <p>When WPA+WPA2 is selected as the Layer 2 security policy, and Pre-shared Key is enabled, then neither CCKM or 802.1X can be enabled; although, both CCKM and 802.1X can be enabled at the same time.</p>                                                                                                                                                                                                                                                                                                                          |
| CKIP      | <p>Cisco Key Integrity Protocol (CKIP). A Cisco access point advertises support for CKIP in beacon and probe response packets. CKIP can be configured only when Aironet IE is enabled on the WLAN.</p> <p><b>Note</b> CKIP is not supported on 10xx APs.</p> <p>When selected, these CKIP parameters are displayed.</p> <p>Key size: Not set, 40, or 104.</p> <p>Key Index: 1 to 4</p> <p>Encryption Key: Specify encryption key.</p> <p>Key Format: ASCII or HEX.</p> <p><b>Note</b> Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device.</p> <p>MMH Mode: Select the check box to enable.</p> <p>Key Permutation: Select the check box to enable.</p> |

**Step 2** Select the **MAC Filtering** check box if you want to filter clients by MAC address.

**Note** The ability to join a controller without specification within a MAC filter list is only supported on mesh access points.

**Note** For releases prior to 4.1.82.0, mesh access points do not join the controller unless they are defined in the MAC filter list.

You may want to disable the MAC filter list to allow newly added access points to join the controller. Before enabling the MAC filter list again, you should enter the MAC addresses of the new access points.

**Step 3** Choose the desired type of authentication key management. The choices are 802.1X, CCKM, or PSK.

**Note** If you choose PSK, you must enter the shared key and type (ASCII or hexadecimal).

**Note** Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device.

**Step 4** Click **Save**.

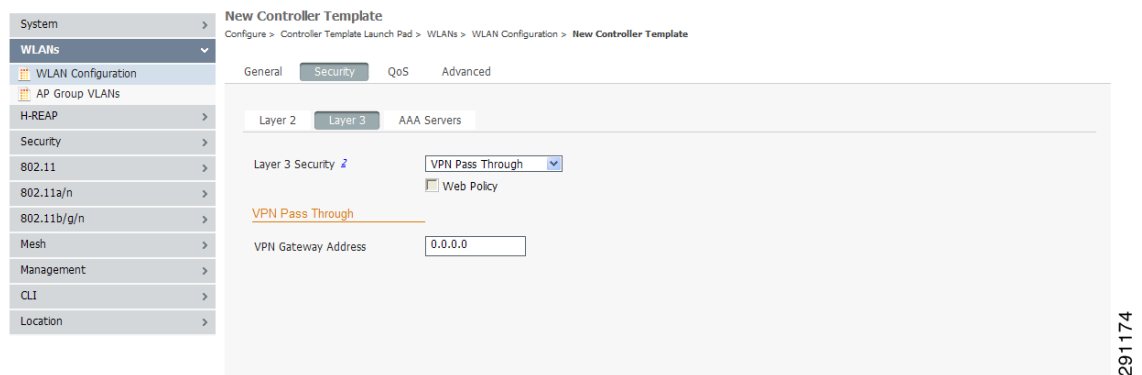

## Layer 3

When you click the Layer 3 tab, the Layer 3 tab appears (see [Figure 11-12](#)).

**Note** The tab contains different views depending on what option is chosen in the Layer 3 Security drop-down list.

**Figure 11-12 Layer 3 Tab**

To configure the Layer 3 tab, follow these steps:

**Step 1** Use the Layer 3 security drop-down list to choose between None and VPN Pass Through. The page parameters change according to the selection you make. If you choose VPN pass through, you must enter the VPN gateway address.

**Note** The VPN passthrough option is not available for the 2106 or 5500 series controllers.

**Step 2** You can modify the default static WEP (web authentication) or assign specific web authentication (login, logout, login failure) pages and the server source.

- a. To change the static WEP to passthrough, select the **Web Policy** check box and choose the Passthrough option from the drop-down list. This option allows users to access the network without entering a username or password.

An Email Input check box appears. Select this check box if you want users to be prompted for their email address when attempting to connect to the network.

- b. Choose the **WebAuth on MAC Filter Failure** option so that when clients fail on MAC filter, they get automatically switched to webAuth.

---

**Note** The WebAuth on Mac Filter Failure option works only when the Layer 2 Mac Filtering option is enabled.

---

- c. To specify custom web authentication pages, unselect the Global WebAuth Configuration **Enable** check box.

1. When the Web Auth Type drop-down list appears, choose one of the following options to define the web login page for the wireless guest users:

Default Internal—Displays the default web login page for the controller. This is the default value.

Customized Web Auth—Displays custom web login, login failure, and logout pages. When the customized option is selected, three separate drop-down lists for login, login failure, and logout page selection appear. You do not need to define a customized page for all three of the options. Choose **None** from the appropriate drop-down list if you do not want to display a customized page for that option.

These optional login, login failure, and logout pages are downloaded to the controller as webauth.tar files. For specifics on downloading custom pages, see the “[Downloading Customized Web Authentication](#)” section on page 3-42.

External—Redirects users to an external server for authentication. If you choose this option, you must also enter the URL of the external server in the URL text box.

---

**Note** External web auth is not supported for 2106 and 5500 series controllers.

---

You can select specific RADIUS or LDAP servers to provide external authentication in the Security > AAA page. To do so, continue with Step 4.

---

**Note** The RADIUS and LDAP servers must be already configured to have selectable options in the Security > AAA page. You can configure these servers in the RADIUS Authentication Servers page and TACACS+ Authentication Servers page.

---

**Step 3** If you selected External as the Web Authentication Type in Step 2, choose **Security > AAA**, and choose up to three RADIUS and LDAP servers using the drop-down lists.

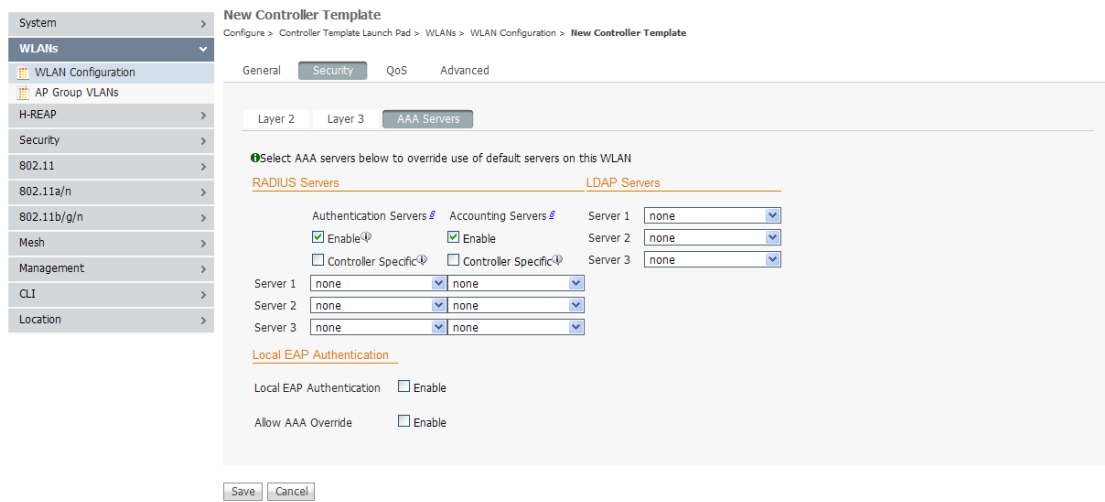

**Step 4** Click **Save**.

**Step 5** Repeat this process if a second (anchor) controller is being used in the network.

## AAA Servers

When you click the AAA Servers tab, the AAA Servers tab appears (see Figure 11-13).

**Figure 11-13 AAA Servers Tab**

291175

To configure the AAA Servers tab, follow these steps:

- Step 1** Select the **Radius Server Overwrite Interface** check box to send the client authentication request through the dynamic interface which is set on the WLAN. When you enable the Radius Server Overwrite Interface option, the WLC will source all radius traffic for a WLAN using the dynamic interface configured on that WLAN.

**Note** You cannot enable Radius Server Overwrite Interface when Diagnostic Channel is enabled.

**Note** The Radius Server Overwrite Interface option is supported since controller version 7.0.x.

- Step 2** Select the **Enable** check boxes, then use the drop-down lists in the RADIUS and LDAP servers section to choose authentication and accounting servers. This selects the default RADIUS server for the specified WLAN and overrides the RADIUS server that is configured for the network. If all three RADIUS servers are configured for a particular WLAN, server 1 has the highest priority, and so on.

If no LDAP servers are chosen here, NCS uses the default LDAP server order from the database.

- Step 3** Select the **Local EAP Authentication** check box if you have an EAP profile already configured that you want to enable. Local EAP is an authentication method that allows users and wireless clients to locally authenticate. It is designed for use in remote offices that want to maintain connectivity to wireless clients when the backend system becomes disrupted or the external authentication server goes down.

- Step 4** When AAA Override is enabled, and a client has conflicting AAA and controller WLAN authentication parameters, client authentication is performed by the AAA server. As part of this authentication, the operating system moves clients from the default Cisco WLAN Solution to a VLAN returned by the AAA server and predefined in the controller interface configuration (only when configured for MAC filtering,

802.1X, and/or WPA operation). In all cases, the operating system also uses QoS and ACL provided by the AAA server, as long as they are predefined in the controller interface configuration. (This VLAN switching by AAA override is also referred to as identity networking.)

For instance, if the corporate WLAN primarily uses a management interface assigned to VLAN 2, and if AAA override returns a redirect to VLAN 100, the operating system redirects all client transmissions to VLAN 100, regardless of the physical port to which VLAN 100 is assigned.

When AAA override is disabled, all client authentication defaults to the controller authentication parameter settings, and authentication is only performed by the AAA server if the controller WLANs do not contain any client-specific authentication parameters.

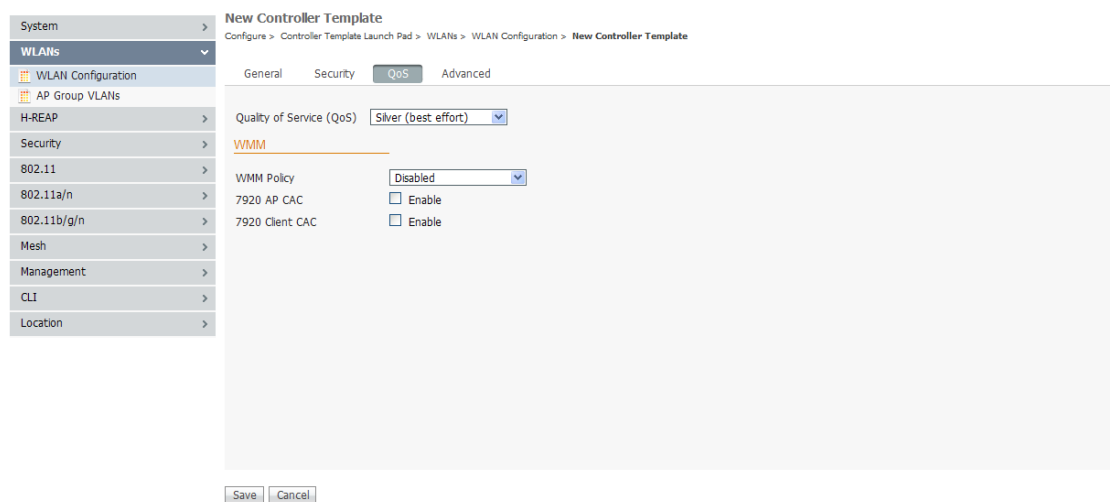

The AAA override values may come from a RADIUS server, for example.

**Step 5** Click **Save**.

## QoS

When you click the QoS tab in the WLAN Template page, the QoS tab appears (see [Figure 11-14](#)).

**Figure 11-14** QoS Tab

291176

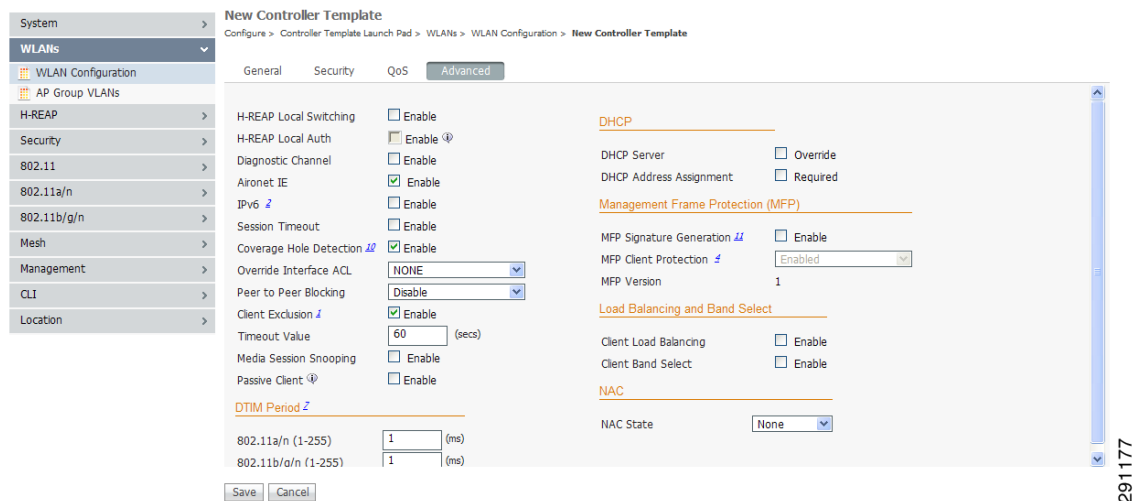

To configure the QoS parameters, follow these steps :

- Step 1** Use the QoS drop-down list to choose Platinum (voice), Gold (video), Silver (best effort), or Bronze (background). Services such as VoIP should be set to gold while non-discriminating services such as text messaging can be set to bronze.
- Step 2** Use the WMM Policy drop-down list to choose Disabled, Allowed (so clients can communicate with the WLAN), or Required to make it mandatory for clients to have WMM enabled for communication.
- Step 3** Select the **7920 AP CAC** check box if you want to enable support on Cisco 7920 phones.
- Step 4** If you want WLAN to support older versions of the software on 7920 phones, select the **7920 Client CAC** to enable it. The CAC limit is set on the access point for newer versions of software.
- Step 5** Click **Save**.

## Advanced

When you click the Advanced tab in the WLAN Template page, the Advanced tab appears (see [Figure 11-15](#)).

**Figure 11-15** *Advanced Tab*

- Step 1** Select the **Hybrid REAP local switching** check box if you want to enable Hybrid REAP local switching. For more information on Hybrid REAP, see the [“Configuring Hybrid REAP”](#) section on page 12-4. If you enable it, the hybrid-REAP access point handles client authentication and switches client data packets locally.

H-REAP local switching is only applicable to the Cisco 1130/1240/1250 series access points. It is not supported with L2TP or PPTP authentications, and it is not applicable to WLAN IDs 9-16.

- Step 2** Select the **H-REAP Local Auth** check box if you want to enable H-REAP local authentication.

Local authentication is useful where you cannot maintain the criteria a remote office setup of minimum bandwidth of 128 kbps with the roundtrip latency no greater than 100 ms and the maximum transmission unit (MTU) no smaller than 500 bytes. In local switching, the authentication capabilities are present in the access point itself. Thus local authentication reduces the latency requirements of the branch office.

---

**Note** Local authentication can only be enabled on the WLAN of a HREAP AP that is in local switching mode.

---

Local authentication is not supported in the following scenarios:

- Guest Authentication cannot be performed on a HREAP local authentication enabled WLAN.
- RRM information is not available at the controller for the hybrid REAP local authentication enabled WLAN.
- Local radius is not supported.
- Once the client has been authenticated, roaming will only be supported after the WLC and the other hybrid REAPs in the group are updated with the client information.

- Step 3** Choose to enable the diagnostic channel feature or leave it disabled. The diagnostic channel feature allows you to troubleshoot problems regarding client communication with a WLAN. When initiated by a client having difficulties, the diagnostic channel provides the most robust communication methods with the fewest obstacles to communication.
- Step 4** Select the **Aironet IE** check box if you want to enable support for Aironet information elements (IEs) for this WLAN. If Aironet IE support is enabled, the access point sends an Aironet IE 0x85 (which contains the access point name, load, number of associated clients, and so on) in the beacon and probe responses of this WLAN, and the controller sends Aironet IEs 0x85 and 0x95 (which contains the management IP address of the controller and the IP address of the access point) in the reassociation response if it receives Aironet IE 0x85 in the reassociation request.
- Step 5** Select the **IPv6** check box. You can configure IPv6 bridging and IPv4 web auth on the same WLAN.
- Step 6** Select the **Session Timeout** check box to set the maximum time a client session can continue before requiring reauthorization.
- Step 7** Choose to enable or disable coverage hold detection (CHD) on this WLAN. By default, CHD is enabled on all WLANs on the controller. If you disable CHD on a WLAN, a coverage hole alert is still sent to the controller, but no other processing is done to mitigate the coverage hole. This feature is useful for guest WLANs where highly mobile guests are connected to your network for short periods of time.
- Step 8** The Override Interface drop-down lists provides a list of defined access control lists (ACLs). (See the [“Configuring an Access Control List Template”](#) section on page 11-69 for steps on defining ACLs.) Upon choosing an ACL from the list, the WLAN associates the ACL to the WLAN. Selecting an ACL is optional, and the default for this parameter is None.
- Step 9** You can configure peer-to-peer blocking per WLAN rather than applying the status to all WLANs. From the Peer to Peer Blocking drop-down list, choose one of the following:
- **Disable**—Peer-to-peer blocking is disabled, and traffic is bridged locally whenever possible.
  - **Drop**—The packet is discarded.
  - **Forward Up Stream**—The packet is forwarded on the upstream VLAN, and the decision is made about what to do with the packet.

If H-REAP local switching is enabled for the WLAN, which prevents traffic from passing through the controller, this drop-down list is dimmed.

---

**Note** Peer-to-peer blocking does not apply to multicast traffic.

---

**Step 10** Select the check box if you want to enable automatic client exclusion.

**Step 11** If you enable client exclusion, you must also set the Timeout Value in seconds for disabled client machines. Client machines are excluded by MAC address, and their status can be observed. A timeout setting of 0 indicates that administrative control is required to re-enable the client.

---

**Note** When session timeout is not set, it implies that an excluded client remains and will not timeout from the excluded state. It does not imply that the exclusion feature is disabled.

---

**Step 12** Enter the maximum number of clients to be associated in a WLAN in the Maximum Clients text box.

**Step 13** Enable dynamic anchoring of static IP clients by selecting the **Static IP Tunneling** check box.

**Step 14** Select the **Media Session Snooping** check box. This feature enables access points to detect the establishment, termination, and failure of voice calls and then report them to the controller and NCS. It can be enabled or disabled per WLAN.

When media session snooping is enabled, the access point radios that advertise this WLAN snoop for Session Initiation Protocol (SIP) voice packets. Any packets destined to or originating from port number 5060 are considered for further inspection. The access point tracks whether Wi-Fi Multimedia (WMM) and non-WMM clients are establishing a call, already on an active call, or in the process of ending a call and then notify the controller of any major call events.

**Step 15** NAC State—From the **NAC State** drop-down list, choose **SNMP NAC** or **Radius NAC**. SIP errors that are discovered generate traps that appear on the client troubleshooting and alarms screens. The controller can integrate with the NAC appliance in out-of-band mode, where the NAC appliance remains in the data path only until clients have been analyzed and cleaned. Out-of-band mode reduces the traffic load on the NAC appliance and enables centralized NAC processing. See the “[NAC Integration](#)” section on [page 9-43](#) for more information.

**Step 16** Off-Channel Scanning Defer is essential to the operation of RRM, which gathers information about alternate channel choices such as noise and interference. Additionally, Off-Channel Scanning Defer is responsible for rogue detection. Devices that need to defer Off-Channel Scanning Defer should use the same WLAN as often as possible. If there are many of these devices (and the possibility exists that Off-Channel Defer scanning could be completely disabled by the use of this feature), you should implement an alternative to local AP Off-Channel Scanning Defer, such as monitor access points, or other access points in the same location that do not have this WLAN assigned.

Assignment of a QoS policy (bronze, silver, gold, and platinum) to a WLAN affects how packets are marked on the downlink connection from the access point regardless of how they were received on the uplink from the client. UP=1,2 is the lowest priority, and UP=0,3 is the next higher priority. The marking results of each QoS policy are as follows:

- Bronze marks all downlink traffic to UP= 1.
- Silver marks all downlink traffic to UP= 0.
- Gold marks all downlink traffic to UP=4.
- Platinum marks all downlink traffic to UP=6.

Set the Scan Defer Priority by clicking the priority argument and Set the time in milliseconds in the Scan Defer Interval text box. Valid values are 100 through 60000. The default value is 100 milliseconds.

**Step 17** In 802.11a/n and 802.11b/g/n networks, lightweight access points broadcast a beacon at regular intervals, which coincides with the Delivery Traffic Indication Map (DTIM). After the access point broadcasts the beacon, it transmits any buffered broadcast and multicast frames based on the value set for the DTIM period. This feature allows power-saving clients to wake up at the appropriate time if they are expecting broadcast or multicast data.

Normally, the DTIM value is set to 1 (transmit broadcast and multicast frames after every beacon) or 2 (transmit after every other beacon). For instance, if the beacon period of the 802.11a/n or 802.11b/g/n network is 100 ms and the DTIM value is set to 1, the access point transmits buffered broadcast and multicast frames 10 times per second. If the beacon period is 100 ms and the DTIM value is set to 2, the access point transmits buffered broadcast and multicast frames 5 times per second. Either of these settings may be suitable for applications, including VoIP, that expect frequent broadcast and multicast frames.

However, the DTIM value can be set as high as 255 (transmit broadcast and multicast frames after every 255th beacon) if all 802.11a/n or 802.11b/g/n clients have power save enabled. Because the clients have to listen only when the DTIM period is reached, they can be set to listen for broadcasts and multicasts less frequently, resulting in longer battery life. For instance, if the beacon period is 100 ms and the DTIM value is set to 100, the access point transmits buffered broadcast and multicast frames once every 10 seconds, allowing the power-saving clients to sleep longer before they have to wake up and listen for broadcasts and multicasts, resulting in longer battery life.

Many applications cannot tolerate a long time between broadcast and multicast messages, resulting in poor protocol and application performance. We recommend a low DTIM value for 802.11a/n and 802.11b/g/n networks that support such clients.

Under DTIM Period, enter a value between 1 and 255 (inclusive) in the 802.11a/n and 802.11b/g/n fields. The default value is 1 (transmit broadcast and multicast frames after every beacon).

**Step 18** When you select the check box to override DHCP server, another parameter appears where you can enter the IP address of your DHCP server. For some WLAN configurations, this is required. Three valid configurations are as follows:

- DHCP Required and a valid DHCP server IP address - All WLAN clients obtain an IP address from the DHCP server.
- DHCP is not required and a valid DHCP server IP address - All WLAN clients obtain an IP address from the DHCP server or use a static IP address.
- DHCP not required and DHCP server IP address 0.0.0.0 - All WLAN clients are forced to use a static IP address. All DHCP requests are dropped.

You cannot choose to require a DHCP address assignment and then enter a DHCP server IP address.

**Step 19** If the MFP Signature Generation check box is selected, it enables signature generation for the 802.11 management frames transmitted by an access point associated with this WLAN. Signature generation makes sure that changes to the transmitted management frames by an intruder are detected and reported.

**Step 20** At the MFP Client Protection drop-down list, choose Optional, Disabled, or Required for configuration of individual WLANs of a controller. If infrastructure MFP is not enabled, this drop-down list is unavailable.

**Note** Client-side MFP is only available for those WLANs configured to support Cisco Compatible Extensions (version 5 or later) clients, and WPA2 must first be configured.

**Step 21** Enter a value between 1 and 255 beacon intervals in the 802.11a/n DTIM Period portion of the page. The controller sends a DTIM packet on the 802.11a/n radio for this WLAN based on what is entered as an interval.

- Step 22** Enter a value between 1 and 255 beacon intervals in the 802.11b/g/n DTIM Period portion of the page. The controller sends a DTIM packet on the 802.11b/g/n radio for this WLAN based on what is entered as an interval.

**Note** DTIM configuration is not appropriate for guest LANs.

- Step 23** Click **Save**.

## Configuring WLAN AP Groups Template

Site-specific VLANs or AP groups limit the broadcast domains to a minimum by segmenting a WLAN into different broadcast domains. Benefits include more effective management of load balancing and bandwidth allocation.

To configure WLAN AP Groups, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **AP Groups** or choose **WLAN > AP Groups** from the left sidebar menu. The **WLAN > AP Groups** page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The AP Groups template page appears (see [Figure 11-16](#)).

**Figure 11-16** WLAN AP Groups

The screenshot shows the Cisco Prime Network Control System interface. The top navigation bar includes 'Home', 'Monitor', 'Configure', 'Services', 'Reports', and 'Administration'. The left sidebar menu is expanded to 'WLANs', with sub-items like 'WLAN Configuration', 'AP Group VLANs', 'H-REAP', 'Security', '802.11', '802.11a/n', '802.11b/g/n', 'Mesh', 'Management', 'CLI', and 'Location'. The main content area is titled 'New Controller Template' and shows configuration options for 'Name' and 'Description (Optional)'. Below this is a section for 'WLAN Profiles' with a note: 'Each AP Group can contain up to 16 WLAN Profiles.' A table with columns 'WLAN Profile Name', 'Interface', 'NAC Override', and 'Edit' is present, but it is empty. 'Add' and 'Remove' buttons are located below the table.

This page displays a summary of the AP groups configured on your network. From here you can add, remove, edit, or view details of an AP group. Click in the Edit column to edit its access point(s). Select the check box in the WLAN Profile Name column, and click **Remove** to delete WLAN profiles.

281178

---

**Note** The maximum characters that you can enter in the Description text box is 256.

---

## Adding Access Point Groups

To add a new access point group, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **AP Group VLANs** or choose **WLAN > AP Group VLANs** from the left sidebar menu.

---

**Note** AP Groups (for 5.2 and above controllers) are referred to as AP Group VLANs for controllers prior to 5.2.

---

**Step 3** Choose **Add Template** from the Select a command drop-down list, and click **Go**.

**Step 4** Enter a name and group description for the access point group.

---

**Note** The group description is optional.

---

**Step 5** Select the **WLAN Profile** check box.

---

**Note** To display all available WLAN profile names, delete the current WLAN profile name from the text box. When the current WLAN profile name is deleted from the text box, all available WLAN profiles display in the drop-down list.

---

---

**Note** Each access point is limited to sixteen WLAN profiles. Each access point broadcasts all WLAN profiles unless the WLAN override feature is enabled. The WLAN override feature allows you to disable any of the 16 WLAN profiles per access point.

---

---

**Note** The WLAN override feature applies only to older controllers that do not support the 512 WLAN feature (can support up to 512 WLAN profiles).

---

**Step 6** Type a WLAN profile name or choose one from the WLAN Profile Name drop-down list.

**Step 7** Enter an interface/interface group or choose one from the Interface/Interface Group drop-down list.

---

**Note** To display all available interfaces, delete the current interface from the Interface text box. When the current interface is deleted from the Interface text box, all available interfaces display in the drop-down list.

---

**Step 8** Select the **NAC Override** check box, if applicable. NAC override is disabled by default.

**Step 9** When access points and WLAN profiles are added, click **Add**.

**Note** After saving, click the edit icon on the WLAN Profiles tab to edit the WLAN profile information.

## Deleting Access Point Groups

To delete an access point group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click **AP Groups** or choose **WLAN > AP Groups** from the left sidebar menu.
  - Step 3** Click **Remove**.
- 

## Configuring H-REAP Templates

This section contains the following topics:

- [Configuring H-REAP AP Groups Template, page 11-38](#)
- [Configuring H-REAP Users, page 11-40](#)

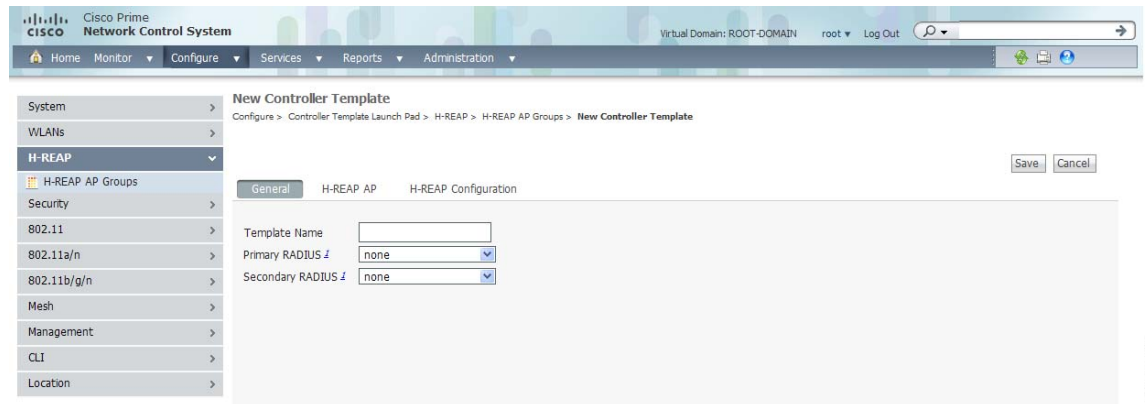

## Configuring H-REAP AP Groups Template

Hybrid REAP enables you to configure and control access points in a branch or remote office from the corporate office through a wide area network (WAN) link without deploying a controller in each office. There is no deployment restriction on the number of hybrid-REAP access points per location, but you can organize and group the access points per floor and limit them to 25 or so per building, since it is likely the branch offices share the same configuration.

To set up an H-REAP AP group, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
  - Step 2** Click **H-REAP AP Groups** or choose **H-REAP > H-REAP AP Groups** from the left sidebar menu. The H-REAP > H-REAP AP Groups page appears. It displays the primary and secondary RADIUS, as well as the number of controllers and virtual domains that the template is applied to, which automatically populates. The last column indicates when the template was last saved.  
  
The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
  - Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The General tab of the H-REAP AP Groups page appears (see [Figure 11-17](#)).

Figure 11-17 AP Groups H-REAP Template

291179

- Step 4** The Template Name parameter shows the group name assigned to the HREAP access point group.
- Step 5** Choose the primary RADIUS authentication servers for each group. If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply. A value of 10 indicates that the primary RADIUS server is not configured for this group.
- Step 6** Choose the secondary RADIUS authentication servers for each group. If a RADIUS authentication server is not present on the controller, the NCS configured RADIUS server does not apply. A value of 0 indicates that the primary RADIUS server is not configured for this group.
- Step 7** If you want to add an access point to the group, click the **H-REAP AP** tab.
- Step 8** An access point Ethernet MAC address cannot exist in more than one H-REAP group on the same controller. If more than one group is applied to the same controller, select the **Ethernet MAC** check box to unselect an access point from one of the groups. You should save this change or apply it to controllers.
- Step 9** Click **Add AP**. The H-REAP AP Group page appears.
- Step 10** Click the **H-REAP Configuration** tab to enable local authentication for a hybrid REAP group.

**Note** Make sure that the Primary RADIUS Server and Secondary RADIUS Server parameters are set to **None** on the General tab.

- Step 11** Select the **H-REAP Local Authentication** check box to enable local authentication for this hybrid-REAP group. The default value is unselected.

**Note** When you attempt to use this feature, a warning message indicates that it is a licensed feature.

**Note** You can click the **Users configured in the group** link that appears at the bottom of the page to view the list of H-REAP users. You can create H-REAP users only after you save the H-REAP AP Group.

- Step 12** To allow a hybrid-REAP access point to authenticate clients using LEAP, check the **LEAP** check box. Otherwise, to allow a hybrid-REAP access point to authenticate clients using EAP-FAST, check the **EAP-FAST** check box.

- Step 13** Perform one of the following, depending on how you want protected access credentials (PACs) to be provisioned:
- To use manual PAC provisioning, enter the key used to encrypt and decrypt PACs in the EAP-FAST Key and Confirm EAP-FAST Key text box. The key must be 32 hexadecimal characters.
  - To allow PACs to be sent automatically to clients that do not have one during PAC provisioning, check the **Auto key generation** check box.
- Step 14** In the EAP-FAST Key text box, enter the authority identifier of the EAP-FAST server. The identifier must be 32 hexadecimal characters.
- Step 15** In the EAP-FAST Authority ID text box, enter the authority identifier of the EAP-FAST server in text format. You can enter up to 32 hexadecimal characters.
- Step 16** In the EAP-FAST Pac Timeout text box, specify a PAC timeout value by entering the number of seconds for the PAC to remain viable in the edit box. The valid range is 2 to 4095 seconds.
- Step 17** Click **Save**.
- 

## Configuring H-REAP Users

**Note** You can create H-REAP users only after you save the H-REAP AP Group.

---

**Note** Maximum 100 H-REAP users are supported from 5.2.x.x controller version. If controller version is less than 5.2.0.0, only 20 H-REAP users are supported.

---

To configure a H-REAP user, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **H-REAP AP Groups** or choose **H-REAP > H-REAP AP Groups** from the left sidebar menu. The H-REAP > H-REAP AP Groups page appears.
- Step 3** Click the **H-REAP Configuration** tab to enable local authentication for a hybrid REAP group.
- Step 4** Select the **H-REAP Local Authentication** check box to enable local authentication for this hybrid-REAP group. The **Users configured in the group** link that appears at the bottom of the page
- Step 5** Click the **Users configured in the group** link. The H-REAP Users page appears.
- Step 6** If you want to add a new user, choose **Add User** from the Select a command drop-down list, and click **Go**. The **Add User** page appears.
- Step 7** In the User Name text box, enter the H-REAP username.
- Step 8** In the Password text box, enter the password.
- Step 9** Re-enter the password in the Confirm Password text box.
- Step 10** Click **Save**.

**Note**

To delete a H-REAP User, select a user from the H-REAP Users list, and then click **Delete**.

## Configuring Security Templates

This section contains the following topics:

- [Configuring a General Security Controller Template, page 11-41](#)
- [Configuring a File Encryption Template, page 11-42](#)
- [Configuring a RADIUS Authentication Template, page 11-43](#)
- [Configuring a RADIUS Accounting Template, page 11-45](#)
- [Configuring a RADIUS Fallback Template, page 11-46](#)
- [Configuring a LDAP Server Template, page 11-47](#)
- [Configuring a TACACS+ Server Template, page 11-48](#)
- [Configuring a Local EAP General Template, page 11-50](#)
- [Configuring a Local EAP Profile Template, page 11-51](#)
- [Configuring an EAP-FAST Template, page 11-53](#)
- [Configuring a Network User Priority Template, page 11-54](#)
- [Configuring a Local Network Users Template, page 11-55](#)
- [Configuring a Guest User Template, page 11-56](#)
- [Configuring a User Login Policies Template, page 11-58](#)
- [Configuring a MAC Filter Template, page 11-58](#)
- [Configuring an Access Point or MSE Authorization Template, page 11-59](#)
- [Configuring a Manually Disabled Client Template, page 11-61](#)
- [Configuring a Client Exclusion Policies Template, page 11-61](#)
- [Configuring an Access Point Authentication and MFP Template, page 11-63](#)
- [Configuring a Web Authentication Template, page 11-64](#)
- [Configuring an External Web Auth Server Template, page 11-67](#)

### Configuring a General Security Controller Template

To add a new template with general security information for a controller, follow these steps:

- 
- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **New** beside the template you want to add.
- Step 3** Add or modify the following parameters:
- Template Name

**Note** Template Name is the unique key used to identify the template. A template name is mandatory to distinguish between two templates that have identical key attributes.

- Maximum Local Database Entries (on next reboot)—Enter the maximum number of allowed database entries. This amount becomes effective on the next reboot.

**Step 4** Click **Save**. Once saved, the template displays in the Template List page. In the Template List page, you can apply this template to controllers. See the “[Applying Controller Templates](#)” section on page 11-2 for more information.

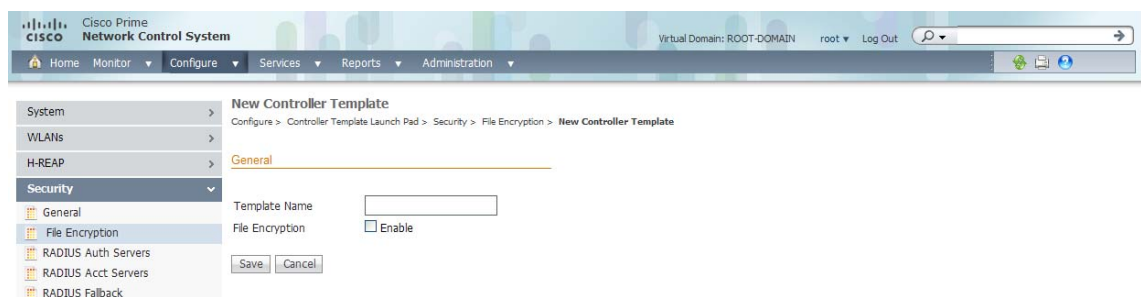

## Configuring a File Encryption Template

This page enables you to add a file encryption template or make modifications to an existing file encryption template.

To configure a File Encryption template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **File Encryption** or choose **Security > File Encryption** from the left sidebar menu. The Security > File Encryption page appears. The number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The File Encryption template page appears (see [Figure 11-18](#)).

**Figure 11-18 File Encryption Template**

- Step 4** Check if you want to enable file encryption.
- Step 5** Enter an encryption key text string of exactly 16 ASCII characters.
- Step 6** Retype the encryption key.
- Step 7** Click **Save**.

291180

## Configuring a RADIUS Authentication Template

This page allows you to add a RADIUS authentication template or make modifications to an existing template. After these server templates are configured, controller users who log into the controller through the CLI or GUI are authenticated.

To configure a RADIUS Authentication template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **RADIUS Auth Servers** or choose **Security > RADIUS Auth Servers** from the left sidebar menu. The Security > RADIUS Auth Servers page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The IP address of the RADIUS server and the port number and admin status for the interface protocol is also displayed. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The RADIUS Auth Servers template page appears (see [Figure 11-19](#)).

**Figure 11-19 RADIUS Authentication Server Template**

The screenshot shows the Cisco Prime Network Control System interface. The main content area is titled 'New Controller Template' and is part of the 'RADIUS Auth Servers' configuration. The left sidebar shows a tree view with 'Security' expanded to 'RADIUS Auth Servers'. The main form contains the following fields:

- Template Name: Radius\_Auth\_Serv\_Temp
- Server Address: 209.165.200.224
- Port Number: 1812
- Shared Secret Format: ASCII (dropdown menu)
- Shared Secret: [Redacted]
- Confirm Shared Secret: [Redacted]
- Key WRAP:  Enable
- Admin Status:  Enable
- Support for RFC 3576:  Enable
- Network User:  Enable
- Management User:  Enable
- Retransmit Timeout: 2 (secs)
- IPsec:  Enable

Buttons for 'Save' and 'Cancel' are at the bottom of the form.

- Step 4** Use the Shared Secret Format drop-down list to choose either ASCII or hex shared secret format.

**Note** Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device.

- Step 5** Enter the RADIUS shared secret used by your specified server.

**Step 6** Click if you want to enable key wrap. If this option is enabled, the authentication request is sent to RADIUS servers that have key encryption key (KEK) and message authenticator code keys (MACK) configured. Also, when enabled, the parameters below appear:

- Shared Secret Format: Determine whether ASCII or hexadecimal.

**Note** Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device.

- KEK Shared Secret: Enter KEK shared secret.
- MACK Shared Secret: Enter MACK shared secret.

**Note** Each time the controller is notified with the shared secret, the existing shared secret is overwritten with the new shared secret.

**Step 7** Click if you want to enable administration privileges.

**Step 8** Click if you want to enable support for RFC 3576. RFC 3576 is an extension to the Remote Authentication Dial In User Service (RADIUS) protocol. It allows dynamic changes to a user session and includes support for disconnecting users and changing authorizations applicable to a user session. With these authorizations, support is provided for Disconnect and Change-of-Authorization (CoA) messages. Disconnect messages immediately terminate a user session, whereas CoA messages modify session authorization attributes such as data filters.

**Step 9** Click if you want to enable network user authentication. If this option is enabled, this entry is considered as the RADIUS authenticating server for the network user.

**Step 10** Click if you want to enable management authentication. If this option is enabled, this entry is considered as the RADIUS authenticating server for the management user.

**Step 11** Specify the time in seconds after which the RADIUS authentication request times out and a retransmission is attempted by the controller. You can specify a value between 2 and 30 seconds.

**Step 12** If you click to enable the IP security mechanism, additional IP security parameters are added to the page, and Steps 13 to 19 are required. If you disable it, click **Save** and skip Steps 13 to 19.

**Step 13** Use the drop-down list to choose which IP security authentication protocol to use. The options are HMAC-SHA1, HMAC-MD5, and None.

Message Authentication Codes (MAC) are used between two parties that share a secret key to validate information transmitted between them. HMAC (Hash MAC) is a mechanism based on cryptographic hash functions and can be used in combination with any iterated cryptographic hash function. HMAC-MD5 and HMAC-SHA1 are two constructs of the HMAC using the MD5 hash function and the SHA1 hash function. HMAC also uses a secret key for calculation and verification of the message authentication values.

**Step 14** Set the IP security encryption mechanism to use. Options are as follows:

- DES—Data Encryption Standard is a method of data encryption using a private (secret) key. DES applies a 56-bit key to each 64-bit block of data.
- Triple DES—Data Encryption Standard that applies three keys in succession.

- AES 128 CBC—Advanced Encryption Standard uses keys with a length of 128, 192, or 256 bits to encrypt blocks with a length of 128, 192, or 256 bits. AES 128 CBC uses a 128-bit data path in Cipher Block Chaining (CBC) mode.
  - None—No IP security encryption mechanism.
- Step 15** The Internet Key Exchange (IKE) authentication is not an editable text box. Internet Key Exchange protocol (IKE) is used as a method of distributing the session keys (encryption and authentication), as well as providing a way for the VPN endpoints to agree on how data should be protected. IKE keeps track of connections by assigning a bundle of security associations (SAs) to each connection.
- Step 16** Use the IKE phase 1 drop-down list to choose either aggressive or main. This sets the IKE protocol. IKE phase 1 is used to negotiate how IKE is protected. Aggressive mode passes more information in fewer packets, with the benefit of a slightly faster connection, at the cost of transmitting the identities of the security gateways in the clear.
- Step 17** At the Lifetime parameter, set the timeout interval (in seconds) when the session expires.
- Step 18** Set the IKE Diffie Hellman group. The options are group 1 (768 bits), group 2 (1024 bits), or group 5 (1536 bits). Diffie-Hellman techniques are used by two devices to generate a symmetric key where you can publicly exchange values and generate the same symmetric key.
- Although all three groups provide security from conventional attacks, Group 5 is considered more secure because of its larger key size. However, computations involving Group 1 and Group 2 based keys might occur slightly faster because of their smaller prime number size.
- Step 19** Click **Save**.
- 

## Configuring a RADIUS Accounting Template

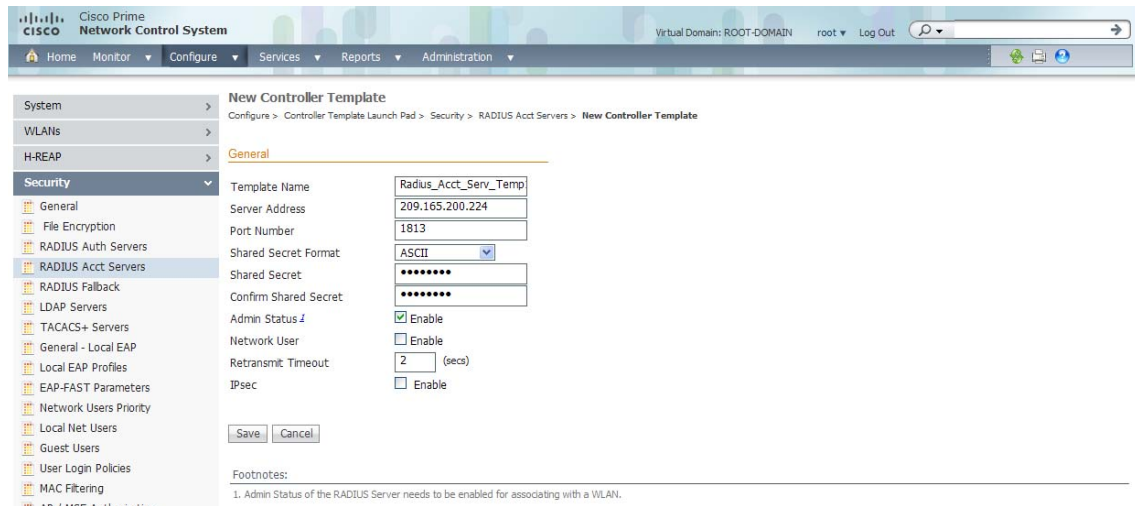

This page allows you to add a RADIUS accounting template or make modifications to an existing RADIUS accounting template.

To configure a RADIUS Accounting template, follow these steps:

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **RADIUS Acct Servers** or choose **Security > RADIUS Acct Servers** from the left sidebar menu. The Security > RADIUS Acct Servers page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The IP address of the RADIUS server and the port number and admin status for the interface protocols are also displayed. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The RADIUS Accounting Server template page appears (see [Figure 11-20](#)).

Figure 11-20 RADIUS Accounting Server Templates

291182

- Step 4** Use the Shared Secret Format drop-down list to choose either ASCII or hexadecimal.

**Note** Regardless of the format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. You should set the key format again in the template in case a discovered template is applied to another device.

- Step 5** Enter the RADIUS shared secret used by your specified server.
- Step 6** Retype the shared secret.
- Step 7** Click if you want to establish administrative privileges for the server.
- Step 8** Click if you want to enable the network user authentication. If this option is enabled, this entry is considered as the RADIUS authenticating server for the network user.
- Step 9** Specify the time in seconds after which the RADIUS authentication request will timeout and a retransmission by the controller will occur. You can specify a value between 2 and 30 seconds.
- Step 10** Click **Save**.

## Configuring a RADIUS Fallback Template

This page allows you to add a RADIUS fallback template or make modifications to an existing RADIUS fallback template.

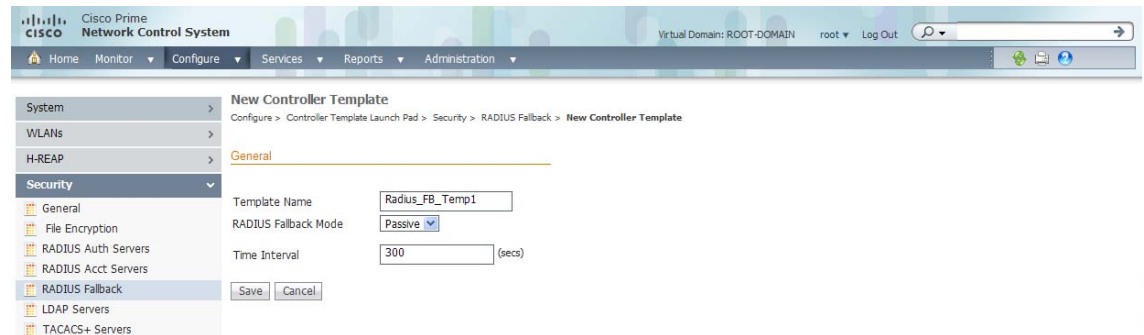

To configuring a RADIUS Fallback template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **RADIUS Fallback** or choose **Security > RADIUS Fallback** from the left sidebar menu. The Security > RADIUS Fallback page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, choose **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The RADIUS Fallback template page appears (see [Figure 11-21](#)).

**Figure 11-21 RADIUS Fallback Page**

- Step 4** From the RADIUS Fallback Mode drop-down list, choose **Off**, **Passive**, or **Active**.

- Off—Disables fallback.
- Passive—You must enter a time interval.
- Active—You must enter a username and time interval.

- Step 5** Click **Save**.

291183

## Configuring a LDAP Server Template

This section explains how to configure a Lightweight Directory Access Protocol (LDAP) server as a backend database, similar to a RADIUS or local user database. An LDAP backend database allows the controller to query an LDAP server for the credentials (username and password) of a particular user. These credentials are then used to authenticate the user. For example, local EAP may use an LDAP server as its backend database to retrieve user credentials.

To add an LDAP server template or make modifications to an existing LDAP server template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **LDAP Servers** or choose **Security > LDAP Servers** from the left sidebar menu. The Security > LDAP Servers page appear. The IP address of the LDAP server and the port number for the interface protocols are displayed. Also, the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The LDAP Server template page appears (see [Figure 11-22](#)).

**Figure 11-22** LDAP Server Template

The screenshot shows the 'New Controller Template' configuration page in the Cisco Prime Network Control System. The breadcrumb trail is 'Configure > Controller Template Launch Pad > Security > LDAP Servers > New Controller Template'. The left sidebar shows the 'Security' menu expanded to 'LDAP Servers'. The main content area is titled 'General' and contains the following fields:

- Template Name: LDAP\_Serv\_Temp1
- Server Address: 209.165.200.224
- Port Number: 389
- Bind Type: Anonymous (dropdown menu)
- Server User Base DN: (empty text box)
- Server User Attribute: (empty text box)
- Server User Type: (empty text box)
- Retransmit Timeout: 2 (secs)
- Admin Status:  Enable

At the bottom of the form are 'Save' and 'Cancel' buttons. Below the form, there are footnotes:

1. LDAP can only be used with EAP-FAST, EAP-TLS and PEAP-GTC methods
2. SNMP support for configuring Bind Type, Bind Username and Bind Password are applicable from controller version 5.2.26.x.

- Step 4** The port number of the controller to which the access point is connected.
- Step 5** From the Bind Type drop-down list, choose **Authenticated** or **Anonymous**. If you choose Authenticated, you must enter a bind username and password as well. A bind is a socket opening that performs a lookup. Anonymous bind requests are rejected.
- Step 6** In the Server User Base DN text box, enter the distinguished name of the subtree in the LDAP server that contains a list of all the users.
- Step 7** In the Server User Attribute text box, enter the attribute that contains the username in the LDAP server.
- Step 8** In the Server User Type text box, enter the ObjectType attribute that identifies the user.
- Step 9** In the Retransmit Timeout text box, enter the number of seconds between retransmissions. The valid range is 2 to 30 seconds, and the default value is 2 seconds.
- Step 10** Select the **Admin Status** check box if you want the LDAP server to have administrative privileges.
- Step 11** Click **Save**.

## Configuring a TACACS+ Server Template

This page allows you to add a TACACS+ server or make modifications to an existing TACACS+ server template. After these server templates are configured, controller users who log into the controller through the CLI or GUI are authenticated.

To configure a TACACS+ Server template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **TACACS+ Server** or choose **Security > TACACS+ Server** from the left sidebar menu. The Security > TACACS+ Servers page appears. The IP address and the port number and admin of the TACACS+ template are displayed. Also, the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The TACACS+ Servers template page appears (see Figure 11-23).

**Figure 11-23 TACACS+ Server Template**

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controller Template Launch Pad > Security > TACACS+ Servers > New Controller Template. The left sidebar shows the 'Security' menu expanded, with 'TACACS+ Servers' selected. The main content area is titled 'New Controller Template' and contains the following fields:

- Template Name: TACACS+\_Serv\_Temp1
- Server Type: Authentication
- Server Address: 209.165.200.224
- Port Number: 49
- Shared Secret Format: ASCII
- Shared Secret: [Redacted]
- Confirm Shared Secret: [Redacted]
- Admin Status:  Enable
- Retransmit Timeout: 5 (secs)

Buttons for 'Save' and 'Cancel' are located at the bottom of the form.

**Step 4** Select the server type. The choices are authentication, authorization, or accounting.

**Step 5** Use the drop-down list to choose either ASCII or hex shared secret format.

**Note** Regardless of which format you choose, for security reasons, only ASCII is visible on the WLC (and NCS). For this reason, you cannot use a template to replicate the configuration on a second controller during auto provisioning. Set the key format again in the template in the event a discovered template is applied to another device.

**Step 6** Enter the TACACS+ shared secret used by your specified server.

**Step 7** Re-enter the shared secret in the Confirm Shared Secret text box.

**Step 8** Select the **Admin Status** check box if you want the TACACS+ server to have administrative privileges.

**Step 9** Specify the time in seconds after which the TACACS+ authentication request times out and a retransmission is attempted by the controller.

**Step 10** Click **Save**.

## Configuring a Local EAP General Template

This page allows you to specify a timeout value for local EAP. You can then add or make changes to an existing local EAP general template.

### Note

If any RADIUS servers are configured on the controller, the controller tries to authenticate the wireless clients using the RADIUS servers first. Local EAP is attempted only if no RADIUS servers are found, either because the RADIUS servers timed out or no RADIUS servers were configured. If four RADIUS servers are configured, the controller attempts to authenticate the client with the first RADIUS server, then the second RADIUS server, and then local EAP. If the client attempts to then reauthenticate manually, the controller tries the third RADIUS server, then the fourth RADIUS server, and then local EAP.

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Local EAP General** or choose **Security > Local EAP General** from the left sidebar menu. The **Security > Local EAP General** page appears. The number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Local EAP General controller template page appears (see [Figure 11-24](#)).

**Figure 11-24** Local EAP General Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controller Template Launch Pad > Security > General - Local EAP > New Controller Template. The left sidebar shows the navigation menu with 'Security > General - Local EAP' selected. The main content area is titled 'New Controller Template' and contains the following configuration fields:

| Field Name                                 | Value                                      | Unit    |
|--------------------------------------------|--------------------------------------------|---------|
| Template Name                              | Gen_LocalEAP_Temp1                         |         |
| Local Auth Active Timeout                  | 300                                        | (secs)  |
| Local EAP Identity Request Timeout         | 30                                         | (secs)  |
| Local EAP Identity Request Maximum Retries | 2                                          |         |
| Local EAP Dynamic Wep Key Index            | 0                                          |         |
| Local EAP Request Timeout                  | 30                                         | (secs)  |
| Local EAP Request Maximum Retries          | 0                                          |         |
| EAPOL-Key Timeout                          | 1000                                       | (msecs) |
| EAPOL-Key Max Retries                      | 2                                          |         |
| Max-Login Ignore Identity Response         | <input checked="" type="checkbox"/> Enable |         |

Buttons for 'Save' and 'Cancel' are located at the bottom of the configuration area.

**Step 4** In the Local Auth Active Timeout text box, enter the amount of time (in seconds) that the controller attempts to authenticate wireless clients using local EAP after any pair of configured RADIUS servers fail. The valid range is 1 to 3600 seconds, and the default setting is 1000 seconds.

291186

**Step 5** The following values should be adjusted if you are using EAP-FAST, manual password entry, one-time password, or 7920/7921 phones. You must increase the 802.1x timeout values on the controller (default=2 seconds) for the client to obtain the PAC using automatic provisioning. The recommended and default timeout on the Cisco ACS server is 20 seconds.

---

**Note** Roaming fails if these values are not set the same across multiple controllers.

---

- Local EAP Identify Request Timeout =1
- Local EAP Identity Request Maximum Retries=20
- Local EAP Dynamic WEP Key Index=0
- Local EAP Request Timeout=20
- Local EAP Request Maximum Retries=2

**Step 6** Click **Save**.

---

## Configuring a Local EAP Profile Template

This page allows you to add a local EAP profile template or make modifications to an existing template. Local EAP is an authentication method that allows users and wireless clients to be authenticated locally. It is designed for use in remote offices that want to maintain connectivity to wireless clients when the backend system becomes disrupted or the external authentication server goes down. When you enable local EAP, the controller serves as the authentication server and the local user database, thereby removing dependence on an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP backend database to authenticate users.

---

**Note** The LDAP backend database supports only these local EAP methods: EAP-TLS and EAP-FAST with certificates. LEAP and EAP-FAST with PACs are not supported for use with the LDAP backend database.

---

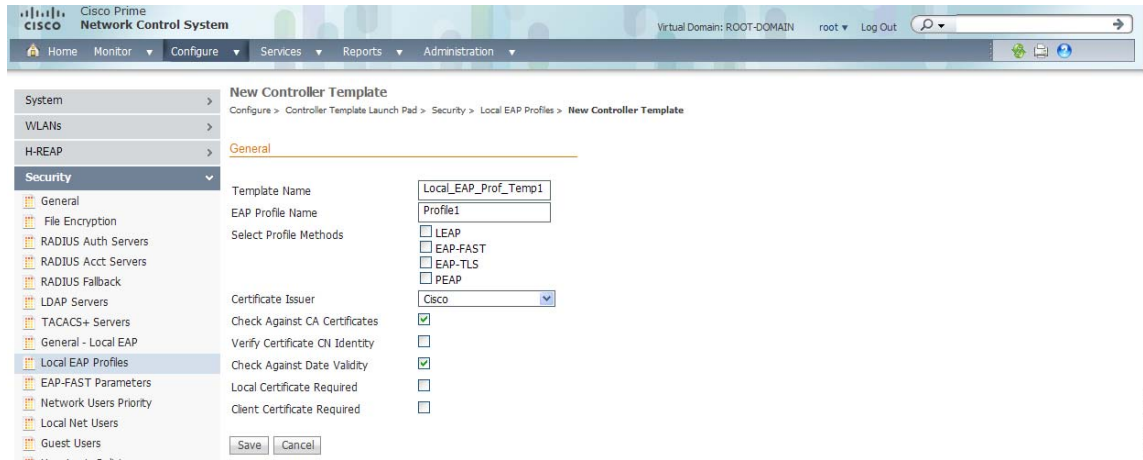

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Local EAP Profiles** or choose **Security > Local EAP Profiles** from the left sidebar menu. The Security > Local EAP Profiles page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. It also shows the EAP profile name and indicates whether LEAP, EAP-FAST, TLS, or PEAP is used. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Local EAP Profiles template page appears (see [Figure 11-25](#)).

Figure 11-25 Local EAP Profiles Template

- Step 4** Each EAP profile must be associated with an authentication type(s). Choose the desired authentication type:
- **LEAP**—This authentication type leverages Cisco Key Integrity Protocol (CKIP) and MMH message integrity check (MIC) for data protection. A username and password are used to perform mutual authentication with the RADIUS server through the access point.
  - **EAP-FAST**—This authentication type (Flexible Authentication via Secure Tunneling) uses a three-phased tunnel authentication process to provide advanced 802.1X EAP mutual authentication. A username, password, and PAC (protected access credential) are used to perform mutual authentication with the RADIUS server through the access point.
  - **TLS**—This authentication type uses a dynamic session-based WEP key derived from the client adapter and RADIUS server to encrypt data. It requires a client certificate for authentication.
  - **PEAP**—This authentication type is based on EAP-TLS authentication but uses a password instead of a client certificate for authentication. PEAP uses a dynamic session-based WEP key derived from the client adapter and RADIUS server to encrypt data.
- Step 5** Use the Certificate Issuer drop-down list to determine whether Cisco or another vendor issued the certificate for authentication. Only EAP-FAST and TLS require a certificate.
- Step 6** If you want the incoming certificate from the client to be validated against the certificate authority (CA) certificates on the controller, select the **Check Against CA Certificates** check box.
- Step 7** If you want the common name (CN) in the incoming certificate to be validated against the CA certificates' CN on the controller, select the **Verify Certificate CN Identity** check box.
- Step 8** If you want the controller to verify that the incoming device certificate is still valid and has not expired, select the **Check Against Date Validity** check box.
- Step 9** If a local certificate is required, select the check box.
- Step 10** If a client certificate is required, select the check box.
- Step 11** Click **Save**.
- Step 12** To enable local EAP, follow these steps:
- Choose **WLAN > WLAN Configuration** from the left sidebar menu.
  - Click the profile name of the desired WLAN.
  - Click the **Security > AAA Servers** tab to access the AAA Servers page.

- d. Select the **Local EAP Authentication** check box to enable local EAP for this WLAN.

**Step 13** Click **Save**.

## Configuring an EAP-FAST Template

This authentication type (Flexible Authentication via Secure Tunneling) uses a three-phased tunnel authentication process to provide advanced 802.1X EAP mutual authentication. A username, password, and PAC are used to perform mutual authentication with the RADIUS server through the access point. This page allows you to add an EAP-FAST template or make modifications to an existing EAP-FAST template.

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **EAP-FAST Parameters** or choose **Security > EAP-FAST Parameters** from the left sidebar menu. The Security > EAP-FAST Parameters page appears. The number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The EAP-FAST Parameters template page appears (see Figure 11-26).

**Figure 11-26** EAP-FAST Parameters Template

The screenshot shows the Cisco Prime Network Control System interface. The breadcrumb trail is: Configure > Controller Template Launch Pad > Security > EAP-FAST Parameters > New Controller Template. The left sidebar shows the 'Security' menu expanded to 'EAP-FAST Parameters'. The main content area is titled 'New Controller Template' and contains the following fields:

- Template Name: EAP-Fast\_Parm\_temp1
- Time to live for the PAC: 1 (days)
- Authority ID: 436973636f (hex)
- Authority Info: Cisco A-D
- Server Key: [masked] (hex)
- Confirm Server Key: [masked]
- Anonymous Provision:

Buttons for 'Save' and 'Cancel' are visible at the bottom of the form.

**Step 4** In the Time to Live for the PAC text box, enter the number of days for the PAC to remain viable. The valid range is 1 to 1000 days, and the default setting is 10 days.

**Step 5** In the Authority ID text box, enter the authority identifier of the local EAP-FAST server in hexadecimal characters. You can enter up to 32 hexadecimal characters, but you must enter an even number of characters.

**Step 6** In the Authority ID text box, enter the ID for the authority identifier of the local EAP-FAST server.

**Step 7** In the Authority Info text box, enter the authority identifier of the local EAP-FAST server in text format.

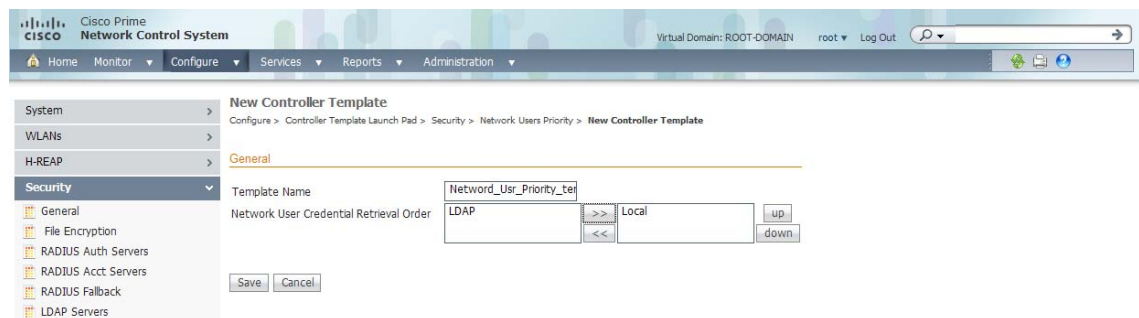

- Step 8** In the Server Key and Confirm Server Key fields, enter the key (in hexadecimal characters) used to encrypt and decrypt PACs.
- Step 9** If you want to enable anonymous provisioning, select the **Anonymous Provision** check box. This feature allows PACs to be sent automatically to clients that do not have one during PAC provisioning. If you disable this feature, PACs must be manually provisioned.
- Step 10** Click **Save**.

## Configuring a Network User Priority Template

You can specify the order that LDAP and local databases use to retrieve user credential information. This page allows you to add or make modifications to an existing network user credential retrieval priority template.

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Network Users Priority** or choose **Security > Network Users Priority** from the left sidebar menu. The Security > Network User Credential Retrieval Priority page appears. The network retrieval order and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.  
  
The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Network Users Priority template page appears (see [Figure 11-27](#)).

**Figure 11-27** Network User Credential Retrieval Priority Order Template

- Step 4** Use the left and right pointing arrows to include or disclude network user credentials in the right page.
- Step 5** Use the up and down buttons to determine the order credentials are tried.
- Step 6** Click **Save**.

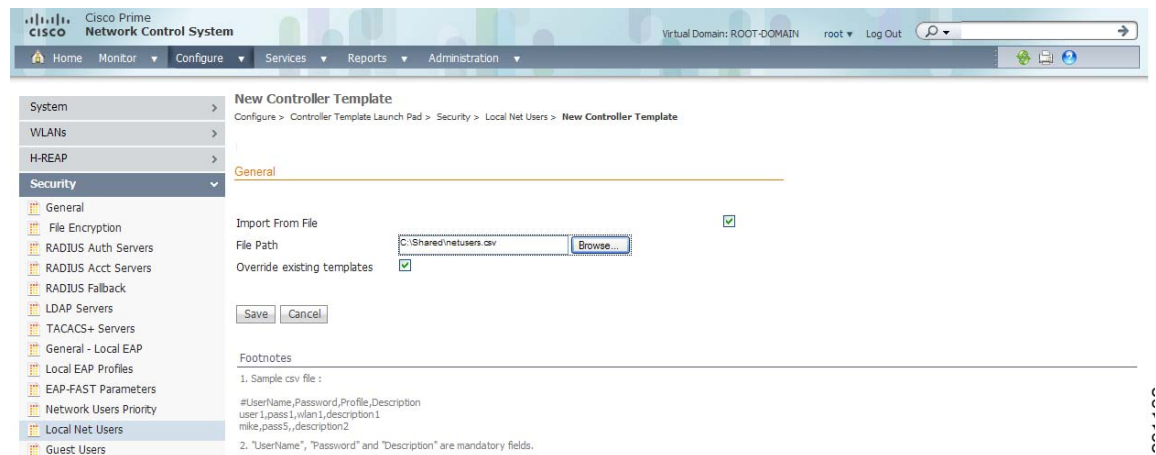

## Configuring a Local Network Users Template

With this template, you can store the credentials (username and password) of all the local network users. These credentials are then used to authenticate the users. For example, local EAP may use the local user database as its backend database to retrieve user credentials. This page allows you to add or make modifications to an existing local network user template. You must create a local net user and define a password when logging in as a web authentication client.

To configure a Local Network Users template, follow these steps:

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Local Net Users** or choose **Security > Local Net Users** from the left sidebar menu. The Security > Local Net Users page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.
- The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Local Net Users template page appears (see [Figure 11-28](#)).

**Figure 11-28 Local Net Users Template**

- Step 4** If you keep Import from File enabled, you need to enter a file path or click the Browse button to navigate to the file path. Then continue to Step 11. If you disable the import, continue to Step 5.

**Note** You can only import a.csv file. Any other file formats are not supported.

The first row in the file is the header. The data in the header is not read by NCS. The header can either be blank or filled. The Cisco NCS reads data from the second row onwards.

- Step 5** Enter a username and password. It is mandatory to fill the Username and Password fields in all the rows.
- Step 6** Enter a profile. The Profile column if left blank (or filled in with *any profile*) means a client on any profile can use this account.

- Step 7** Enter a description of the profile.
  - Step 8** Use the drop-down list to choose the SSID which this local user is applied to or choose the *any SSID* option.
  - Step 9** Enter a user-defined description of this interface. Skip to Step 11.
  - Step 10** If you want to override the existing template parameter, click to enable this parameter.
  - Step 11** Click **Save**.
- 

## Guest User Templates

Choose **Configure > Controller Template Launch Pad > Security > Guest Users** to access the Guest Users list page.

**Note** To reduce clutter, NCS does not show expired templates by default. You can specify which guest users to filter based on their status (active, scheduled, expired, not active, or none). Use the Select a Status Filter drop-down list to determine the filter criteria.

---

**Note** Click the **Edit View** link to add, remove or reorder columns in the Guest Users table.

---

This section contains the following sections:

- [Configuring a Guest User Template, page 11-56](#)

## Configuring a Guest User Template

This page allows you to add a guest user template or make modifications to an existing guest user template. The purpose of a guest user account is to provide a user account for a limited amount of time. A Lobby Ambassador is able to configure a specific time frame for the guest user account to be active. After the specified time period, the guest user account automatically expires. See the “[Creating Guest User Accounts](#)” section on page 7-9 for further information on guest access.

---

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Guest Users** or choose **Security > Guest Users** from the left sidebar menu. The Security > Guest User page appears.

**Note** To reduce clutter, NCS does not show expired templates by default. You can specify which guest users to filter based on their status (active, scheduled, expired, not active, or none). Use the Select a Status Filter drop-down list to determine the filter criteria.

---

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Guest Users template page appears (see [Figure 11-29](#)).

Figure 11-29 Guest User Template

291193

- Step 4** Enter a guest name. Maximum size is 24 characters.
- Step 5** Enter a password for this username.
- Step 6** Click the **Advanced** tab.
- Step 7** Use the Profile drop-down list to choose the guest user to connect to.
- Step 8** Choose a user role for the guest user from the drop-down list. User roles are predefined by the administrator and are associated with the guests' access (such as contractor, customer, partner, vendor, visitor, and so on).  
User Role is used to manage the amount of bandwidth allocated to specific users within the network.
- Step 9** Define how long the guest user account will be active by choosing either the Limited or Unlimited Lifetime option.
- For the limited option, you choose the period of time that the guest user account is active using the hours and minutes drop-down lists. The default value for Limited is one day (8 hours).
  - When Unlimited is chosen, there is no expiration date for the guest account.
- Step 10** Choose the area (indoor, outdoor), controller list, or config group to which the guest user traffic is limited from the Apply to drop-down list.  
If you choose the controller list option, a list of controller IP addresses appears.
- Step 11** (Optionally) Modify the default guest user description on the General tab if necessary.
- Step 12** (Optionally) Modify the Disclaimer text on the General tab, if necessary. If you want the supplied text to be the default, select the **Make this Disclaimer default** check box.
- Step 13** Click **Save**.

## Configuring a User Login Policies Template

This page allows you to add a user login template or make modifications to an existing user login policies template. On this template you set the maximum number of concurrent logins that each single user can have.

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **User Login Policies** or choose **Security > User Login Policies** from the left sidebar menu. The Security > User Login Policies page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The User Login Policies template page appears (see [Figure 11-30](#)).

**Figure 11-30** User Login Policies Template

- Step 4** You can adjust the maximum number of concurrent logins each single user can have.
- Step 5** Click **Save** to keep this template.

## Configuring a MAC Filter Template

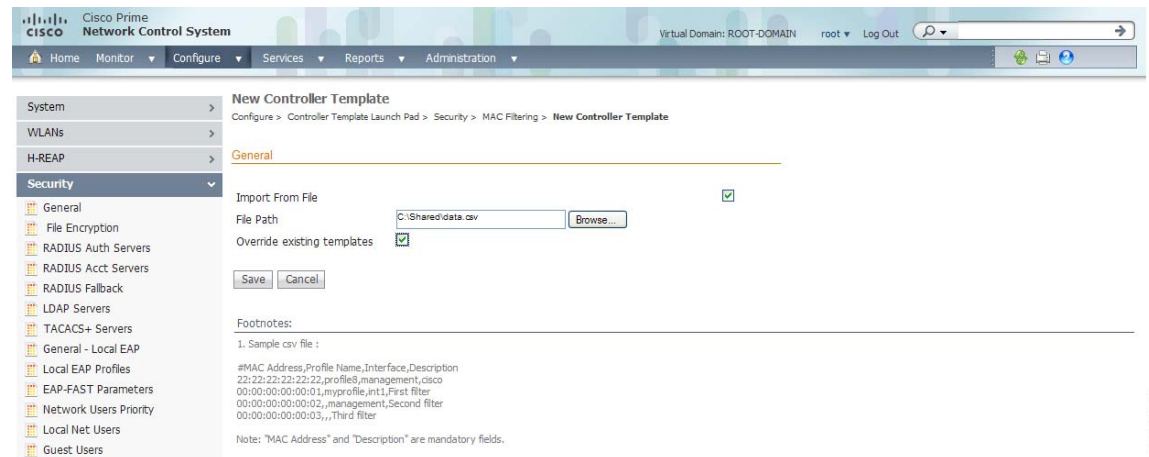

This page allows you to add a MAC filter template or make modifications to an existing MAC filter template.

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **MAC Filtering** or choose **Security > MAC Filtering** from the left sidebar menu. The Security > MAC Filtering page appears.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The MAC Filtering template page appears (see [Figure 11-31](#)).

**Figure 11-31** MAC Filter Templates

- Step 4** If you keep **Import From File** enabled, you need to enter a file path or click the **Browse** button to navigate to the file path. The import file must be a CSV file with MAC address, profile name, interface, and description (such as 00:11:22:33:44:55,Profile1,management,test filter). If you disable **Import From File**, continue to [Step 5](#). Otherwise, skip to [Step 8](#).

The client MAC address appears.

- Step 5** Choose the profile name to which this MAC filter is applied or choose the **any Profile** option.
- Step 6** Use the drop-down list to choose from the available interface names.
- Step 7** Enter a user-defined description of this interface. Skip to [Step 9](#).
- Step 8** If you want to override the existing template parameter, click to enable this parameter.
- Step 9** Click **Save**.

**Note** You cannot use MAC address in the broadcast range.

## Configuring an Access Point or MSE Authorization Template

To add an MSE authorization or make changes to an existing access point or MSE authorization template, follow these steps:

**Note** These templates are devised for Cisco 11xx/12xx series access points converted from Cisco IOS to lightweight access points or for 1030 access points connecting in bridge mode. See the *Cisco Mobility Services Engine Configuration Guide* for further information.

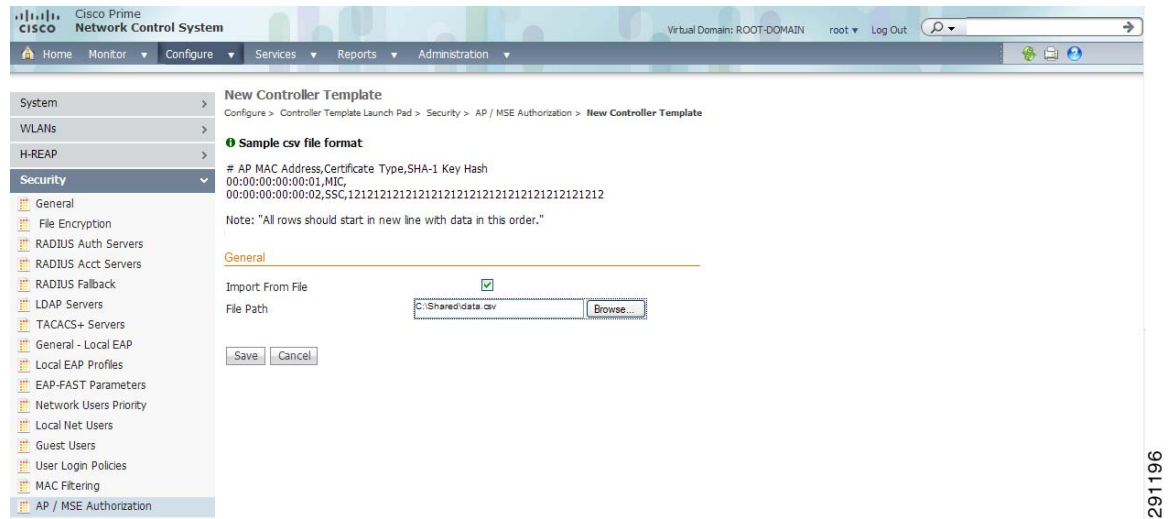

- Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **AP/MSE Authorization** or choose **Security > AP/MSE Authorization** from the left sidebar menu. The Security > AP/LBS Authorization Template appears, and the number of controllers and virtual domains that the template is applied to automatically populates. This initial page also shows the Base Radio MAC and the certificate type and key. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The AP/MSE Authorization template page appears (see [Figure 11-32](#)).

**Figure 11-32 AP/MSE Authorization Templates**

**Step 4** Select the **Import from File** check box if you want to import a file containing access point MAC addresses.

**Note** You can only import a .csv file. The .csv file format parallels the fields in the GUI and therefore includes access point base radio MAC, Type, Certificate Type (MIC or SSC), and key hash (such as 00:00:00:00:00:00, AP, SSC, xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx). Any other file formats are not supported.

**Step 5** Enter the file path from where you want to import the file.

**Step 6** Click **Save**.

**Note** You cannot use MAC address in the broadcast range.

## Configuring a Manually Disabled Client Template

This page allows you to add a manually disable client template or make modifications to an existing disabled client template.

- Step 1** Choose **Configure > Controller Template Launch Pad**.
- Step 2** Click **Disable Clients** or choose **Security > Disabled Clients** from the left sidebar menu. The Security > Disabled Clients page appears.
- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Manually Disabled template page appears (see [Figure 11-33](#)).

**Figure 11-33** Manually Disabled Clients Template

The screenshot shows the 'New Controller Template' configuration page. The breadcrumb trail is 'Configure > Controller Template Launch Pad > Security > Manually Disabled Clients > New Controller Template'. The left sidebar shows a tree view with 'Security' expanded to 'Manually Disabled Clients'. The main form area has the following fields:

|               |                       |
|---------------|-----------------------|
| Template Name | DisabledCleints_Temp1 |
| MAC Address   | 00:16:36:d3:31:49     |
| Description   |                       |

Buttons for 'Save' and 'Cancel' are located below the form fields.

- Step 4** Enter the MAC address of the client you want to disable.
- Step 5** Enter a description of the client you are setting to disabled.
- Step 6** Click **Save**.

**Note** You cannot use MAC address in the broadcast range.

## Configuring a Client Exclusion Policies Template

To add a client exclusion policies template or modify an existing client exclusion policies template, follow these steps:

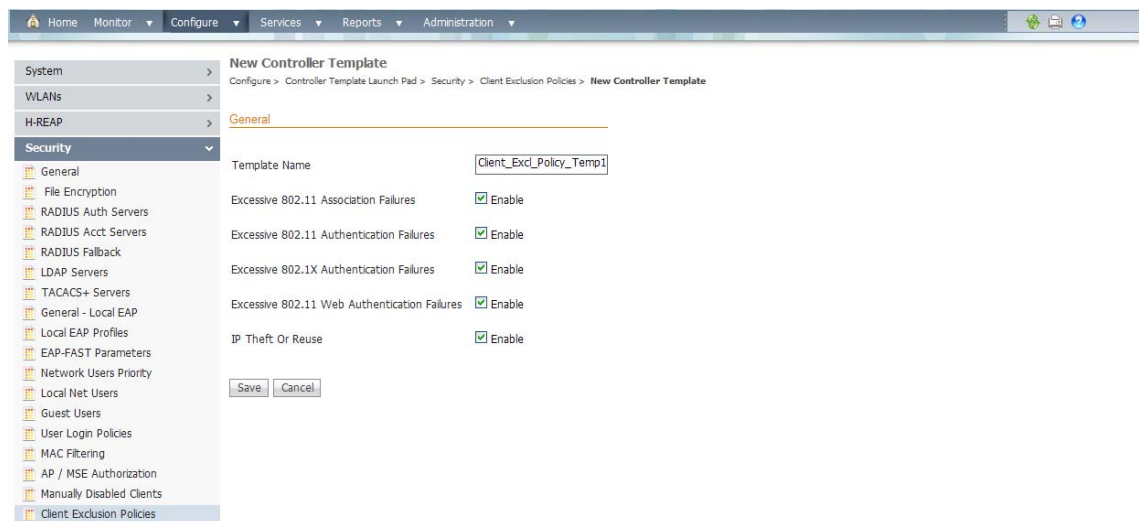

- Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Client Exclusion Policies** or choose **Security > Client Exclusion Policies** from the left sidebar menu. The Security > Client Exclusion Policies page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Client Exclusion Policies template page appears (see [Figure 11-34](#)).

**Figure 11-34** Policies Template

**Step 4** Edit a client exclusion policies template by configuring its parameters. (see [Table 11-3](#))

**Table 11-3** Policies Template Parameters

| Parameter                                    | Description                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------|
| Template Name                                | Enter a name for the client exclusion policy.                                |
| Excessive 802.11 Association Failures        | Enable to exclude clients with excessive 802.11 association failures.        |
| Excessive 802.11 Authentication Failures     | Enable to exclude clients with excessive 802.11 authentication failures.     |
| Excessive 802.1X Authentication Failures     | Enable to exclude clients with excessive 802.1X authentication failures.     |
| Excessive 802.11 Web Authentication Failures | Enable to exclude clients with excessive 802.11 web authentication failures. |
| IP Theft or Reuse                            | Enable to exclude clients exhibiting IP theft or reuse symptoms.             |

**Step 5** Click **Save**.

---

## Configuring an Access Point Authentication and MFP Template

Management Frame Protection (MFP) provides for the authentication of 802.11 management frames by the wireless network infrastructure. Management frames can be protected to detect adversaries who are invoking denial of service attacks, flooding the network with associations and probes, interjecting as rogue access points, and affecting the network performance by attacking the QoS and radio measurement frames.

When enabled, the access point protects the management frames it transmits by adding a message integrity check information element (MIC IE) to each frame. Any attempt to copy, alter, or replay the frame invalidates the MIC, causing any receiving access point configured to detect MFP frames to report the discrepancy. An access point must be a member of a WDS to transmit MFP frames.

When MFP detection is enabled, the access point validates every management frame that it receives from other access points in the network. It ensures that the MIC IE is present (when the originator is configured to transmit MFP frames) and matches the content of the management frame. If it receives any frame that does not contain a valid MIC IE from a BSSID belonging to an access point that is configured to transmit MFP frames, it reports the discrepancy to the network management system.

To add or make modifications for the access point authentication and management frame protection (MFP) template, follow these steps:

---

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **AP Authentication and MFP** or choose **Security > AP Authentication and MFP** from the left sidebar menu. The **Security > AP Authentication Policy Template** appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The **Applied to Controllers** number is a link. Clicking the number opens an **Applied to Controllers** page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The **Applied to Virtual Domains** number is also a link. Clicking this link opens an **Applied to Virtual Domains** page that shows all partition names.

**Step 3** If you want to add a new template, click **Add Template** from the **Select a command** drop-down list, and click **Go**. To modify an existing template, click the template name. The **AP Authentication and MFP** template page appears (see [Figure 11-35](#)).

Figure 11-35 AP Authentication Policy Template

The screenshot shows the 'New Controller Template' configuration page. The breadcrumb trail is: Home > Monitor > Configure > Services > Reports > Administration > New Controller Template. The left sidebar shows the navigation tree with 'Security' expanded to 'AP Authentication and MFP'. The main content area is titled 'New Controller Template' and shows the following fields:

- Template Name: AP\_Auth\_temp1
- Protection Type: AP Authentication (selected from a dropdown)
- Alarm Trigger Threshold: 1

There are 'Save' and 'Cancel' buttons below the fields. A 'Footnotes' section at the bottom contains the text: '1. In case of multi-controller environment, please enable NTP on all controllers.'

291199

**Step 4** From the Protection Type drop-down list, choose one of the following authentication policies:

- None: No access point authentication policy.
- AP Authentication: Apply authentication policy.
- MFP: Apply management frame protection.

Alarm trigger threshold appears only when AP authentication is selected as a protection type. Set the number of hits from an alien access point to ignore before raising an alarm.

The valid range is from 1 to 255. The default value is 255.

**Step 5** Click **Save**.

## Configuring a Web Authentication Template

With web authentication, guests are automatically redirected to a web authentication page when they launch their browsers. Guests gain access to the WLAN through this web portal. Wireless LAN administrators using this authentication mechanism should have the option of providing unencrypted or encrypted guest access. Guest users can then log into the wireless network using a valid username and password, which is encrypted with SSL. Web authentication accounts may be created locally or managed by a RADIUS server. The Cisco Wireless LAN controllers can be configured to support a web authentication client. You can use this template to replace the Web authentication page provided on the controller.

To add or make modifications to an existing web authentication template, follow these steps:

**Step 1** Choose **Configure > Controller Template Launch Pad**.

**Step 2** Click **Web Auth Configuration** or choose **Security > Web Auth Configuration** from the left sidebar menu. The Security > Web Authentication page appears, and the number of controllers and virtual domains that the template is applied to automatically populates. The last column indicates when the template was last saved.

The Applied to Controllers number is a link. Clicking the number opens an Applied to Controllers page, which displays the controller name and IP address to which that template is applied, as well as the time it was applied and its status. The Applied to Virtual Domains number is also a link. Clicking this link opens an Applied to Virtual Domains page that shows all partition names.

- Step 3** If you want to add a new template, click **Add Template** from the Select a command drop-down list, and click **Go**. To modify an existing template, click the template name. The Web Authentication template page appears (see Figure 11-36).

**Figure 11-36** Web Authentication Configuration Template

291200

- Step 4** Choose the appropriate web authentication type from the drop-down list. The choices are default internal, customized web authentication, or external.
- If you choose default internal, you can still alter the page title, message, and redirect URL, as well as whether the logo appears. Continue to Step 5.
